HOUNSLOW, in *Geography*, a town, partly belonging to the pariſh of Heſton, and partly to that of Iſleworth, in the hundred of Offulſton, and county of Middleſex, England. It is chiefly ſupported by its great thoroughfare, and abounds with inns and public-houſes for the accommodation of travellers. Here was formerly a market, which is now diſcontinued: but a fair is held here every Trinity Monday. At the weſtern extremity of the town is a chapel of eaſe, which formerly belonged to a priory, that was founded in the thirteenth century. The architecture, and ſome ornaments in the chapel, indicate the age of the building to have been coeval with the foundation of the priory. In the chancel is a monument for Whitelocke Bulſtrode, eſq. who died November 27, 1724. Adjoining the town is a large tract of waſte land called Hounſlow-heath. According to a ſurvey made in the year 1546, this heath conſiſted of 4293 acres, nearly the whole of which was then waſte, and almoſt uſeleſs. It continued in this ſtate, till within the laſt 20 years, but an act of parliament has been recently obtained to incloſe and cultivate it. Many acres are now under tillage, and will conſequently be rendered beneficial to the community, and profitable to the proprietors. (See Middleton's Agricultural Survey of Middleſex.) This heath has been noted in the annals of military hiſtory, and alſo in thoſe of Newgate. Veſtiges of ancient encampments are ſtill viſible, and it is related that the military forces of the kingdom have frequently been aſſembled and brought to action here. In 1267, the earl of Glouceſter, leading the Londoners againſt king Henry III. aſſembled them on Hounſlow-heath. King Charles's army, after the memorable battle of Brentford in 1642, entrenched themſelves here. On the 3d of Auguſt 1647, the parliamentary forces, amounting to 20,000 foot and horſe, under ſir Thomas Fairfax, were aſſembled on this heath, when the ſpeakers of both houſes of parliament were preſent. Several other inſtances might be cited. In the year 1793, barracks were erected here to contain above 400 ſoldiers, with horſes, &c. Large gun-powder and oil mills are ſtanding upon the banks of the old river. The former have ſeveral times taken fire, and ſeveral buildings have been blown up. Lyſons's Environs of London, vol. iii.

HOU-QUANG, a province of China, occupying nearly the centre of the empire; bounded on the N. by Honan, on the E. by Kiang-ſi and Kiang-nan, on the S. by Quang-ſi and Quang-tong, and on the W. by Se-tchuen and Koei-tcheou, about 480 miles from N. to S. and 350 from E. to W. The river Yang-tſeokiung traverſes this province from W. to E., and divides it into two parts, the northern and ſouthern. The greater part of the province is level, watered by lakes, canals, and rivers, and celebrated for its fertility. By the Chineſe it is called the ſtore-houſe of the empire, and among them it is a common ſaying, that "the abundance of Kiang-ſi could furniſh all China with a breakfaſt; but the province of Hou-quang alone could ſupply enough to maintain all its inhabitants." The people boaſt much of their cotton cloths, ſimples, gold-mines, wax, and paper made of the bamboo-reed. The capital of the whole province is Vou-tchang, and its population, as ſtated by ſir George Staunton, 27 millions. The northern part of the province contains eight cities of the firſt claſs, and ſixty of the ſecond and third. The ſouthern comprehends ſeven of the firſt claſs and 54 of the ſecond and third, excluſive of forts, towns, and villages, which every where occur.

HOUR, Ὥρα, *Hora*, in *Chronology*, an aliquot part of a natural day, uſually a 24th, ſometimes a 12th.

The origin of the word *hora*, or ὥρα, comes, according to ſome authors, from a ſurname of the ſun, the father of hours, whom the Egyptians call *Horus*. Others derive it from the Greek ὁρίζειν, *to terminate, diſtinguiſh*, &c. Others from the word οὖρον, *urine*; pretending that Triſmegiſtus was the firſt that ſettled the diviſion of hours; which he did from obſervation of an animal conſecrated to Serapis, named the *cynocephalus*, which makes water twelve times a day, and as often in the night, at equal intervals.

An hour with us is a meaſure or quantity of time, equal to a twenty-fourth part of the natural day, or nycthemeron; or it is the duration of the twenty-fourth part of the earth's diurnal rotation. Fifteen degrees of the equator anſwer to an hour; though not preciſely, but near enough for common uſe.

The hour is divided into ſixty minutes, the minute into ſixty ſeconds, &c.

The diviſion of the day into hours is very ancient; as is ſhewn by Kircher, Œdip. Egypt. tom. ii. part ii. claſs vii. cap. 8. though the paſſages he quotes from ſcripture do not prove it. The moſt ancient hour is that of the twelfth part of the day. Herodotus, lib. ii. obſerves, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts. The aſtronomers of Cathaya, &c. biſhop Beveridge obſerves, ſtill retain this diviſion. They call the hour *chag;* and to each *chag* they give a peculiar name, taken from ſome animal: the firſt is called *zeth*, *mouſe;* the ſecond *chiu*, *bullock;* the third *zem*, *leopard;* the fourth *mau*, *hare;* the fifth *chin*, the *crocodile*, &c.

The diviſion of the day into twenty-four hours was not known to the Romans before the Punic war. Till that time they only regulated their days by the riſing and ſetting of the ſun.

They divided the twelve hours of their day into four; *viz. prime*, which commenced at ſix o'clock, *third* at nine, *ſixth* at twelve, and *none* at three. They alſo divided the night into four watches, each containing three hours.

There are divers kinds of hours, uſed by chronologers, aſtronomers, dialiſts, &c.

Sometimes hours are divided into *equal* and *unequal*.

Hours, *Equal*, are the twenty-fourth parts of a day and night preciſely; that is, the time wherein the fifteen degrees of the equator mount above the horizon.

Theſe are alſo called *equinoctial* hours, becauſe meaſured on the equinoctial; and *aſtronomical*, becauſe uſed by aſtronomers.

They are alſo differently denominated, according to the manner of accounting them in different countries.

Hours, *Aſtronomical*, are equal hours, reckoned from noon, or mid-day, in a continued ſeries of twenty-four.

Hours, *Babyloniſh*, are equal hours, reckoned from ſun-riſe in a continued ſeries of twenty-four.

Hours, *European*, are equal hours, reckoned from midnight; twelve from thence till noon, and from noon till midnight twelve more.

Hours, *Jewiſh*, or *Planetary*, or *Ancient*, are twelfth parts of the artificial day and night.

Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the hours of the day are equal to thoſe of the night: at other times they will be always either increaſing or decreaſing.

They are called *ancient* or *Jewiſh* hours, becauſe uſed by the ancients, and ſtill among the Jews. They are called *planetary* hours, becauſe the aſtrologers pretend, that a new planet comes to predominate every hour; and that the day takes its denomination from that which predominates the firſt hour thereof: as Monday from the moon, &c.

Hours, *Italian*, are equal hours, reckoned from ſun-ſet, in a continued ſeries of twenty-four.

Hours, *Unequal*, or *Temporary*, are twelfth parts of the artificial day or night. The obliquity of the ſphere renders theſe more or leſs unequal at different times; ſo that they only agree with the equal hours at the times of the equinoxes.

To find the hour of the day, when the latitude of the place, the ſun's declination, and his altitude, are given. Thus, ſuppoſe the latitude is 51° 32′, the ſun's declination 18° north, and his altitude 40°, to find the hour of the day.

The geometrical ſolution of this problem is performed by projecting ſtereographically on the plane of the meridian the oblique-angled ſpherical triangle, which is made by the complement of the latitude, the complement of the ſun's altitude, and the ſun's diſtance from the elevated pole. Thus with the chord of 60° (*Plate* XVI. *Aſtronomy, fig.* 142.) draw the primitive circle Z O N H; quarter it; alſo draw the axis P C P through the poles, and the equinoctial Æ C Q; likewiſe the parallel of declination D ⊙ *d* equal 18°; then draw parallel to the horizon H O, the almacanter or parallel of the ſun's altitude A *a* = 40°, to cut the parallel of the ſun's declination in ⊙, the place of the ſun at that time. Then through ⊙ draw two great circles, one through Z and N the poles of the horizon, and the other through P and P the poles of the equinoctial, as Z ⊙ N, and P ⊙ P; which form the oblique-angled ſpherical triangle P Z ⊙; and the angle Z P ⊙, meaſured on the line of half tangents, gives the hour of the day from twelve, *viz.* 47° 20′ equal to three hours nine minutes nearly, or to 51 minutes after eight in the morning, or 51 minutes before four in the afternoon. But by ſpherical trigonometry, having three ſides given, that is, Z P, 38° 28′, the complement of the latitude, Z ⊙, 50° 00′, the complement of the ſun's altitude, and P ⊙, 72° 00′, the ſun's diſtance from the elevated pole (which is the declination added to 90°, when the latitude and declination are of a contrary name; but if of one name, it is the complement of the declination); and the angle Z P ⊙, the hour of the day, is found by caſe 11. of ſpherical trigonometry, as follows.

Firſt add the complement of the latitude, complement of the ſun's altitude, and the ſun's diſtance from the elevated pole, into one ſum. Secondly, from half that ſum ſubtract the complement of the ſun's altitude, noting the half ſum, and the remainder; then the complement arithmetical of the ſines of the complement of the latitude, and the ſun's diſtance from the pole, and the ſines of the ſaid half ſum and remainder, added together; the ſine of half this ſum, doubled, and ſubtracted from 180 degrees, gives the hour from noon.

Side { Z P Co. lat. 38° 28′ } containing ſides { S. co. ar. — 0.206168
⊙ P Co. decl. 72° 00′ S. co. ar. — 0.021794
Z ⊙ Co. alt. 50° 00′ half ſum ſides 80° 14′ S. — 9.993660

Sum is, 160° 28′ remainder 30° 14′ S. — 9.702019

Half is 80° 14′ ſum of the 4 — 19.923641

Co. alt. 50° 00′ ſine half ſum — 9.961820

Remainder 30° 14′

66° 20′
66° 20′

Which doubled gives 132° 40′.

This ſubtracted from 180° 00′ leaves 47° 20′ equal to three hours nine minutes nearly, the ſame as before.

By the ſame operation you may find the ſun's azimuth P Z ☉, if inſtead of the complement of the ſun's altitude you ſubtract the ſun's diſtance from the pole, noting the half ſum and remainder as before. And the rule will ſtand thus: to the complement arithmetical of the ſines of the complement of the latitude, and complement of the ſun's altitude, add the ſines of the aforeſaid half ſum and remainder; then the ſine of half the total of theſe four, doubled, and taken from 180 degrees, gives the ſun's azimuth from the north, in north latitude; and from the ſouth, in ſouth latitude.

If the hour of the night is required, the height of ſome ſtar muſt be taken. And it is found by adding to, or ſubtracting the right aſcenſion of that ſtar from that of the ſun.

To find the hour of the day or night by the globe, ſee Globe.

Hour, in *Mining*, is uſed by ſeveral foreign writers to expreſs $\frac{1}{24}$th part of the circumference or horizon, or 15° of azimuth; the ſouth and the north being called twelve hours, the eaſt and weſt ſix hours; and in deſcribing the courſe or range of a vein or ſtratum, they ſay, if N.W. and S.E., that it has a nine o'clock range, &c. In the ſame manner, Engliſh colliers, ſpeaking of the prevailing dip of the ſtrata, ſay, that the meaſures generally dip to the ten o'clock ſun; and the collieries of Derbyſhire are found by Mr. Farey generally to face the two o'clock ſun, or the ſlines or length-way joints, at right angles to theſe, tend to the eight o'clock ſun, which is either the deep end or the riſe-end of the works, according as the ſtrata dip towards the N.W. or S.W. or *vice verſâ*.

Hours, *Horæ*, in the *Ancient Mythology*, were certain goddeſſes, the daughters of Jupiter and Themis; at firſt only three in number, Eunomia, Dice, and Irene; to which were afterwards added two more, Carpo, and Thallote.

Homer makes them the door-keepers of heaven. Ovid allots them the employment of harneſſing the horſes of the ſun:

> "Jungere equos Titan velocibus imperat Horis."

And ſpeaks of them as ſtanding, at equal diſtances, about the throne of Sol:

> " ——— et poſitæ ſpatiis equalibus, Horæ."

The poets repreſent them as dreſſed in fine coloured, or embroidered robes, and gliding on with a quick and eaſy motion. Ovid. Faſt. v. ver. 218. Met. ii. ver. 119. Stat. Theb. iii. ver. 410.

Hours, *Horæ*, in the *Romiſh Church*, are certain prayers performed at ſtated times of the day; as *matins*, *veſpers*, *lauds*, &c.

The leſſer hours, are *prime*, *tierce*, *ſixth*, and *none*. They are called *hours*, or *canonical* hours, as being to be rehearſed at certain hours preſcribed by the canons of that church, in commemoration of the myſteries accompliſhed at theſe hours. Theſe hours were anciently alſo called *courſe*, *curſus*. F. Mabillon has a diſſertation on them, entitled de Curſu Gallicano.

The firſt conſtitution enjoining the obſervation of the canonical hours, is of the ninth century, being found in a capitular of Heito, biſhop of Brazil, directed to his curates, importing, that the prieſts ſhall never be abſent at the canonical hours, either by day or night.

Hours, *Prayers of forty*, are public prayers continued for the ſpace of three days ſucceſſively, and without intermiſſion before the holy ſacrament, to obtain the aſſiſtance of heaven on ſome important occaſion.

In theſe days, care is taken, that the holy ſacrament be expoſed forty hours, *viz.* thirteen or fourteen hours each day.

Hour-*circles*, or Horary *Circles*, in *Aſtronomy*, &c. are great circles, meeting in the poles of the world, and croſſing the equinoctial at right angles; the ſame as meridians.

They are ſuppoſed to be drawn through every fifteenth degree of the equinoctial and equator, and on both globes are ſupplied by the meridian hour-circle and index. See Globe.

The planes of the hour-circles are perpendicular to the plane of the equinoctial, which they divide into twenty-four equal parts.

Hour-*glaſs*, a popular kind of chronometer or clepſydra, ſerving to meaſure the flux of time, by the deſcent or running of ſand out of one glaſs veſſel into another.

The beſt hour-glaſſes are thoſe, which, inſtead of ſand, have egg-ſhells well dried in the oven, then beaten fine and ſifted.

Hour-glaſſes are much uſed at ſea for reckoning, &c.

There is alſo a ſort of hour-glaſſes, which depend on the flux of water, or ſome other liquid, more properly called *clepſydræ*. See Clepsydra.

Hour-*lines*, on a *Dial*, are lines which ariſe from the interſections of the plane of the dial, with the ſeveral planes of the hour-circles of the ſphere, and therefore muſt be all right lines. See Dial.

Hour-*ſcale*, a divided line on the edge of Collins's quadrant, being only of tangents of forty-five degrees each, ſet together in the middle. Its uſe, together with the lines of latitude, is to draw the hour-lines of dials that have centres, by means of an equilateral triangle, drawn on the dial-planes. See Dialling *lines*, and Scale.

HOURA, in *Geography*, a ſmall iſland near the W. coaſt of Scotland. N. lat. 57° 56′. W. long. 5° 16′.

HOURIS, in *Modern Hiſtory*, is a name given by the Mahometans to thoſe females that are deſigned for the faithful in paradiſe. Theſe are not the ſame with whom they have lived on earth, but formed for this purpoſe, with ſingular beauty and undecaying charms.

HOURSAK, in *Geography*, a town of Perſian Armenia; 150 miles E.N.E. of Erivan.

HOUSAGE, a fee which a carrier, or other perſon, pays for laying up goods in a houſe.

HOUSANABUD, in *Geography*, a town of Hindooſtan, in Bahar.

HOUSANGUNGE, a town of Hindooſtan, in Oude; 40 miles N. of Manickpour.

HOUSATONICK, or Hooestonnuc, ſignifying in the Indian language "over the mountain," a river of Connecticut, which has two ſources; one in Laneſborough, the other in Windſor, both in Berkſhire county, Maſſachuſetts. Theſe branches unite in Pittsfield, and the river, after paſſing through a number of towns, diſcharges itſelf into Long iſland Sound, between Stratford and Milford, in Connecticut. It is navigable about 12 miles to Derby. Between Saliſbury and Canaan, this river forms a cataract 150 yards wide, and 60 feet in perpendicular fall. Several uſeful mills and iron works are erected on the falls of this river.

HOUSE, a habitation, or a building conſtructed for ſheltering a man's perſon and goods from the inclemencies of the weather, and the injuries of ill diſpoſed perſons. Houſes differ in magnitude, being of two or three, and four ſtories, in the materials of which they conſiſt, as wood, brick, or ſtone, and in the purpoſes for which they are deſigned, as a manor-houſe, farm-houſe, cottage, &c.

Ancient Rome conſiſted of forty-eight thouſand houſes, all inſulated or detached from one another.

For the number of houſes, and of inhabitants to a houſe in England, &c. ſee the article EXPECTATION *of Life*. See alſo each county and town, under its reſpective appellation.

A pleaſure houſe, or country houſe, is that built for occaſional reſidence, and for the pleaſure and benefit of retirement, air, &c. This is the *villa* of the ancient Romans; and what in Spain and Portugal they call *quinta;* in Provence, *caſſine;* in ſome other parts of France, *cloſerie;* in Italy, *vigna*.

The citizens of Paris have alſo their *maiſons de bouteilles, bottle houſes,* to retire to, and entertain their friends; which in Latin might be called *micæ;* the emperor Domitian having a houſe built for the like purpoſe, mentioned under this name by Martial, lib. ii. ep. 59.

It is a thing principally to be aimed at, in the ſcite or ſituation of a country houſe, or ſeat, that it have wood and water near it.

It is far better to have a houſe defended by trees than hills; for trees yield a cooling, refreſhing, ſweet, and healthy air and ſhade, during the heat of the ſummer, and very much break the cold winds and tempeſts from every point in the winter. The hills, according to their ſituation, defend only from ſome certain winds; and if they are on the north-ſide of the houſe, as they defend from the cold air in the winter, ſo they alſo deprive you of the cool refreſhing breezes, which are commonly blown from thence in the ſummer. And if the hills are ſituate on the ſouth ſide, they then prove alſo very inconvenient.

A houſe ſhould not be too low ſeated, ſince this precludes the convenience of cellars. If you cannot avoid building on low grounds, ſet the firſt floor above the ground the higher, to ſupply what you want to ſink in your cellar in the ground; for in ſuch low and moiſt grounds, it conduces much to the dryneſs and healthineſs of the air to have cellars under the houſe, ſo that the floors be good and cieled underneath. Houſes built too high, in places obvious to the winds, and not well defended by hills or trees, require more materials to build them, and more alſo of reparations to maintain them; and they are not ſo commodious to the inhabitants as the lower-built houſes, which may be built at a much eaſier rate, and alſo as complete and beautiful as the other.

In buildings or houſes not above two ſtories with the ground-room, and not exceeding twenty feet to the raiſon-place, and upon a good foundation, the length of two bricks, or eighteen inches for the heading courſe, will be ſufficient for the ground-work of any common ſtructure, and ſix or ſeven courſes above the earth to a water-table, where the thickneſs of the walls is abated, or taken in, on either ſide the thickneſs of a brick, namely, two inches and a quarter.

For large and high houſes, or buildings, of three, four, or five ſtories with the garrets, the walls of ſuch edifices ought to be from the foundation to the firſt water-table three heading courſes of brick, or twenty-eight inches at leaſt; and at every ſtory a water-table, or taking in on the inſide for the ſummers, girders, and joints, to reſt upon, laid into the middle, or one quarter of the wall at leaſt, for the better bond. But as for the innermoſt or partition wall, a half brick will be ſufficiently thick; and for the upper ſtories, nine inches, or a brick length, will ſuffice.

The parts, proportions, &c. of the houſes in London, are regulated by ſtatute. See BUILDING, and article FIRE-*cocks*.

Every man has a right to air and light in his own houſe; and therefore if any thing of an infectious ſmell be laid near the houſe of another, or his lights be ſtopped up and darkened by buildings, &c. they are nuiſances puniſhable by our laws; but no action lies for merely obſtructing the opening of a proſpect. If a man's houſe be attacked with intent to kill, and the owner or his ſervants kill the thieves in defending him and his houſe, this is not felony, and incurs no forfeiture. One man may compel another to repair his houſe in ſeveral caſes, by the writ *de domo reparanda*. The doors of a houſe may not be broke open on arreſts, except in caſes of treaſon or felony, &c. The riotouſly pulling down of a houſe is felony excluded clergy. Stealing lead, or iron bars, or rails fixed to houſes, &c. is felony puniſhable by tranſportation, by 4 Geo. cap. 32. The hundred is liable to damages by the burning of houſes. 9 Geo. cap. 32. See ARSON, BURGLARY, &c.

HOUSE-*cricket*, in *Entomology*. See GRYLLUS *domeſtica*.

HOUSE, *Hot*. See HOT-*houſe* and STOVE.

HOUSE, *Green*. See GREEN-HOUSE.

HOUSE, *Ice*. See ICE.

HOUSE-*lamb*, in *Rural Economy*, a name given to that ſort of lamb which has been reared and fattened in the houſe. See LAMB-*ſuckling*.

HOUSE, *Summer*, a little edifice erected at the corner of a garden, and contrived ſo as to let air in on all ſides; or to exclude it, as you find proper.

HOUSE, *Town*, or *Hall*, is a place where the officers and magiſtrates of a town or city hold their meetings, for the due adminiſtration of their laws and policy. See HALL and GUILD.

HOUSE, *Work*. See WORK-*houſe* and BRIDEWELL. See alſo the article RASPHUYS.

HOUSE *of Correction*. Juſtices of the peace in ſeſſions are to make orders for erecting or enlarging houſes of correction, and for the maintenance and government of the ſame, and for the puniſhment of offenders committed thither; on preſentment of the grand jury, or of a juſtice on his own view or knowledge, that ſuch houſes are wanted. (7 Jac. I. c. 4. 17 Geo. II. c. 5. 14 Geo. II. c. 33. 22 Geo. III. c. 64. 24 Geo. III. ſeſſ. 2. c. 55.) In every county of England there ſhall be a houſe or houſes of correction, built at the charge of the county, with all conveniences for the ſetting of people to work. The expence of building, repairing, and purchaſing land, &c. for houſes of corrrection, and maintaining them, ſhall be defrayed by order of the juſtices in ſeſſions, by the monies raiſed in the ſame manner as the general county-rate; and when the amount thereof ſhall exceed one-half of the amount of the ordinary annual aſſeſſment for the ſame, (computed at a medium for the laſt five preceding years), they may borrow on mortgage of the ſaid rates, any ſum not leſs than 50*l.* nor more than 100*l.* each, ordering the intereſt to be paid off yearly, and ſo much of the principal ſum as ſhall at leaſt be equal to the intereſt, until the whole ſhall be diſcharged; provided that the whole money borrowed be fully paid within 14 years from the time of borrowing the ſame. (17 Geo. II. c. 5. 22 Geo. III. c. 64. 24 Geo. III. ſeſſ. 2. c. 55.) The juſtices at their quarter ſeſſions ſhall nominate one or more juſtices, within their reſpective diſtricts as viſitors and inſpectors, who ſhall report to the next quarter ſeſſions. And the juſtices in ſeſſions are to appoint governors or maſters of ſuch houſes of correction, and their ſalaries, &c. which are to be paid quarterly out of the county rate. They may alſo allow ſuch governors ſome proportion of the profits earned by the priſoners. The ſalaries ſhall be fixed with a reference to the quantity of work done. (22 Geo. III. c. 64. 31 Geo. III. c. 46.) Theſe governors are to ſet the perſons ſent on work, and to puniſh offenders (except by whipping); and in caſe of repetition of offences to report to the viſiting juſtices, who ſhall order ſuch offenders to be puniſhed, either by moderate whipping, repeated whippings, or cloſe confinement for any term not exceeding one month. Governors are to yield a true account every quarter-ſeſſions of perſons committed to their cuſtodies; and if they ſuffer any to eſcape, the juſtices may fine them.

The juſtices, at ſome general or quarter-ſeſſions, at which five juſtices, at the leaſt, ſhall be preſent, may make ſuch rules and orders for receiving, ſeparating, claſſing, dieting, clothing, maintaining, employing, reforming, governing, managing, treating, and watching offenders during their confinement in penitentiary houſes, according to 19 Geo. III. c. 47. (See PENITENTIARY *Houſes*, and TRANSPORTATION.) Such rules and orders are to be ſubmitted to the judges of aſſize, &c. 31 Geo. III. c. 46. If perſons ordered to hard labour ſhall eſcape, or be aſſiſted in eſcaping, or reſcued, every ſuch offence ſhall be puniſhed in the ſame manner as the like offence would be puniſhed by 19 Geo. III. c. 74. concerning penitentiary houſes. Separate apartments ſhall be provided by 22 Geo. III. c. 64. By the ſame act, the governor or keeper of every houſe of correction ſhall employ perſons, not committed to hard labour, in ſome work that is not ſevere, and allow them half their earnings, to be paid at the time of their diſcharge. The juſtices in ſeſſions may alſo appoint, at pleaſure, a miniſter of the church of England, reſiding near the houſe of correction, to perform divine ſervice there every Sunday, and appoint him a ſalary not exceeding 20*l.* a-year. No governor or aſſiſtant ſhall ſell, or be licenſed to ſell, or have any benefit from the ſale of any wine, ale, beer, ſpirituous or other liquors; nor ſhall ſuch liquors be brought into the houſe of correction, to be drank there, unleſs for a medical purpoſe, by a written direction, under the hand of the apothecary or ſurgeon attending ſuch houſe, under a penalty of 10*l.* The maſter ſhall deliver to the juſtices, at every general quarter-ſeſſions, a written account of the perſons in cuſtody, with the offence of each, time of commitment, diſtinguiſhing the age and ſex of thoſe committed to hard labour, the buſineſs in which they have been employed, and the behaviour of each during confinement.

The houſe of correction is for the employing and puniſhing of idle and diſorderly perſons, parents of baſtard children, beggars, ſervants running away, treſpaſſers, rogues, vagabonds, &c. Poor perſons refuſing to work, are there to be whipped, and ſet to work and labour; and any perſon who lives extravagantly, having no viſible way to ſupport himſelf, may be ſent to the houſe of correction, and ſet to work there, and may be kept there, until he gives the juſtice ſatisfaction in reſpect to his living, but not to be whipped. A perſon ought to be convicted of vagrancy, &c. before he is ordered to be whipped.

Whereas doubts may ariſe where authority is given to any juſtice or juſtices, to commit offenders to the houſe of correction, for offences cognizable before them out of ſeſſions, how long offenders may be there detained, and in what manner treated, when the time and manner of their puniſhment is not by law expreſsly limited; it is enacted by 17 Geo. II. c. 5. that when any offender ſhall be committed as aforeſaid, by virtue of any law in being, or to be made, and the time and manner of their puniſhment are not expreſsly limited, the ſaid juſtice or juſtices ſhall commit ſuch offenders to the houſe of correction, there to be kept to hard labour until the next general or quarter-ſeſſions, and until diſcharged by due courſe of law: and two juſtices (of whom the juſtice who committed him to be one) may diſcharge the ſaid offender before the ſeſſions if they ſee cauſe: and if he ſhall not be ſo diſcharged, the ſaid ſeſſions may either diſcharge him or continue him further, not exceeding three months. A table of rules and orders for the government of houſes of correction, is ordered to be fixed in ſome conſpicuous part of ſuch houſes by 22 Geo. III. c. 64, of which the following is a copy:

"Rules, orders, and regulations to be obſerved and inforced at every houſe of correction provided and eſtabliſhed, or to be provided and eſtabliſhed, under the authority of the acts of the 7th year of the reign of his late majeſty king James I. the 17th of king George II. and the 22d of king George III.

"1. That the ſeveral perſons who ſhall be committed to the houſe of correction to be kept to hard labour, ſhall be employed (unleſs prevented by ill health) every day during their confinement (except Sundays, Chriſtmas day, and Good-Friday), for ſo many hours as the day-light in the different ſeaſons of the year will admit, not exceeding twelve hours, being allowed thereout to reſt half an hour at breakfaſt, an hour at dinner, and half an hour at ſupper, and that the intervals ſhall be noticed by the ringing of a bell.

"2. That the governor of each houſe of correction ſhall adapt the various employments, which ſhall be directed by the juſtices at their quarter-ſeſſions, to each perſon in ſuch manner as ſhall be beſt ſuited to his or her ſtrength and ability, regard being had to age and ſex.

"3. That the males and females ſhall be employed, and ſhall alſo eat and be lodged in ſeparate apartments, and ſhall have no intercourſe or communication with each other.

"4. That every perſon ſo committed ſhall be ſuſtained with bread, and any coarſe but wholeſome food and water; but perſons under the care of the phyſician, ſurgeon, or apothecary, ſhall be ſuſtained with ſuch food and liquor as he ſhall direct.

"5. That the governor, and ſuch other perſons (if any) as ſhall be employed by the juſtices to aſſiſt the governor, ſhall be very watchful and attentive in ſeeing that the perſons ſo committed are conſtantly employed during the hours of work; and if any perſon ſhall be found remiſs or negligent in performing what is required to be done by ſuch perſon to the beſt of his or her power and ability, or ſhall wilfully waſte, ſpoil, or damage the goods committed to his or her care, the governor ſhall puniſh every ſuch perſon in the manner hereafter directed.

"6. That if any perſon ſo committed ſhall refuſe to obey the orders given by the governor, or ſhall be guilty of profane curſing or ſwearing; or of any indecent behaviour or expreſſion; or of any aſſault, quarrel, or abuſive words, to or with any other perſon: he or ſhe ſhall be puniſhed for the ſame in the manner hereafter directed.

"7. That the governor ſhall have power to puniſh the ſeveral offenders for the offences herein before deſcribed, by cloſer confinement; and ſhall enter in a book, to be kept by him for the inſpection of the juſtices at the quarter-ſeſſions, and the viſiting juſtice or juſtices, the name of every perſon who ſhall be ſo puniſhed by him, expreſſing the offence, and the duration of the puniſhment inflicted."

Bridewell is a priſon for correction in London, and offenders may be ſent thither. See BRIDEWELL and HOSPITAL.

HOUSE is alſo uſed for a convent or monaſtery.

Regular prieſts give the name houſes to the places they reſide in, and not that of convents or monaſteries, which properly belong to ſimple friars. Thus we ſay the Jeſuits' houſe, and the Barnabites or Theatins' houſe.

The Jeſuits have both profeſſed houſes, and colleges for novices, which they call *houſes of probation.*

They have alſo *houſes of retreat* for ſpiritual exerciſes, where they receive ſecular perſons and eccleſiaſtics diſpoſed to practiſe the ſame with them for eight or ten days.

House is alſo uſed for one of the eſtates of the kingdom aſſembled in parliament.

Thus we ſay, the houſe of lords, the houſe of commons, &c. See Commons, Parliament, and Peers.

House is alſo uſed for a noble family; or a race of illuſtrious perſons iſſued from the ſame ſtock. See Genealogy.

In this ſenſe we ſay, the houſe or family of the Stuarts, the houſe of Bourbon, the houſe of Hanover, of Auſtria, of Lorrain, of Savoy, &c.

House, in *Aſtrology*, a dodecatemory, or 12th part of the heavens.

The diviſion of the heavens into houſes is founded on this, that the ſtars and planets, when found herein, are ſuppoſed to have certain influences, either good or evil, upon ſublunary bodies; and to each houſe is aſſigned its particular virtue or influence; upon the conſideration whereof they draw horoſcopes. See Horoscope.

This diviſion is made by ſix great circles, called *circles of poſition*, which cut each other in the common interſection of the meridian and horizon, in the ordinary way of domiſying, which is that of Regiomontanus: for the ancients had three other ways.

Theſe circles divide the equator into 12 equal parts, of 30 degrees each, without any regard to the zodiac. The horizon and meridian are two circles of the celeſtial houſes, which divide the heavens into four equal parts, each whereof comprehends three houſes. There are ſix above the horizon, and as many below it; and ſix eaſtern and ſix weſtern houſes.

The ſcheme or figure of the heavens conſiſts of 12 triangles, which are likewiſe called houſes; wherein are laid down the ſtars, ſigns, and planets, comprised within the reſpective ſpaces of the circles of poſition.

Each planet has two certain houſes, whereing they ſay it exerts itſelf with peculiar vigour. Leo is the ſun's houſe, and Cancer that of the moon; Capricorn is Saturn's, &c.

Some call the houſes dodecatemories; but that name is more immediately appropriated to the twelve ſigns or diviſions of the zodiac. See Dodecatemory.

The Aſtrological houſes have their particular names according to their qualities. The firſt is the *houſe of life*, being the aſcendant, and containing five degrees above the horizon, the reſt beneath it; the ſecond is the *houſe of riches;* the third, the *houſe of brothers;* the fourth, in the loweſt part of heaven, the *houſe of relations*, and the angle of the earth; the fifth, the *houſe of children;* the ſixth, the *houſe of health;* the ſeventh, the *houſe of marriage*, and the angle of the weſt; the eighth, the *houſe of death*, and upper gate; the ninth, the *houſe of piety;* the tenth, the *houſe of offices;* the eleventh, *the houſe of friends;* and the twelfth, the *houſe of enemies.*

It is popularly, and as it were poetically, ſaid, that the ſun had 12 houſes, by which are meant the 12 ſigns, though in reality it has only one ſign, *viz.* Leo: beſides, the diviſion of houſes is accommodated to the equator, and not the zodiac.

They begin numbering the houſes with the aſcendant, and paſs them to the imum cœli; ſo that the vertical point makes the beginning of the tenth.

Houses, *Differences of*, in *Heraldry*. See Differences.

House-*bote, Eſtovers*, in *Law;* or an allowance of timber out of the lord's wood, for the repair and upholding a houſe or tenement.

Some make houſe-bote two-fold, *viz. Eſtoverium ædificandi & ardendi.* See Estovers.

House-*breaking*, or *Houſe-robbing*, the robbing or plundering a man in ſome part of his houſe, or his booth, or ſtall, in a fair or market; the owner, or his wife, children, or ſervants, being within the ſame.

This was made felony by ſtat. 23 Hen. VIII. and 3 Ed. VI. but it is ſince alſo made felony, though none be within the houſe, 26 Eliz. See Burglary and Larceny.

House-*burning*. See Arson.

House-*coal*, in *Mining*, is applied to ſuch ſort of coals, as are adapted, and in general uſed as firing by the inhabitants of coal diſtricts, called alſo *fire-coal*, to diſtinguiſh them from lime-coal, engine-coal, fleck, &c. which are refuſe, or ſtinking-coal, uſed chiefly for burning lime, working ſteam-engines, &c.

House-*iſland*, in *Geography*, one of the Shetland iſlands, about ſeven miles long and one broad. N. lat. 60′ 4°. W. long. 1° 35′.

House *painter*. See Painting.

House *of Recovery*, a hoſpital for the reception of perſons labouring under infectious fever, or typhus, with a view not only to the cure of the diſeaſe, but to the ſuppreſſion of the contagion.

This very important inſtitution, of which many examples are now to be found in England and Ireland, is of very recent date; the firſt houſe of the kind having been eſtabliſhed at Mancheſter in the year 1796, when this appellation was adopted, as being leſs alarming to the feelings of the poor, and of the public in general, than that of *fever-houſe.* For the original ſuggeſtion of ſuch eſtabliſhments, and for the ſatisfactory documents in proof of the ſafety and advantages which they afford, deduced from a long and philoſophical inveſtigation of the nature of contagion, the country is indebted to Dr. Haygarth. The principles on which he recommended the plan, had been inferred by ſo cautious an induction from obſervation and experiment, that every inſtance of the practical application of them has ſerved but to corroborate their truth.

It is well known to thoſe who have attended to the hiſtory of epidemic diſeaſes, that the various contagious fevers, which have been denominated the plague, putrid, ſpotted, and malignant fevers, have, together with the ſmall-pox, meaſles, and ſcarlet fever, been the principal ſcourges of mankind, ſince hiſtory has afforded us any accurate records on the ſubject; and that the ravages of peſtilence in general have been confined to the crowded population of large camps, towns, and cities. (See Epidemic.) With the origin of the ſmall-pox, meaſles, and ſcarlet-fever, we are altogether unacquainted; they ſeem to be propagated only by a ſpecific contagion, generated in the bodies of thoſe who labour under the diſeaſes. But the origin of the other fevers above ſpecified has been traced, we apprehend, with a clearneſs that admits of no doubt, to the effluvia generated from the accumulated filth, and the uncleanly perſons and habitations, abounding in large and populous cities. (See Health, *Public.*) And although it has been ſhewn, that the frequency and extenſive range of theſe peſtilential fevers have been curtailed, and ſome of them actually annihilated, by the ſyſtem of public and private cleanlineſs and ventilation adopted in modern times; yet until the abodes of poverty can be rendered airy and cleanly, (a conſummation ſcarcely to be hoped for,) contagion will continue to be generated under certain circumſtances, and will neceſſarily tend to propagate itſelf to an indefinite extent. And ſuch, in fact, has been the actual ſtate of the caſe, in all large and crowded towns, until within a very few years. The inhabitants of the cellars and garrets in the dirty alleys and lanes in Mancheſter, Liverpool, London, Dublin, &c. &c. have been found to ſuffer ſeverely from the generation of infectious fever in their apartments, or from the ready propagation of it, whenever introduced.

From the nature of the accommodation of the poor in their lodging-houſes, from their inability to preſerve cleanlineſs, and from the conſtant intercourſe between the inhabitants of the different apartments of theſe houſes, not only is contagious fever generated; it is alſo readily propagated, and it becomes an irremovable inmate, as it were, of the houſes. "When a fever either ariſes in, or is introduced into the houſe of a poor perſon, every circumſtance favouring its progreſs, it generally attacks the family in ſucceſſion: their clothes, and the woollen and cotton part of their furniture become infected, retain the infection tenaciouſly, and are capable of communicating the diſeaſe for a long time. Theſe they can neither afford to purify or deſtroy. Thus their dwellings and perſons continually breathe contagion; and where this is the ſituation, not of one family only, but of a great number, it is hardly poſſible to prevent a communication of the diſeaſe to the families of the rich, among whom it would never have been *produced.*" (Ferriar's Med. Hiſt. and Reflect. vol. i. p. 243.) The ſame author, ſpeaking of the ſituation of ſome of theſe habitations of the poor in Mancheſter, obſerves, "In thoſe houſes a very dangerous fever conſtantly ſubſiſts, and *has ſubſiſted for a conſiderable number of years.* I have known nine patients confined in fevers at the ſame time in one of theſe houſes, and crammed into three ſmall dirty rooms, without the regular attendance of any friend or even of a nurſe. Four of theſe poor creatures died, abſolutely from want of the common offices of humanity, and neglect in the adminiſtration of their medicines. As ſoon as one dies, or is driven out of his cell, he is replaced by another, who ſoon feels, in his turn, the conſequences of breathing infected air. In moſt of theſe places lodgers are received; the conſequence is a perpetual ſucceſſion of fever patients among them." That theſe repreſentations are faithfully correct, thoſe who have had an opportunity of viſiting the ſick poor in this metropolis can evince. We have ſeen the inhabitants of the ſame houſe attacked, ſeveral ſucceſſive times, by the influence of their own contagion. Even the convaleſcents, from their confinement in the midſt of infection, have frequent relapſes, ſo that the diſeaſe would ſometimes continue on the ſame ſpot for ſeveral months together.

It muſt be obvious, that theſe neſts of contagion are conſtant ſources of danger to the public, and that diſeaſes may be communicated even to diſtant quarters of the town, by the ſale of clothes, impregnated with it in its moſt active form (ſee Dr. Willan on Scarlatina), and by the public coaches, &c. And it muſt be not leſs clear, that the mere removal of a few infected individuals to the public hoſpitals, is altogether inadequate to ſtrike at the root of the evil, although it may preſerve the lives of ſome of the individuals thus removed. A ſtriking illuſtration of theſe points is afforded in a caſe mentioned by the late Dr. T. A. Murray. He was called upon to viſit a poor man in a cloſe alley leading from Shoe-lane, who was ill of typhus-fever. This patient occupied a back room, on the ground floor, *together with his wife and five female children,* the eldeſt of whom was ſixteen years of age, the youngeſt two. There was but one bedſtead in the room, but ſome bedding lay on the floor, between this and the fire-place; it was lighted by one window, which, from its conſtruction, could not be opened. The room, the bedding, and the perſons of the inhabitants were all filthy and offenſive in the higheſt degree. It appeared, however, that the mother had been firſt attacked, in conſequence, as ſhe ſuppoſed, of having viſited a perſon who died of the fever in one of the upper apartments. She had immediately obtained admiſſion into an hoſpital, and remained there until ſhe thought herſelf able to return to her family; though ſtill retaining in her clothes, or perſon, enough of the contagion to infect them. Soon after her return her huſband was attacked by the fever; then the ſecond and third of her daughters; afterwards the eldeſt and the two youngeſt. Medicine, as might have been foretold, was of very little ſervice in ſuch a ſituation. The father of the family died on the fourth day after he was viſited. The children continued to linger under the diſeaſe, when this report was made. The eldeſt of them was conveyed to a hoſpital *in a hackney coach,* having, until the time of her removal, lain by the ſide of her ſiſter, on that part of the infected bed which the dead body of their father had previouſly occupied. See Remarks on the Situation of the Poor in the Metropolis, as contributing to the Progreſs of Contagious Diſeaſes, by Dr. Murray, publiſhed by the Society for bettering the Condition of the Poor, in 1801. p. 27.

On contemplating ſcenes like this, and conſidering the danger thence reſulting to the public, and the miſery inflicted on the families of the poor, we cannot but highly approve the nature of an inſtitution, which has for its object at once the removal of the patients from ſuch peſtilential habitations (by means which ſecure the public), to a *Houſe of Recovery,* and alſo the purification of the infected apartments, and the deſtruction of the contagion, in the clothes and furniture, and whatever elſe may be imbued with it. Such are the purpoſes accompliſhed by the inſtitution of Houſes of Recovery; and we ſhall briefly ſtate the grounds upon which ſuch eſtabliſhments were propoſed, the methods in which they have been executed, and the happy reſults which have accrued from them.

The firſt ſuggeſtion of the advantages of the eſtabiſhment in queſtion was made by Dr. Haygarth, at Cheſter, about the year 1772, from a conſideration of the nature of contagion, and of the mode and limits of its propagation. His own obſervations, ſupported by thoſe of ſir John Pringle, Dr. Lind, and others, had taught him that contagious effluvia are particularly active in cloſe and unventilated apartments; but that, in the open air, or when diluted by the free admiſſion of freſh air into the infected room, they become comparatively inert and harmleſs, and might be breathed for a long time with perfect impunity; and that even the concentrated infection of a cloſe room might be reſpired for a ſhort time without producing fever, eſpecially at a little diſtance from the perſon deceaſed. It had been ſhewn too, by Dr. O'Ryan's experiments at Montpellier, that the contagion of ſmall-pox was limited in its operation to the diſtance of a few feet from the perſon infected; and by Dr. Ruſſell, Dr. Mertens, &c. that even the contagion of the plague was harmleſs at a ſimilar diſtance, particularly in the air of well ventilated places. (See Contagion, where the evidence of theſe ſtatements is adduced.) In ſhort, Dr. Haygarth was irreſiſtibly led to the concluſion, that contagion is not communicated to any diſtance through the air, and that, in a well ventilated and clean apartment in a houſe or hoſpital, perſons affected with contagious fever might be received, without any riſk to the occupants of other apartments in the ſame building, much leſs to the inhabitants of neighbouring or even adjoining houſes. In conſequence of theſe well-founded opinions, a *fever-ward* was opened in the infirmary at Cheſter, in the year 1773, with the moſt beneficial effects; *i.e.* two wards were ſet apart for the reception of patients labouring under typhus-fever, and were continued open without any injury to the other wards of that hoſpital, or to the neighbourhood, but with a great diminution of contagious fever in the town.

For, in the mean time, the attention of the officers of the infirmary was directed to the apartments from which the ſick had been removed; the furniture, clothes, &c. which had been about the perſons of the patients, were purified, by waſhing, fumigation, &c. and the rooms cleanſed and white-waſhed. The patients, after their recovery in the fever-wards, were ſent home to their families in clean garments; being thus rendered ſecure from the chance of re-infection on their arrival, and incapable of communicating it to their inmates.

The ſucceſs of this eſtabliſhment led to the opening of fever-wards in the infirmary at Liverpool, under the direction of the late Dr. Currie, where the experiment was attended with the ſame ſucceſs. The inhabitants of Mancheſter, from the preſſing repreſentations of Dr. Ferriar, were induced to form a ſeparate eſtabliſhment, as already ſtated, in 1796; and ſimilar houſes have been inſtituted in ſeveral of the large towns both in England and Ireland, eſpecially at Dublin, Waterford, Cork, &c. in London, Leeds, and other places; in all of which the principles of Dr. Haygarth have been invariably confirmed, and the moſt ſubſtantial benefits conferred upon the inhabitants.

Regulations of a Houſe of Recovery.—The following are the principal regulations adopted in the management of the Houſe of Recovery, in Gray's-inn-lane Road, London, which was opened in 1802, under the patronage of the Society for bettering the Condition of the Poor; they are chiefly taken from thoſe of the eſtabliſhment at Mancheſter. See Dr. Ferriar, loc. cit. vol. iii. p. 66.

1. The admiſſion of patients is left entirely to the phyſician, who, as ſoon he has aſcertained the ſtate of the perſon recommended, gives an order for that purpoſe; whence no time is loſt by ſearching for the recommendation of governors, or by ſtated periods of admiſſion, as in the ordinary hoſpitals.

2. A ſedan chair, or covered litter, provided with a moveable lining, is kept at the houſe, in which all perſons are carried thither at the expence of the inſtitution; ſo that no public carriages can be thus infected.

3. All patients on admiſſion have their infectious clothes changed for clean linen, and are waſhed with lukewarm water. The clothes brought into the houſe with them are properly purified and aired. During their continuance in the houſe, all linen and bed-clothes, on being removed from the bodies of the patients, are immediately immerſed in cold water, and all diſcharges are removed from the wards without delay.

4. The floors of the wards are waſhed daily near the beds, and twice a week generally; and fumigations with nitre and ſulphuric acid are frequently employed; the walls are white-waſhed once every three months with quick-lime, freſh ſlaked in water, and while it continues bubbling and hot. The bedſteads are of iron, without curtains, and the beds ſtuffed with ſtraw for the convenience of being frequently changed.

5. The fumigation, juſt mentioned, the efficacy of which in deſtroying contagion, has been ſatisfactorily proved by M. Morveau, Dr. Johnſtone, and Dr. C. Smyth (ſee FUMIGATION), is employed in the apartments which the patients have left; their walls are white-waſhed with hot lime, where that operation is deemed neceſſary; and ſuch articles of clothing as are not capable of being puriſied are deſtroyed, and replaced at the expence of the inſtitution. (See the Reports of the Inſtitution for the Cure and Prevention of Contagious Fever in the Metropolis. Ferriar, Med. Hiſt. and Refl. vol. iii. p. 66.)

The advantages of ſuch inſtitutions have become almoſt immediately apparent wherever they have been adopted. Great apprehenſions were at firſt entertained (founded entirely on popular prejudices and miſtakes in regard to the nature of contagion), that the neighbouring dwelling-houſes might be infected through the air, where a houſe of recovery was eſtabliſhed. But it was ſoon perceived that no ſuch infection took place; but, on the contrary, that the neighbourhood of the houſes (at Mancheſter for inſtance), was the firſt part of the town to be purified from the contagion which it heretofore cheriſhed. This apprehenſion was alſo ſtrongly expreſſed in London, where the Houſe of Recovery was originally a private dwelling-houſe, ſtanding *in a row*, and of courſe *contiguous* to dwelling-houſes on both ſides. But the experience of nine years has completely removed all the fears of the adjoining inhabitants.

In reſpect to the eſtabliſhment at Mancheſter, it is ſtated that "the beneficial effects of the Houſe of Recovery are almoſt beyond belief; the facts are, however, eſtabliſhed by authentic documents. The number of fever patients in the pile of buildings *in the neighbourhood of the Houſe of Recovery*, for the two preceding years and eight months, were 1256, ſomething more than an average of *four hundred* a year; thoſe in the ſame diſtrict, from July 1796 (a period commencing two months after the eſtabliſhment of the Houſe of Recovery), to July 1797, being twelve months, were only *twenty-ſix*."

Again, "in January 1796 (before the eſtabliſhment of the Houſe of Recovery), the whole number of home-patients viſited by the phyſicians of the Mancheſter Infirmary was 296, of which 226 were caſes of fever; in January 1797, the number of their home-patients was 161, and of theſe only 57 were caſes of fever." See Reports of the Society for bettering the Condition of the Poor.

Both at Mancheſter and at Dublin (where the number of fevers is much greater, and the eſtabliſhment upon a more extenſive ſcale), the diminution of fevers has been ſo great, as to enable thoſe inſtitutions to comprehend a much wider diſtrict than in the outſet. In London, many of the alleys and courts near Gray's-inn-lane, Saffron-hill, and other crowded diſtricts, in which contagious fever was generally exiſting, have been, for ſeveral years, ſince the purifying meaſures of the Houſe of Recovery were put in execution, altogether free from fever.

Dr. Ferriar remarks, while enumerating the benefits derived from theſe inſtitutions, "I can alſo perceive, that a ſalutary impreſſion has been made upon the minds of the poor reſpecting the utility of cleanneſs in their houſes. The idea of fever comprehends, among them, that of ruin to their circumſtances, and deſertion by their neighbours; it may, therefore, be expected, that they will catch at every means within their reach to avoid ſo dreadful an evil." (Loc. cit.)

Notwithſtanding the ample and demonſtrative evidence which now exiſts of the advantages and perfect ſecurity with reſpect to the public, of theſe inſtitutions, the prejudiced and erroneous notions of the communication of contagion, through the air, continue to prevail with great numbers of perſons, and to prevent the eſtabliſhment of fever-wards and houſes of recovery. Thoſe who wiſh for ſatisfactory proofs upon this ſubject, may conſult Dr. Haygarth's Letter to Dr. Percival on the Prevention of contagious Fevers: Dr. Currie's Reports on the Effects of Water: Dr. Ferriar's Med. Hiſt. and Reflections, vol. ii. and iii.: the Reports of the Houſes of Recovery of Dublin, London, &c.; and of the Society for bettering the Condition of the Poor. And in the collection of papers (2 vols.) publiſhed by Dr. Clarke of Newcaſtle, may be found the almoſt unanimous opinions upon the ſafety of ſuch eſtabliſhments, from a multitude of the moſt able and reſpectable phyſicians and ſurgeons in the iſland.

House-*tax*. See Window.

House-*water*, in *Mining*, is uſed where ſteam-engines are employed on mines, or collieries, for the water which is neceſſary for condenſing, which often is obtained at very conſiderable expence, particularly in deep lead mines, in rocky diſtricts, where the water that is pumped from the bottom of the mine can otherwiſe be diſcharged into a ſough at a great diſtance below the ſurface; in ſuch ſituations, the high-preſſure engines of Trevethick, which want no condenſing water, have been found very ſerviceable. At Yateſtoop mine, near Winſter, in Derbyſhire, they ſome years ago erected a large ſteam-engine under ground, on this ſough, to avoid the lifting of houſe-water.

House-*wife's Cloth*, is a middle ſort of linen cloth between fine and coarſe, fit for family uſes.

HOUSED-in, in *Ship Building*. The ſeaman ſay of a ſhip, which, after the breadth of her bearing is brought in too narrow to her upper-works, that ſhe is houſed-in, or pinched too much.

Housed is alſo applied to the ſituation of the great guns of a ſhip, when they are ſecured at ſea by their tackles and breechings.

HOUSEE, in the *Manege*. See Housing.

HOUSELEEK, in *Botany*. See Sempervivum.

Houseleek, *Leſſer*. See Sedum.

Houseleek, *Small Annual*. See Tillæa.

Houseleek, *Water, of Egypt*. See Pistia.

HOUSHOLD, the family or domeſtics of a prince, or private perſon.

The principal officers of the king's houſhold are the lord ſteward, lord chamberlain, groom of the ſtole, maſter of the great wardrobe, and maſter of the horſe.

The civil government of the king's houſe belongs chiefly to the lord ſteward of the houſhold, who has an annual ſalary of 1460*l.* He has authority over all officers and ſervants of the king's houſe, except thoſe of the chapel, chamber, and ſtable, who are under the juriſdiction of the lord chamberlain, maſter of the horſe, and dean of the chapel, and he is the judge of all crimes committed within the court, or the verge. See Court.

Under the lord ſteward are a treaſurer of the houſhold, whoſe place is 1200*l.* a-year; comptroller, with the ſame ſalary; paymaſter, with 500*l.* a-year; maſter of the houſhold, at 500*l.* a-year; clerks of the houſhold, aſſiſtant clerks, clerks comptrollers, &c.; the officers and ſervants belonging to the almonry, the marſhalſea, the verge, the kitchen, gardener, purveyors, &c.

The next principal officer of his majeſty's houſhold is the lord chamberlain, whoſe ſalary is 1200*l.* a-year; in whoſe department are the vice-chamberlain, with a ſalary of 1159*l.* 8*s.* 4*d.* a-year; ſecretary and clerks, ſuperintendant of payments, groom of the ſtole, with an annual appointment of 2000*l.*; lords of the bed-chamber, grooms of the bed-chamber, gentlemen of the privy-chamber, maſter of the ceremonies with aſſiſtant and marſhal, gentlemen uſhers of the privy-chamber, gentlemen uſhers who are daily waiters, to whom belongs black rod, aſſiſtant gentleman uſher, grooms of the privy-chamber, gentlemen uſhers who are quarterly waiters in ordinary, pages of the back ſtairs, pages of the bed-chamber, maſter of the robes with groom and clerks, wardrobe-keepers, ſerjeants at arms, &c. the band of muſic, the medical department, houſe-keepers, tradeſmen, artiſts, rangers and troopers of the foreſts, ſurveyors general of the king's woods, &c. chief juſtices in Eyre, officers of the royal chapels, chaplains in ordinary, ten prieſts in ordinary, ſixteen gentlemen of the chapel-royal; preachers at the king's chapel, Whitehall, organiſts, &c. ſubordinate to the maſter of the horſe, whoſe ſalary is 1266*l.* 13*s.* 4*d.* the clerk-martial and firſt equerry; the equerries, pages of honour, clerk of the ſtables, equerry of the crown ſtable, and yeomen riders. To the king's hunt belong the maſter of the ſtag-hounds, whoſe annual appointment is 2000*l.* a-year; the huntſman, ſix yeomen prickers, and grand falconer, whoſe yearly ſalary is 1200*l.* The military department of the king's houſhold conſiſts of the yeomen of the king's guards, the honourable band of gentlemen-penſioners, and the troops of the houſhold, comprehending the horſe and foot guards, &c.

Houshold *Days*, are four ſolemn feſtivals in the year, when the king, after divine ſervice, offers a beſant of gold to God on the altar. See Besant.

The houſhold days are Chriſtmas, Eaſter, Whitſunday, and All Saints.

The houſhold days are a part of the twelve collar and offering days.

HOUSING, in *Agriculture*, a term denoting the twiſting or running together of hop-binds above the tops of the poles; by which means great injury is done to the crops.

It is likewiſe employed to ſignify the practice of putting of different ſorts of live-ſtock into ſheds or other covered buildings, in order to protect them during the ſeverity of the winter ſeaſon.

Housing, or *Houſée*, a cover laid over the ſaddle of a horſe, in order to ſave it from the weather, dirt, &c.

The word is formed of the French *houſſe*, which ſignifies the ſame thing; though it anciently denoted a kind of *hood* worn by country people.

The cavaliers appeared with their embroidered houſings.

Housing, *Boot*, is a piece of ſtuff faſtened to the hinder part of the ſaddle that covers a horſe's croup; either for the ſake of ornament to hide the horſe's leanneſs, or to ſave the clothes of the rider from being daubed and ſoiled by the ſweat of the horſe.

Housing, *Shoe*, is a piece of cloth bordered with a fringe, oftentimes put round the ſaddle to cover the croup, and hang down to the lower part of the belly, to ſave the ſtockings of thoſe who ride without boots.

Housing, among *Bricklayers*, a term uſed for a brick which is warped, or is caſt crooked or hollow in burning; in ſuch a caſe, they ſay it is houſing.

Housing, or *Houſe-line*, in *Sea Language*, denotes a ſmall line formed of three fine ſtrands or twiſts of hemp, ſmaller than rope-yarn. It is chiefly uſed to ſeize blocks into their ſtrops, to bind the corners of the ſails, or to faſten the bottom of a ſail to its bolt-rope, &c.

HOUSSA, in *Geography*, a country of Africa, lying N. and S. of the Niger, or Neel-Abeed, and placed in major Rennell's map of Africa S. of the Great Deſert, or Sahara, and between Tombuctoo on the W. and Tocrur on the E., in N. lat. from about 15° to 17° 30′, and E. long. from about 3° to 5°. The inhabitants, according to the account which Mr. Horneman received of them, are negroes, but not quite black; they are diſtinguiſhed from their neighbours by an intereſting countenance, and are repreſented as the moſt intelligent people in the interior of Africa; their ſtature is leſs diſagreeable than that of the negroes, and they are much addicted to pleaſure, dancing, and ſinging. Their diſpoſition is benevolent and mild. They are deſcribed as induſtrious and ſkilful in the culture of the natural productions of their country, and in this reſpect they excel the Fezzaners, who obtain their clothes and houſhold implements from them. Their muſic, compared with that of the Europeans, is imperfect, but the Houſſanian women poſſeſs muſical powers ſufficient to produce tears from their huſbands, and to inflame their courage to the greateſt fury againſt their enemies. The capital of this country is Houſſa, ſituated, in Rennell's map, in N. lat. 16° 30'. E. long. 4° 30'. It lies at a ſmall diſtance N. from Neel-Abeed. Mr. Park was informed by a ſhereef, whom he met with at Benowm, and who had travelled through a number of kingdoms, that he had viſited Houſſa, and that it was the largeſt town he had ever ſeen. Mr. Park was alſo informed by others, that of the chief towns of Jenné, Tombuctoo, and Houſſa, ſituated on or near the banks of the Niger, the laſt was the moſt conſiderable, and that the leaſt of them was much larger than Sego. He was further told, that caravans frequently arrive both at Tombuctoo and Houſſa, from the countries on the Mediterranean, travelling acroſs the Deſert by the way of Fezzan, with European goods and other merchandize.

HOUSTONIA, in *Botany*, named by Gronovius and Linnæus, after Dr. William Houſtoun, F.R.S. who reſided ſeveral years in the Weſt Indies, and viſited the Spaniſh main, from whence he ſent various ſeeds to Miller and other botaniſts of that time, between the years 1728 and 1732, beſides making ſeveral curious obſervations upon Contrayerva, Jalap, and other medicinal plants. He died in Jamaica in 1733. Some engravings, by his own hand, of the parts of fructification of various new genera of plants, in the manner of Plumier, came into Miller's hands, who ſent an impreſſion of them, in 1736, to Linnæus. Moſt of theſe plates were purchaſed, with Miller's herbarium and papers, by ſir Joſeph Banks, who printed and liberally diſtributed an edition of them, with the Latin deſcriptions and remarks of the author, under the title of *Reliquiæ Houſtounianæ*, in quarto, in 1781. A few of the plates were reengraved, after impreſſions of ſome that had been loſt.—Linn. Gen. 51. Schreb. 68. Willd. Sp. Pl. v. 1. 583. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 235. Juſſ. 197. Lamarck. Illuſtr. t. 79. Gærtn. t. 49.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth half ſuperior, of four ſmall, upright, permanent teeth. *Cor.* of one petal, funnel-ſhaped; tube much longer than the calyx, cylindrical, ſlightly dilated at the top; limb in four deep, roundiſh or elliptical, ſpreading ſegments. *Stam.* Filaments four, in the neck of the tube, very ſmall; anthers ſimple. *Piſt.* Germen half inferior, roundiſh, two-lobed, compreſſed; ſtyle ſimple, ſhorter than the tube; ſtigma cloven, acute. *Peric.* Capſule in the bottom of the calyx, ſurrounded by its teeth, roundiſh, didymous, burſting at the top tranſverſely, of two cells, and two valves which are contrary to the partition. *Seeds* few, ſmall, ovate, attached to the partition.

Obſ. Linnæus appears, as Gærtner remarks, to have miſtaken the receptacle covered with ſeeds for one ſingle ſeed, owing probably to the unripe ſtate in which he ſaw it.

Eſſ. Ch. Corolla of one petal, funnel-ſhaped. Capſule of two cells, half ſuperior. Seeds ſeveral, roundiſh.

1. H. *cærulea*. Linn. Sp. Pl. 152. Curt. Mag. t. 370. (Lychnidis, aut potiùs Alſines, cognata diſpermos; Pluk. Phyt. t. 97. f. 9.)—Radical leaves ovate. Stipulas abrupt. Stem repeatedly branched. Flower-ſtalks elongated, ſingle-flowered.—Native of Virginia and other parts of North America. It was brought to Kew in 1785, from the weſt coaſt of that country, by Mr. Menzies, to whom botany is ſo much indebted for various diſcoveries in that quarter, the South ſeas, and New Holland. The *roots* are fibrous and perennial. *Stems* numerous, erect, four or five inches high, and ſometimes much more, repeatedly branched, ſquare, ſmooth, ſlender, leafy, many-flowered. *Leaves* from half an inch to an inch long, entire, ſmooth, rough-edged, rather acute; the radical ones obovate or ſpatulate, ſtalked; ſtem-leaves oppoſite, much narrower, elliptic-lanceolate, ſeſſile. *Stipulas* very ſhort and broad. *Flowers* of a brilliant pale blue, or almoſt white, with a yellow eye, jaſmine-like and very pretty, but ſcentleſs, produced all ſummer long. Each grows on a very long, ſimple, naked, lateral or terminal, ſmooth ſtalk. The two-lobed *germen*, and ſtill more the *capſule*, riſes above the entire part of the calyx; though its lower half be immerſed in the baſe of the latter, all plants of this natural order having, ſtrictly ſpeaking, an inferior germen. Mr. Curtis ſays this ſpecies is quite hardy in England, beſt cultivated in a pot, with plenty of moiſture, and eaſily encreaſed by parting its roots. If paid the leaſt attention to, it flowers perpetually, ſpring, ſummer, and autumn. We have no where ſeen it ſo fine as at Kew.

2. H. *longifolia*. Willd. n. 2. Gærtn. v. 1. 226.—Leaves lanceolate, tapering at each end. Stipulas ovate, pointed, often cloven. Flowers corymboſe.—Native of North America. Gathered near Lancaſter in Pennſylvania, by the Rev. Dr. Muhlenberg. This has more the habit of a *Galium*. It ſeems perennial. The *ſtem* is from three to five inches high, ſquare, ſmooth, leafy, but little branched. *Leaves* linear-lanceolate, tapering at each end, about an inch long, ſmooth, ſomewhat revolute. *Stipulas* pale, ovate or triangular, acute; the lower ones undivided; the upper in two, three, or more ſegments. *Flower-ſtalks* axillary and terminal, forming a leafy corymbus. Teeth of the *calyx* very long; its baſe ſhort. Limb of the *corolla* not much ſpreading.

This ſpecies was confounded by Linnæus and ſome of his correſpondents with the following, from which it differs greatly in the narrowneſs of its leaves. Our Pennſylvanian ſpecimen ſeems a fellow one to what Willdenow deſcribed.

3. H. *purpurea*. Linn. Sp. Pl. 152.—Leaves ovate, roughiſh; the lower ones heart-ſhaped. Stipulas ovate, pointed. Flowers corymboſe.—Native of Virginia; ſaid to have been introduced to the Kew garden, where it flowers moſt part of the ſummer, by Mr. Maſſon, in 1800. The plant is roughiſh in many parts. *Stem* much branched, forked. *Leaves* an inch or more in length, and half an inch broad, ovate or heart-ſhaped. *Stipulas* much as in *H. longifolia*. *Inflorescence* alſo ſimilar, but the ſtalks are rough, more numerous and more divided. *Calyx* and *corolla* ſhaped as in the laſt.

That beautiful plant the *Bouvardia triphylla* of Saliſ. Parad. t. 88; Hort. Kew. ed. 2. v. 1. 245; which is *Houſtonia coccinea* of Andr. Repoſ. t. 106, and has been referred to *Ixora* by Jacquin and Cavanilles, was long miſtaken by our cultivators for *Houſtonia purpurea*, and was once contended by ſome to be an *Hamellia*. We may now hope it will reſt in peace; yet the ignorant, who have learned to call it by a wrong name, will perhaps not eaſily adopt a new one. So important is it for thoſe who direct the public information, to be circumſpect before they decide, and never to alter but with ſufficient reaſons.

HOUT or Wood *bay*, in *Geography*, a bay on the S. coaſt of Africa, N.N.W. from the Cape of Good Hope. S. lat. 34° 5'. E. long. 18° 19'. This bay is contiguous to Chapman's bay; the latter communicating, by a defile of the mountains, about 2700 yards in length, with Vis or Fiſh bay cloſe to Simon's bay; and the former, by another defile, with the great road leading from cape Town to Simon's bay. Hout bay affords ſafe and convenient anchorage for eight or ten ſhips; and has a rivulet of freſh water falling into it from the back part of Table mountain; but the getting out of the bay is ſuppoſed to be very difficult and precarious, on account of the eddy winds from the ſurrounding mountains when they are moderate in the offing, or from the ſouth-eaſterly winds ſetting into the entrance, as well as from the conſtant weſterly ſwell and wind prevailing from that quarter in the winter ſeaſon. Hout bay is now defended with a battery and a block-houſe.

HOU-TCHEOU, a city of China, of the firſt rank, in the province of Tche-kiang, ſituated on a lake from which it takes its name. The quantity of ſilk manufactured here is almoſt incredible; and it is alſo the chief place in China for making writing pencils. Its diſtrict contains ſeven cities, one of which is of the ſecond, and ſix of the third claſs. N. lat. 30° 52′. E. long. 119° 32′.

HOUTEVILLE, Claude Francis, in *Biography*, was born at Paris in 1688. He became a member and ſecretary of the French academy, and ſecretary to cardinal Dubois, whoſe friendſhip obtained for him the abbey of St. Vincent du Bourg-ſur-mer, in the dioceſe of Bourdeaux. This was in the year 1723, and in the ſame year he was admitted a member of the French academy. He died in 1742, aged 54. His principal work is entitled "The Truth of the Chriſtian Religion proved by Facts," three vols. 4to.

HOUTTUYNIA, in *Botany*, received its name in compliment to Dr. Houttuyn, of Amſterdam, a collector and merchant of natural curioſities, one of the people who ſubſcribed towards the expence of ſending Thunberg to Japan, by which he enriched both his collection and his purſe, in the true ſpirit of a Dutch virtuoſo and patron. Thunb. Jap. 12. Act. Holm. ann. 1783. 149. t. 5. Murray in Linn. Syſt. Veg. ed. 14. 519. Schreb. 614. Willd. Sp. Pl. v. 2. 290. Mart. Mill. Dict. v. 2. Juſſ. 25. Lamarck. Illuſtr. t. 739.—Claſs and order, *Heptandria Trigynia.* Nat. Ord. *Piperitæ,* Linn. *Aroideæ,* Juſſ.

Gen. Ch. *Cal.* Spatha of four ovate, concave, obtuſe, coloured, ſpreading leaves; ſpadix about as long as the ſpatha, oblong, covered with flowers; perianth none. *Cor.* none. *Stam.* Filaments generally ſeven, ſhort, equal; anthers vertical, ovate, two-lobed. *Piſt.* Germen roundiſh, ſomewhat triangular; ſtyles three, awl-ſhaped, ſhort; ſtigmas recurved, acute, downy on the upper ſide.—*Fruit* unknown.

Eſſ. Ch. Spatha of four leaves. Spadix covered with flowers. Corolla none.

1. H. *cordata.* Thunb. Jap. 234. t. 26. *Doku Dami,* or *Sjunjak,* of the Japaneſe. Found by Thunberg, very abundantly, in ditches by the way ſides, and about towns, between Miaco and Jedo in Japan, flowering in May and June. The *root* is fibrous and annual. *Stem* herbaceous, erect, from a ſpan to a foot high, ſimple, or ſlightly branched, rather zigzag, furrowed, leafy, ſcarcely downy; its lower joints throwing out numerous whorled fibres. *Leaves* alternate, ſtalked, heart-ſhaped, broad, pointed, entire, veiny, ſmooth, finely dotted; paler beneath. *Stipulas* broad, ſheathing, united to the footſtalks and claſping the ſtem. *Flowers* few, ſtalked, ſolitary, oppoſite to ſome of the upper leaf-ſtalks. Leaves of the *involucrum* white, rather above half an inch long. *Flowers* purpliſh, with yellow anthers.

One of profeſſor Thunberg's own ſpecimens, (indeed no other botaniſt, as far as we know, has gathered the plant,) ſhews very plainly the three recurved ſtigmas, with the ſtyles, in each flower, and has enabled us to correct the character and claſſification of the genus. The *Houttuynia* ſeems to occupy in Japan the place of our *Sagittaria,* to which its flowers bear a not very remote reſemblance, however different in botanical characters. The leaves look ſomewhat like thoſe of *Ariſtolochia Clematitis.*

HOW, in *Agriculture,* a term which frequently denotes a ſmall round hillock, or ſmall hill of the artificial kind.

How, in *Geography,* a town of Poland, in the palatinate of Lenciez; 32 miles N.E. of Lenciez.

HOWAN Sound, a ſtrait of the ſea, between the iſlands of Egilſha and Rowſa, two of the Orkney iſlands.

HOWARD, Thomas, in *Biography,* earl of Surrey, and duke of Norfolk, an eminent commander in the reign of Henry VIII., was born in 1473. He was brought up to arms, and ſoon after the acceſſion of Henry was decorated with the knighthood of the garter. He ſerved with his brother ſir Edward, againſt ſir Andrew Barton, a Scotch free-booter, or pirate, who periſhed in the action. When his brother, ſir Edward, was killed in an action near Breſt, in 1513, he was appointed to the office in his ſtead, and in the capacity of high admiral he effectually cleared the channel of French cruiſers. The victory of Flodden-field, in which the king of Scotland was ſlain, was chiefly owing to his valour and good conduct. For this his father was reſtored to the title of duke of Norfolk, and the title of earl of Surrey was conferred on him. In 1521 he was ſent to Ireland as lord-lieutenant, chiefly for the purpoſe, it was thought, of having him out of the way during the proceedings againſt his father-in-law, the duke of Buckingham. Here he was very inſtrumental in ſuppreſſing the rebellion, and having ſerved there two years, he returned, and had the command of the fleet againſt France. By the death of his father, he ſucceeded to the title and eſtates as duke of Norfolk. Notwithſtanding his great ſervices, Henry, at the cloſe of his tyranical life and reign, cauſed the duke to be ſent to the Tower on a charge of high treaſon, and his ſon to be beheaded in his preſence. The death of the king ſaved the duke's life. (See Henry VIII.) He was, however, detained priſoner during the whole of the reign of Edward VI., but one of the firſt acts of Mary, after her acceſſion to the throne, was to liberate this faithful ſervant of her late father. He was, after this, the principal inſtrument in ſuppreſſing the rebellion excited by ſir Thomas Wyatt. He died in Auguſt 1554, having paſſed his eightieth year. Hume's Hiſt.

Howard, Henry, earl of Surrey, ſon of the preceding, a nobleman of conſiderable accompliſhments, and one of the early Engliſh poets, was born about the year 1520. In his youth, he reſided at Windſor as companion to the young duke of Richmond, natural ſon to Henry VIII., whom he afterwards accompanied to Wolſey's new college at Oxford. He then made the tour of Europe, under the impreſſion of a romantic paſſion for the daughter of the earl of Kildare, whom he characterizes with the epithet of "Fair Geraldine." In the ſpirit of chivalry, he publiſhed at Florence a general challenge at tilting to all perſons who ſhould diſpute the ſupremacy of her beauty. He came off victorious, and as a reward, was preſented with a ſhield by the grand duke of Tuſcany. On his return to England, about 1541, he was decorated with the order of the garter. In 1542 he acted as lieutenant-general in the army with which his father invaded Scotland. He accompanied the king in his expedition to France in 1544, and was field-marſhal of the army before Boulogne. After ſerving his country with great valour, he fell a victim to the jealouſy of Henry VIII., who pretended to ſuſpect him of a deſign to marry his daughter Mary. He and his father, as we have already ſeen, were ſent to the Tower, and the ſon was beheaded on Tower-hill, in the year 1547, leaving behind him two ſons and three daughters. His ſonnets are printed in Anderſon's collection of Britiſh Poets. His eldeſt ſon, Thomas, was the duke of Norfolk, who was ſo conſpicuous in the reign of Elizabeth for his negociations with Mary, queen of Scots, terminating in his ruin. The earl of Surrey tranſlated the ſecond and fourth books of Virgil's Æneid, which were publiſhed in 1557. According to Warton, "Surrey, for juſtneſs of thought, correctneſs of ſtyle, and purity of expreſſion, may juſtly be pronounced the firſt Engliſh claſſical poet."

HOWARD, CHARLES, lord Effingham, and earl of Nottingham, a diſtinguiſhed naval commander, was born in 1536; he was ſon of lord William of Effingham, and grandſon to Thomas, ſecond duke of Norfolk. In his youth he ſerved in ſeveral expeditions under his father, then lord-admiral, and, in 1559, he was ſent as ambaſſador to France, and after his return he was elected knight of the ſhire for Surrey. In 1568 he was appointed general of the horſe. The ſame year he diſplayed great valour in the north, againſt the rebels commanded by the earls of Northumberland and Weſtmoreland. The following year he had the command of a ſquadron, with which he eſcorted, from Zealand to Spain, Anne of Auſtria, daughter of the emperor Maximilian, who was betrothed to Philip of Spain. In 1572 he ſucceeded his father as lord Effingham, and not long after was made knight of the garter. He had, as we have ſeen in ſome preceding articles, the important command of the Engliſh fleet when the Spaniſh Armada entered the channel, and by his great ſkill and prudence contributed principally to its deſtruction. For this important ſervice he was created earl of Nottingham, and enjoyed the queen's confidence to her death. (See ELIZABETH.) In the rebellion excited by the earl of Eſſex, lord Nottingham commanded the force which inveſted Eſſex-houſe, and brought him to ſubmiſſion. At the coronation of king James, the earl officiated as lord high-ſteward, and he was ſoon after appointed ambaſſador to the court of Spain. His laſt ſervice in the capacity of admiral, was the convoying to Fluſhing of the princeſs Elizabeth, married in 1613 to the elector palatine. After his return, he loſt the king's favour, and reſigned the poſt to the duke of Buckingham. He died in 1614. Biog. Brit. - Hume.

HOWARD, *ſir* ROBERT, an Engliſh writer, was the ſon of Thomas, earl of Berkſhire, and educated at Magdalen college, Oxford. He ſuffered conſiderable loſſes during the civil wars, but at the Reſtoration he was knighted, and made auditor of the exchequer. He was a zealous friend of the Revolution, and died about the year 1700. As an author, he wrote ſeveral plays: the Hiſtory of the Reigns of Edward and Richard II.: the Hiſtory of Religion, 1694.

HOWARD, JOHN, born at Hackney, or Enfield, in 1727, was ſon of a carpet-warehouſeman, and upholſterer in London. The father died during the infancy of his ſon, who was left in the hands of guardians, by whom he was apprenticed to a grocer. He did not ſerve his time out, but bought his indentures, and indulged his curioſity in a tour to France and Italy. Upon his return, he fell into a weakly ſtate of health, which, with his attachment to reading and the ſtudy of nature, induced him to withdraw into privacy in the country. From a motive of gratitude, he married the perſon with whom he lodged, and who had carefully attended him, though ſhe was ſickly, and twice his age, and even remonſtrated againſt the inequality of ſuch an union. He paſſed three years with her in conjugal harmony, and upon her death, in 1756, ſat out upon another tour to the continent. In this, his leading object was to view the ruins of Liſbon, lately deſolated by an earthquake. He was defeated in his plan by the capture of the veſſel in which he ſailed, and by being carried a priſoner into France. The ſufferings which he underwent, and to which he was witneſs in others, made a deep impreſſion on his mind; this was probably the principal cauſe of the philanthropical exertions which afterwards employed ſo large a portion of his life. Upon his liberation, he laid the ſtate of his fellow-ſufferers before the commiſſioners of the ſick and wounded, who received his information with gratitude. In 1758 he married the eldeſt daughter of Mr. Serjeant Leeds, of Croxton, Cambridgeſhire. His principal reſidence for ſome years was at Cardington, near Bedford, where he put in practice thoſe ſchemes for the good of his poor neighbours and tenants, in which he ever took delight. He built upon his eſtate a number of very neat and comfortable cottages, to each of which he annexed a little ground for a garden. Theſe he peopled with ſober and induſtrious tenants, over whoſe welfare he watched with the vigilance of a parent. In 1765 his domeſtic happineſs was irreparably injured by the death of his wife, ſoon after ſhe had borne him her only child. The care of his ſon and his uſual benevolent occupations continued to employ him till the year 1773, when he was ſelected to ſerve the office of high-ſheriff for the county of Bedford. In the courſe of his official duties he found that a multitude of abuſes prevailed, which he knew not how to remedy; he determined, however, to obtain every poſſible information on the ſubject. He began by viſiting moſt of the county gaols in England; and on a ſecond journey he extended his reſearches into town-priſons and houſes of correction, and ſo diligently did he purſue his object, that he was enabled, in the month of March 1774, to lay before the houſe of commons a large maſs of information, for which he received the public thanks, and on the credit of his teſtimony, two bills were paſſed during the ſame ſeſſion of parliament, one, "For the Relief of acquitted Priſoners in Matters of Fees:" the other, "For preſerving the Health of Priſoners." The heads of theſe bills, with the ſeveral regulations contained in them, Mr. Howard procured to be printed, and ſent to every keeper of a gaol throughout England. He now felt the high importance of the buſineſs in which he had engaged, and reſolved to devote himſelf and his fortune to the improvement of this part of civil polity. With this view he made two tours on the continent, travelled into Scotland and Ireland, and the fruit of his reſearches was given to the public in 1777, under the title of "The State of the Priſons in England and Wales, with Preliminary Obſervations, and an Account of ſome Foreign Priſons." As ſoon as this work appeared, the world was aſtoniſhed at the maſs of valuable materials accumulated by a private, unaided individual, through a courſe of prodigious labour, and at the conſtant hazard of his life, in conſequence of the infectious diſeaſes prevalent in the ſcenes of his enquiries. He was, from this moment, looked on as one of the extraordinary characters of the age, raiſed up by providence for the purpoſe of meliorating the condition of that wretched part of the community for whom he intereſted himſelf. He was anxious to correct their vices, which he thought would be beſt effected by gentle but ſtrict diſcipline, accompanied with all the comforts of which their wretched ſituation was ſuſceptible. His zeal was ſeconded by the exertions of parliament, and a bill was brought in for the eſtabliſhment of houſes of correction, according to his ideas. He now made another tour on the continent, and took a ſtill more accurate view of all the priſons in every part of England, Wales, Scotland, and Ireland, including in his obſervations whatever related to hoſpitals. He every where noted down the ſtructure and regulations of theſe ſeveral kinds of buildings, and procured plans and draughts where he thought they might ſuggeſt ſomething uſeful for imitation. Theſe reſearches furniſhed him with materials for an appendix to his former work, which was printed in the year 1780. About this period he accepted the office of one of the three ſuperviſors appointed for eſtabliſhing penitentiary houſes. He made it a condition of his acceptance that Dr. Fothergill ſhould be one of his aſſociates, but the death of the doctor, and ſome difference of opinion concerning the ſituation of the firſt of theſe buildings, cauſed him, in 1781, to reſign his office, but it was only to reſume his far greater exertions in the ſame noble cauſe. He travelled through the whole of the northern kingdoms of Europe, and reviſited the priſons of his own country: he ſeemed reſolved to take no repoſe while any thing remained in which he thought his farther labours might ſerve the intereſts of humanity. The progreſs of contagion, in priſons and hoſpitals, had led him to conſider all the means uſed for checking it, and he expected to find theſe practiſed in their fulleſt extent in the prevention of the plague; he therefore reſolved to examine all the lazarettos in Europe. Perſonal riſk never, in his eſtimation, ſtood in the way of duty: he did not heſitate to expoſe himſelf to all the dangers which attended ſo near an approach to the moſt alarming peſtilence. He ſat out in 1785, unaccompanied by a ſervant, not thinking it juſtifiable to expoſe any human being to the dangers which, for the public good, he was willing to undergo. He took his way by the ſouth of France, through Italy, to Malta, Zante, Smyrna, and Conſtantinople. From the laſt named city he returned to Smyrna, where he knew the plague then prevailed, for the expreſs purpoſe of going to Venice with a "Foul Bill," as it is called, that he might be ſubjected to all the rigour of a quarantine in a lazaretto, in order that he might practically know its rules. Such an enterpriſing and heroic conduct in the great cauſe of humanity excited the attention of almoſt every thinking individual of Europe. On his return by Vienna, the emperor Joſeph expreſſed a deſire of ſeeing him: the interview paſſed as between an enlightened ſovereign deſirous of information, and a plain independent gentleman, above the awe of rank or the vanity of being noticed. During his abſence on this journey, a ſubſcription was entered into for the purpoſe of erecting a ſtatue, and it was ſoon filled with names of the firſt diſtinction. As ſoon as he heard of the ſcheme, he expreſſed ſuch a decided averſion from what he denominated being "dragged out in public," that it was reluctantly abandoned. On his return he reviſited once more the priſons, bridewells, hoſpitals, and priſon-hulks of his own country, which occupied his attention during the courſe of two years. The year 1789 was chiefly devoted by him to the methodizing and printing the important matter which he had collected ſince his laſt publication. This appeared in a quarto volume, entitled "An Account of the principal Lazarettos in Europe, with various Papers relative to the Plague, &c." At the cloſe of this publication he declared his intention of again quitting his native country, for the purpoſe of reviſiting Ruſſia and Turkey, and extending his travels in the Eaſt. He quitted England in the ſummer of 1789, and proceeded through Germany, to Peterſburg and Moſcow; at all places the priſons and hoſpitals were thrown open to him, as if the governments of the earth were ready to ſecond his humane and benevolent deſigns, and hailed his preſence as that of a general cenſor of that part of the police, whoſe authority was recognized in every civilized country. He next proceeded to the new Ruſſian ſettlements on the Black ſea, and took his ſtation at the town of Cherſon. At this place a fever of a moſt malignant kind prevailed; among the victims of which was a young lady whom he had been requeſted to viſit, being ſuppoſed to poſſeſs medical ſkill of a ſuperior kind in thoſe caſes. From her he probably received the contagion which carried him off on the 20th of January 1790, about the age of ſixty-three. He was buried in the neighbourhood of Cherſon, and all honours were paid to his memory by prince Potemkin and other men in office. For a more full and very intereſting account of this gentleman, who has been frequently characterized, and juſtly ſo, as "The nobleſt of all the Howards;" the reader is referred to Dr. Aikin's "View of the Character and public Services of the late John Howard, eſq. LL. D. F. R. S." 1792. Dr. Aikin expreſſes himſelf in the following terms in the General Biography: "The bare recital of what Mr. Howard did in the cauſe of humanity, is ſufficient to place him among the greateſt benefactors of mankind, as well as the moſt extraordinary private characters recorded in biography. He was, indeed, ſingularly calculated for the taſk which he undertook. Accuſtomed to the moſt rigorous temperance, ſo as to diſcard from his diet animal food and fermented liquors, he found no difficulty in living in the pooreſt countries. In all other reſpects his mind was equally maſter of his body, and he incurred hardſhips of every kind without repugnance. In temper he was calm and repoſed, but firm and reſolute; proof againſt every allurement or intimidation that might divert him from his purpoſe. Economical in private expences, he knew no bounds in his expenditure on objects of public utility, and regarded money only as an inſtrument of beneficence. In honour, integrity, and attachment to principles, he was not ſurpaſſed by any human being. His talents were rather of the uſeful than the ſhining kind, but peculiarly adapted for that collection of facts and obſervations in which he employed himſelf. The teſtimony of public reſpect which he refuſed when living, has been conferred upon his memory, and his monumental ſtatue was one of the firſt of thoſe by which the cathedral of St. Paul's has been made a receptacle of national worthies."

We cannot cloſe this article without ſubjoining the eloquent eulogium pronounced upon Mr. Howard, by Mr. Burke in his "Speech at Briſtol, previous to the election in 1780." Having occaſion to mention him, he adds, "I cannot name this gentleman without remarking, that his labours and writings have done much to open the eyes and hearts of mankind. He has viſited all Europe,—not to ſurvey the ſumptuouſneſs of palaces, or the ſtatelineſs of temples; not to make accurate meaſurements of the remains of ancient grandeur, nor to form a ſcale of the curioſity of modern art; not to collect medals, or collate manuſcripts;—but to dive into the depths of dungeons; to plunge into the infection of hoſpitals; to ſurvey the manſions of ſorrow and pain; to take the gage and dimenſions of miſery, depreſſion, and contempt; to remember the forgotten, to attend to the neglected, to viſit the forſaken, and to compare and collate the diſtreſſes of all men in all countries. His plan is original; and it is as full of genius as it is of humanity. It was a voyage of diſcovery; a circumnavigation of charity. Already the benefit of his labour is felt more or leſs in every country; I hope he will anticipate his final reward, by ſeeing all its effects fully realized in his own. He will receive not by retail, but in groſs, the reward of thoſe who viſit the priſoner; and he has ſo foreſtalled and monopolized this branch of charity, that there will be, I truſt, little room to merit by ſuch acts of benevolence hereafter."

Howard, Samuel, brought up in the king's chapel, took his degree of doctor of muſic at Cambridge at the time of the Inſtallation of the duke of Grafton as chancellor of that univerſity. Dr. Howard had ſtudied much under Dr. Pepuſch at the Charter-houſe, and was well acquainted with the mechanical rules of counterpoint. His overture in the "Amorous Goddeſs," a happy imitation of Handel's overture in "Alcina," particularly the muſette and minuet, was long very popular in the theatres and public gardens. But his ballads, which were long the delight of natural and inexperienced lovers of muſic, had the merit of facility; for this honeſt Engliſhman preferred the ſtyle of his own country to that of any other ſo much, that he never ſtaggered in his belief of its being the beſt in the world, by liſtening to foreign artiſts or their productions, for whom and for which he had an invincible averſion.

He began to flouriſh about the year 1740, and from that time till Arne's Vauxhall ſongs were publiſhed under the title of "Lyric Harmony," they were the moſt natural and pleaſing which our country could boaſt.

After the deceaſe of Michael Chriſtian Feſting, Dr. Howard took the lead in managing the affairs of the muſical fund; but not with equal addreſs and intelligence.

He was a dull, vulgar, and unpleaſant man; and by overrating his own importance, and reigning paramount over his equals, he rendered the monthly meetings diſagreeable, and cooled the zeal of many well-wiſhers to the ſociety.

He long laboured under a dropſy, yet walked about with legs of an enormous ſize, during ſeveral years. But it was not this diſorder which put an end to his exiſtence, at laſt, but repeated paralytic ſtrokes. He died about the year 1783.

Howard's *Point*, in *Geography*, a cape on the N. W. coaſt of the iſland of Egmont, or New Guernſey. S. lat. 10° 42'. E. long. 164° 18'.

Howard, a townſhip of America, in the county of Suffolk, Upper Canada, W. of Oxford; watered on the N. by the Thames and on the S. by lake Erie.

HOWASSE, a town of Hindooſtan, in Malwa; 10 miles N.E. of Tandla.

HOWDEN, anciently called *Hoveden*, a market town in the diviſion of Howdenſhire, in the Eaſt Riding of the county of York, England, is 20 miles S.E. of the city of York, 25 W. of Hull, and 184 N. of London. In the year 1801 the town contained 325 houſes and 1552 inhabitants. In the reign of Edward the Confeſſor this town, with the church and lands around it, belonged to the monaſtery of Peterborough. William the Conqueror, however, ſeized them, and gave the whole to the biſhop of Durham: in conſequence of which the biſhop built a palace here. And ſome of them made it their principal reſidence. The following prelates died here: Hugh Pudſey in 1195: Walter de Kirkham in 1260; and Walter de Skirlaw in 1405. Leland deſcribes the biſhop's palace as built partly of timber and partly of brick and ſtone. What remains is now converted into a farm houſe, near which are the ruins of ſeveral large buildings, and a long range of granaries. King Henry III. granted the biſhops the following privileges attached to this manor: the goods of all perſons who committed felo-de-ſe; of wrecks caſt on the ſhores of the Ouſe; of tollage and laſtage; of having a clerk of the market; and a coroner, &c. This town has been much improved lately, in the erection of new buildings, paving the ſtreets, and in other reſpects. In the market place is a large edifice called the Moot-hall; in which is the council houſe, a place for keeping courts. The biſhops of Durham are required by ancient cuſtom to maintain a bull-ring in the market place, and to provide ropes for ſecuring the bulls when baited. In the year 1791 a large work-houſe was built here by ſubſcription. The Domeſday ſurvey notices a church at the place; but the preſent building is of different eras. The tower was built by biſhop Skirlaw about the year 1390, and the ſame prelate alſo erected a chapter-houſe on the ſouth ſide of the choir. This church is collegiate, and is built in a cruciform ſhape, with a nave, tranſepts at the eaſtern end, or chancel, and tower in the centre. It diſplays ſome intereſting ſpecimens of ancient eccleſiaſtical architecture. It is much to be regretted that the inhabitants have ſuffered the elegant chapter-houſe to fall in ruins: and the chancel part is alſo in a ſhameful dilapidated ſtate. Here are a weekly market on Saturdays, and five annual fairs, one of which, commencing on the 25th of September, ending on the 3d of October, is conſidered the greateſt mart for horſes in England. In the pariſh are two chapels of eaſe, one at Barmley, and the other at Laxton. A chapel for Methodiſts, and another for Independents, are eſtabliſhed here. This place gave birth to Roger of Hoveden, who was monk of the abbey. Savage's Hiſtory of Howden Church, 12mo. 1799, and Hutchinſon's Hiſtory, &c. of Durham.

HOWE, John, in *Biography*, a learned Engliſh nonconformiſt divine, was born at Loughborough, in Leiceſterſhire, in the year 1630. His father, who was miniſter of the place, being ejected by archbiſhop Laud, on account of connecting himſelf with the Puritans, removed with his ſon to Ireland, where they continued, till the rebellion in that country obliged them to return to England, when they ſettled in Lancaſhire. The ſon received a good claſſical education, and was ſent at an early age to Chriſt's college, Cambridge. He continued at Cambridge till he took his degree of B. A., and then removed to Oxford, where he was appointed bible-clerk of Brazen-Noſe college in 1643. In this ſituation he ſo diſtinguiſhed himſelf in learning and piety, that he was elected fellow of Magdalen college. In 1652 or 3, he became a preacher, and was ordained at the church of Winwick, Lancaſhire, after which he was choſen miniſter of Great Torrington in Devonſhire, where he diſcharged the functions of his office in the moſt exemplary manner. Having occaſion to take a journey to London, he went as a hearer to the chapel at Whitehall. Cromwell was preſent, and, ſtruck with his demeanor and perſon, ſent a meſſenger to inform him that he wiſhed to ſpeak with him when the ſervice was over. In the courſe of the interview he deſired him to preach before him the following Sunday: he requeſted to be excuſed: the protector would not be denied, and even undertook to write to his congregation a ſufficient apology for his abſence from them longer than he intended. This led to the appointment of Mr. Howe to the office of his domeſtic chaplain, and he accordingly removed with his family to Whitehall. He was ſoon appointed lecturer of St. Margaret's church, Weſtminſter, where he was much admired and followed as a preacher. In this ſituation of importance and influence Mr. Howe embraced every occaſion that offered of promoting the intereſts of religion and learning, and was always ready to do kind offices to men of merit among the royaliſts. He was ſo zealous in behalf of the intereſts of others, that Cromwell once aſked him if he never meant to think of himſelf; "I wonder," ſays he, "when the time is to come, that you will move for any thing for yourſelf, or your family." To ſome of the peculiar notions of Cromwell Mr. Howe could not aſſent, and in one particular inſtance he thought it right to preach againſt them in his preſence, becauſe he believed they might lead to practical ill conſequences. The friends of the preacher were alarmed for him, and one of them predicted, that he would find it difficult, if not impoſſible, to regain his favour. "I have," ſaid the worthy man, "diſcharged my conſcience, and the event muſt be left to God." From this period the friendſhip of Cromwell was leſs ardent, and his manners cool and reſerved, but he never mentioned the ſubject to him. Upon the death of Oliver, he was continued by his ſon Richard in the ſame ſituation, as domeſtic chaplain at Whitehall, and upon the depoſition of Richard, he returned to his people at Torrington. In 1662, he was ejected from his living under the act of Uniformity; but after he had been ſilenced by the law, he continued to preach occaſionally in the private houſes of his friends and acquaintance, till a proceſs was taken out againſt him. He was ſummoned before the biſhop of Exeter, who did what he could, as a friend, to perſuade him to conform, but when he found that his admonitions were in vain, the prelate diſmiſſed him with ſtrong aſſurances of his continued regard. In 1671, Mr. Howe removed to Ireland, to become chaplain to lord Maſſarene, who lived at Antrim, by whom he was received and treated with great reſpect and attention. On account of his learning, and true Chriſtian temper, he acquired the particular friendſhip of the biſhop of Antrim, who, together with his metropolitan, gave him leave to preach in the pariſh church every Sunday in the afternoon, without ſubmitting to the terms of conformity. In the year 1685, the Diſſenters being cruelly perſecuted in every corner of the kingdom, Mr. Howe accepted of an invitation from lord Wharton to accompany him on his travels into foreign countries. During theſe travels he had the ſatisfaction of ſeeing moſt parts of Europe, and of converſing freely, not only with a number of learned Papiſts, but ſeveral eminent Proteſtant divines, both Lutherans and Calviniſts. In 1686, he ſettled at Utrecht, where he took his turn in preaching at the Engliſh church in the city, and aſſiſted the Engliſh ſtudents in the univerſity, by his inſtruction and advice in the proſecution of their ſtudies. Here he became acquainted with ſeveral eminent perſons of his own country, and among others with Dr. Burnet, afterwards biſhop of Saliſbury, with whom he was accuſtomed to ſpeak freely upon a variety of topics. In a converſation they once had reſpecting nonconformity, Dr. Burnet told him that it would not laſt long; but that when Mr. Baxter, Dr. Bates, and himſelf (Mr. Howe) were laid in their graves, it would ſink and come to nothing. Mr. Howe ſaid it could not be ſo, becauſe it did not depend on perſons but principles, which, when adopted on grounds approved of after ſerious and ſincere enquiry, would not be laid aſide by men of conſcience. While he continued in Holland, Mr. Howe was admitted to frequent audiences by the prince of Orange, afterwards king William III. of England, who always maintained a ſincere reſpect for him. Mr. Howe returned home in 1687 upon king James's declaration for liberty of conſcience, but ſcarcely was he quietly ſettled when he was called on by his brethren to conſider what was to be done in that criſis, and he without heſitation gave his opinion againſt the king's diſpenſing power. After the Revolution he diſcharged the duties of his paſtoral office with unwearied diligence, labouring moſt zealouſly to promote the intereſts of real practical religion, and to diffuſe a ſpirit of candour, charity, and mutual forbearance, among his diſſenting brethren. He died in 1705, when he had nearly completed his ſeventy-fifth year. Mr. Howe was a perſon of diſtinguiſhed piety and virtue, of eminent intellectual endowments, and of extenſive learning. According to Granger, "He was one of the moſt learned and polite writers among the Diſſenters. His reading in divinity was very extenſive: he was a good Orientaliſt, and underſtood ſeveral of the modern languages." His works are numerous and truly excellent; the whole have been collected and printed in two volumes folio, 1724, with a life of the author prefixed, to which the reader is referred for more particulars than can be given in this article. Perhaps the principal of his pieces are "The Bleſſedneſs of the Righteous laid open," and "The Living Temple: or a deſigned Improvement of that Notion that a good Man is the Temple of God." Biog. Brit. Neal's Hiſtory of the Puritans.

Howe, Richard, *Earl,* born in 1725, was the ſecond ſon of lord viſcount Howe. He was educated at Eton, which he left when he was only fourteen years of age, to enter the ſervice of his country on board the Severn, commanded by the honourable captain Legge, which made a part of commodore Anſon's ſquadron deſtined for the ſouth ſeas. At twenty years of age he was appointed to the command of a ſloop of war; in this he beat off two large French frigates after a gallant action, for which he was made poſt-captain. He was now appointed to a frigate, and afterwards made captain of admiral Knowles's own ſhip of eighty guns in Jamaica, with which, at the peace in 1748, he returned to England. On the renewal of the war he was appointed to the Dunkirk of ſixty guns, making part of admiral Boſcawen's ſquadron, and he captured, off Newfoundland, the Alcide French man-of-war of ſixty-four guns. In 1757, he ſerved under admiral Hawke, and in the following year was appointed commodore of a ſquadron, with which he deſtroyed a number of ſhips and magazines at St. Malo. Prince Edward, afterwards duke of York, ſerved on board his ſhip, and on the ſixth of Auguſt, of the ſame year, he took Cherbourg, and deſtroyed the baſon. About this time, by the death of his brother, he became lord Howe, and ſhortly after had a conſiderable ſhare in the victory over the French fleet commanded by Conflans. When admiral Hawke preſented him to the king, his majeſty ſaid, "your life, my lord, has been one continued ſeries of ſervices to your country." On the return of peace he was appointed a lord of the admiralty, and afterwards treaſurer of the navy. In 1770 he was promoted to the rank of rear-admiral of the blue and commander-in-chief in the Mediterranean. In 1775 he roſe in ſucceſſion to vice-admiral of the blue: at this time, lord Hawke gave the following ſeaman-like teſtimony to his merit in the houſe of lords, "I adviſed his majeſty," ſaid he, "to make the promotion, I have tried my lord Howe on important occaſions: he never aſked me how he was to execute any ſervice, but always went and performed it." In the conteſt with America, it was the policy of miniſters to employ, in high commands, officers whoſe public principles had led them to be favourers of popular rights, and the oppoſers of coercive meaſures. Among theſe none ſtood higher than lord Howe, and his brother the general. Theſe, by embarking in the cauſe, were probably actuated with the perſuaſion that they could ſettle the differences without having recourſe to the ſword. Lord Howe went out with limited inſtructions, and every attempt at pacific meaſures proved to be in vain. He was now obliged, by his naval character, to follow ſuch a plan as would do honour to his profeſſion. When the French joined the American cauſe, lord Howe had an opportunity of exhibiting his great talents as a commander; in 1778, through the inattention of the adminiſtration, he was left with a force very inferior to that of the enemy, and the Engliſh fleet was brought into a ſituation of much danger, but by the ſkilful exertion of his lordſhip, the French thought it prudent to ſail away, without putting their ſtrength to a trial. The enemy's fleet now inveſted Rhode Iſland, but by the manœuvres of lord Howe its plans were again defeated. Diſguſted, probably, with the cauſe in which he never cordially embarked, and deteſting the principles of an adminiſtration who were deſirous of deſtroying the rights of their countrymen acroſs the Atlantic, lord Howe reſigned in 1778, and remained unemployed till 1782, when, upon the change of adminiſtration, he was advanced to the rank of admiral of the blue, created a viſcount of Great Britain, and appointed to the command of a fleet fitted out for the relief of Gibraltar, which he performed in the teeth of the combined fleets of France and Spain, who ſhunned an action, though far ſuperior in force and numbers. At the concluſion of the war he was made firſt lord of the admiralty, an office which he held with a ſhort intermiſſion by a change of adminiſtration, till 1788, when he was created an Engliſh earl. In 1793, when the war with France broke out, his lordſhip, at the king's particular deſire, accepted the command of the channel fleet, and on the glorious 1ſt of June, as it is now called, he obtained a moſt deciſive victory over the French Fleet, took ſeven men of war, and rendered the others incapable of farther oppoſition. On the part of the Britiſh not a ſhip was deſtroyed, or taken, or even much injured, and this vaſt ſucceſs was obtained with the loſs of but few men, though the ſlaughter among the enemy's crews was very great. The gratitude and enthuſiaſm of the nation was proportioned to the importance of the ſervice, and the 1ſt of June is conſigned, by the epithet already noticed, to futurity, among the moſt ſplendid days of our national calendar. In 1795 lord Howe was appointed general of the marines, and in 1797 he reſigned his naval command, and was decorated with the order of the garter. His lordſhip died in 1799, at the age of ſeventy-three, having ſerved his country with the higheſt reputation for a long period of almoſt threeſcore years. Lord Howe was ever diſtinguiſhed by cool and ſteady valour, ſound judgment, and conſummate ſeamanſhip. Month. Mag. Gent. Mag.

Howe, *The*, in *Geography*, a ſmall iſland in the Engliſh channel, near the N.W. coaſt of the iſland of Guernſey.

Howe's *Foreland*, the northern point of a peninſula on the N.E. coaſt of Kerguelen's land. S. lat. 48° 48'. E. long. 69° 28'.

Howe's *Iſland*, an iſland in the South Pacific ocean. S. lat. 31° 36'. W. long. 159° 4'.

Howe's *Iſland*, an iſland in the South Pacific ocean, diſcovered by Captain Wallis in 1767, on which a few cocoanut trees were growing. It is about ten miles long and four broad. S. lat. 16° 46'. W. long. 154° 8'. Captain Cook obſerved it in his paſſage from Ulietea to the Friendly iſles, in 1774, and found it to be a low reef-iſland of a circular form, about four leagues in compaſs, compoſed of ſeveral ſmall patches connected by breakers, the largeſt lying on the N.E. part. It appeared to have no inhabitants.

Howe's, or *Lord Howe's Iſland*, one of the cluſter, called Queen Charlotte's iſlands, ſeparated from Egmont iſland by a paſſage extending about 11 leagues, and about four miles broad. Lord Howe's iſland lies in S. lat. 11° 10'. E. long. 164° 43'; and Cape Byron, the N. E. point of Egmont iſland, in S. lat. 10° 40'. E. long. 164° 49'. Both theſe iſlands appear to be fertile, and have a pleaſant appearance, being covered with tall trees of a beautiful verdure. The inhabitants of Egmont iſland are extremely nimble, vigorous, and active, and ſeem to be almoſt as well qualified to live in the water as upon the land, as they were in and out of their canoes almoſt every minute.

Howe's *Sound*, a bay or inlet in the gulf of Georgia. The entrance is in N. lat 49 23'. E. long. 237°.

HOWELL, James, in *Biography*, born in Carmarthenſhire about 1596, was educated at Jeſus college, Oxford, and at the cloſe of his ſtudies he came to London to ſeek employment, being unable, through ſtraightened circumſtances, to remain at the univerſity the uſual period. Through the intereſt of ſir Robert Manſel he was appointed ſteward to a patent glaſs manufactory, it being requiſite to ſend an agent abroad to procure the beſt materials and workmen. He left England in 1619, and viſited many commercial towns in Holland, Flanders, France, Spain, and Italy. In this journey he laid in a large ſtock of knowledge of men and things, and obtained an acquaintance with modern languages very unuſual at that period. His love of literature did not prevent him from performing his duty to his employers. He negociated a ſupply of the beſt barilla, at a cheap rate, from Alicaut, and engaged ſome able workmen at Venice and other places. He returned to London in the winter 1621; in the following year he went to Spain, and during his abſence was choſen fellow of Jeſus college. In 1624 he had acquired ſuch reputation that he was made ſecretary to lord Scrope, preſident of the North, and in 1627 was choſen member of parliament for Richmond, Yorkſhire. In 1630 he accompanied Robert, earl of Leiceſter, who was appointed ambaſſador extraordinary to the court of Denmark, in quality of his ſecretary, and diſplayed his oratorical talents in Latin ſpeeches before the king of Denmark and ſome German princes. He was afterwards employed in ſtate affairs, and in 1640 became clerk of the council; but in 1643 his papers were ſeized by order of parliament, and he was committed to the Fleet, where he ſupported himſelf by his pen. His writings were numerous, but chiefly of a temporary kind. He is chiefly known as an author by A Collection of Letters, in one volume, octavo, containing much of the hiſtory of the times. In the reign of Charles I. he was eſteemed a royaliſt, but his remarks upon the fatal cataſtrophe which terminated that inglorious reign ſhew that he felt nothing for the fate of the monarch. He flattered Cromwell, and by his bending temper he was made hiſtoriographer to Charles II. He died in 1666, and the following inſcription is to be ſeen on his tomb in the Temple church: "Jacobus Howell, Cambro-Britannus, Regius Hiſtoriographus (in Anglia primus); qui poſt varias peregrinationes tandem naturæ curſum peregit, ſatur annorum et famæ, domi foriſque huc uſque erraticus, his fixus. Biog. Brit.

HOWILEMUR, in *Geography*, a town of Perſia, in the province of Ghilan; 90 miles N.W. of Reſhd.

HOWITZERS, in *Artillery*, are a kind of mortars, invented by the Germans about the year 1593 or 1594, which are mounted upon carriages like travelling gun-carriages, and have their trunnions placed nearly in the middle. The conſtruction of howitzers is as various as that of mortars, excepting the chambers, which are all cylindric. They are diſtinguiſhed by the diameter of the bore, *e. g.* a ten inch howitzer is that, the diameter of which is 10 inches. Howitzers are capable of doing great execution, by firing ſhells and grapes of ſhots, in a ſiege where the diſtance is ſmall, and in the field, if they were placed in the flanks or between the battalions. They are alſo more eaſily carried from one place to another than mortars. For the dimenſions of different howitzers, and remarks on their conſtruction, the reader may conſult the article Cannon.

HOWKER, or Hooker, a veſſel much uſed by the Dutch; built ſomething like a pink, but rigged and maſted like a hoy.

Howkers carry from 50 to 200 ton; and with a ſmall number of hands will go to the Eaſt Indies. They are commonly navigated with two maſts, *viz.* a main-maſt and a mizen-maſt. They tack ſoon and ſhort, will ſail well, and lie near the wind, and live almoſt in any ſea.

HOWLE, in *Ship-Building*. When the foot-hooks of a ſhip are ſcarfed into the ground-timbers, and bolted, and then the plank laid on them up to the orlop, the carpenters ſay, they begin to make the ſhip howle.

HOWSTACK, in *Geography*, one of the ſmaller Shetland iſlands, near the E. coaſt of Mainland. N. lat. 60° 23'. W. long. 1° 10'.

HOWTH, a peninſula on the W. coaſt of Ireland, which ſtretches to the eaſtward, on the north of Dublin bay. The hill of Howth is an important guide to the mariner, and a light-houſe has been erected on it in a conſpicuous ſituation. As, however, the bay of Dublin is often difficult of acceſs, and as the bar is a great impediment to the ſailing of the packets at a fixed hour, the attention of government has been directed to the forming of an harbour on the north ſide of the peninſula of Howth; and a very fine pier is now (1811) erecting for this purpoſe under the direction of able engineers. It is expected that this new harbour will not only anſwer as a much better ſtation for the packet-boats, but will alſo contribute to improve the trade of Dublin. The pier commences nearly under the ſmall town of Howth, and extends towards Ireland's eye. The *point* of Howth is in N. lat. 53° 21'. W. long. 6° 3'.

Howth, a ſmall poſt-town of the county of Dublin, province of Leinſter, Ireland, on the northern ſide of the peninſula noticed in the laſt article. It is ſeven miles from Dublin.

HOXTER, a town of Weſtphalia, belonging to the abbey of Corvey, three miles N.W. of it, but given to the king of Pruſſia in 1802.

HOY, one of the larger Orkney iſlands, about 11 miles long and more than three broad, ſeparated from Pomona by a channel about a mile and a half wide. Round the coaſt are ſeveral bays, in which there is good fiſhing. The principal places are Hoy and Southwalls. N. lat. 58° 43'. W. long. 3° 7'.

Hoy, a ſmall veſſel or bark, uſually rigged like a ſloop, and employed for carrying paſſengers and luggage from one place to another, particularly on the ſea-coaſt. In Holland the hoy has two maſts; in England it has but one, when the main-ſail is ſometimes extended by a boom, and ſometimes without it.

Hoy *Head*, in *Geography*, a cape on the W. coaſt of the iſland of Hoy. N. lat. 58° 48'. W. long. 3° 12'.

HOYA, in *Botany*, named by Mr. Brown in honour of Mr. Thomas Hoy, F.L.S. an experienced botaniſt, and able cultivator. Brown Tr. of the Wernerian Society, v. 1. 26. Aſclep. 15. Prodr. Nov. Holl. v. 1. 459.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juſſ.

Eſſ. Ch. Corolla wheel-ſhaped, five-cleft. Crown of the ſtamens in five depreſſed fleſhy leaves, whoſe inner angle extends into a tooth over each anther. Anthers terminated by a membrane; maſſes of pollen attached by their baſe, converging, compreſſed. Stigma pointleſs. Follicles ſmooth. Seeds comoſe.

A genus of twining or decumbent ſhrubs, with oppoſite leaves, and many-flowered umbels ſtanding between the foot-ſtalks. Two ſpecies only are defined by Mr. Brown, though he ſuſpects the firſt of them may prove, when properly examined, to comprehend ſeveral hitherto confounded.

1. H. *carnoſa*. (Aſclepias carnoſa; Linn. Suppl. 170. Willd. Sp. Pl. v. 1. 1264. Sims in Curt. Mag. t. 788. Sm. Exot. Bot. v. 2. 21. t. 70. Stapelia chinenſis; Lour. Cochinch. 205.)—Leaves elliptic-oblong, fleſhy. Corolla downy. Leaflets of the crown furrowed underneath.—Native of various parts of Aſia, as well as of New Holland, within the tropics. The late Hon. Mrs. Barrington received the living plant from the ſtraits of Sunda, and it flowered in her ſtove for ſeveral ſucceſſive ſeaſons, from May to July. The whole ſhrub is ſucculent and ſmooth. *Stem* climbing, round, downy above. *Leaves* two or three inches long, ſlightly revolute, pale beneath, on thick ſtalks. *Flowers* extremely beautiful and ſingular, in large globoſe umbels, ſmelling like a mixture of honey and the Peruvian Heliotrope. They are bluſh-coloured, with a purple centre; their corolla downy; the ſtar-like crown ſmooth and poliſhed, like porcelain.

2. H *viridiflora*. (Aſclepias volubilis; Linn. Suppl. 170. Watta-kaka-codi; Rheede Malab. v. 9. 25. t. 15.)—Leaves ovate, pointed, membranous, ſmooth, as well as the corolla. Crown without furrows. *Brown*. Native of woods in Ceylon. *Koenig*. Smooth in all its parts. *Leaves* ovate or heart-ſhaped. *Flowers* green, without ſcent.

Hoya, in *Geography*, a principality of Germany, bounded on the N. by the county of Delmenhorſt, the territory of Bremen, and the Weſer, on the E. by the principalities of Luneberg and Calenberg, on the ſouth by the principality of Minden, and on the W. by the county of Diepholz; about 32 miles long and 29 broad. In this diſtrict the heaths are large and the ſoil is ſandy; nevertheleſs it contains ſome good paſtures and arable lands, producing wheat, rye, barley, oats, flax, and buck-wheat. On the ſides of the rivers are good meadows. The chief rivers are the Weſer and the Aller. The inhabitants are partly employed in agriculture and breeding of cattle, and rearing of bees, and partly in manufacturing linen, woollen, ſtockings, &c. Moſt of the peaſants are bondſmen. The country comprehends 54 pariſhes, in which Lutheraniſm is profeſſed. Hoya was annexed to the dominions of the elector of Hanover in 1705; a ſmall part excepted, which belonged to Heſſe-Caſſel. It contains 17 ſmall towns, beſides the capital of the ſame name, ſituated on the Weſer. N. lat. 52° 51'. E. long. 9° 12'.

Hoya, *La*, a town of Mexico, in the province of New Biſcay; 90 miles N.W. of Parral.

HOYACHU, in *Botany*, the name given by the Chineſe to the acacia tree. They make great uſe of this tree in arts and medicine. They have a way of ſtriking a fine yellow upon paper with its flowers; and they give the ſeeds in ſeveral diſeaſes, in ſome of which, as in the dyſentery and hæmorrhages, they are of great ſervice. But, beſide theſe, they make an odd medicine of them, which they take with great readineſs for purpoſes it can never anſwer. They pick out the ſeeds carefully from the pods, as ſoon as ripe; they put theſe into a flat veſſel, and cover them with ox's gall; this is to be ſet for a hundred days to dry, in a place where the ſun does not come; after this, one of theſe ſeeds is to be ſwallowed every day before the firſt meal; and, by continuing this a proper time, they ſay the eye-ſight, if loſt, is reſtored, and their gray hairs become black. Obſerv. ſur les Coûtumes de l'Aſie, p. 240.

HOYER, in *Geography*, a town of Denmark, in the duchy of Sleſwick, with a harbour for ſmall veſſels, ſituated on the coaſt of the North ſea, celebrated for its oyſter fiſhery; 6 miles W. of Tondern.

HOYERSWERDA, a town of Luſatia, on the river Elſter; 34 miles N.N.E. of Dreſden. N. lat. 51° 26'. E. long. 14° 16'.

HOYLAND, a town of Norway, in the dioceſe of Drontheim; 92 miles N.N.E. of Drontheim.

HOYLE Lough, one of the many large lakes in the county of Weſtmeath, province of Leinſter, Ireland, and remarkable for the circumſtance of two rivers flowing in oppoſite directions from it. This lake is about 3 miles N. from Mullingar.

HOZA, a town of Lithuania, in the palatinate of Troki; 8 miles N. of Grodno.

HOZARDARA, a mountain of Perſia, in the province of Irak; 21 miles S. of Iſpahan.

HOZIER, Peter d', *Seigneur* de la Garde, in Provence, a gentleman diſtinguiſhed by his genealogical and hiſtorical reſearches, was born at Marſeilles in 1592. He received a good education, and then entered into the army under the count de Crequi, the genealogy of whoſe family he drew up. His ſucceſs in this attempt cauſed him to be employed by ſeveral other noble families in a ſimilar ſervice. To favour his purſuits, he obtained, in 1620, a place among the gentlemen of the king's houſhold. He was raiſed to other poſts of honour, and in 1628 the order of St. Michael was conferred on him by Lewis XIII. He was, immediately after this, penſioned by the court, expreſsly for the purpoſe of affording him leiſure for his curious reſearches concerning the illuſtrious families of the kingdom, of which, by his long labours, he had acquired a particular knowledge. In 1642, he was made maitre-d'hôtel to his majeſty, and in 1654 was raiſed to the dignity of counſellor of ſtate. He died at Paris in 1660. He was author of "A Hiſtory of Britanny," in folio, and a number of genealogies, ſome of which were printed, and others left in MS. His private character was highly eſtimable; and ſo good was his memory, that he was able to anſwer at once any queſtion concerning arms, contracts, affinities, dates, &c. relative to all the families which had been the ſubjects of his enquiries, ſo that it was ſaid jokingly, "that he muſt needs have been preſent at all the marriages and baptiſms in the univerſe." He left a ſon Charles-René d', who ſucceeded him in the office of judge of arms, and was honoured by the duke of Savoy with the knighthood of St. Maurice. He died at Paris in 1732, and had been diſtinguiſhed by his knowledge of heraldry. He had written ſeveral works by order of Lewis XIV., particularly "Le Nobiliaire de Champagne." The nephew of this gentleman, Lewis Peter d'Hozier, was alſo his ſucceſſor in office: he died in 1767. During the period of his adminiſtration appeared "L'Armorial ou Regiſtres de la Nobleſſe de France," in ten vols., folio. Moreri.

HOZING *of* Dogs, the cutting out the balls of their feet. See Expeditation.

HOZOW, in *Geography*, a town of Poland, in the palatinate of Kiev; 30 miles S.W. of Bialacerkiev.

HRADEK, a town of Bohemia, in the circle of Konigingratz; 12 miles S.E. of Konigingratz.

HRADISCH, or Hradista, a town of Moravia, capital of a circle of the ſame name, ſeated on an iſland in the river Moraw, famous for its excellent wine and fruit; 30 miles S. of Olmutz. N. lat. 49° 5'. E. long. 17° 24'.

HRADITZ, a town of Bohemia, in the circle of Rakonitz; 15 miles S.W. of Rakonitz.

HRASGRAD, a town of European Turkey, in Bulgaria; 32 miles S. of Ruſcek.

HREBNIA, a town of Lithuania, in the palatinate of Minſk; 16 miles S.S.E. of Minſk.

HRESK, a town of Lithuania, in the palatinate of Novogrodek; 10 miles N.N.E. of Sluck.

HROZOW, a town of Lithuania, in the palatinate of Novogrodek; 18 miles N. of Sluck.

HUA. See Faifo.

HUACRE-CHUCO, a town of Peru, in the audience of Lima, and juriſdiction of Guamalies.

HUAHEINE, or Huahene, one of the Society iſlands, in the South Pacific ocean, ſituated in S. lat. 16° 43', W. long. 150° 52', firſt diſcovered by Cook in 1769, and viſited again in 1777, when he left Omai, after his viſit to England, in poſſeſſion of a houſe and land, which he took care to provide for him. This iſland is diſtant from Otaheite about 31 leagues, in the direction of N. 58° W., and is about ſeven leagues in compaſs. Its ſurface is hilly and ununeven, and it has a ſafe and commodious harbour, called by the natives "Owalle," or "Owharre," lying on the W. ſide, under the northernmoſt high land, and within the north end of the reef, which paſſes along that ſide of the iſland. This harbour may be entered by two inlets or openings through the reef, about 1½ mile diſtant from each other: the ſouthernmoſt being the wideſt, and having on the ſouth ſide of it a very ſmall ſandy iſland. The productions of this iſland are much the ſame with thoſe of Otaheite, but about a month forwarder. Of the cocoa-nuts the inhabitants make a food which they called "Poe," by mixing them with yams; they ſcrape both fine, and having incorporated the powder, they put it into a wooden trough, with a number of hot ſtones, by which they make a kind of oily haſty-pudding, which the Engliſh ſailors liked very well, eſpecially when fried. The inhabitants are nearly the ſame with thoſe of Otaheite, with regard to perſon, dreſs, language, and other circumſtances pertaining to their diſpoſition and character. They are, however, of a larger ſize, and of a ſtouter ſtructure. Mr. (ſir Joſeph) Banks meaſured one of theſe men, and found him to be ſix feet three inches and a half high; but they are invincibly lazy. The women were fairer than thoſe of Otaheite, and in general more handſome. Perſons of both ſexes ſeemed to be leſs timid and leſs curious. Although they were not ſtrictly honeſt, yet it is acknowledged, to their honour, that when they underſtood that one of their number had been detected in the act of ſtealing, they manifeſted ſtrong ſigns of diſapprobation, and preſcribed a good beating for the thief, which was immediately adminiſtered. In this iſland they obſerved a kind of cheſt or ark, the lid of which was nicely ſewed on, and thatched very neatly with palm-nut leaves, it was fixed upon two poles, and ſupported on little arches of wood neatly carved; the poles ſerved to remove it from one place to another. In one part of it was a ſquare hole, in the middle of which was a ring, touching the ſides, and leaving the angles open, ſo as to form a round hole within a ſquare one. See Ark.

HUALE, a town of Arabia, in the province of Hadſjar, on the W. coaſt of the Perſian gulf. N. lat. 25° 49'. E. long. 50°.

HVALSOE, a ſmall iſland on the North ſea, near the coaſt of Norway. N. lat. 69° 40'.

HUANACO, in *Zoology*, a Peruvian animal of the camel tribe. See Camelus *Huanacus*.

HUARTE, John, in *Biography*, a native of French Navarre, who was diſtinguiſhed in the ſeventeenth century by a Spaniſh work of great merit, entitled, "A Trial of the Wits, or a Treatiſe on the different Kinds of Genius among Men, with Rules and Directions, ſhewing to what Kind of Study any Perſon is beſt adapted." The book has been tranſlated into Engliſh. Moreri.

HUBAIAN, in *Geography*, a town of Perſia, in the province of Farſiſtan; 50 miles E. of Baiza.

HUBALD, Hucbald, or Hugbald, in *Biography*, a monk of St. Amand, in Flanders, who preceded Guido more than one hundred years, was contemporary with Remi, and author of a treatiſe on muſic, which is ſtill ſubſiſting in the king of France's library, under the title of "Enchiridion Muſicæ," No. 7202, tranſcribed in the eleventh century. In this work there is a kind of gammut, or expedient for delineating the ſeveral ſounds of the ſcale, in a way wholly different from his predeceſſors; but the method of Guido not only ſuperſeded this, but, by degrees, effaced the knowledge and remembrance of every other that had been adopted in the different countries and convents of Europe. However, the aukward attempts at ſinging in conſonance, which appear in this tract, are curious, and clearly prove that Guido neither invented, nor, rude as it was before his time, much contributed to the improvement of this art.

Hubald places the whole force of his *diaphonics*, or harmony, upon fourths and fifths.

The good monk ſays, if to theſe two parts two more are added in the octave, the harmony will be complete: and then writes, after his manner, the ſame fragment of melody over again, with a very ſmall change at the end in the accompaniment, which he calls *organum*; which ſee. It is eaſy for a profeſſed muſician to divine what a ſtrange effect ſuch a combination of ſounds would have. At length, however, growing ſtill more daring in his experiments, in the eighteenth chapter the queſtion is, "How much higher the principal melody may go than the *organum*," and the ingenious monk determines the point by allowing that while one voice remains in the ſame tone, the other may wander about at its pleaſure. The ſucceſſion of four 3ds in the next example, renders it more like muſic of this world, in point of harmony, than any of the reſt. And, indeed, a very few alterations in the under part would make the whole fragment ſupportable to modern ears.

Hubald, the reſpectable author of theſe curious ſpecimens of crude harmony, was not only a muſician but a poet; and an idea may be formed of his patience and perſeverance, if not of his genius, from a circumſtance related by Sigebert, the author of his life, by which it appears that he vanquiſhed a much greater difficulty in poetry than the lippogrammiſts of antiquity ever attempted: for they only excommunicated a ſingle letter of the alphabet from a whole poem: but this determined monk compoſed three hundred verſes in praiſe of *baldneſs*, which he addreſſed to the emperor Charles the Bald, and in which he obliged the letter C to take the lead in every word, as the initial of his patron's name and infirmity, as thus:

"Carmina Clariſonæ Calvis Cantate Camœnæ."

Theſe examples will ſufficiently indicate the infant ſtate of counterpoint previous to the time of Guido, and enable the reader to judge whether it was much improved by his diſcoveries.

Hubald died in 930, at the age of ninety. See COUNTERPOINT.

HUBARA, or HOUBARA *of Buffon*, in *Ornithology*, the ruffed buſtard of Latham. See OTIS.

HUBARLIK, in *Geography*, a town of Pruſſian Lithuania; 25 miles E. of Bialacerkiev.

HUBBARDSTON, a townſhip of America, in Worceſter county, Maſſachuſetts, incorporated in 1767; containing 1113 inhabitants; 60 miles W. of Boſton.

HUBBER, a ſmall iſland in the Baltic, between the iſland of Uſedom and the continent. N. lat. 54° 38′. E. long. 13° 40′.

HUBBERTON, a townſhip in Rutland county, Vermont, containing 642 inhabitants; 50 miles N. of Bennington.

HUBELI, a town of Hindooſtan, in the country of Sanore; 20 miles N.W. of Sanore. N. lat. 25° 53′. E. long. 75° 24′.

HUBER, JOHN-JAMES, in *Biography*, a celebrated anatomiſt, was born at Baſle in 1707. He was a pupil of the great Haller at Berne in 1730; after which he ſtudied at Straſburgh, and in 1733 took the degree of M.D. at his native place. He viſited Paris in 1735, and in the ſame year was appointed phyſician to the court of Baden Dourlach. At the requeſt of his preceptor, Haller, who had removed to Göttingen he examined the Graubund mountains in Switzerland, and tranſmitted to him his collection of plants found in that diſtrict, previous to the publication of Haller's work on the botany of Switzerland. The author acknowledged the ſervices of Huber in his preface, and invited him to Göttingen, in 1738, to be diſſector. He ſpeedily roſe to conſiderable reputation, being made extraordinary profeſſor of anatomy in that city in 1739; profeſſor in the Caroline college at Caſſel, with the rank of court-phyſician, in 1742; and counſellor of ſtate and body-phyſician to the prince, in 1748; which office he continued to fill during thirty years, and died in 1778. He had the honour of being elected, without his knowledge, into the moſt celebrated of the learned ſocieties of Europe. The chief objects of his reſearch were the ſtructure and ramifications of the ſpinal marrow, and the nerves originating from it; the ſuppoſed influence which the imagination of the mother has over the child; and the cauſe of miſcarriages. His principal works are entitled, "Commentatio de Medulla Spinali, ſpeciatim de Nervis ab ea provenientibus," cum icon. Goett. 1741, 4to. "Commentatio de Vaginæ Uteri ſtructura rugoſa, necnon de Hymene," 1742, 4to. He publiſhed a letter in the Philoſ. Tranſactions, vol. 46. "De cadavere aperto in quo non exiſtit veſica fellea, et de Sterno gibboſo." Gen. Biog.

HUBERT, MATTHEW, was born of humble parents, at Chatillon, on the Maine, in the year 1640. He was educated for the church, and was admitted into holy orders as ſoon as he had attained the proper age. His eloquence as a preacher cauſed him to be noticed, and followed by vaſt crowds. His popularity did not produce in his mind any ill effects: he was diſtinguiſhed for piety, humility, and a general kindneſs and ſuavity of manners. He was not aſhamed, at the higheſt pitch of his popularity, of his low origin, or of the obligations he had been under to his friends. Meeting once, in company, with a perſon of diſtinction, who obſerved to him that he recognized in Hubert an old fellow-ſtudent; he replied, with emotions of pure and unfeigned gratitude, "That is a circumſtance which I can never forget, for you had the goodneſs not only to furniſh me with books, but to beſtow on me a part of your clothes." He died in 1717 at the age of 77. Six volumes of his ſermons were publiſhed by father Monteuil in 1725, which were, at one time, as much read in the cloſet, as they had been admired from the pulpit. Moreri.

HUBERT, *St.*, anciently *Andainum*, or *Andagium*, in *Geography*, an ancient town of France, in the department of the Forêts, ſituated in the foreſt of Ardennes, on the ſmall river Homme. It took its name from an abbey of Benedictines, where the remains of St. Hubert were depoſited in 825, in compliance with the decree of a council, held at Aix-la-Chapelle; 25 miles N.W. of Arlon. N. lat. 50° 1′. E. long. 5° 27′.

HUBERT, *St.*, *Order of*, an order of knighthood, inſtituted, in the duchy of Juliers, by Gerard V., duke of Juliers, in memory of a victory gained by him over Arnold of Egmont, on St. Hubert's day, in the year 1447. In 1709 it was revived by John-William, elector-palatine of the Rhine. The reigning elector-palatine is grand maſter. It was alſo uſed at Wurtemberg, where the reigning duke of Wurtemberg was grand maſter. The collar of the order is a chain of gold, to which is pendent a croſs pattée, ſet with jewels, from the angles of which iſſue rays of gold; on the centre is a medallion of gold enamelled, with a portrait of St. Hubert, kneeling before a crucifix, placed between the horns of a ſtag ſtanding in a wood, all proper. The knights alſo wear, on the left ſide of their coat, a circle ſurrounded with rays, embroidered in gold; and in the middle of it, on a red ground, ſome German words, ſignifying "Keep firm in the Faith." At all times, except feſtival days, they wear the croſs tied to a red ribbon, which paſſes ſcarf-wiſe from the left ſhoulder to the right thigh.

HUBKOW, in *Geography*, a town of Poland, in Volhynia; 64 miles N.W. of Zytomiers.

HUBNER, John, in *Biography*, a German hiſtorian and geographer, born in 1668, was celebrated likewiſe as an inſtructor of youth, and became rector of the ſchool of Hamburgh. He died in 1732, and is known to poſterity by ſeveral uſeful compendiums in hiſtory, geography, &c., which have been tranſlated into ſeveral languages. His chief works are, "Bibliotheca Hiſtorica Hamburgenſis;" "Muſæum Geographicum." Moreri.

HUBS, in *Rural Economy*, a term applied in ſome diſtricts to the names of wheels of certain kinds.

HUCAMYBUFF, in *Agriculture*, a term applied in ſome places to ſuch coarſe tufty graſs as remains after eating down the more luxuriant paſture lands by live ſtock, and which is afterwards mown and made into rough ſort of hay. This ſort of work is in other diſtricts often denominated *hobbing*. It is often pronounced *hogamybuff* by the farmers.

HU-CHOUI-LO-TCHUAN, in *Geography*, a town of Corea; 600 miles E.N.E. of Peking. N. lat. 42° 27′. E. long. 128° 51′.

HUCH, or Hucho, in *Ichthyology*. See Salmo *Hucho*.

HUCKABACK, in *Commerce*, is a kind of linen, on which the figures are raiſed.

HUCKESWAGEN, in *Geography*, a town of the duchy of Berg; 24 miles E.S.E. of Duſſeldorp.

HUCKLE Bone, the hip-bone. See Coxæ *Oſſa*.

HUCQUELIERS, in *Geography*, a town of France, in the department of the ſtraits of Calais, and chief place of a canton, in the diſtrict of Montreuil; nine miles N.E. of it. The place contains 710, and the canton 11,967 inhabitants, on a territory of 242½ kiliometres, in 24 communes.

HUCKSTER, one that ſells proviſions or ſmall wares by retail.

HUD Sheaf, in *Agriculture*, the name by which the ſheaf that covers the top of the hattock is frequently known. See Hudder.

HUDDE, John, in *Biography*, a burgomaſter of Amſterdam, who flouriſhed in the ſeventeenth century, and died in 1704, was eminent in his character of a magiſtrate, and poſſeſſed a commanding genius for mathematical ſtudies. Much was expected from his talents as a man of ſcience, but he was diverted from the purſuit by ſtate affairs. He was nevertheleſs the author of ſeveral excellent little pieces "On the Reduction of Equations;" "De Maximis et Minimis," and his "Commentary on the Geometry of Deſcartes," &c. Moreri.

HUDDELGUR, in *Geography*, a town of Hindooſtan, in Oriſſa; 15 miles N. of Boad.

HUDDER, in *Agriculture*, a name given, in many counties, to the ſheaf by which the hattock is covered and protected at top from the effects of rain, &c.

HUDDERSFIELD, or Huthersfield, in *Geography*, a market-town and pariſh in the Weſt Riding of Yorkſhire, England, is a large improving place, noted for being the centre of a manufacturing diſtrict. The pariſh conſiſts of the following hamlets, or townſhips; Quarmby with Lindley, Longwood, Golcarr, and part of Scamandan, Slaughthwaite, and Marſden, all of which are chiefly occupied by perſons engaged in different branches of the woollen manufacture. The goods made here conſiſt chiefly of narrow plain cloths, both fine and coarſe, with ſome broad cloths, elaſtics, beaverettes, kerſeymeres, &c. For the diſplay and ſale of theſe, a commodious building, of a circular form, called the Cloth-hall, was erected here, in 1765, by ſir John Ramſden, who poſſeſſes nearly the whole of the land on which the town is built, and alſo a great many houſes. The building conſiſts of two ſtories, and is divided into two courts. All the windows open to theſe areas. A market is held here every Tueſday, which commences early in the morning, and is cloſed at half paſt twelve o'clock at noon. The reſort of manufacturers, wool-ſtaplers, &c. to this mart, is very numerous, many of whom come from Leeds, Halifax, Wakefield, and other places in the vicinity. Beſides the market here are three annual fairs. The police of the town is under a conſtable and his deputy, who are annually choſen, or rather appointed, by the Ramſden family at their court-leet held at Almonſbury. Huddersfield is 14 miles weſt of Wakefield, and 188 from London. In the year 1800 it contained 1398 houſes, and 7268 inhabitants. In the vicinity of the town are the following ſeats: Whitley-hall, belonging to the Beaumont family; Kirklees-hall, the property of ſir George Armytage, bart.; Fixly-hall, the ſeat of Thomas Thornhill, eſq.; and Millsbridge, belonging to W. Radcliffe, eſq. Weſt of Almonſbury is an eminence called Caſtle-hill, on the ſummit of which is an ancient entrenchment, ſuppoſed by ſome topographers to have been the Roman Cambodunum; but Mr. Watſon, in his Hiſtory of Halifax, attributes it to the Saxons, and thinks, that Slack, to the north of Huddersfield, was the ſcite of that ſtation. The Roman road from Mancheſter, Mancunium, to York, Eboracum, paſſed near Almonſbury, and the name, and contiguity to the Roman road, are againſt Mr. Watſon's conjectures.

Huddersfield *Canal*, is an inland navigation in Yorkſhire and Lancaſhire, begun in purſuance of acts of parliamen paſſed in the years 1793 and 1800, of which we gave an account in our article Canal, and have here only to add, that the locks are 72 feet long and nine feet wide, and generally riſe about ten feet: there is a tunnel of about 200 yards long, S.E. of Scout Mill, near Aſhton-under-line: an aqueduct of caſt-iron, 50 or 60 feet long, having a ſtone bridge of one arch by its ſide for the towing-path: theſe were erected in 1801 and 1802. At Wright's Mill the canal croſſes the Tame, to its weſtern ſide, juſt after it has entered Yorkſhire, on a two-arch ſtone aqueduct. The canal has been now a long time completed, and is uſed, from its weſtern end, about eight miles to Woolroyd, and from its eaſtern end to Diglee in Sadleworth; and at this time, the great tunnel 3¼ miles long and 250 yards beneath Pule hill on the grand ridge, is, we believe, very nearly finiſhed. The bridges on this canal have been imprudently conſtructed, many of them, even under the public roads, without towing-paths under them, and muſt be taken down and widened. On the 29th of November, 1810, a ſecond accident happened to the reſervoirs of this canal, when the Driggle reſervoir on Stanedge, containing 28 acres, burſt, and inundated the vallies below.

HUD-SJERA, a town of Arabia Felix, in the province of Yemen; 36 miles W.N.W. of Sana.

HUDSON, Henry, in *Biography*, a diſtinguiſhed naval commander, of whom nothing is known till about the year 1607. At this period he was ſent out on an expedition, by ſome London merchants, in a ſmall veſſel for exploring a north-eaſt paſſage to Japan and China. This daring adventurer ſet ſail on the 1ſt of May with a crew of only ten men and a boy, beſides himſelf, and proceeded beyond the 80th degree of latitude in the North ſea, when, being ſtopped by the ice, they returned and arrived at England in the following September. In a ſecond voyage he landed at Nova Zembla, but proceeded no farther eaſt, and returned in Auguſt. In 1609 he was fitted out for a third voyage by ſome merchants of the Dutch-Eaſt-India-company, and after another unſucceſsful attempt to the eaſtward he ſteered for the American coaſt, and went down as far as Cheſapeak-bay. His crew, diſſatisfied with their want of ſucceſs, prevented him from endeavouring to find a weſterly paſſage through Davis's ſtrait, and he returned in November. In a fourth voyage he came, June 4th 1610, within ſight of Greenland, and proceeding weſtward, he reached, in ſixty degrees of latitude, the mouth of the ſtrait bearing his name. Through this he advanced along the coaſt of Labrador, to which he gave the name of Nova Britannia, till it iſſued in the vaſt bay which perpetuates the memory of Hudſon. At firſt he thought he had diſcovered the long ſought paſſage to the north-weſt, but experience taught him that it was only a bay, and he reſolved to winter in it. They found proviſions during the winter ſeaſon, but at the approach of ſpring they were reduced to the utmoſt difficulties. The commander forgot his own ſufferings in the hope of making new diſcoveries, but his crew, not having the ſame motives for patience and perſeverance, began to mutiny, and he threatened to ſet them on ſhore. They, on the other hand, willing to anticipate the execution of his purpoſe, ſeized Mr. Hudſon, his ſon, and ſeven others, who were moſt attached to him, and putting them on ſhore at the weſt end of the ſtraits, left them to periſh by the waves, or other hardſhips. Such was the end of Henry Hudſon, a man illuſtrious in the annals of naval diſcovery.

Hudson, John, was born in 1662 at Widehope, near Cockermouth, where he received the early part of his education, and at the age of fourteen he was admitted into Queen's college, Oxford. In 1684 he took his degree of M.A. and then removed to Univerſity college, of which, in two years after, he was choſen fellow. In 1701 he was elected head-keeper of the Bodleian library, againſt the competition of the learned Wallis, afterwards Arabic profeſſor. He now took his degree of D.D., and in 1712 he was made principal of St. Mary-hall. He employed the advantages of his ſituation in editing ſeveral of the moſt valuable authors of antiquity. Of theſe the following may be mentioned, "Velleius Paterculus;" "Thucydides;" "Geographiæ Veteris Scriptores Græci Minores;" "Dionyſius Halicarnaſſus;" and "Longinus." The editions of Dr. Hudſon are valued for their elegance and correctneſs. He never poſſeſſed any eccleſiaſtical preferment, and died at St. Mary-hall in Nov. 1719. Biog. Brit.

Hudson, Thomas, a portrait painter, who enjoyed for many years the principal repute and practice of the profeſſion in London, after Richardſon, under whom he ſtudied, and Jervas were gone. Yet, though confeſſedly the beſt of his time, it is but ſmall praiſe to ſay ſo of him; he will be longer remembered as the maſter of an illuſtrious pupil who ſoon eclipſed him, when he began to appear before the public, and who yet remains unrivalled, ſir Joſhua Reynolds.

Hudſon certainly improved upon the taſte of the artiſts who immediately preceded him, and who had fallen in ſucceſſion from Kneller, into the utmoſt imbecility of practice as well as feeling in the art. For a while his ſucceſs was interrupted by Vanloo and Liotard, but the Engliſh gentry in general were faithful to their compatriot, and were content with his honeſt ſimilitudes, with fair tied wigs, velvet coats and white ſattin waiſtcoats, duly gilt and embroidered.

When Reynolds began to practiſe and gain fame, Hudſon was advanced in years, and having acquired an independency of fortune, he retired and left the field to his youthful rival, after having finiſhed his moſt capital performance, the family piece of Charles duke of Marlborough.

He went to reſide at a beautiful villa which he built at Twickenham, where he died in 1779, at the age of 78. He was twice married, firſt to the daughter of his maſter Richardſon, and afterwards, towards the cloſe of his life, to a Mrs. Fiennes, a gentlewoman of good fortune, to whom he bequeathed his villa, with an excellent collection of cabinet pictures and drawings by the old maſters.

Hudson, William, one of the earlieſt Linnæan botaniſts in England, was born in Weſtmoreland, about the year 1730. He ſerved his apprenticeſhip to an apothecary in Panton ſtreet, Haymarket, to whoſe buſineſs he ſucceeded, and with whoſe widow and daughters he continued to reſide. His acquaintance with the amiable and learned Mr. Benjamin Stillingfleet, greatly advanced his taſte and information in natural hiſtory. This gentleman directed his attention to the writings of Linnæus, and gave his mind that correct and ſcientific turn, which cauſed him to take the lead as a claſſical Engliſh botaniſt, and induced him to become the author of the *Flora Anglica*, publiſhed in 1762, in one volume octavo. The plan of this book was, taking Ray's *Synopſis* as a ground-work, to diſpoſe his plants in order, according to the Linnæan ſyſtem and nomenclature, with ſuch additions of new ſpecies, or of new places of growth, as the author or his friends were able to furniſh. The ſynonyms of the moſt valuable authors, ſince the time of Ray or Dillenius, were ſuperadded, as well as deſcriptions of new or rare plants; and even new ſpecific characters, wherever the Engliſh ſpecimens did not well anſwer to the definitions in Linnæus. Some few generic alterations were alſo hazarded; but for the moſt part the Linnæan definitions in this department were relied on. Many ſynonyms alſo were copied from Linnæus or other writers, as appears by errors of the preſs retained in the tranſcribing. Of this too common fault we have had occaſion to take notice on ſome other occaſions, but we by no means intend to aſſert that Mr. Hudſon conſulted none of the authors he quoted. On the contrary, we believe ſuch blind tranſcription was more rarely practiſed by him than by many other writers. The particular places of growth of the rarer ſpecies were given in Ray's manner, in Engliſh, though the reſt of the book was Latin. The elegant preface was written by Mr. Stillingfleet, and probably the conciſe, but not leſs elegant, dedication to the late duke of Northumberland, "*artium, tum utilium, tum elegantiorum, judici et patrono.*"

This publication gave Mr. Hudſon a conſiderable rank as a botaniſt, not only in his own country, but on the continent, and derived no ſmall advantage from a compariſon with Dr. Hill's attempt of the ſame kind. He had indeed previouſly, in the courſe of his medical practice, formed ſome valuable connexions, which were cemented by botanical taſte, and he found leiſure, from time to time, to viſit ſeveral friends in the courſe of his botanical expeditions, eſpecially in Devonſhire. His correſpondence with Linnæus, Haller, and others, as well as amongſt his countrymen, was frequent and very uſeful to him in the courſe of his ſtudies, which were extended not only to botany in all its cryptogamic *minutiæ*, but, with great ardour alſo, to inſects, ſhells, and other branches of Britiſh zoology. He was elected a fellow of the Royal Society Nov. 5th, and admitted Nov. 12th 1761. He took the lead very much in the affairs of the Apothecaries' company, and was their botanical demonſtrator in the Chelſea garden for many years.

Mr. Hudſon, having never married, continued to reſide in Panton ſtreet with the laſt-ſurviving daughter of his friend and maſter, an amiable and valuable woman, married to Mr. Hole; nor did he remit in his attention to ſcience or buſineſs. There the writer of the preſent narrative often viſited him, and experienced his kind, though ſomewhat reſerved, communications and favour. His *Flora* being grown very ſcarce, inſomuch that a copy had been ſold for near twenty times its original price, he publiſhed, in 1778, a new edition, in two volumes, with many additions, and various alterations. Some of the latter, reſpecting the ſpecies or varieties of graſſes, have been thought leſs advantageous than the reſt. On the whole, however, this edition was worthy of its author, and of the advanced ſtate of the ſcience. The *Flora Scotica* of his contemporary Mr. Lightfoot, a man of more popular manners and ſtyle, will not bear a compariſon with it for authenticity or originality, however pleaſing and eſtimable for the graces it beſtows on even the drieſt parts of the ſcience.

The merits of the ſubject of this article were of a higher order. In his ſocial intercourſe he courted not the many, but was warmly attached to a few. His moral character was without a ſtain, and his mind was eſtabliſhed on the ſoundeſt principles. His tranquillity received a dreadful ſhock in the winter of 1783, when his houſe, and the greater part of his literary treaſures, were deſtroyed by a ſudden fire, cauſed, as it was believed, by the villany of a confidential ſervant, who knew of a conſiderable ſum in money which his maſter had received a day or two before. No traces of the gold were found amongſt the ruins. The ſervant, after a treacherous application for aſſiſtance, on the pretence of being totally deſtitute, diſappeared. The property had, by accident, been for a ſhort time only, uninſured, and the loſs was therefore conſiderable, in a pecuniary point of view, to a man whoſe reſources were not extenſive. He bore the whole like a philoſopher and a Chriſtian, giving up his practice, and retiring, with Mr. and Mrs. Hole, to a more economical reſidence in Jermyn ſtreet, where he died May 23d 1793, Mrs. Hole ſurviving him but a few months.

The accident of the fire entirely defeated a project Mr. Hudſon had for many years kept in view, of publiſhing a *Fauna Britannica*, on the plan of his *Flora*, for which he had long been collecting materials. His taſte for his favourite purſuit remained to the laſt, unimpaired and unembittered by theſe diſappointments. He became a fellow of the Linnæan Society early in 1791, liberally contributing to its infant funds, and attending the meetings as often as his now declining health would allow. His lungs had for many years been in an ulcerated ſtate, and he laboured under frequent impoſthumes in that part; but a ſucceſſion of paralytic attacks appear to have been the more immediate cauſe of his diſſolution. His reſigned and placid exit was conformable to the tenour of his life. His remains were interred at the adjoining church of St. James's. "May the writer of this leave no more errors behind him, as an author, or as a man!" S.

HUDSON *City*, in *Geography*, a port of entry and poſt-town of America, in the county of Columbia, and ſtate of New York, on the E. ſide of Hudſon river; 132 miles N. of New York city. This town was begun in 1783, on a ſpot, acceſſible by veſſels of any ſize; and was laid out in ſquares, formed by ſpacious ſtreets, croſſing one another at right angles. Each ſquare contains 30 lots, and each lot is 50 feet in front and 120 feet in depth. From the period of its commencement, the increaſe of this town has been wonderfully rapid; in two years 150 dwelling houſes were erected, with ſhops, barns, warehouſes, and other buildings, a covered rope-walk, and one of the beſt diſtilleries in America; and the number of inhabitants collected in this ſhort interval of time amounted to 1500. Since the year 1786, a printing-office has been eſtabliſhed, ſeveral public buildings have been erected, with dwelling-houſes, ſtores, &c. The town is abundantly ſupplied with water, conveyed by pipes to their cellars, from a ſpring at the diſtance of two miles. To the ſouthward is a large bay, and it commands extenſive views from the eminence on which it is ſituated. The river is a mile wide, and forms towards the north a number of creeks and bays. From the S.E. to the S.W. the city is ſkreened by hills, and the diſtant proſpect is terminated by a chain of ſtupendous mountains, called the "Kaat's hill." Here is a bank, called the "bank of Columbia, whoſe capital may not exceed 160,000 dollars, compoſed of 400 ſhares, at 400 dollars each. This city is governed by a mayor, recorder, four aldermen, four aſſiſtants, and other officers. The number of inhabitants in Hudſon townſhip is 3664. N. lat. 42° 14′.

HUDSON, a flouriſhing town in Trumbull county, and ſtate of Ohio, about 35 miles W. of Warren, containing about 200 inhabitants.

HUDSON'S *Bay*, an inland ſea, ſo called from the voyager Hudſon, who in 1610 diſcovered the ſtraits which bear his name, and this inland ſea, approaching the Baltic in ſize, which has, however, been denominated Hudſon's bay. Hudſon's ſea may be conſidered as extending from W. long. 70°, to long. 115°, or 45° of longitude, which, allowing the degree only 30 miles, will be 1350 geographical miles in length, and its medial breadth about 350. The entrance of this bay from the ocean, after leaving to the N. cape Farewell and Davis's ſtraits, is between Reſolution iſles on the N., and Button's iſles on the Labrador coaſt, to the S., forming the eaſtern extremity of the ſtraits diſtinguiſhed by the name of the diſcoverer. The ſhores are generally rocky and precipitous; with ſome large beaches; the iſles of Saliſbury, Nottingham, and Digges, are alſo very lofty and naked. The depth of water in the middle of the bay is 140 fathoms. From cape Churchill to the S. end of the bay are regular ſoundings; near the ſhore ſhallow with a muddy or ſandy bottom. To the N. of Churchill, the ſoundings are irregular, the bottom rocky, and in ſome parts the rocks appear above the ſurface at low water. From Mooſe river, or the bottom of the bay, to Cape Churchill, the land is flat, marſhy, and wooded with pines, birch, larch, and willows. From cape Churchill to Wager's water, the coaſts are all high and rocky to the ſea, and deſtitute of wood, except the mouths of Pockerekeſko and Seal rivers. The hills on their back are naked, nor are there any traces of trees for a great diſtance inland. The mouths of all the rivers are filled with ſhoals, except that of Churchill, in which the largeſt ſhips may lie; but 10 miles higher, the channel is obſtructed with ſand-banks; and all the rivers, as far as they have been navigated, abound with rapids and cataracts, from 10 to 60 feet perpendicular. As far inland as the Hudſon-bay Company have ſettlements, which is 600 miles to the W., at a place called "Hudſon Houſe," N. lat. 53°. W. long. 106° 27′, is flat country. The climate is almoſt always wintry, the hot weather in June, though violent, being of ſhort duration. The ſnows begin to fall in October, and continue to fall at intervals during the winter; the ice on the rivers is eight feet thick. Port wine freezes in a ſolid maſs, and brandy coagulates. The ice begins to diſappear in May, and hot weather commences about the middle of June. Mock ſuns and halos are frequent and brilliant; the night is enlivened with the Aurora Borealis; and the ſtars appear with a firey redneſs. Thunder, though not frequent, is very violent. The ſea does not abound with fiſh, but it furniſhes the common whale, and the beluga or white whale is taken in conſiderable numbers in June, when the rivers on the ſouth have diſcharged their ice. Large ſturgeons are alſo caught near Albany. Shell fiſh are very rare, common muſcles excepted, which are frequent. Multitudes of birds retire to this remote country, as well as to Labrador and Newfoundland, from places moſt remotely ſouth, perhaps from the Antilles; and ſome even of the moſt delicate little ſpecies. Moſt of them, with numbers of aquatic fowls, are ſeen returning ſouthward, with their young broods to more favourable climates. The ſavages partly regulate their months by the appearance of birds. All the grouſe kind, ravens, cinereous crows, titmouſe, and Lapland finch, brave the ſevereſt winter; and ſeveral of the falcons and owls ſeek ſhelter in the woods. The rein deer paſs in vaſt herds towards the N. in October, ſeeking the extreme cold. The male polar bears rove out at ſea, on the floating ice, moſt of the winter, and till June: the females lie concealed in the woods, or beneath the banks of rivers till March, when they come out with their twin cubs, and bend their courſe to the ſea in ſearch of their conſorts. The large tract of territory on the ſouth of this ſea is the property of the Hudſon's Bay company, who derive their chief profits from furs. This ſea has been repeatedly explored for a N.W. paſſage to no purpoſe. Cheſterfield inlet, (ſee CHESTERFIELD,) ſtretches far to the W., and terminates in a magnificent lake of freſh water, communicating with this ſea by a broad river; the adjacent land being level, rich in paſture, and abounding with deer. It is probably believed, that the Hudſon ſea on the N.E. opens into the Arctic ocean, where the perpetual ice preſents an inſurmountable barrier to commercial adventurers. The gulf, or ſea of Davis, may be conſidered as part of the ſea of Hudſon, and probably joins the Arctic ocean.

The regions around Hudſon's bay and that of Labrador have been ſometimes called *New* BRITAIN (which ſee). The parts on the W. of Hudſon's bay have alſo been called New North and South Wales; while that on the E. is ſtyled Eaſt Main. In the S., James's bay ſtretches inland about 300 miles by about 500 in breadth; and the moſt valuable ſettlements are in that vicinity, as Albany fort, Mooſe fort, and Eaſt Main factory. Further to the S. and on the confines of Upper Canada, are Brunſwick houſe, Frederick houſe, and ſome others, belonging, probably, to the N.W. company. In the N., Severn houſe is at the mouth of a large river, which ſeems to flow from the lake of Winnipic. York fort ſtands on Nelſon's river: and ſtill further to the N. is Churchill fort, which ſeems to be the fartheſt ſettlement in that direction. To the W. the Hudſon's Bay company had extended little further than Hudſon's houſe; while the ſuperior ſpirit of the N.W. company, eſtabliſhed in 1784, has nearly approached the Pacific. The boundary between the Hudſon's Bay company and Canada is underſtood to follow the ridge that gives ſource to the rivers flowing N. and S. as far as lake Annipeg, ſo that lat. 49° is ſaid to form the limit. The moſt important rivers in this country are, the Nelſon, or Saſkaſhawin, and the Severn: the comparative courſe of the latter ſcarcely exceeding 400 Britiſh miles, but of great breadth and depth. In the S. the Albany, Mooſe, Abitib, and Harricana, are the moſt conſiderable; but all the rivers are impeded with falls and ſhoals. In the ſea of Hudſon are ſeveral high iſlands. Pennant's Arctic Zoology. Pinkerton's Geog. vol. iii.

HUDSON's *Bay Company*. See COMPANY, and the preceding article.

HUDSON's *Houſe*, a factory belonging to the Hudſon's Bay company in North America, on the W. ſide of the Saſkaſhawin river. N. lat. 53°. W. long. 106° 27′.

HUDSON's *Point*, a cape of the iſland of Antigua, on the S.E. coaſt. N. lat. 17° 12′. W. long. 61° 23′.

HUDSON's *River*, one of the largeſt and fineſt rivers in the United States of America, which riſes in a mountainous country of New York, between the lakes Ontario and Champlain, and after purſuing a ſouth-eaſterly courſe within ſix or eight miles of lake George, then a ſtraight courſe E. and afterwards S. 12 or 15 W., diſcharges itſelf into York bay. The whole length is about 250 miles; from Albany to lake George the courſe is 65 miles, which is navigable only for batteaux, and has two portages, occaſioned by falls, of half a mile each. The paſſage through the highlands, of 16 or 18 miles, affords a wild romantic ſcene. The bed of this river, which is deep and ſmooth to a ſurpriſing diſtance through a hilly, rocky country, and even through ridges of ſome of the higheſt mountains in the United States, muſt have been produced by ſome ſignal convulſion of nature. The tide flows a few miles above Albany, which is 160 miles from New York. The river is navigable for ſloops of 80 tons to Albany, and for ſhips to Hudſon city. About 60 miles above New York the water becomes freſh. This river is ſtored with a variety of fiſh; and it affords ſingular advantages for carrying on the fur-trade with Canada, by means of the lakes: and its conveniences for internal commerce are very great.—Alſo, a river broad but ſhort, emptying itſelf into Cheſapeak bay, in Dorcheſter county, Maryland. Hill's Point, N.E. of it, cloſes the broad mouth of this river.

HUDSON's *Straits*, or *Frobiſher's Miſtaken Strait*, the narrow ſea between the Atlantic ocean and Hudſon's bay, N. of Labrador. See HUDSON's *Bay*.

HUDSON's *Bay Porcupine*, in *Zoology*. See HYSTRIX *Dorſata*.

HUDSONIA, in *Botany*, named by Linnæus in honour of his friend and correſpondent Mr. William Hudſon, author of the *Flora Anglica*.—Linn. Mant. 11. Schreb. 322. Willd. Sp. Pl. v. 2. 858. Mart. Mill. Dict. v. 2. Juſſ. 162. Lamarck. Illuſtr. t. 401.—Claſs and order, *Dodecandria Monogynia*. Nat. Ord. *Ericis affine*, Juſſ. *Hyperica*, Bergius.

Gen. Ch. *Cal.* Perianth inferior, in three deep, lanceolate, obtuſe, rather concave ſegments. *Cor.* Petals five, ſeſſile, ovate-oblong, obtuſe, ſhorter than the calyx. *Stam.* Filaments 15 or 18, capillary, the length of the corolla; anthers roundiſh. *Piſt.* Germen ſuperior, ovate; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma ſimple. *Peric.* Capſule cylindrical, half as long as the calyx, of one cell and three valves. *Seeds* three, rounded on one ſide, angular on the other.

Eſſ. Ch. Petals five. Calyx in three deep parallel ſegments. Stamens fifteen. Capſule ſuperior, of one cell and three valves. Seeds three.

Obſ. The characters are corrected from the deſcription of Bergius, which eſcaped the notice of Schreber; who merely copied the *Mantiſſa*, in which there is ſaid to be no corolla.

1. H. *ericoides*. Linn. Mant. 74. Willd. Hort. Berol. v. 1. t. 15. Bergius in Act. Holm. for 1778. 19. t. 1; not 18. t. 2, as in Willdenow. (Ericæformis ſuffrutex virginianus, floribus exiguis, vaſculo ſeminali oblongo trifariam diviſo; Pluk. Mant. 68.)—The only known ſpecies, a native of Virginia and other parts of North America, yet Michaux has it not. We ſaw it alive and in flower at Kew in the ſpring of 1809. The *ſtem* is ſhrubby, procumbent, round, with very numerous, aſcending, compound leafy branches, greatly reſembling a heath. *Leaves* ſcattered, ſmall, needle-like, cloſe-preſſed, ſomewhat imbricated, acute, hairy, eſpecially on the younger ſhoots. *Flowers* lateral, on ſlender, hairy, ſolitary, ſimple ſtalks longer than the leaves. *Calyx* externally downy, internally yellow. *Petals* and *ſtamens* of an uniform lemon-colour, much reſembling ſome ſmall *Hypericum*.

HUE, in *Painting*, ſignifies any degree of ſtrength or vividneſs in a colour, from its greateſt or deepeſt power to the weakeſt intimation of it.

HUE-AND-CRY, in *Law*, derived from the French *huer* and *crier*, which both ſignify *to ſhout*, or *cry aloud*, denotes the purſuit of one who has committed felony, &c. on the highway.

If a party robbed, or any in the company of one murdered or robbed, come to the conſtable of the next town, and require him to raiſe hue-and-cry, or to purſue the offender, deſcribing him, and ſhewing, as near as he can, which way he is gone, the conſtable is forthwith to call for aid from the pariſh to ſeek the felon; and if he is not found there, he is to give the next conſtable warning, till he be apprehended, or at leaſt purſued to the ſea-ſide.

The Normans had a purſuit with a cry after offenders, not unlike this; which they called *clamor de haro*. See CLAMOR.

Hue is alſo uſed alone, ann. 1 Edw. I. ſtat. 2. In ancient records it is called *huteſium & clamor*, which properly ſignify a purſuit by horn and by voice.

This proceſs of purſuing is mentioned by ſtatute Weſtm. 1. 3 Edw. I. cap. 9. and 4 Edw. I. *de officio coronatoris*. But the principal ſtatute relative to this matter is that of Wincheſter, 13 Edw. I. cap. 1. & 4. which directs, that from thenceforth every county ſhall be ſo well kept, that immediately upon robberies and felonies committed, freſh purſuit ſhall be made from town to town, and from county to county; and the hue-and-cry ſhall be raiſed upon the felons, and they who keep the town ſhall follow with hue-and-cry, with all the town and towns near; and ſo hue-and-cry ſhall be made from town to town, until they be taken and delivered to the ſheriff. And that ſuch hue-and-cry may more effectually be made, the hundred is bound by the ſame ſtatute, cap. 3, to anſwer for all robberies therein committed, unleſs they take the felon, which is the foundation of an action againſt the hundred, in caſe of any loſs by robbery. By ſtat. 27 Eliz. cap. 13. no hue-and-cry is ſufficient, unleſs made with both horſemen and footmen. And by ſtat. 8 Geo. II. cap. 16. the conſtable or like officer refuſing or neglecting to make hue-and-cry, forfeits 5*l.* and the whole vill or diſtrict is ſtill in ſtrictneſs liable to be amerced, according to the law of Alfred, if any felony be committed therein, and the felon eſcape. Hue-and-cry may be raiſed either by precept of a juſtice of the peace, or by a peace-officer, or by any private man that knows of a felony. (2 Hal. P. C. 100—104.) But if a man malicioully or wantonly raiſes a hue-and-cry, without cauſe, he ſhall be ſeverely puniſhed as a diſturber of the public peace. 1 Hawk. P. C. 75. Blackſt. Comm. vol. iv. p. 290, &c. See HIGHWAYMEN.

In ſupplement to this ancient eſtabliſhment, ſir John Fielding's plan was inſtituted for the diſcovery of offenders, after they have eſcaped the freſh purſuit upon hue-and-cry, by ſending immediate notice to a certain known office in London, from whence are iſſued weekly accounts to every part of the kingdom, deſcribing the offence and the offenders with as much accuracy as the caſe will admit. By theſe means many notorious offenders have been apprehended, and much ſtolen property hath been recovered.

HUELAMO, in *Geography*, a town of Spain, in New Caſtile; 22 miles N.N.E. of Cuença.

HUELBA, or HUELVA, a town of Spain, in the province of Seville, ſituated on the coaſt of the Atlantic; three miles W. of Moguer. N. lat. 37° 13′. W. long. 7° 1′.

HUELGOAT, LE, a town of France, in the department of the Finiſterre, and chief place of a canton, in the diſtrict of Chateaulin; nine miles N.W. of Carhaix. The place contains 766, and the canton 9496 inhabitants, on a territory of 305 kiliometres, in ſeven communes.

HUELMA, a town of Spain, in Grenada; 13 miles S.W. of Grenada.

HUERNIA, in *Botany*, ſo called by Mr. R. Brown, "in memory of Juſtus Huernius, one of the earlieſt collectors of Cape plants, and from whoſe drawings the firſt account of *Stapelia* was taken," from which genus the preſent is ſeparated.—Brown. Aſclep. 11.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juſſ.

Eſſ. Ch. Corolla bell-ſhaped, its limb in ten ſegments, the intermediate ones very ſmall and tooth-like. Column of fructification concealed. Crown of the ſtamens double; the outer in five cloven ſegments; inner of five undivided awl-ſhaped leaves, gibbous at their baſe, alternate with the ſegments of the outer. Anthers ſimple at their ſummit; maſſes of pollen erect, attached by their baſe, cartilaginous and pellucid at one edge. Stigma pointleſs. Follicles nearly cylindrical, ſmooth. Seeds comoſe.

The plants which compoſe this genus have the remarkable fleſhy, angular, and toothed habit of *Stapelia*, and the whole of the third ſection of that genus in Willd. Sp. Pl. v. 1. 1293, (with a ten-toothed corolla,) is thought to belong to *Huernia*. Mr. Brown has however examined only the *campanulata*, Maſſon. Stapel. t. 6; *venuſta*, t. 3; and *guttata*, t. 4. They are all natives of the ſouth of Africa. The flowers of theſe three are all pale yellow, richly dotted with red or dark purple. The *reticulata*, t. 2, which has every appearance of being of the ſame genus, bears a ſplendid crimſon corolla, reticulated with yellow lines.—As far as habit is concerned, we cannot but think this genus artificial, the crown of the ſtamens in *Stapelia*, and its neareſt allies, being ſomewhat liable to aberration of character.

HUERS. See BALKERS and *Pilchard* FISHERY.

HUERS, the name given to certain fountains in Iceland, which form jets d'eaux of ſcalding water 94 feet high and 30 feet in diameter. They ariſe from cylindric tubes of unknown depth; near the ſurface they expand into apertures of a funnel-ſhape, and the mouths ſpread into a large extent of ſtalactitical matter, formed of ſucceſſive ſcaly concentric undulations. The occurrence of this phenomenon is foretold by noiſes roaring like the cataract of Niagara. Theſe huers are not confined to the land; they alſo riſe in the ſea, and form ſcalding fountains amidſt the waves.

HUESCA, a town of Spain, in the province of Aragon,

gon, ſituated on the Iſuela, the ſee of a biſhop, ſuffragan of Saragoſſa, containing four pariſhes, five convents, and an univerſity founded in 1354. In the ſeventh century, this town was the capital of a ſmall Mooriſh kingdom; but in 1096 it was recovered by the Chriſtians; 27 miles N.N.E. of Saragoſſa. N. lat. 42° 7'. W. long. 0° 27'.

HUESCAR, a town of Spain, in Granada, containing two pariſhes and four convents; ſeven miles W.N.W. of Carthagena.

HUET, Peter Daniel, in *Biography*, a learned French prelate, was born at Caen in 1630. Owing to the death of his parents, his education devolved upon an aunt who placed him, while young, in the Jeſuits' college at Caen, where he was diſtinguiſhed by aſſiduity and an amiable diſpoſition. He cultivated with much ſucceſs not only polite literature, but mathematics, philoſophy, juriſprudence, and the Hebrew language. In connection with the latter ſtudy, he cultivated the acquaintance of the learned Bochart, the Calviniſt miniſter of Caen, but to avoid ſuſpicion, their conferences were firſt held in ſecret. When he attained to the age of manhood he viſited Paris, and began to indulge his paſſion for books, by purchaſing as many as his finances would admit of. In 1652 he accompanied Bochart in a journey to Sweden, whither that learned man had been invited by queen Chriſtina. He was tired of the country before the approach of winter; and leaving Bochart there, he returned through Holland, where he paſſed ſome time in viſiting the univerſities and men of learning. On his arrival at Paris, a controverſy aroſe between him and Bochart, concerning Origen's commentary on St. Matthew's goſpel, which put an end to their friendſhip. In 1661, Huet publiſhed his firſt work, entitled "De Interpretatione," the object of which was to confine, within due limits, the licence of tranſlators, eſpecially thoſe of the ſcriptures. He inſtituted, about this period, an academy of phyſics at Caen, the members of which aſſembled weekly at his houſe, where they read memoirs, and conducted experimental enquiries. This inſtitution was patronized by the miniſter Colbert, through whoſe influence the royal munificence was extended, not only to the ſociety, but alſo to its founder, and Huet was put on the liſt of learned men upon whom penſions were regularly conferred. In 1670, when Boſſuet was appointed preceptor to the dauphin, Huet was called to the office of ſub-preceptor. In this poſt, one of his employments was to ſuperintend that edition of the claſſics which is commonly known here as the Delphin edition. In 1674 he was elected a member of the French academy, in 1676 prieſts' orders, which he had hitherto deferred taking, were given him, and in 1678 he was preſented to the abbey of Aunay in Normandy, a place, the beauties of which he has celebrated in verſe, and which became his favourite reſidence. He was preſented, in 1685, to the biſhopric of Soiſſons, but owing to the diſputes then exiſting between France and Rome, he never obtained his bulls, nor took poſſeſſion of his ſee, and which he readily exchanged in 1689 for that of Avranches, which was his native province. To this ſee he was not conſecrated till 1692, and in 1699 finding the burthen of the ſituation too great for his comfort, he begged permiſſion to reſign his biſhopric, and was preſented by the king, as a pecuniary compenſation, with the abbacy of Fontenai near Caen. Here he became the victim of ſeveral law ſuits, and at length made his retreat from the world and its vexations into the houſe of the Jeſuits at Paris, to which he bequeathed his library. Here he remained abſorbed in his ſtudies, and in intercourſe with a few learned men, till his death in January 1721, at the great age of ninety-one. Huet was the author of many learned works, and may be regarded as one of the moſt diſtinguiſhed literary ſcholars of the age in which he flouriſhed. Of his various publications the following have been tranſlated into Engliſh. "On the Origin of Romances:" "On the Situation of the Terreſtrial Paradiſe:" "Hiſtory of the Commerce and Navigation of the Ancients;" and "On the Weakneſs of the Human Underſtanding." Moreri.

HUETA, in *Geography*. See Gueta.

HUF, a town of European Turkey, in Moldavia, on the Pruth; 50 miles S.S.E. of Jaſſi. N. lat. 46° 34'. E. long. 46° 19'.

HUG, or *Corniſh* Hug, a term uſed in wreſtling, when one has an adverſary on his breaſt, and holds him faſt there.

HUGH, in *Biography*, abbot of Flavigny, who flouriſhed in the beginning of the twelfth century, celebrated for his talents as an eccleſiaſtical hiſtorian, deſcended from an illuſtrious family, was born in the year 1065. He embraced the monaſtic life in the abbey of St. Vannes at Verdun, but when the members of that community were diſperſed, he, together with the other monks, took refuge at the monaſtery of Flavigny, in the dioceſe of Autun. Here he acquired ſo much eſteem and reſpect, that, upon the death of the abbot, in 1097, he was elected to that dignity, though he was not more than thirty-two years of age. He was author of "Chronicon Verdunenſe," which is divided into two parts, the firſt contains an eccleſiaſtical hiſtory from the birth of Chriſt to the cloſe of the tenth century, and the ſecond a continuation of the ſame from 1002 to 1102. This ſecond part furniſhes us with much valuable information concerning the eccleſiaſtical affairs of France in the eleventh century. It was drawn out of obſcurity by father Labbe, who calls it an ineſtimable treaſure, and printed it in the firſt volume of his "Bibliotheca nova Manuſcriptorum," from a ſuppoſed autograph of the author, found in the Jeſuits' college at Paris. Moreri.

Hugh of Fleury, a learned French monk, who flouriſhed about the year 1120, and embraced the eccleſiaſtical life in the abbey of Fleury. He was author of "Chronicon Libris VI. ad Ivonem Carnotenſem," commencing with the reign of Ninus, king of the Aſſyrians, and terminating with the death of the emperor Lewis the Pious, in the year 840; and alſo of a ſhort, but well digeſted chronicle, from the beginning of the world to the reign of Lewis the Pious. Hugh was author likewiſe of "Lib. II. de regia Poteſtate, et ſacerdotali Dignitate, ad Henricum Angliæ Regem," which is thought by ſome critics to be the moſt valuable of his works. Moreri.

Hugh of St. Victor, was born near Ypres, in Flanders, about the year 1097. When he was eighteen years of age, he entered into the congregation of the canons regular of St. Auguſtine, at the monaſtery of St. Victor, in Paris, where he ſpent the remainder of his life, and roſe to the office of prior. In 1130 he was appointed to the theological chair, which he filled with ſo much reputation, that he was commonly called a "ſecond Auguſtine." He died in 1140, when only in the 44th year of his age. His works were collected and publiſhed in three volumes folio. They have been ſeveral times reprinted.

Hugh of St. Charus, or St. Theodoric, a French monk, and cardinal in the thirteenth century, was born in the vicinity of Vienne, in Dauphine. In 1225 he entered into the Dominical order of preaching friars, of which he was ſoon appointed provincial. He was afterwards created doctor by the faculty of the Sorbonne, and was ſent by pope Gregory IX. on a miſſion to Conſtantinople, to attempt to bring about an union between the eaſtern and weſtern churches. In 1245 he was created a cardinal by pope Innocent IV. under the title of St. Sabina, who alſo employed him in many important and difficult negociations. He died at Orvieto in the year 1263. He was author of many very uſeful works, but the moſt celebrated is the "Concordance of the Bible," of which he was the inventor, and in drawing up which, he employed many monks of his order. This work was printed at Cologne in 1684, and is entitled "Concordantia major Latinorum Bibliorum pro omnibus vocibus declinabilibus in tota S. ſcriptura repertis." Moreri.

Hugh Capet. See Capet.

HUGHES, John, in *Biography*, an Engliſh poet, was born, in 1677, at Marlborough. He was educated in London, was a ſtudent in the academy of Mr. Thomas Rowe, and was a contemporary of Dr. Watts, Mr. Say, and ſome others who arrived at eminence. Mr. Hughes attached himſelf to polite literature, and was a practitioner in the fine arts. He obtained a place in the office of ordnance, and was ſecretary to various commiſſions, for purchaſing lands for the uſe of the Royal docks. His employments under government, and his political principles, induced him to exerciſe his poetic talents upon public topics. He publiſhed "A Poem on the Treaty of Ryſwick:" "The Court of Neptune;" "A Poem on the Return of King William from Holland;" and a pindaric ode, entitled "Of the Houſe of Naſſau." His ſentiments and poetry rendered him acceptable to the Whig party, and connected him with Addiſon, Steele, and other perſons of diſtinction. He became one of the writers in the Tatler, Spectator, and Guardian. His taſte for muſic introduced him to the acquaintance of ſeveral eminent compoſers, and led him to write many pieces for muſical accompaniment. In 1715 he publiſhed, by ſubſcription, an edition of Spencer, by which he gained great credit as an elegant critic. In 1717 he obtained the patronage of lord chancellor Cowper, who gave him the place of ſecretary to the commiſſions of the peace. His want of health interrupted the enjoyment of his good fortune. Under much bodily langour he compoſed his tragedy of "The Siege of Damaſcus," which was brought on the ſtage in February 17th, 1719-20, on which night the author finiſhed his earthly career, at the age of forty-three. He was a man generally beloved and reſpected: his temper was amiable, his morals were pure, and his integrity was unimpeachable. His tragedy is the principal piece of his compoſition. In 1735 a complete collection of his poems and dramatic pieces was publiſhed with an account of his life in two volumes, 12mo. by his brother-in-law, William Duncombe, eſq. The younger brother, Jabez Hughes, publiſhed a tranſlation from Claudian of the Rape of Proſerpine: and the ſtory of Sextus and Erictho from Lucan; alſo Suetonius's Lives of the Cæſars, and ſome of Cervantes novels. Another John Hughes, fellow of St. John's college, Cambridge, publiſhed, in 1712, an edition of Chryſoſtom on the Prieſthood.

Mr. John Hughes, during the early part of the laſt century, was our principal lyric poet; and not only wrote for muſic, but was himſelf a performer in Britton, the ſmall-coal man's concerts. He wrote the Engliſh opera of "Calypſo and Telemachus," for Galliard to ſet, and "Apollo and Daphne," for Dr. Pepuſch, with cantatas for both. His verſes on Mrs. Barbier's elopement, and on the rivalry of Margarita and Mrs. Tofts, ſhew that he intereſted himſelf in the tranſactions of the muſical world, and was on the watch to ridicule the follies and diſplay the talents of its profeſſors.

HUGHESBURG, in *Geography*, a town of America, in Northumberland county, Pennſylvania, called alſo "Cataweſſy," ſituated at the mouth of Cataweſſy creek; 25 miles N.E. of Sunbury. It contains 1315 inhabitants. N. lat. 40° 54′.

HUGH-TOWN, a town of St. Mary's, one of the Scilly iſlands.

HUGO, Charles Louis, in *Biography*, a French writer, abbot of Eſtival, and biſhop of Ptolemais, died in 1735. His chief works are, "Annales Premonſtratenſium," which is a curious hiſtory of the monaſtic order. "Vie de St. Norbert, Fondateur des Premontres:" "Sacræ Antiquitates monumenta hiſtorica, dogmatica, diplomatica," 2 vols. fol. "Traité Hiſtorique et Critique de la Maiſon de Lorraine." This laſt, on account of the freedom with which crowned heads are treated in it, was publiſhed under the borrowed name of Baleicourt, and pretendedly printed at Berlin. Moreri.

HUGONIA, in *Botany*, ſo named by Linnæus in honour of Dr. Auguſtus John Hugo, phyſician to his Britiſh majeſty at Hanover, the friend of Haller, and the companion of ſome of his botanical expeditions among the Alps. He graduated at Leyden in 1711, and publiſhed a theſis *de variis plantarum methodis*.—Linn. Gen. 349. Schreb. 457. Willd. Sp. Pl. v. 3. 694, Mart. Mill. Dict. v. 2. Juſſ. 275. Lamarck. Illuſtr. t. 572. Cavan. Diſſ. 177. Gærtn. t. 58.—Claſs and order, *Monadelphia Decandria*. Nat. Ord. *Malvaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of five ovate, acute, concave, coriaceous, permanent leaves; the two outer ones largeſt. *Cor.* Petals five, roundiſh, large, ſpreading, emarginate, contracted at the baſe into a thin claw, attached to the cup formed by the ſtamens. *Stam.* Filaments ten, awl-ſhaped, equal, ſhorter than the corolla, united by their baſe into a little cup; anthers roundiſh, furrowed, incumbent. *Piſt.* Germen ſuperior, roundiſh; ſtyles five, thread-ſhaped, longer than the ſtamens; ſtigmas capitate, orbicular, flat. *Peric.* Drupa globoſe, of one cell. *Seed.* Nut globoſe, deeply ſtriated, of ten cells; kernels oblong, compreſſed, curved at the back.

Obſ. "The two outer leaves of the calyx are entirely downy on their outſide. The middle one is likewiſe downy, except a part of it covered by one of the former, where it is ſmooth and ſhining, like the two innermoſt, which are downy at their points only. Five of the filaments are a little ſhorter than the reſt. Five of the kernels ſeem often to be abortive; hence perhaps it happened that Cavanilles took the nut to have but five cells. In that which I opened there were more than five kernels." *Schreber.*

Eſſ. Ch. Calyx ſimple, of five permanent leaves; two of them external. Petals five. Styles five. Drupa with a furrowed nut of about ten cells.

1. H. *Myſtax.* Linn. Sp. Pl. 944. Lamarck. Dict. v. 3. 149. Willd. n. 1. (Modera-canni; Rheede. Malab. v. 2. 29. t. 19.)—Spines oppoſite, revolute. Leaves obovate, ſmooth, entire.—Native of the Eaſt Indies, in ſandy ground. A ſlender *ſhrub*, about 12 feet high, with numerous, ſhort, leafy, not quite oppoſite branches, each of which bears, about its middle, a pair of remarkable ſtrong, revolute, ſmooth ſpines. The reſemblance of theſe to a pair of muſtaches, is ſaid to be expreſſed in the Indian name *Modera*, as in the Latin one *Myſtax*. *Leaves* numerous, ſcattered, from one to two inches long, obovate, entire, rather pointed, finely veiny, ſmooth on both ſides. *Footſtalks* ſhort, broad and downy. *Stipulas* awl-ſhaped, downy. *Flowers* numerous, on axillary, ſimple, ſilky ſtalks, about the ends of the branches. *Petals* yellow, ſtriated. *Fruit* ſhining, near half an inch in diameter.—The wood is ſaid to be of a reddiſh brown, with a grateful aromatic odour. The root is eſteemed

uſeful as a topical application to inflamed or ſwelled parts, and even in the bite of the hooded ſerpent, *Coluber Naja.* It is alſo given internally for febrile diſorders in children, for the colic, worms, &c. The fruit has a red taſteleſs pulp.

2. H. *ſerrata.* Lamarck. Dict. v. 3. 149. Willd. n. 2. (H. Myſtax; Cavan. Diſſ. 177. t. 73. f. 1.)—Spines oppoſite, revolute. Leaves elliptic-lanceolate, ſerrated, ſmooth, with glandular hairs at the origin of the veins.—Gathered by Commerſon in the iſland of Mauritius. Cavanilles miſtook it for the former, from which it is very diſtinct. The *leaves* are larger, more acute, and ſtrongly ſerrated, furniſhed at the origin of their veins with tufts of hair as in the Lauruſtinus. The young *leaves* only are very ſilky. *Flower-ſtalks* ſomewhat corymboſe. This is the ſpecies drawn in Lamarck's t. 572, after Cavanilles.

3. H. *tomentoſa.* Cavan. Diſſ. 178. t. 73. f. 2. Willd. n. 3. Lamarck. Dict. v. 3. 150.—Leaves elliptic-oblong, ſerrated, downy on both ſides. Stipulas ovate.—Gathered by Commerſon in the iſle of Mauritius, with the laſt, from which it ſeems ſufficiently diſtinct in having broader, rather obovate, downy leaves.

HUGUENOTS, an appellation given by way of contempt to the reformed or proteſtant Calviniſts of France.

The name had its firſt riſe in 1560; but authors are not agreed as to the origin and occaſion of it: but one of the two following ſeems to be the leaſt forced derivation.

One of the gates of the city of Tours is called the gate Fourgon, by corruption from *feu Hugon, i. e.* the late Hugon. This Hugon was once count of Tours, according to Eginhardus, in his life of Charles the Great, and to ſome other hiſtorians. He was it ſeems a very wicked man, who by his fierce and cruel temper made himſelf dreadful; ſo that after his death he was ſuppoſed to walk about in the night time, beating all thoſe he met with: this tradition the judicious Thuanus has not ſcrupled to mention in his hiſtory. Davila and other hiſtorians pretend that the nickname of Huguenots was firſt given to the French proteſtants, becauſe they uſed to meet in the night time in ſubterraneous vaults near this gate of Hugon; and what ſeems to countenance this opinion is, that they were firſt called by the name of Huguenots at this city of Tours.

Others aſſign a more illuſtrious origin to that name; and ſay that the leaguers gave it to the reformed, becauſe they were for keeping the crown upon the head of the royal line deſcended from Hugh Capet; whereas they were for giving it to the houſe of Guiſe, as deſcended from Charles the Great.

Others again derive it from a French and faulty pronunciation of the German word *eidgnoſſen,* ſignifying *confederates,* and originally applied to that valiant part of the city of Geneva, which entered into an alliance with the Swiſs cantons, in order to maintain their liberties againſt the tyrannical attempts of Charles III. duke of Savoy.

Theſe confederates were called *Eignots,* whence *Huguenots.*

The perſecution which they underwent has ſcarce its parallel in the hiſtory of religion: though they obtained a peace from Henry III. in 1576, it was only of ſhort continuance. This peace was the ſource of that civil war, in which the ambitious and powerful houſe of Guiſe, inſtigated by the ſanguinary ſuggeſtions of the Roman pontiffs, aimed at nothing leſs than the extirpation of the royal family, and the utter ruin of the Proteſtant religion; while the Huguenots, on the other hand, headed by leaders of the moſt heroic valour and the moſt illuſtrious rank, combated for their religion and for their ſovereigns with various ſucceſs. Theſe dreadful commotions, in which both the contending parties committed ſuch deeds as cannot be remembered without horror, were, at length, calmed by the fortitude and prudence of Henry IV. This monarch, indeed, ſacrificed the dictates of conſcience to the ſuggeſtions of policy; and imagining, that his government could have no ſtable or laſting foundation, as long as he perſiſted in diſowning the authority and juriſdiction of Rome, he renounced the reformed religion, and made a ſolemn and public profeſſion of popery. Perceiving, however, on the other hand, that it was not poſſible either to extirpate or ſuppreſs entirely the Proteſtant religion, he granted to its profeſſors, by the famous edict of *Nantes,* (which ſee,) in the year 1598, the liberty of ſerving God according to their conſciences, and a full ſecurity for the enjoyment of their civil rights and privileges, without perſecution or moleſtation from any quarter whatever. The ſufferings of the Huguenots were afterwards renewed, when every method which artifice or perfidy could invent had been practiſed in vain againſt the Proteſtants under the reign of Lewis XIV. The biſhops and Jeſuits, whoſe counſels influenced the cabinet of this prince, judged it neceſſary to extirpate, by fire and ſword, this reſolute people; and thus to ruin, as it were by one mortal blow, the cauſe of the reformation in France. Their inſidious arguments and importunate ſolicitations had ſuch an effect upon the weak and credulous mind of Lewis, that, in the year 1685, trampling upon the moſt ſolemn obligations, and regardleſs of all laws, human and divine, he revoked the edict of Nantes, and thus deprived the Proteſtants of the liberty of ſerving God according to their conſciences. This revocation was accompanied, indeed, with the applauſe of Rome; but it excited the indignation even of many Roman Catholics, whoſe bigotry had not effaced or ſuſpended, on this occaſion, their natural ſentiments of generoſity and juſtice. It was moreover followed by a meaſure ſtill more tyrannical and ſhocking; even an expreſs order, addreſſed to all the reformed churches, to embrace the Romiſh faith. The conſequences of this cruel and unrighteous proceeding were highly detrimental to the true intereſts and the real proſperity of the French nation, by the prodigious emigrations it occaſioned among the Proteſtants, who ſought, in various parts of Europe, that religious liberty, and that humane treatment, which their mother country had ſo cruelly refuſed them. Thoſe among them, whom the vigilance of their enemies guarded ſo cloſely as to prevent their flight, were expoſed to the brutal rage of an unrelenting ſoldiery, and were aſſailed by every barbarous form of perſecution that could be adopted to ſubdue their courage, exhauſt their patience, and thus engage them to a feigned and external profeſſion of popery, which in their conſciences they beheld with the utmoſt averſion and diſguſt. In other countries, and particularly in our own, they found an aſylum, and communicated in return for the protection they experienced the benefit of their ſkill and induſtry. Moſheim's Eccl. Hiſt. vol. v.

HUIDE, in *Geography,* a town of Norway, in the dioceſe of Chriſtianſand; 20 miles E. of Skeen.

HUIDINGS, a ſmall iſland in the North ſea, near the weſt coaſt of Norway. N. lat. 59° 3′. E. long. 5° 42′.

HVILGRUND, and HVILGRUNDET, two ſmall iſlands on the weſt ſide of the gulf of Bothnia: the firſt in N. lat. 60° 47′. E. long. 17° 11′; the ſecond in N. lat. 60° 36′. E. long. 17° 27′.

HUIS, L', a town of France, in the department of the Ain, and chief place of a canton, in the diſtrict of Belley; 6 miles W. of Belley. The place contains 1123, and the canton 6465 inhabitants, on a territory of 175 kiliometres, in 13 communes.

HUISSEN, a walled town of Germany, in the duchy of Cleves; 10 miles N.N.W. of Cleves.

HUISSIER, a French name for an uſher, ſerjeant, or beadle.

HUITAN, in *Geography*, a town of Sweden, in Weſt Bothnia; 20 miles N. of Lulea.

HUITINGO Pollachius, in *Ichthyology*. See Gadus *Pollachius*.

HVITTISBURG, in *Geography*, a town of Sweden, in the government of Abo; 12 miles N. of Biorneborg.

HUJUS, or Hujusce Diei, in *Mythology*, a ſurname given by the Romans to Fortune. She had a temple at Rome, erected by Q. Catullus.

HULDIBARRY, in *Geography*, a town of Bengal; 48 miles N.E. of Purneah.

HULDIPOOKRA, a town of Bengal; 46 miles S. of Jauldoe.

HULDOOA, a town of Hindooſtan, in the circar of Dooab; 50 miles N.W. of Pattiary.

HULDSCHIN, or Holtschin, a town of Sileſia, in the principality of Oppau; 11 miles E. of Troppau. N. lat. 49° 48′. E. long. 18° 12′.

HULET Panias, a lake of Paleſtine, anciently called lake "Merom," into which runs a river of the ſame name, anciently denominated the "Dan."

HULIN Rocks, otherwiſe called *the Maids*, rocks in the North channel of the Iriſh ſea, always above water, which lie about 6 miles N.E. from Lough Larne, on the coaſt of Antrim. N. lat. 54° 57′. W. long. 5° 37′.

HULKS are large veſſels, having their gun-decks from a hundred and thirteen to a hundred and fifty feet long, and from thirty-one to forty feet broad, and fitted with an apparatus, in order to fix or take out the maſts of his majeſty's ſhips, as occaſion requires. They will carry from four hundred to a thouſand tons.

Anciently, the word *hulka* ſeems to have ſignified a ſmall veſſel.

Hulk is alſo a name beſtowed on any old veſſel laid by, as unfit for farther ſervice. It is probably derived from the ολκαδες, or veſſels of burthen of the ancient Grecians.

HULL, or Kingston-upon-Hull, in *Geography*, a borough, market-town, and ſea-port in the Eaſt Riding of the county of York, England, is ſituated on the weſtern ſide of the river Hull, and the northern bank of the river Humber, at the diſtance of about 25 miles from the mouth of the latter; nine miles S. of Beverley; 173 N. of London; and 38 S.E. of York. It extends nearly two miles in length, in a direct line, in which extent is included the adjoining pariſh of Sculcoates; and to rather more than half that diſtance in a parallel direction towards Beverley. The town originated in the year 1296, under the immediate patronage of king Edward I., who, on his triumphant return from Scotland, projected the foundation of a port, &c. at this place, then a ſmall hamlet, called Wyke, and put his deſign immediately into execution. Peculiar privileges were granted to builders and reſidents, together with a royal charter, veſting the government in a warden and the body of freemen; and the new-formed town was diſtinguiſhed by the appellation of Kingſton, or Kingſtown-upon-Hull. Edward founded a houſe of White friars, and cauſed a hall to be built for his own reſidence. This was probably given to the De la Poles, for ſoon afterwards a magnificent manor-houſe was erected by that wealthy family, which was frequently honoured with the royal preſence, and falling to the crown by the attainder of Edmund de la Pole, earl of Suffolk, in 1508, became for ſome time the reſidence of king Henry VIII.

So rapid was the progreſs of the place, that, in about ſixty years from its foundation, it was called upon to furniſh king Edward III. with 16 ſhips and 466 men. In Leland's time it was a fair and well built town; and, according to Camden, it poſſeſſed ſtately edifices, ſtrong fortreſſes, ſhips well equipped, a number of merchants, and abundance of all kinds of wealth; having been favoured with not leſs than ſixteen charters from various ſucceſſive monarchs. It was firſt fortified under a charter from king Edward II., and the walls repaired and ſtrengthened with towers of brick in the time of king Richard II. by ſir Michael de la Pole, who appears to have revived in this place the art of brick-making, which had fallen into diſuſe ſince the time of the Romans. King Henry VIII. built two block-houſes and a citadel on the eaſt bank of the river Hull, at an expenſe of 23,000*l.*, although he drew great part of the materials from the diſſolved houſes of Black and White friars, and the church of St. Mary. King Charles II., in 1681, laid out a vaſt ſum in improving the fortifications, which had ſuffered conſiderably from the ſevere ſiege of the town by the earl of Newcaſtle, and during the civil wars in the preceding reign. Within the laſt 35 years, the whole of theſe ancient works of defence, with the gates of the town, have been demoliſhed, except two of the fortreſſes built by Henry, which, being guarded by ſeveral batteries and modern erections, are now converted into magazines, capable of containing more than 20,000 ſtand of arms, and ordnance ſtores for twelve or fifteen ſail of the line, defended by a regular garriſon,

Hull conſiſts of three principal diviſions, formed by the intervention of the docks, which, occupying the greater part of the ſpace where the walls formerly ſtood, nearly inſulate the old town. That on the north ſide of the old dock is in the pariſh of Sculcoates; all its buildings have been erected within the laſt thirty years, and form ſeveral ſpacious and handſome ſtreets. A neat hall has been built for the adminiſtration of juſtice, &c. this part of the town being in the county of York, and not under the juriſdiction of the magiſtrates of Hull. The other diviſion has ariſen ſtill more recently, and lies to the weſt of the Humber dock, occupying the ſituation of the ancient hamlets of Wyke and Myton; by which latter name it is now diſtinguiſhed, and is included in the county of the town of Hull. A ſuburb alſo has lately ſprung up, on the Holderneſs ſide of the river, in the pariſhes of Drypool and Sutton, encompaſſing the garriſon, and connected with the town by a bridge of four ſtone arches, rebuilt in 1787, with a draw-bridge in the centre, which has this year (1811) been renewed on a very ingenious and novel conſtruction, and is wide enough to admit the largeſt veſſels that have occaſion to paſs through it. The whole town ſtands on a level tract of ground, within a ſhort diſtance of the Yorkſhire wolds; the principal ſtreets are broad and well paved, and in lighting and watching it is not inferior to any place in the kingdom. A few years ago, it was computed that about 200 houſes were built annually, but ſince the interruption to the Baltic trade, the principal ſource of revenue to this port, that number has been much diminiſhed.

The edifices for religious worſhip belonging to the eſtabliſhment are two pariſh churches, that of the Holy Trinity and St. Mary's; with a chapel of eaſe, and the chapels of the Trinity-houſe and Charter-houſe. The church of the Holy Trinity, a noble ſtructure, was firſt erected in the reign of king Edward II.; the tower and weſt end were added about the time of king Henry VII., by whoſe ſucceſſor, Hull was made the ſee of a ſuffragan biſhop, who poſſeſſed a ſtately palace in the High-ſtreet, long ſince deſtroyed. The church, however, remained under that of the neighbouring village of Heſsle, until ſeparated by an act of parliament in 1661. St. Mary's was formerly a much larger ſtructure, and belonged to the priory of Ferriby. Great part of it, including the ſteeple, was pulled down by king Henry VIII. as obſtructing the view from his palace. St. John's is a chapel of eaſe to the Holy Trinity, and was finiſhed in 1792 at the ſole expenſe of the Rev. Thomas Dikes, LL.B. the preſent incumbent. There are alſo various meeting-houſes for the peculiar doctrines and worſhip of all the prevailing ſects.

The charitable inſtitutions in Hull are numerous. The moſt ancient and ſplendid is that of the Trinity-houſe, founded by ſubſcription in 1369, and rebuilt in 1753: its funds have been progreſſively augmented by legacies and benefactions. It was incorporated by letters patent in the reign of Henry VI.; and its charters and grants have, at various ſubſequent periods, been renewed and extended. The fund is conſiderably increaſed by a monthly contribution of ſixpence from every ſeaman ſailing from this port; when ſuperannuated, or diſabled, they obtain relief, as do alſo their widows and children, from this charity. Several diſtinguiſhed characters have been admitted to the freedom of this corporation, which is governed by wardens, brethren, and aſſiſtants. In a marine-ſchool, connected with it, thirty-ſix boys are, for three years, clothed and educated for the ſea ſervice; the guild alſo provides North ſea pilots for the royal navy, when required by government. The Charter-houſe hoſpital is worthy of particular notice; it was founded, together with an adjoining priory, by Michael de la Pole, for the ſupport of a certain number of penſioners, denominated brothers and ſiſters; under the ſuperintendance of a maſter, who enjoys a ſalary of 100*l.* per ann., with a houſe and garden. Several other ſmaller hoſpitals, for ſimilar purpoſes, are diſtinguiſhed by the names of the reſpective founders, *viz.* Liſter's, Gregg's, Crowle's, Watſon's, (biſhop of St. David's,) Gee's, Harriſon's, Ratcliff's, and Weaver hoſpitals. The workhouſe is a large building, commonly known by the name of Charity hall. For the relief of the indigent ſick and maimed, a general infirmary was erected, in 1782, by voluntary contributions, on a plan ſuperior to moſt eſtabliſhments of the kind, which has been the means of reſtoring to health near 9000 perſons. Here are likewiſe a free grammar-ſchool, founded by Alcock, biſhop of Ely, in 1486, which enjoyed conſiderable reputation, eſpecially under its late maſter the Rev. Joſ. Milner, A.M.; the Vicar's-ſchool, eſtabliſhed by the Rev. W. Maſon, father of the poet of that name; a ſchool for girls, and a valuable inſtitution for putting out poor boys apprentices, endowed by Ald. Coggan, and another for orphans, endowed by Ald. Ferris. Two handſome buildings have alſo been recently erected, capable of containing 500 boys, and 250 girls, who are inſtructed with great ſucceſs, according to the improved ſyſtem of education. The chief part of the expenſe, as alſo that of ſeveral Sunday-ſchools and other charities, is defrayed by voluntary ſubſcriptions.

Beſides the various buildings already noticed, there are the cuſtom-houſe, intended originally as an exchange alſo, but having been long diſuſed for that purpoſe, the preſent comfortable room, with a news-room over it, was deſigned and executed in 1794, by and at the expenſe of an individual, though with a view to his ultimate advantage; the aſſembly rooms, not now adequate to the wants and opulence of the town; the gaol; the Neptune hotel; the Rodney and Minerva lodges of Free-maſons, the former of which is a moſt elegant and handſome room; the ſubſcription library, founded in 1775, and built in 1800, a great advantage to the inhabitants, and containing many thouſand volumes; and the theatre royal, rebuilt in 1809, a ſpacious and convenient ſtructure, the interior of which is fitted up in a ſuperior ſtyle of comfort and elegance. The avenue from the market-place to the Humber was lately widened, by taking down the guild hall, a mean brick building, and on its ſcite ſhambles were erected, which, for convenience, elegance, and ventilation, may challenge compariſon with any in the kingdom. The old ſhambles being likewiſe removed, the beautiful eaſt end of Trinity church is again thrown open to the market-place, in the centre of which ſtands an equeſtrian ſtatue of king William III. erected in 1734. Until a new guild hall ſhall be provided, the corporation tranſact buſineſs in a large houſe fitted up for the purpoſe. Among the public accommodations enjoyed by the inhabitants, may be reckoned the Barton-boats, which croſs the Humber every tide, to and from Barton, a diſtance of about ſeven miles.

The commerce of Hull will be beſt appreciated by a ſtatement of the annual exports and imports for a few years. The tonnage of this port was, ſeveral years ago, inferior only to that of London, Liverpool, and Briſtol; its cuſtoms only to thoſe of the former two. It ſends at preſent nearly thrice as many ſhips to the whale fiſheries as London, and, excluſive of the latter port, more than all Great Britain beſides. Its facilities of communication with the interior, by means of the Ouſe and Trent, and the canals communicating with them are very great. The groſs amount of the cuſtoms was

The dock was undertaken, according to act of parliament, in 1774, and completed within four years; the entrance is immediately from the river Hull; it extends in length about 600 yards; in width 85; and is 23 feet deep; is capable of containing 100 ſail of ſquare rigged veſſels; and, with the wharfs and quay, occupies a ſpace of more than thirteen acres; containing in the dock 48,188 ſquare yards, in the quay 17,479; exceeding in capacity the largeſt in Liverpool, and now only ſurpaſſed by thoſe of London: when made it was the largeſt in the kingdom. The ſubſcribers to the dock are incorporated by the title of "The Dock Company at Kingſton-upon-Hull." The original number of ſhares was 120, but the trade of the port requiring further accommodation, two other acts of parliament were obtained in 1802 and 1805, by which the company was empowered to increaſe them to 180, the money ariſing from which, amounting to 82,390*l.*, was appropriated to the making of a new dock, which was completed under the title of the Humber dock, in 1809, at an expenſe of 220,000*l.* It opens into the Humber by a lock of excellent workmanſhip, large enough to admit a fifty-gun ſhip, croſſed by an iron bridge in two parts, of very ingenious mechaniſm. The area of the dock and quays is ten acres, with a baſin of four acres; its length 300 yards, width 114, and depth 29 feet; and it is intended to communicate with the old dock at ſome future time, which, when effected, will wholly inſulate the old town. The company is entitled to certain duties on all ſhips entering the port; the profit divided on the ſhares was,

The manufactures of Hull are various and extenſive; one of the principal branches is that of expreſſing and refining oil from linſeed, and preparing the reſidue for feeding cattle: the proceſs is chiefly effected by mills worked by the wind. The largeſt and fineſt mills in the kingdom of this kind, both for the above purpoſe and for grinding corn, are to be found in great numbers near this town; their machinery is excellent, and many of them are from 80 to upwards of 100 feet in height. An iron-foundery, two large ſugar-houſes, an extenſive ſoap, and ſeveral white lead manufactories, Greenland yards, numerous dry-docks, ſhipbuilders' yards, and rope-walks, where a great number of hands are conſtantly employed; and ſeveral large breweries are amongſt the moſt important, but do not comprize half the manufactories now exiſting in the town.

The entire civil authority over the town, and the ſeveral places within what is denominated the county of the town of Kingſton-upon-Hull, a diſtrict of more than eighteen miles in circumference, weſt of it, is, by various royal charters, particularly thoſe of king Henry VI. and king Charles II., veſted in the corporation, which now conſiſts of the mayor, the recorder, twelve aldermen, the ſheriff, two chamberlains, a town clerk, a water-bailiff, and other officers, beſides a high ſteward, who is generally ſome nobleman of rank. The mayor is admiral of the Humber, and poſſeſſed of the power of life and death over criminals within his juriſdiction. The judges of aſſize viſited this town, but of late years this has been diſcontinued, and all trials are removed to York, though cauſing a great additional expenſe to thoſe concerned.

Hull returns two repreſentatives to parliament: the right of election of whom, as well as of the ſeveral principal members of the corporate body, except the recorder and high ſteward, is veſted ſolely in the burgeſſes or freemen of the town, an important body, amounting to upwards of 2000. The population returns to parliament in 1801, ſpecified, that the town and county contained 4767 houſes, occupied by 29,516 perſons, of whom 13,051 were males, and 16,465 females: this does not include the adjoining populous pariſh of Sculcoates, nor the ſuburb on the eaſt of the river Hull. A fair is held annually in October, and the markets are abundantly ſupplied, eſpecially when the tide ſuits for the Lincolnſhire farmers to croſs the Humber, on Tueſdays, Fridays, and Saturdays.

Hull has, at different times, given birth to men diſtinguiſhed on various accounts. In the firſt rank muſt be placed her repreſentative in parliament, that incorruptible patriot, Andrew Marvell, whoſe father was lecturer of Trinity church; and, in later times, a moſt worthy man and excellent poet, the Rev. W. Maſon, A.M. ſon of the late vicar of the ſame. It likewiſe gave the titles of earl and duke, both now extinct, to the family of Pierrepoint.

The village of Sculcoates, though not in the county, may juſtly be conſidered as forming a part of the town of Hull; a portion of the old dock is included within it. The church, ſituated towards the northern extremity of the pariſh, is a neat uniform ſtructure, rebuilt in the year 1760, and contains ſome fragments brought from the neighbouring abbey of Meaux.

Hull *River*, in the Eaſt Riding of Yorkſhire, is a ſmall river, which falls into the Humber at the town of Kingſton-upon-Hull, better known by the name of *Hull* only, and as being the fourth ſea-port in point of importance in the Britiſh dominions. The Hull is made navigable from the Humber, about twelve miles, to Aike-beck mouth, the entrance of the Driffield navigation. Sen Canal.

Hull *and Leven Canal*, is an inland navigation in Yorkſhire, Eaſt Riding, made in purſuance of acts of parliament obtained in 1801 and 1805; it extends about three miles from the Hull river up to the town of Leven. See Canal.

Hull, the Indian *Nantaſket*, a town of America, in Suffolk county, Maſſachuſetts, containing about 21 houſes, and 117 inhabitants. It is a peninſula 8 miles long, 9 miles E. of Boſton, on the S. ſide of the harbour.

Hull, *Little*, a ſmall iſland in the Eaſt Indian ſea, near the W. coaſt of the iſland of Poggy. S. lat. 2° 45′. E. long. 99° 32′.

Hull *of a ſhip* is her main body, without any maſts, yards, ſails, or rigging.

To Hull, or *lie a* Hull, is underſtood of a ſhip, when, either in a dead calm, or in a ſtorm, ſhe cannot carry all her ſails, but they are taken in to preſerve them; ſo that nothing but her maſts, yards, and rigging are abroad, and her helm tied down to the lee ſide of the ſhip. In this ſtate ſhe will lie eaſily under the ſea, if ſhe be a good ſailer, and make her way one point before the beam.

To ſtrike a Hull, is to lie cloſely or obſcurely in the ſea in a ſtorm, or to tarry for ſome conſort, bearing no ſail, with the helm laſhed a-lee.

To Hull *a ſhip*, is to fire cannon-balls into her hull, within the point-blank range.

Hull, in *Agriculture*, a term made uſe of to ſignify the chaff, or huſk of grain.

HULLEAH, in *Geography*, a town of Hindooſtan, in Benares; 20 miles S. of Merzapour.

HULLOCK *of a Sail*, at *Sea*, is when, in a great ſtorm, ſome ſmall part of a ſail is cut and let looſe. It is chiefly uſed in the mizen-ſail, to keep the ſhip's head to the ſea; then all the reſt of the ſail is made up, except a little at the mizen yard-arm. Alſo, when a ſhip will not *weather-coyle*, to lay her head the other way, they looſe a hullock of her fore-ſails, and then changing the helm to the weather-ſide, ſhe is made to fall off, and to lay her head where her ſtern lay.

HULLUAH, in *Geography*, a town of Hindooſtan, in Guzerat; 15 miles N. of Champaneer.

HULME, Nathaniel, M.D. in *Biography*, was born at Halifax, in Yorkſhire, in the year 1732, and was bred to the profeſſion of a ſurgeon-apothecary. He afterwards ſerved in the capacity of ſurgeon in the navy, and being ſtationed at Leith after the peace of 1763, he embraced the favourable opportunity of proſecuting his medical ſtudies at Edinburgh, where he took his degree of doctor in the year 1765. His inaugural theſis was entitled "Diſſertatio Medica Inauguralis de Scorbuto." Soon after his graduation, he ſettled in London as a phyſician, intending to devote his attention particularly to the practice of midwifery. This, however, he ſoon relinquiſhed: and, on the eſtabliſhment of the General Diſpenſary (the firſt inſtitution of the kind in London), he was appointed its firſt phyſician. He was alſo ſome time phyſician to the city of London Lying-in-hoſpital. About the year 1775, he was, through the influence of lord Sandwich, then firſt lord of the admiralty, elected phyſician to the Charter-houſe. His other official ſituations he reſigned many years before his death, and withdrew himſelf at the ſame time in a great meaſure from the active exerciſe of his profeſſion; but the laſt he retained during the remainder of his life. In April, 1807, he was bruiſed by a fall, which he ſurvived but a fortnight, being at the age of ſeventy-five.

Dr. Hulme was the author of ſeveral diſſertations; *viz.* a republication of his theſis, with additions, 1768. "A Treatiſe on Puerperal Fever," 1772. An oration "De Re Medica cognoſcenda et promovenda," delivered at the anniverſary of the medical ſociety in 1777, to which a ſmall tract was annexed, entitled "Via tuta et jucunda Calculum ſolvendi in Veſica urinaria inhærentem." An enlarged edition of this tract, in Engliſh, appeared in the following year, under the title of "A ſafe and eaſy Remedy for the Relief of the Stone and Gravel, the Scurvy, Gout, &c.; and for the Deſtruction of Worms in the Human Body; illuſtrated by Caſes: together with an extemporaneous Method of impregnating Water and other Liquids with fixed Air, by ſimple Mixture only, &c." 1778. In 1800, Dr. Hulme inſtituted a ſeries of experiments "on the light ſpontaneouſly emitted from various bodies," an account of which was publiſhed in the Philoſophical Tranſactions of that and the following year. Dr. Hulme was alſo one of the editors of the "London Practice of Phyſic." See Tranſ. of the Med. Society of London, vol. i. part 1, 1810.

HULPE, LE, in *Geography*, a town of France, in the department of the Dyle, and chief place of a canton, in the diſtrict of Bruſſels; 8 miles S.E. of Bruſſels. The place contains 897, and the canton 9244 inhabitants, on a territory of 115 kiliometres, in 11 communes.

HULST, a town of France (formerly of Flanders), in the department of the Scheldt, and chief place of a canton, in the diſtrict of L'Ecluſe; 16 miles N.N.E. of Ghent. The place contains 1714, and the canton 11,381 inhabitants, on a territory of 205 kiliometres, in 8 communes. It was formerly the capital of four offices, with twelve dependant villages; it is ſituated on a canal that communicates with the Scheldt, and is very ſtrong, by its fortifications and poſition among the marſhes. N. lat. 51° 14'. E. long. 3° 55'.

HULTSIO, a town of Sweden, in the province of Smaland; 26 miles N. of Wexio.

HULVER, in *Rural Economy*, a name by which the holly-tree is frequently known in ſome diſtricts.

HULWAD, in *Geography*, a town of Hindooſtan, in Guzerat; 55 miles N.E. of Wurwana.

HUMAGUACA, a town of South America, in the province of Tucuman; 65 miles N. of St. Salvador de Jugui.

HUMAN, a town of Perſia, in the province of Segeſtan; 180 miles S.E. of Zareng.—Alſo, a town of Ruſſian Poland, in the palatinate of Braclau; 50 miles E.S.E. of Braclau. N. lat. 48° 42'. E. long. 30° 8'.

HUMAN, ſomething that relates to man, or the nature of man. See NATURE.

Epicurus and his followers deny that the gods concern themſelves with human affairs. See EPICUREANS.

Faith is diſtinguiſhed into divine and human. See FAITH.

HUMAN *Figure*, *The*, in *Painting* and *Sculpture*. Amidſt all the various beauties with which this earth abounds, and which attract the eyes and call forth the emulation of the artiſt, nothing is ſo aſtoniſhing and ſo engaging as the ſtructure of the human form, and the elegance and variety of the actions of which it is capable. It has been the ſubject of panegyric in all ages. The naturaliſt, the moraliſt, the philoſopher, and the divine, have dwelt, with holy reverence to its Maker, on its delicacy, its ſimplicity, yet variety of conformation, and on its intellectual and ſpiritual endowments; all of which are moſt juſtly combined in deſcription, in the admired contemplative ſpeech our own Shakſpeare has put into the mouth of Hamlet. "What a piece of work is man! how noble in reaſon! how infinite in faculties! in form and moving how expreſs and admirable! in action, how like an angel! in apprehenſion how like a god! the beauty of the world! the paragon of animals!"

To the painter and ſculptor no object in nature is ſo intereſting as the human figure; none requires more ſtudy and attention to enable them juſtly to diſplay its various beauties of action and expreſſion; and a long continued ſeries of obſervation and practice will alone qualify them for the fulfilment of ſo arduous a taſk.

The ſources of this difficulty are, the very great latitude of its motions, and the numerous combinations of them, added to the various poſſibilities of view, and of light and ſhade. Its beauty is indeed very great, independent of all theſe, but they ſerve to enhance its value and render delight to the artiſt, while they call for his utmoſt exertions in his endeavours to repreſent them. So much has already been ſaid under the various articles BEAUTY, CONTOUR, COMPOSITION, DRAWING, EXPRESSION, FACE, &c. that it will only be neceſſary in this place to treat of the proportions of the human figure, the range of its powers of action, its varieties, and the moſt beautiful and juſt combinations of them.

It has long been acknowledged, among artiſts, that the ſculptures of the Greeks, from the time of Pericles to that of Alexander the Great, afford the beſt examples of beautiful and characteriſtic proportion; and from them a ſcale has been drawn out, which, if it will not ſerve for every purpoſe, will always be of uſe, as well to depart from, as to follow. It is, in either caſe, a line to guide us, and ſhould never be loſt ſight of. We ſhall tranſcribe the following one from the note given by ſir Joſhua Reynolds on ver. 144 of Maſon's Freſnoy.

> "Learn then from Greece, ye youths! proportion's law,
> Informed by her, each juſt poſition draw."

"Du Piles has, in his note on this paſſage, given the meaſures of a human body, as taken by Freſnoy, from the ſtatues of the ancients, which are here tranſcribed.

"The ancients have commonly allowed eight heads to their figures, though ſome of them have but ſeven; but we ordinarily divide the figure into ten faces (this depends on the age and quality of the perſons: the Apollo and Venus de Medicis have more than ten faces); that is to ſay, from the crown of the head to the ſole of the foot, in the following manner:

"From the crown of the head to the forehead is the third part of a face.

"The face begins at the root of the loweſt hairs that grow on the forehead, and ends at the bottom of the chin.

“ The face is divided into three proportional parts; the firſt contains the forehead, the ſecond the noſe, and the third the mouth and chin; from the chin to the pit between the collar bones is two length of a noſe.

“ From the pit, between the collar bones to the bottom of the breaſt, one face.

“ From the bottom of the breaſts to the navel, one face. The Apollo has a noſe more.

“ From the navel to the genitories, one face. The Apollo has half a noſe more, and the upper half of the Venus is to the lower part of the belly, and not to the privities.

“ From the genitories to the upper part of the knee, two faces.

“ The knee contains half a face.

“ From the lower part of the knee to the ankle, two faces.

“ From the ankle to the ſole of the foot, half a face.

“ A man, when his arms are ſtretched out, is, from the longeſt finger of his right hand to the longeſt of his left, as broad as he is long.

“ From one ſide of the breaſts to the other, two faces.

“ The bone of the arm, called humerus, is the length of two faces, from the ſhoulder to the elbow.

“ From the end of the elbow, to the root of the little finger, the bone called cubitus, with part of the hand, contains two faces.

“ From the box of the ſhoulder-blade, to the pit betwixt the collar bones, one face.

“ If you would be ſatisfied in the meaſures of breadth from the extremity of one finger to the other, ſo that this breadth ſhould be equal to the length of the body, you muſt obſerve that the boxes of the elbows with the humerus, and of the humerus with the ſhoulder-blade, bear the proportions of a face when the arms are ſtretched out.

“ The ſole of the foot is in length the ſixth part of the figure.

“ The hand is the length of a face.

“ The thumb contains a noſe.

“ The inſide of the arm, from the place where the muſcle diſappears, which makes the breaſt, (called the pectoral muſcle,) to the middle of the arm, four noſes.

“ From the middle of the arm at the top, to the beginning of the head, five noſes.

“ The longeſt toe is a noſe long.

“ The two outermoſt parts of the teats and the pit between the collar-bone of a woman, make an equilateral triangle.

“ For the breadth of the limbs no preciſe meaſures can be given, becauſe the meaſures themſelves are changeable, according to the quality of the perſons, and according to the movement of the muſcles. Du Piles.

“ The meaſures of the ancient ſtatues by Audran appear to be the moſt uſeful, as they are accompanied with the outline of the figures which are moſt diſtinguiſhed for correctneſs.”

Audran, whoſe work ſir Joſhua Reynolds thus recommends, takes a different plan from that of Freſnoy, and is more minutely accurate. He divides the figure into heads, each head into four parts, and each part into twelve minutes; which certainly has given with more accuracy the exact proportions of thoſe figures he has meaſured; but Freſnoy's is fully equal to the general purpoſes of art; for where variety of character is requiſite, it is evident that the ſame proportions would be an evil; therefore the more general ſcheme is quite adequate as a guide in drawing the figure.

The knowledge of theſe proportions, and of the forms and poſitions of the bones and muſcles, which compoſe the human figure, may be regarded as the foundation on which to proceed to the more difficult taſk of becoming duly acquainted with its powers and varieties of actions. A perfect knowledge of the ſhapes of the bones is more particularly requiſite in this matter; ſince by their projecting parts coming in contact with each other, a limit is put to the actions of the joints; and they are ſecured from diſlocation by the natural exertions of the muſcles; and the muſcles themſelves directed and governed in their own actions.

Mr. A. Carliſle, profeſſor of anatomy to the Royal Academy, in his able and uſeful lectures before that body, entered much at large upon this part of our ſubject, and in a very ſatisfactory manner demonſtrated it on the ſkeleton and the living figure. To his kindneſs we are indebted for the following remarks, taken chiefly from angular meaſurements, and which will be found highly uſeful to all artiſts who apply their talents in the repreſentation of the human figure.

“ The motions of the head and trunk of the body are limited by the ſeveral joints of the ſpine.

“ The motions of the whole body upon the lower limbs take place at the hip joints, at the knees, and at the ankles.

“ The great limbs, technically called the upper and lower extremities, have rotatory motions at their junctions with the trunk, by means of ball and ſocket joints at the ſhoulders and the hips.

“ The analogy of parts between the upper and the lower extremities is not carried throughout the ſtructure of thoſe limbs in the human body.

“ The fulcrum of the upper limb is itſelf moveable upon the trunk, as appears by the extenſive motions of the ſcapula, which ſo generally accompany the rotations of the ſhoulder, and which ſupply that limb with a greater range of movements than is poſſeſſed by the lower limb.

“ The junction of the thigh, with the motionleſs maſs of the pelvis, limits its rotation to its ball and ſocket-joint.

“ The rotation of the head upon the neck takes place at the joint between the firſt and ſecond vertebræ.

“ When the noſe is parallel with the ſternum, the face may be turned towards each ſhoulder, through an angle of 60 degrees on each ſide, or the whole range of this turning will extend through 120 degrees.

“ The lateral bending of the neck is divided equally between the junctions of the ſeven vertebræ; but the bowing of the head, and the act of throwing the head violently backward, are principally effected, at the joint of the ſkull and the firſt bone of the vertebral column, called the atlas.

“ Theſe laſt motions are conſiſtent with an erect ſtate of the neck, while the lateral motions demand a curvature of its whole maſs.

“ The movements of the trunk are limited to the rotatory and lateral motions, which are almoſt equally divided among the ſeveral joints of the vertebræ of the back and loins.

“ The joints of the dorſal vertebræ are, however, more cloſely compacted than thoſe of the loins, which allows of a wider range for turning and bending in the line of the loins, than in that of the back.

“ The ribs and the ſternum move upward, ſo as to expand the width of the cheſt at the lower margin of the ribs, and to draw the clavicles and ſhoulders upward: this takes place at each full inſpiration of the breathing, and the contrary ſtate follows in the act of expiration. Such apparent movements are characteriſtic of certain paſſions and actions, and are always obſervable in the naked figure.

“ In ſtooping, to touch the ground, the thigh-bone forms an angle of about 55 degrees with the average direction of the ſpine.

" The leg bends upon the thigh, at an angle of 75°, and the line of the tibia forms with the ſole of the foot, when that is elevated, an angle of 65 degrees.

" The whole of this limb is capable of moving at the hip-joint forwards, to a right angle with its perpendicular poſition; and backwards, to an angle of about 20°. The leg will then continue to move by itſelf to its own angle of 75°, with the thigh. It has, beſides this, a motion outwards to about 45°.

" When the ſhoulders are at reſt, the two clavicles uſually meet in an angle of 110 degrees at the ſternum.

" The utmoſt elevation of the upper arm uſually forms an angle of 155° with the ſpinal column, and about 125° with the line of its clavicle. The flexion of the fore arm upon the upper arm, is confined to an angle of nearly 40°.

" The whole arm is capable of moving forward or outward, through nearly half a circle, and backward to an angle of 80°, with its perpendicular ſituation.

" The actions of pronation and ſupination in the hand, range through 270°: but then 90° of the rotatory motion, in the act of pronation, are derived from the ſhoulder-joint.

" The palm of the hand admits of flexion and extenſion through 65 degrees in each direction; its lateral motions are 35° outward, and 30° inward.—The flexion of the fingers at each phalanx is 90°, or a right angle.

" Theſe general rules govern the average and moſt natural actions of the living figure, but peculiar forms and acquired powers conſiderably change all ſuch calculations; neverthelefs it is expected in art that the knowledge of the true actions of the human figure ſhould be derived from the general ſtate of nature, and not from the diſtortions of the poſture-maſter, or the acquired flexibility of the tumbler."

In drawing the joints of the limbs, conſiderable difference will be found in their length, according to the degree of action they are in; thus the elbow joint, when bent inwards, lengthens the arm nearly $\frac{1}{8}$th. The ſame occurs at the knees, and in the joints of the fingers; in the ſame manner as a hinge is extended when opened.

There is a very conſiderable difference noticeable between the joints of children before the age of 8 or 9, and thoſe of grown perſons. In the former they are ſmall and ſurrounded by fat, which gives the appearance, when they are ſtraight, of dimples in the ſurface; whereas, in men they are large, and always projecting; with nothing but ſtrong tendons about them.

When the artiſt is fully acquainted with the proportions and capabilities of action in the human figure above-mentioned, and proceeds to repreſent it either in a tranquil poſition, or in motion, he will find it requiſite to attend to the geometrical and mathematical principles on which it is conſtructed; and by which alone its acting powers, the muſcles, are directed and governed. The due equipoiſe of its parts, either for its own ſupport, or the compound admixture of the weight of other bodies, in lifting, pulling, puſhing, &c. muſt be carefully regulated, or in vain will he attempt to effect his object. The following obſervations may be found uſeful on this ſubject.

When a man is entirely at reſt, and ſtanding equally on both feet, a line drawn perpendicularly from the pit between the clavicles will fall exactly in the midway between his feet.

If he moves, ſo as to ſtand upon one foot, it will fall upon the heel of that foot.

If he raiſes one arm, it will throw as much of his body on the other ſide of the perpendicular, as is equal to the weight of, and is neceſſary to counterbalance, that arm.

If one of the legs is thrown back, the breaſt is brought forwards, ſo as equally to bring the centre of gravity of the whole frame always in the ſame relative ſituation to the parts, in every poſition in which the body can be thrown.

Thus the equipoiſe of the figure is of two ſorts, ſimple and compound. Simple, when a man acts only by and upon himſelf; and compound, when any external weight be ſuperadded; for that muſt be regarded in his actions, while ſuſpending it, as a part of his own frame: and in order to lift or ſupport it, he muſt throw as much of his own weight in a contrary direction on the central line, to that where the object is applied, as is equal to it; or it will overpower and draw him to the ground. Indeed it will be neceſſary, in lifting, to throw a larger proportion of weight or muſcular force over, or it cannot be effected.

In action, the ſame principle governs the figure. Having, by the motion forwards of one part, in walking for inſtance, removed its centre of gravity, it endeavours, in the inſtant, to recover the balance loſt, and brings up another to ſupport itſelf; and theſe actions, going on progreſſively, carry it forwards. In running, a greater impetus is given; the breaſt is thruſt farther forwards, and a quicker application of the ſupport of the limbs is required; thus, the ſlower the motion, the nearer the ſupport will be under the centre of gravity; and on the contrary, when the motion is quickened, the farther it will be removed from it.

When a man intends to ſtrike a ſevere blow, he endeavours to add the weight of his body to the force of his arm, and to effect this he draws back himſelf over the perpendicular to a conſiderable diſtance, then, ruſhing forwards while he ſtrikes, conveys his body as far on the contrary ſide.

Thus, the motions of the figure muſt be always regulated by its centre of gravity; the perpendicular of which is its centre of motion. The motion being created by the loſs of equipoiſe, or inequality of weight, will, of courſe, be more or leſs violent, accordingly as a greater or leſs proportion of the body be removed from the perpendicular.

With regard to the muſcular action of the figure, the plates of anatomy, and the deſcriptions given under that article, will ſufficiently inform the reader. Each muſcle has its individual or conjoint power and uſe. It is the artiſt's duty to ſelect, in repreſentation, thoſe which more immediately are employed in, and characterize, an action; and not to make too great a diſplay of anatomical knowledge, nor at all times, and in all the various actions of the human figure, repreſent the ſame muſcles (when ſeen) with the ſame degrees of force, that is, equally tenſe; as if their power was requiſite in every action; as is frequently the caſe among the imitators of M. Angelo. No matter how the man was employed, every muſcle throughout the frame is rendered equally prominent; and the eye and the underſtanding bewildered, in endeavouring to comprehend which part was principally in motion. But more of this when we treat of STYLE, in *Deſign*; ſee that article.

HUMAN *Foſſil-remains*, in *Natural Hiſtory*. With early writers on natural hiſtory and geology, it was no uncommon thing to refer almoſt any large uncommon bones, which were met with in the earth, to giants of the human race. The pretended parts of a human ſkeleton by Scheuchzer, found in the ſlate-pit at Oningen, his anthropolith, protee, &c. are ſhewn in the Annales du Muſeum, vol. xiii. p. 411, to belong to a kind of ſalamander, and at page 198, the pretended human foſſils of Cérigo are ſhewn to be devoid of that character. After all which has been ſaid on the human bones found in the oſſeous rock of Gibraltar (Jones, Phyſ. Diſq. p. 428.), and other places in the Mediterranean and coaſt of Dalmatia, the fact of their having any of them belonged to the human race may fairly be doubted. The arm and ſkeleton of a man, mentioned by Mr. Charlton, in his Hiſtory of Whitby, p. 355, as found in the alum ſhale, were probably no ſuch thing. The tooth which Mr. Jones mentions may, if really human, have been taken from ſome church-yard, or ancient burial-place, whoſe waters were of a petrifying quality, as well as the woman's hand which he mentions, p. 427. If ſuch was not a mere deception, owing to the external form, like the pretended leg and foot of a child in black flint, which we have ſeen, that was taken out of a chalk-pit. The human tongue, or gloſſopetra of Pliny, and the human thigh of ſtone mentioned by Parkinſon, (Org. Rem. p. 16 and 21.), and the two bones of a man's foot in iron-ſtone, which Dr. Grew mentions (Rarities, p. 332.), were probably all deceptions of a ſimilar kind; and to one or other of theſe claſſes, *viz.* 1ſt, miſtaken animal remains; or, 2d, deceptive forms of mineral nodules, may, perhaps, all the ſuppoſed human relics, found imbedded in the ſtrata, be referred. A 3d claſs of human remains may be admitted with leſs heſitation, *viz.* bones found intermixed with works of art, and with circumſtances attending modern alluvial depoſits or ſoils, like the human ribs found along with a boat, under a ſtony or concreted gravelly ſtratum, near Peterſburg (Kirwan's Geo. Eſſ. p. 442.); the ſkeletons found with beads, rings, armour, coins, &c. mentioned by Mr. Whitehurſt (Inquiry 1ſt ed. p. 15.); and by many other writers, but which clearly did not belong to the ſtratified remains. A 4th claſs of human reliquia are found preſerved in peat-bogs, ſome inſtances of which are ſaid to occur in the peat-pits near Newbury (Phil. Tranſ. vol. i. p. 109.); a woman preſerved in a moſs, at Axholm, in Lincolnſhire, and a man in a moſs in Shetland (Jameſon's Shetland Iſle, p. 158.), and various ſimilar inſtances, which are to be met with. Mr. William Martin, in combating the arguments formerly adduced to ſhew that the ſuppoſed human, animal, and vegetable remains of the ſtrata were depoſited at the Noachian deluge, or by parts of its waters left in inland lakes and ſeas, obſerves (Outlines, p. 30.), "According to ſacred hiſtory, the full development of the animal kingdom, as well as the vegetable, had taken place, long before the period in which they were equally involved in one general inundation. And hence, in ſtrata ſuppoſed to have been formed by depoſitions from water left by the deluge, not only might we reaſonably expect to find vegetable and marine relics, but alſo the remains of *land animals*, of quadrupeds for inſtance, and even of *man* himſelf. For, however ſmall a proportion the deſtroyed land animals bore among the general multitude of organic bodies overwhelmed by this cataſtrophe, as they *did* exiſt, and as the bones of quadrupeds are certainly as liable to ſubſidence in water as drifted timber or other vegetable matter, they no doubt would occaſionally be met with in the ſtrata in queſtion, if ſuch ſtrata had really originated from the cauſe aſſigned in the hypotheſis. But, on the contrary, it is an indubitable fact, that neither the remains of man nor of quadrupeds have ever been found in ſtones or earths conſtituting ſtrata productive of genuine mineral coal, nor indeed as integrant parts of *any ſtrata*, excepting thoſe which are decidedly of much later formation, ſuch as we are now treating of. To a far remoter period, therefore, than the flood, muſt we recur, in any endeavour to explain or illuſtrate the agency of nature, in collecting and depoſiting the minerals of regular diſpoſed ſtrata."

HUMANA DE TOMPIERES, in *Geography*, a town of New Mexico; 63 miles S.S.E. of Santa Fé.

HUMANITY, the nature of man, or that which denominates him human.

Neſtorius would not allow the infirmities of humanity to be attributed to the Deity; nor the attributes of the Deity to humanity. See NESTORIANS.

HUMANITIES is uſed, plurally, for the *humaniores literæ*, *i. e.* the ſtudy of the Greek and Latin tongues, grammar, rhetoric, poetry, and the ancient poets, orators, and hiſtorians.

HUMAR, in *Geography*, a ſmall iſland in the Red ſea, near the coaſt of Arabia; three miles N.W. of Loheia.

HUMARES, a town of New Navarre; 120 miles S. of Caſa Grande.

HUMAS, an Indian village on the W. ſide of Miſſiſippi river, in Louiſiana, 60 miles above New Orleans. The Humas were formerly a conſiderable nation, but were reduced, about the year 1770, to about 25 warriors. The Alabamas, whoſe villages are near thoſe of the Humas, had at the ſame period about 30 warriors. The Chetemachas have about 27 warriors.

HUMAXAR, a town of South America, in the government of Tucuman, on the river Dolce; 60 miles S. of St. Jago del Eſtero.

HUMATION, HUMATIO. The moſt ancient way of diſpoſing of the dead was by humation, or interment. Pitiſc. See BURIAL.

HUMBER, in *Geography*, a river of England, or rather a large eſtuary, formed by ſeveral conſiderable rivers, and eſpecially by the Ouſe and Trent, and flowing into the German ocean, N. lat. 58° 30′. E. long. 1° 15′. Beſides the Trent, which enters the Humber after a direct courſe of about 100 miles, and which is navigable to Burton, in Staffordſhire, and the Ouſe, which runs by York, and is navigable to Rippon, the other principal rivers that iſſue into the Humber are the Dun, which runs by Doncaſter; the Aire, navigable to Leeds; and the Calder, navigable to Halifax; the Warf, navigable to Tadcaſter; the Derwent, navigable to New Malton; and the Hull. See CANAL.

HUMBER, a river of Upper Canada, in the E. riding of the county of York, which diſcharges itſelf into lake Ontario, eaſtward of the old fort Torento.—Alſo, a river of Newfoundland iſland, which runs into the gulf of St. Lawrence, through the bay of Iſlands.

HUMBERSTONE, a townſhip of Upper Canada, in the county of Lincoln, lying between Bertie and Wainfleet, and fronting lake Erie.

HUMBERT, in *Biography*, a cardinal in the 11th century, a native of Lorrain, embraced the monaſtic life in the dioceſe of Toul, in the year 1015. Here he acquired ſo high a reputation for talents and learning, that pope Leo IX. ſent for him into Italy, where he promoted him to the biſhopric of the White Foreſt. In 1049 he was raiſed to the purple by the ſame pope, who ſent him his legate to Conſtantinople, to attempt to reſtore the ancient union between the eaſtern and weſtern churches. In 1059, by the order of pope Nicholas II. he drew up the confeſſion of faith for the famous Berenger to ſign, in which he laid down the monſtrous doctrine, that "the bread and wine, after conſecration, were not only a ſacrament, but the real body and blood of Jeſus Chriſt; and that this body and blood were actually handled by the prieſts, and conſumed by the faithful, in reality and truth as other ſenſible objects are." Cardinal Humbert died after the year 1069. His works are numerous and chiefly theological. Moreri.

HUMBLE-Bee, in the *Hiſtory of Inſects*. See BOMBYLIUS.

HUMBLE-*bee, Baſtard.* See FAUX *bourdon*.

HUMBLE-*bee Flies*, in *Natural Hiſtory*, the name of a claſs of flies of different ſizes, but all agreeing in the great reſemblance they bear to the humble-bees, of the ſmaller or middle-ſized ſpecies. Theſe might, at firſt ſight, very naturally paſs for real humble-bees; but a cloſer examination will ſhew them not to be ſuch, as they have not the trunk of the humble-bee, and have only two wings. The ſpecies of the humble-bee fly are many of them of abſolutely different genera one from another, ſome of them having trunks, and others having a diſtinguiſhable mouth. See CULEX.

If the figure of theſe flies, in their winged ſtate, attracts our curioſity and attention, their prior ſtate, that of the fly-worm, of moſt of them ought ſurely much more to do ſo. The place nature has aſſigned the worms of theſe flies for their habitation is, indeed, a moſt ſtrange one; there is no other place for them to live in under this form, to begin their deſtined growth, and be fitted for their transformations, but in the inteſtines of horſes, or under the thick and firm ſkin of oxen. In the latter caſe, the worm hatched from the egg of its parent fly, depoſited there, makes the tumour in the places which alone furniſhes it with food and habitation, and in the middle of which it has a place to breathe. See HIPPOBOSCA.

It is not an invariable law of nature, however, that all the worms of the humble-bee flies are to feed on animal ſubſtances; for we find ſome delighted with vegetable food, and particularly one which loves none but the bulbous roots of flowers. Reaumur's Hiſt. Inſ. vol. iv. p. 497, &c.

HUMBLE-*Plant*, in *Gardening*. See MIMOSA.

HUMBLED, in *Rural Economy*, a term that is frequently applied to neat cattle and ſheep, in order to denote their being hornleſs.

HUMBOLDTIA, in *Botany*, ſo named by Vahl, who had firſt denominated it *Batſchia*, in honour of the celebrated traveller and botaniſt Von Humboldt. "Vahl. Symb. faſc. 3. 106." Willd. Sp. Pl. v. 1. 1147.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminoſæ*, Juſſ.

Eſſ. Ch. Calyx in four deep ſegments. Petals five. Legume oblong, compreſſed.

1. H. *laurifolia*. (Batſchia laurifolia; Vahl. Symb. faſc. 3. 39. t. 56.)—Native of Ceylon. A *tree* with jointed, zigzag, hollow branches. *Leaves* abruptly pinnate, of four or five pair of ſtalked, ovate-oblong, pointed, entire leaflets. *Stipulas* double; the outer ones horizontal, half arrow-ſhaped; the inner ovate, pointed, erect, much the largeſt. *Cluſters* of many flowers, axillary, ſolitary, or in pairs. *Willdenow*.

HUME, DAVID, in *Biography*, an eminent hiſtorian, was born at Edinburgh in 1711. He was the youngeſt ſon of a man of good family, who died while David was in his infancy, ſo that his education was entruſted to his mother. He diſplayed, at a very early period, a great love for literature, which became his predominant paſſion. His patrimony was too ſlender to permit him to follow his inclinations without ſome view to profit, and he attempted to gain ſome commercial employment at Briſtol. In a few months he found that kind of buſineſs totally unſuitable to his genius, and went to France with the intention of proſecuting his literary purſuits in a country retreat, reſolving to ſupply by economy his pecuniary deficiencies. He reſided firſt at Rheims, but chiefly in Anjou, and paſſed three years very agreeably in that kingdom. In 1737 he came to London, and in the end of the following year publiſhed his "Treatiſe on Human Nature," which he had compoſed during his reſidence in France. Mr. Hume's ardent paſſion for literary fame received a ſevere mortification from the neglect attending his firſt publication, which "fell dead-born from the preſs, without reaching ſuch diſtinction as even to excite a murmur among the zealots." He did not deſpair, but proceeded in his ſtudies, and in 1742 printed his "Eſſays, Moral, Political, and Literary." Theſe were ſo favourably received as to make the author amends for his former diſappointment. In 1745 he received an invitation from the young marquis of Annandale to come and live with him in England. This connection laſted but a ſingle year, when he ſtood forward as candidate for the profeſſorſhip of moral philoſophy in the univerſity of Edinburgh, and was powerfully ſupported by perſons of conſideration and high rank. He was, however, unſucceſsful. General St. Clair, in 1746, nominated him his ſecretary in an expedition deſigned for Canada, but which ended in an attack upon the French coaſt. In 1747 he attended the general, in the ſame ſtation, upon a military embaſſy to the courts of Vienna and Turin. On his return, he re-publiſhed his piece on human nature, with alterations, under the title of "An Enquiry concerning the Human Underſtanding." It was ſcarcely more ſucceſsful in this form than it had been before, but his other works were beginning to attract notice, and make their way rapidly. In 1752 he publiſhed his "Political Diſcourſes," which were received with immediate approbation. In the ſame year his "Enquiry concerning the Principles of Morals" was publiſhed, which he conſidered as the beſt of all his writings, but which met with little notice. He obtained, in 1752, the appointment of librarian to the Faculty of Advocates in Edinburgh, which afforded him the command of a large and curious collection of books. It was this circumſtance which ſeems to have inſpired him with the idea of becoming an hiſtorical writer, as it was probably his local ſituation which ſuggeſted to him, as his firſt ſubject, the "Hiſtory of England under the Houſe of Stuart." The firſt volume, containing the reigns of James I. and Charles I. appeared in 1754, which was furiouſly aſſailed from all quarters, on account, as he thought, of what he had ſaid in defence of the earl of Strafford; but it was probably owing to his undiſguiſed contempt for all religions, of which he recognizes but two ſpecies, ſuperſtition and enthuſiaſm. This work was ſo completely neglected as well as decried, that, had not a war broken out between England and France, he would probably have retired to ſome provincial town of the latter kingdom, have changed his name, and for ever renounced his country. The ſecond volume of his hiſtory, compriſing the period from the death of Charles I. to the Revolution, appeared in 1756, and was received much better than the firſt had been. With this encouragement he publiſhed his hiſtory of the houſe of Tudor in the year 1759, which excited againſt him a renewed portion of rancour. His reputation as an hiſtorian continued to gain ground, ſo that he was induced to go back to the earlier periods, and write down to the point at which his laſt work had commenced. Theſe two additional volumes appeared in 1761, and his hiſtory of England thenceforth became a ſtandard book, read by all, at home and abroad, who wiſhed to take a compendious and intereſting view of the Engliſh affairs. The reſearches of Mr. Hume into the origin of the conſtitution are not remarkable for depth or accuracy; and he ſeems too ready to admit the idea that the liberties of the country are of modern date, and were ſo many forced conceſſions from the ſovereigns. In his hiſtory of the Tudors and Stuarts there ſeems a manifeſt deſign of exaggerating the deſpotiſm of the former, in order to lighten, by compariſon, the uſurpations and high pretenſions of the latter. His ſtyle is clear, lively, ſometimes eloquent, always agreeable, though not unfrequently careleſs and incorrect. The money which Mr. Hume obtained for the copy-right of his hiſtory, joined to a conſiderable penſion granted him by the crown as a literary man, had now ſecured him an independence, with which he intended to retire to his native country, but in 1763 he received an invitation from the earl of Hertford to attend him on an embaſſy to Paris. This he accepted; and his character as a writer and philoſopher being well known in that capital, procured him an exceſs of attention and civility, with which he was highly delighted. He remained at Paris as "Chargè d'affaires," after the departure of lord Hertford in 1765, and did not return to England till 1766, when he brought with him the celebrated Rouſſeau, who, having excited perſecutions againſt himſelf in every country near him, was induced to ſeek for an aſylum in the only true land of liberty. Mr. Hume's conduct towards his friend was extremely kind and generous; but ſo capricious was the temper of Rouſſeau, that he fancied all the world was leagued againſt him, and betrayed ſuch groundleſs and unworthy ſuſpicions as finally diſſolved their friendſhip. In 1767 Mr. Hume accepted the office of under-ſecretary of ſtate, which he held under general Conway till the reſignation of that miniſter in 1769. He then retired to Edinburgh, expecting to enjoy a comfortable old age by means of the friends, the reputation, and opulence which he poſſeſſed. In that northern metropolis he drew around him a choſen circle of ſuitable aſſociates, with whom he lived upon eaſy and very familiar terms. He died in 1776. The account which he has given of his laſt illneſs is as follows: "In ſpring, 1775, I was ſtruck with a diſorder in my bowels, which at firſt gave me no alarm, but has ſince, as I apprehend it, become mortal and incurable. I now reckon upon a ſpeedy diſſolution. I have ſuffered very little pain from my diſorder; and what is more ſtrange, have, notwithſtanding the great decline of my perſon, never ſuffered a moment's abatement of my ſpirits, inſomuch that were I to name a period of my life which I ſhould moſt chuſe to paſs over again, I might be tempted to point to this later period. I poſſeſs the ſame ardour as ever in ſtudy, and the ſame gaiety in company. I conſider, beſides, that a man of 65, by dying, cuts off only a few years of infirmities; and though I ſee many ſymptoms of my literary reputation's breaking out at laſt with additional luſtre, I knew that I could have but few years to enjoy it. It is difficult to be more detached from life than I am at preſent." The account of his own life, of which the foregoing is an extract, was dated the 18th of April 1776, and he gradually grew worſe till Auguſt the 25th, when he died, in the 65th year of his age. His character has been drawn by Dr. Adam Smith: "He was one," ſays he, "concerning whoſe philoſophical opinions men will, no doubt, judge variouſly, every one approving or condemning them according as they happen to coincide or diſagree with his own, but concerning whoſe character and conduct there can ſcarcely be a different opinion. His temper indeed ſeemed to be more happily balanced, if I may be allowed ſuch an expreſſion, than that perhaps of any other man I have ever known. Even in the loweſt ſtate of his fortune, his great and neceſſary frugality never hindered him from exerciſing, upon proper occaſions, acts both of charity and generoſity. It was a frugality, founded not upon avarice, but upon the love of independence. Upon the whole, I have always conſidered him, both in his life-time and ſince his death, as approaching as nearly to the idea of a perfectly wiſe and virtuous man as perhaps the nature of human frailty will permit." To this picture, drawn by the pen of friendſhip, we may add the obſervations of a very judicious biographer. "We may," ſays he, "reaſonably demur to Dr. Smith's moral eſtimate, in attributing the perfection of virtue to a man whoſe leading principle was, by his own confeſſion, ſelfiſh (the acquiſition of literary fame), and who never ſeems to have made any of thoſe ſacrifices of intereſt and inclination to public good, in which virtuous action chiefly conſiſts. Further, whatever degree of freedom of diſcuſſion may be juſtifiable, with the benefit of mankind in view, it may be doubted whether a mere fondneſs for ſpeculation, or a love of philoſophical applauſe, will morally excuſe a writer for ſporting with opinions which are commonly held of the higheſt importance to human welfare." Two of his poſthumous works were publiſhed after the death of Mr. Hume, *viz.* "Dialogues concerning Natural Religion;" and "Eſſays on Suicide." The latter contain ſome of his moſt obnoxious principles, conveyed in the moſt offenſive form. See Hume's account of his own life, and Dr. Smith's letter prefixed to the 8vo. edition of the Hiſtory of England 1789. Gen. Biog.

HUMEA, in *Botany*, ſo named, by the writer of the preſent article, in juſt commemoration of the late right hon. lady Amelia Hume, ſiſter of the preſent earl of Bridgewater, and wife of ſir Abraham Hume, bart. who firſt raiſed this plant in England, and communicated it to him. Her ladyſhip for many years cultivated ſucceſsfully, and ſtudied ſcientifically, a fine collection of plants, at her ſeat at Wormleybury, Herts, and was always diſtinguiſhed by the liberality with which ſhe imparted to others her acquiſitions or diſcoveries. She departed this life, admired and beloved by all who knew her, in September, 1809, and is interred at Wormley.—Sm. Exot. Bot. v. 1. 1. (Calomeria; Venten. Jard. de la Malmaiſ. 73.)—Claſs and order, *Syngeneſia Polygamia-æqualis*. Nat. Ord. *Compoſitæ Diſcoideæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common Calyx* of numerous, imbricated, obovate, obtuſe, concave, coloured, pointleſs ſcales, the outer ones ſmalleſt and gradually more diſtant. *Cor.* compound, uniform, tubular, of very few florets, whoſe proper corolla has a cylindrical tube, and a bell-ſhaped limb, with five revolute ſegments. *Stam.* Filaments five, capillary; anthers united into a pentagon, with five ſharp teeth. *Piſt.* Germen oblong, glandular; ſtyle cloven; ſtigmas ſpreading, capitate. *Peric.* none, except the permanent ſcarioſe calyx. *Seed* oblong, without any crown or wing. *Recept.* very ſmall, glandular.

Eſſ. Ch. Receptacle minute, glandular. Down none. Calyx looſely imbricated, membranous, pointleſs. Florets about three. Anthers awned.

1. H. *elegans.* Sm. Exot. Bot. t. 1. (Calomeria amaranthoides; Venten. Jard. de la Malmaiſ. t. 73.)—Native of New South Wales, not far from Port Jackſon, from whence we received ſpecimens amongſt the firſt plants ſent from that country in 1791.

The *root* is biennial. *Stem* herbaceous, five or ſix feet high, erect, panicled, round, filled with ſpongy pith, and rough (like the leaves) with ſhort rigid viſcid pubeſcence. *Leaves* alternate, ſeſſile, lanceolate, acute, from ſix to twelve inches long, ſlightly waved at their edges, and claſping the ſtem by their heartſhaped baſe, of a full green colour on both ſides, and furniſhed with a midrib, with copious reticulated veins; the upper leaves gradually diminiſh into bracteas of a ſmall lanceolate figure. *Panicle* drooping and widely ſpreading, of innumerable ſmall pendulous flowers, on capillary branched ſtalks. The florets are tipped with violet; the calyx is of a more or leſs deep roſe-colour, crimſon, or browniſh red, ſometimes white. The whole plant is fragrant, like red cedar wood, or the hautboy ſtrawberry, but too ſtrong to be agreeable if much handled. It is raiſed on a hotbed, and planted out for flowering.

The name *Calomeria* is a pun upon the word *Buonaparte*, from καλος, *fair* or *good*, and μερις, a *part*, and is, in every reſpect but its harmony, truly inſufferable, eſpecially as there is a plant already called, ſomewhere or other, *Buonapartea*; there is alſo a *Napoleona* and a *Joſephinia* for thoſe who deſire them; the laſt being certainly well merited, and perhaps the leaſt exceptionable of all.

HUMECTATION, formed of *humor*, *moiſture*, *moiſtening*, in *Pharmacy*, the preparing of a medicine, by ſteeping it awhile in water, in order to ſoften and moiſten it when too dry; or to cleanſe it, or prevent its ſubtle parts from being diſſipated in grinding, or the like.

HUMECTATION is alſo uſed for the application of moiſtening remedies.

HUMERALIS, in *Anatomy*, a name frequently given to the artery and vein of the arm.

HUMERUS, or HUMERI OS, the bone of the upper arm. See EXTREMITIES.

HUMERUS, *Fracture of the*. See FRACTURE.

HUMERUS, *Luxation of the*. See LUXATION.

HUMERUS *of Birds*. See *Anatomy of* BIRDS.

HUMFRE, in *Geography*, a cape on the E. coaſt of the iſland of Guernſey.

HUMID, HUMIDUM, *moiſt*. The ſchool philoſophers make water the *primum humidum*, the firſt of humid bodies, and the cauſe or principle of humidity in others; which are more or leſs moiſt, as they partake more or leſs of this element.

HUMIDITY, MOISTURE; the quality or power of wetting or moiſtening other bodies.

Modern writers conſider humidity as a particular ſpecies of fluidity; and define it a fluor, which, being applied on a ſolid body, adheres to, and communicates the quality to other bodies. Others, ſomewhat more accurately, call humidity the power whereby a body moiſtens another; but what that power is they do not ſhew.

But of this we are certain, humidity is only a ſort of relative mode. So far as the component particles of a fluid, compared with reſpect to the pores and particles of other bodies, or the texture thereof, are apt and diſpoſed to enter thoſe pores, or ſtick to thoſe particles, ſo far is that fluid humid: on the contrary, ſo far as there is a repugnance or incongruity between the particles, &c. in reſpect of ſuch bodies, the fluid is not humid.

Thus quickſilver is not moiſt in reſpect to our hands or clothes, and other things, which it will not ſtick to; but it may be called humid, in reference to gold, tin, or lead, to whoſe ſurfaces it will preſently adhere, and render them ſoft and moiſt. Even water itſelf, which wets almoſt every thing, and is the great ſtandard of moiſture and humidity, is not capable of wetting all things; for it ſtands or runs off in globular drops from the leaves of cabbages, and many other plants; and it will not wet the feathers of ducks, ſwans, and other water-fowl.

Add, that the texture alone may cauſe the fluid to be humid, as is plain, in that neither quickſilver, lead, nor biſmuth alone will ſtick upon glaſs; yet being mixed together, they will form a maſs that will do ſo; as appears from ſuch a compoſition being frequently uſed in foliating looking-glaſſes. See COHESION, FLUID, and HYGROMETER.

HUMIDUM RADICALE, or *Radical Moiſture*, in the pathology of the ancient philoſophers, a ſuppoſed principle in the animal economy, which, together with the *radical heat*, was eſſential to life, or conſtituted the vital energy. The principle being altogether gratuitous, different notions were formed concerning it by different writers; and ſome confeſſed that they did not underſtand what was meant by theſe terms. See Sennert. lib. i. cap. 5. De Calido innato et Humido radicale. Fernel, lib. vi. cap. 4. entitled "Humidi primigenii, quod tum caloris tum ſpiritus ſubjecta eſt materia, demonſtratio."

HUMILIATI, a congregation of religious in the church of Rome, eſtabliſhed by ſome Milaneſe gentlemen on their releaſe from priſon, where they had been confined under the emperor Conrad, or, as others ſay, under Frederick I. in the year 1162. This order, which acquired great wealth, and had no leſs than ninety monaſteries, was aboliſhed by pope Pius V. in 1570, and their houſes given to the Dominicans and Cordeliers, for their luxury and cruelty.

HUMILIATION, the act of humbling, *i. e.* of abating a perſon's pride, and bringing him lower in his opinion.

In this ſenſe, humiliation ſtands diſtinguiſhed from mortification: humiliation brings down the mind; mortification ſubdues the fleſh.

HUMILIS MUSCULUS, in *Anatomy*, a name mentioned by Caſſerius, as given by ſome people of his time to one of the muſcles of the eye, the rectus inferior of Fabricius, and deprimens of Riolan: it is the depreſſor oculi of Albinus, being one of the quatuor recti muſculi oculorum of that author. See EYE.

HUMILITY, in *Ethics*, is a virtue conſiſting in the moderate value which a perſon puts upon himſelf, and every thing relating to him. Or, more particularly, it conſiſts in not attributing to ourſelves any excellence or good which we have not; in not over-rating any thing which we have or do; in not taking an immoderate delight in one's ſelf; in not aſſuming more of the praiſe of a quality or action than belongs to us, and in a lowly ſenſe and acknowledgment of our imperfections, errors, and ſins. This virtue expreſſes itſelf in the modeſty of our appearance, of our purſuits, and of our behaviour towards other men. It is diſtinguiſhed from affectation, baſhfulneſs, and meanneſs.

HUMISUGA, the *Ground-ſucker*, in *Natural Hiſtory*, the name of a fly, ſo called, becauſe it is ſuppoſed to live by ſucking the juices of the earth, without taking in any ſolid food. It has a browniſh or dun body; a white ſpot at the inſertion of the wings, and another at the head; the legs are black; the back is grey, with four ſullied white lines running longitudinally; the wings are ſilvery, and, if put into water, they ſhine with a bright light like that of the glow-worm. This creature is common with us about path-ways, on mole-hills, and in other places where the ground is newly turned up. We call it the *path-fly*.

HUMMEL'S TOWN, in *Geography*, a thriving town of America, in Dauphine county, Pennſylvania, containing a German Lutheran church, and about 90 houſes, on the S. ſide of Swetara creek; 100 miles W.N.W. of Philadelphia.

HUMMET, THE, a ſmall iſland in the Engliſh Channel, near the N.E. coaſt of the iſland of Guernſey.

HUMMING-BIRD, in *Ornithology*. See TROCHILUS.

HUMMOCK, in *Geography*, a ſmall iſland in the Eaſt Indian ſea; 15 miles S. of Mindanao. N. lat. 5° 24'. E. long. 126° 37'.

HUMMOCK *Point*, a cape on the N. coaſt of the iſland of Celebes, ſo called by captain Carteret in 1767, who ſuppoſed it to be the ſame with that which is alſo called "Stroomen Point." N. lat. 1° 20′. E. long. 121° 39′.

HUMMOCK, in *Geology*, is a term introduced by Dr. William Richardſon (Phil. Tranſ. 1808.) to denote an important claſs of iſolated *Hills* (ſee that article), and patches of ſtrata, which are compoſed of piles of ſtrata, known in the neighbourhood, but entirely detached from the continuous part of ſuch ſtrata, owing to the intervening ſtrata having been carried away, or *abrupted*, as the doctor called it, a phenomenon which had been previouſly noticed and deſcribed by Mr. Farey, and called *Denudation*. (See that article in our work, and the Phil. Mag. vol. xxxiii. p. 258.) Dr. Richardſon very aptly compares a hummock to one of thoſe dead-men, buoys, &c. which labourers, employed to move ground by meaſure, leave in different parts of the ſpace they have excavated, in order to mark the original height of the ſurface in that place. The following are the names of curious baſaltic hummocks which Dr. Richardſon has particularized in the north of Ireland; ſome of them being iſolated, and higher knowls on the tops of hills and mountains, and others of them conical or groteſque knowls, in valleys or low tracts, which are equally the ſcite of hummocks in denudated diſtricts; *viz.*

Altabrian, on the Derry mountains, hemiſpherical.

Clogher rock, near Buſhmills, a ſmall cone or knowl, ſtratified like the hummock of Dunmull.

Doland's hill hummocks, near Glennuller vale and Mayole vale.

Dunmull, 3 miles S.E. of Portruſh, on a high ridge, cylindrical, like Fermayle and Clogher rock.

Fermayle, on the Derry mountains, cylindric and flat at top, like Dunmull.

Knock Loughran, near Maghera.

Liſanoure, one mile E. of the town.

Magilligan, on the top of the mountain, irregular.

M'Art's Caſtle, on Cave-hill façade, irregular.

Sconce, on the Derry mountains, hemiſpherical.

Slemiſh, 23 miles S.E. of Portruſh, on the ridge, very large, with a flat top.

Mr. Farey has given an ample liſt and account of the hummocks in and near Derbyſhire, in the 1ſt vol. of his "Report to the Board of Agriculture," to which we muſt refer. The curious hummocks of ſand-ſtone at Andernach, in Bohemia, and others near Tunis, reſembling ruins, alſo at Namaquas, in Southern Africa, and on the banks of the Wolga, are noticed in our article FLETZ, where they are ſuppoſed, but not perhaps on ſufficient ground, to be peculiar to a particular rock, or ſtratum, inſtead of occurrences peculiar to the ſtrata of certain diſticts, however various, as in Derbyſhire they appear to be.

The *partial tract* of William Martin, (Outlines, addenda, p. iii.) "under which the ſtrata conſtituting the ſurrounding tract are obſerved to dip," includes our hummocks on the tops of hills, or iſolated knowls in vallies or plains, whoſe nearly horizontal ſtrata baſſet or ſhew their edges on all ſides, and alſo the *Baſin* or SWILLEYS (ſee that article) of coal and other ſtrata, which are often met with, dipping towards a central point or line, and baſſeting or riſing to the ſurface round the circumference of ſuch ſwilleys: of the latter character, ſome of the depreſſed hummocks of the Derbyſhire Report partake, as Darley-flaſh, Goyte-moſs, and Shallcroſs, of the ſecond coal-ſhale; Combes-moſs of the firſt coal-ſhale; Wardlow-mines of the lime-ſtone ſhale; Peak Foreſt town of the third lime, &c. The accurate diſcrimination of tracts of ſtrata, in conducting mineral ſurveys, ſeem of the utmoſt importance to the progreſs of geological ſcience, as well as to the proceſſes of the miner, collier, &c.

HUMMOCK, a term uſed by *Navigators* to expreſs circular and elevated mounts, appearing at a diſtance.

HUMMUDNAGUR, a town of Hindooſtan, in Bahar; 45 miles S.S.W. of Patna.

HUMOR, or HUMOUR. See HUMOUR.

HUMOR, in *Geology*, was introduced by M. de Luc, "Elementary Treatiſe on Geology," p. 55, and defined to mean water, not as a compound of hydrogen and oxygen, but as an elementary ſubſtance of the globe, diſtinct from the forms of water, ice, (or cryſtallized water,) or ſteam: ſuppoſing, ſays he, that "in its primitive ſtate, when nothing of what we now obſerve upon the earth was produced, nor as yet diſpoſed to be produced, this ſubſtance (humor) was neither water, nor ice, nor agua: its elementary particles were intermixed with all thoſe to which they are at preſent united by affinity, in the different bodies with which we are acquainted; and thoſe particles, then acquiring liquidity by their union with fire, and thus immediately entering into all the aſſociations, to which its numerous affinities gave birth among elementary ſubſtances, produced the *Primordial* LIQUIDS; which ſee.

HUMORAL PATHOLOGY, that pathology, or doctrine of the nature of diſeaſe, which attributes all morbid phenomena to the diſordered condition of the fluids, or *humours*, of the body, and attempts to explain the progreſs and changes of diſeaſes by certain fermentative or digeſtive operations in the *humours*.

In many of our articles in *medicine* we have had occaſion to allude to the *humoral pathology* as the foundation of many opinions and peculiar modes of practice, which a more accurate pathology has confuted and exploded. It would be a fruitleſs labour to enter into a minute detail of all the abſurd ſpeculations reſpecting the morbid changes in the fluids of the body, which have been ſucceſſively adopted, from the time of Galen downwards: for, not only the followers of Galen, but all thoſe in modern times who have diſſented from his opinions, and have transferred the doctrines of chemiſtry and of mechanics to the phenomena of the living body, have, nevertheleſs, admitted the changes of the fluids into their ſyſtems, as the principal cauſes of diſeaſe, and as the foundation for explaining the operation of medicines: nay, even after the peculiar property of living bodies, (the faculty of irritability, excitability, ſenſorial power, or nervous energy, as it has been variouſly denominated,) which is reſident in the nervous ſyſtem, came to be viewed as a principal agent in the production of diſeaſe, and in the reſtoration of health, according as it is influenced by morbific cauſes, or by ſalutary impreſſions; or when, as Hoffmann firſt maintained, (Medicin. Rational. Syſtem. tom. iii. § 1. chap. 4.) the affections of the living ſolids came to be admitted as the moſt probable grounds of diſeaſe, and as affording a more rational explanation of morbid phenomena, than the diſordered conditions of the fluids; ſtill a humoral pathology was received, and combined with theſe opinions, to a conſiderable extent. Dr. Cullen himſelf, who advanced far beyond Hoffmann in his appeal to the agency of the living ſolids, occaſionally refers to certain ſuppoſed "acrimony of the fluids," as the eſſence of ſome diſeaſes: and it was in the ſyſtems of Brown and Darwin that all conſideration of the changes of the humours, as the origin of diſeaſe, was firſt rejected, and every morbid condition was referred to the agency of that power, the nervous energy, which diſtinguiſhes the living body from dead matter. (See EXCITABILITY and IRRITABILITY.) But the doctrines of the older phyſicians continue to be, in a great meaſure, the prevailing opinions of the vulgar, if not of the generality of unprofeſſional perſons, and even of a great number of routiniſts in the profeſſion.

We ſhall, therefore, briefly ſtate the principles of thoſe doctrines, and ſhew the futility of the arguments on which they reſt.

The four elementary humours of Hippocrates and Galen, namely, *pituita*, or phlegm, blood, bile, and black bile (melancholia), were received as the principles of all the animal fluids and ſolids, conſtituting by their due proportion the health of the body, and by their *intemperies*, or undue proportion, the varieties of diſeaſe, until the time of Paracelſus. This bold and conceited chemiſt, who ſet up for a reformer of all philoſophy, renounced the ſyſtem of Galen, denied the exiſtence of the four humours, and contended that diſeaſes were not produced by humours, but that humours originated from diſeaſe. At the ſame time he promulgated a ſyſtem of his own, uſing a jargon which is not very intelligible, and to which it may be queſtioned whether either himſelf or his followers ever attached any clear ideas. He adopted the notion of three elementary ſubſtances, to which he applied the appellations of *ſalt*, *ſulphur*, and *mercury*, with Baſil, Valentine, and others; but theſe terms were employed in new acceptations, about which the chemiſts were not altogether agreed. They are to be conſidered, it would appear, as general expreſſions of ſome faculty or property, which they communicate. Thus mercury appears to repreſent the principle of fluidity, ſulphur that of inflammability, and ſalt that of ſolidity. According to Severinus, one of the followers of Paracelſus, "*ſalt* gives conſiſtency, ſolidity, or coagulation to things; *ſulphur* imparts a fat oleaginous quality, which tempers the conſiſtency of the ſalt; and *mercury* gives fluidity to both, and facilitates their mixture." And Quercetanus, another writer of that ſchool, ſays that things receive their various taſtes from *ſalt*, their odours from *ſulphur*, and their colours from both theſe, but moſt chiefly from *mercury*. (See Sennert. Tract de Conſenſu et Diſſenſu Galenicorum et Peripatet. cum Chymicis. cap. 11.) They ſpeak alſo of animal ſulphur, vegetable ſulphur, and mineral ſulphur; of animal ſalt, vegetable ſalt, &c.; ſo that it is obvious theſe were merely gratuitous and hypothetical expreſſions, which every one might uſe according to his own fancy, and which led to every ſpecies of abſurdity. When they treat of the origin of diſeaſes, this abſurdity is manifeſt throughout. Paracelſus lays down two genera of diſeaſe, one of which he calls, in barbarous language, *iliaſtrum*, the other *cagaſtrum*; the former including thoſe diſorders which grow "from ſeed, like apples and nuts," ſuch as dropſy, jaundice, &c.; the other thoſe which ariſe "from corruption, ſuch as fevers, the plague, &c." (Paracelſ. Labyrinth. Medic. err. cap. 11.) We ſhould conſider our time, and that of our readers, as loſt in examining the minutiæ of this ſyſtematic jargon. If curioſity ſhould impel any one to inveſtigate the ſubject, he may peruſe the various writings of Paracelſus himſelf, or Scheunemann's "Hydromantia Paracelſica," and "Medicina reformata;" as well as Quercetanus's "Hermeticæ Medicinæ Defenſio," the works of Oſwald Crollius, of Petrus Severinus, &c. Sennertus has attempted to refer the jargon of theſe chemiſts to the Galenical doctrines, from which, where it is intelligible, it ſeems to differ more in appearance than in eſſence: for it ultimately refers diſeaſes to various conditions of the humours, which are eſtimated by the appearances and ſenſible qualities of the excretions and diſcharges, changing only the terms by which they are deſignated. (Loc. cit. cap. 16.) See GALENICAL *Syſtem*.

As the ſtudy of chemiſtry advanced, and its various operations and products were inveſtigated, pathologiſts began to modify the doctrines of Galen generally, and, laying aſide the four humours of that writer, they deſignated the various humours, connected with different ſtates of diſeaſes, according to analogous properties, fancied or real, in theſe morbid humours, and in the ſubſtances with which chemiſtry had made them acquainted. Thus we find the writers of the 17th century ſpeaking of mucilaginous acid, vitriolic, tartarous, alkaline, corroſive, and acrid humours, of a ſaline, putrid, rancid acrimony, &c.; (ſee ſir J. Floyer's "Preternatural State of Animal Humours deſcribed by their ſenſible Qualities, &c.") and likewiſe attributing much to the agency of the *ſpirits*, or animal ſpirits, which they ſeem to have conſidered as a ſecretion from the brain, communicated through the canals (as they were ſuppoſed to be) of the nerves, and conſtituting the moſt "exalted" portion of the animal humours. Our countryman, Willis, ſubſtituted this term for the *mercury* of Paracelſus, and ſpeaks of the *ſalt*, *ſulphur*, and *ſpirits*, as the three principal elements of the humours, to which he likewiſe adds *earth* and *water*. (Willis, Diatriba de Fermentatione, cap. 2. et de Febribus, cap. 1.) The humours of Galen, he contends, are not parts of the blood, but its recrements; the blood, properly ſo called, being the ſame in every part of the body, and the *pituita*, bile, and black bile, being the impurities thrown off by it, by means of a ſort of efferveſcence or fermentation. In like manner, he obſerves, in the caſe of the fermentation of wine or porter, the lighter parts aſcend to the top, forming the *flos* or yeaſt, and the thicker parts fall to the bottom, in the ſhape of dregs or tartar, leaving the liquor clear; yet no one, he ſays, could correctly affirm, that wine or porter is compoſed of yeaſt, tartar, and a vinous liquor.

But whatever notions pathologiſts have at different times adopted, in regard to the number and qualities of the elementary principles of the humours, they have all agreed in explaining the phenomena of diſeaſes, by a certain inteſtine proceſs, which has been variouſly compared to digeſtion, fermentation, efferveſcence, or ebullition, by which the humours were ſuppoſed to be purified, in conſequence of the expulſion of the offending matter. The ancients conſidered this depuratory proceſs as analogous to that of the digeſtion, or concoction (as they termed it) of the food in the ſtomach. For as the various ſubſtances, taken into the ſtomach for the purpoſes of nutrition, became gradually converted, by the proceſs of concoction, which was carried on by the innate heat, into a bland homogeneous fluid, the chyle, which was abſorbed by the meſenteric veſſels for the nouriſhment of the body, while the dregs or fæces were carried off by the bowels, and diſcharged; in like manner they ſuppoſed that when the blood was in a ſtate of *intemperies* or *dyſcraſy*, the conſtitution was excited to febrile action, during which a ſort of concoction, or digeſtive proceſs, was carried on, and the blood, being thus depurated, the morbid humours were diſcharged by ſome of the uſual excrementitious paſſages, the bowels, the bladder, the veſſels of the ſkin, &c. When this diſcharge, whether a diarrhœa, a ſediment in the urine, a profuſe perſpiration, &c. took place, a *criſis* was ſaid to occur; and the purpoſe of the febrile commotion having been effected, the conſtitution ceaſed from its inordinate action, and health was reſtored. (See CONCOCTION and CRISIS.) Theſe diſcharges, with which it was obſerved that fevers often terminated, were conſidered as the proofs of the exiſtence of the morbid humours in the blood, and of the origin of the febrile commotion, which continued while they were retained in the body, and ceaſed when they were expelled.

After the revival of learning, when chemiſtry had made ſome advances, the proceſs of *fermentation* was more commonly aſſumed, as explanatory of the nature of febrile diſeaſes. The phyſicians of the 17th century, Willis, Floyer, and others, referred all the phenomena of acute diſeaſes to this ſource; and Sydenham acknowledges a great analogy in the two proceſſes, yet remarks that the analogy is not perfect, and therefore prefers the term *commotion* to that of *fermentation* or *ebullition*, which other writers employ. (See his Obſ. Med. § 1. cap. 4.) It is to be remarked, however, that the term "fermentation," in the acceptation adopted by Willis, ſignifies every ſpecies of chemical action, combination, or change, as well as the operations of animal and vegetable nutrition and growth, by which unorganized matter is aſſimilated with living bodies. See his Diatriba de Fermentatione.

During the 17th century, then, or rather from the latter part of the 16th century, nearly to the time of Dr. Cullen, the proceſs of *fermentation* was conſidered as conſtituting the eſſence of all febrile diſeaſes: and as fermentation, in regard to the production of vinous liquors, is excited commonly by ſome ferment introduced for that purpoſe, ſo a ferment was ſuppoſed to have found its way into the blood, when the animal ſyſtem was excited into a febrile fermentation or commotion; and thus the blood was depurated, and the peccant matter expelled, or ſeparated, like the dregs of wine. This ferment, or *cacochymia*, was accounted for in various ways by different pathologiſts: but we may collect, on the whole, that they maintained the notion of two principal internal ſources of *cacochymia*, namely, improper *food*, and imperfect *ſecretion* from the different glandular organs. Fernelius remarks, "Omnis enim cacochymia et humorum impuritas aut ex vitioſa viſcerum affectione, aut ex improba vivendi ratione, non aliis ex cauſis, proficiſcitur;" for, he adds, when the ſtomach, liver, ſpleen, and neighbouring organs, are diſeaſed, either by *intemperies* or organic diſorder, they produce humours, ſimilarly diſeaſed, even from pure and temperate aliment; and, when the food is immoderate, heavy, glutinous, or corrupted, it cannot be ſo wholly and perfectly changed by digeſtion, as not to carry ſome of its crude or unwholeſome qualities with it to the blood and other humours. (See Fernel. Febr. Curand. Methodus Generalis, cap. 2.) In like manner, Willis obſerves, "Atque hujuſmodi motus (nimirum ſanguinis verè inteſtinum bellum) dependet tum à partium ipſius ſanguinis heterogenitate, tum à variis fermentis, quæ à viſceribus cruoris maſſæ inſpirantur." (Diatr. de Feb. cap. 2.) It may be remarked, by the way, that in thus referring ſome of the morbid humours to the viſcera, they ſeem to admit, though unintentionally, the primary action of the ſolids in the production of diſeaſe. In general, however, they looked to the concoction or fermentation of the aliment into chyle, as the ſource of the cacochymia; and ſir John Floyer conſiders all the internal variations of the humours as originating from a *defective* or *exceſſive* degree of the fermentation by which nutrition is carried on. "If the chyle be rightly fermented, all the humours ariſing from it are rightly prepared; but if the fermentation of that is vitiated, all the other humours, produced from vitiated chyle, retain a tincture of its defect in their preparation. This fermentation, by which the chyle and blood are prepared, may be depraved both ways, for it may be depreſſed under its natural ſtate, or exalted above that degree, which is ſuitable to the natural temper of any animal; of both of which errors, and the cacochymias depending on them, I ſhall next diſcourſe." (Loc. cit. p. 34.) He then informs us that if the animal humours are digeſted or fermented "to any degree *below* their natural ſtate, ſome of the cold cacochymias are produced." Among theſe he enumerates a mucilaginous or pituitous, a tartareous or acerb, a flatulent, and a ſerous ſtate of the humours. If the chyle be *over-fermented*, or digeſted *too much*, "it becomes bitter, acrid, rancid, or putrid;" it alſo produces a viſcid ſtate of blood, which occaſions pain and inflammations, and ſhews itſelf in the *ſizineſs* of blood that is drawn in inflammatory diſeaſes; as well as "a ſalt acrimony, which corrodes and eats the gums, infects the ſkin with ſpots, and is the hot ſcurvy." (Ibid.) Theſe various ſpecies of cacochymia, then, are deemed *ferments*, by which the blood is excited to violent fermentative commotions, or fevers. But there are other diſeaſes, "which depend wholly on an outward ferment received into the fleſh, as in hydrophobia," or ariſe from the poiſon of ſerpents, or from "the touch of a ſalt humour to which the morphews, ſcab, pox, and ſcald-head are referrable, and leproſy;" and "all malignant fevers, as the ſmall-pox, meaſles, and plague, or peſtilential fevers, have their original from the malignity of the air, and the poiſonous ſulphurs of the earth." (Floyer on Preternat. State of Humours, p. 15.) In like manner, Sydenham aſcribes all epidemic diſeaſes to a ferment, poiſon, or peccant matter, introduced into the blood by reſpiration, the air inſpired being impregnated with this poiſon, either from the bowels of the earth, or from ſome peculiar influence of the planets:—while he attributes ſporadic febrile diſeaſes to the particular ebullition or inflammation of the blood, occaſioned by the peculiar *intemperies* of individuals, which he ſeems to impute chiefly to the influence of external temperature, and to errors in diet, and the other *non-naturals*. Sydenham, De Morbis Epidem. chap. 2. and Tractat. de Podagra.

From whatever ſource theſe *cacochymiæ*, or peccant humours originate, they are conſidered as inimical to the well-being of the body; in conſequence of which enmity, nature, or the ſuppoſed preſiding principle of the conſtitution (which has been variouſly perſonified by different writers, under the titles of *Archeus*, *Antocrateia*, *Anima medica*, &c.) begins a conteſt, in order to expel from the blood this intruſive peccant matter. "Reaſon informs us," ſays Sydenham, "If I have any judgment, that a diſeaſe is nothing elſe than a ſtruggle of nature, labouring with all her might to expel the morbific matter for the health of the patient." And, he remarks, in another place, "the inordinate commotion of the blood, which is the cauſe or concomitant of continued fever, is excited by nature, either for the purpoſe of ſeparating ſome heterogeneous matter, contained in and offenſive to it, or in order that the blood may be ſomehow or other altered in its diatheſis." (Loc. cit. cap. 4.) Willis, Floyer, and others, view the ſubject in the ſame light, except that they introduce the *ſpirits* as the agents employed by nature, for the purpoſe of exciting the commotion in the blood. "A fever," ſays Floyer, "is a preternatural fermentation or effervеſcence of the blood, occaſioned by ſome ferment irritating the ſpirits of the blood and nerves, for the diſſolving, or putrefying, and ſeparating ſome part of the cacochymical *ſuccus nutritius* from its mixture with the maſs of humours. (P. 210.) According to the peculiar nature of the cacochymia, or morbific humour, the nature of the fever was ſuppoſed to vary. "It is evident that every perſon has ſome antecedent cacochymia," ſays the ſame writer, "by which the particular ſymptoms of the fever are produced, &c.—The ſeveral ſtages of the diſeaſe are very naturally deſcribed by the ſeparation of the greater or leſs quantity of the ſuccus nutritius from the blood, in the increaſe of the fever, and the *criſis* is a full or perfect ſeparation of all the depraved ſuccus nutritius from the maſs of blood, when the fever is curable, and then the febrile effervеſcence ceaſes; but if the ſuccus nutritius be but in part ſeparated, the maſs of humours remains turbid and undepurated, and the fever becomes fatal." (Floyer, chap. 15. App. i. of Fevers.) When this morbific matter, inſtead of being thrown out by the excretions, as in the caſe of critical diſcharges by diarrhœa, turbid urine, or ſweats, is

“ evacuated upon particular parts, it produces the ſeveral inflammations; as quinſies, apoplexies, lethargies, palſies, pleuriſies, rheumatiſms, colics, which are the ſymptoms of the ordinary intermitting fever, and diſtinguiſh it into its ſeveral ſpecies.” Ibid.

But as *acute*, or febrile diſeaſes, which terminate in a ſhort time, (*e. g.* within the compaſs of fourteen or twenty-one days,) were conſidered as reſulting from this active fermentation, and depuration of the humours; ſo, according to Sydenham, all *chronic* diſeaſes, which run through a long and indefinite period, ariſe from an imperfect digeſtion or fermentation of the offending humours, and the conſequent inability of nature to expel them. “ For when any perſon has on the one hand, the principles of his nature debilitated or worn out, whether by old age, or by great and continual errors of the non-naturals, particularly in reſpect to food and drink; or, when, on the other hand, the organs of ſecretion have been ſo far weakened, as to be unable to depurate the blood, by carrying off its excrementitious and ſuperfluous parts; in theſe caſes, a greater quantity of humours is accumulated than the powers of the individual are capable of digeſting or concocting, which humours, in conſequence of their detention, undergo various degrees of fermentation and putrefaction, until at length they aſſume ſpecific properties, and, according to the variety of depravation, give riſe to various forms of diſeaſe. They alſo fall upon particular parts, which are more diſpoſed to receive them according to their peculiar qualities; and thus ultimately produce the long trains of ſymptoms, which are deſignated by the names of certain diſeaſes, and which vary in relation to the nature of the morbid humour, and to the morbid condition of the part, reſpectively.” Sydenham, Tractat. de Podagra.

It may be inferred, from the long and extenſive prevalence of this humoral pathology, that it was not founded on mere fancy; but that ſomething like ſound obſervation and eſtabliſhed facts could be adduced in ſupport of it: and we have already hinted, that the common occurrence of certain profuſe or altered excretions, towards the termination of febrile diſeaſes, was deemed concluſive evidence of the truth of the hypotheſis. But the doctrine was apparently ſtrengthened ſtill more, where there occurred not a mere increaſe of the ordinary excretions, but the diſcharge of a new and preternatural humour, altogether uncongenial with the healthy blood. Thus, when a tumour formed in any particular part, from the ſuppoſed ſettling of the peccant matter there, an inflammatory commotion or fermentation took place, in conſequence of which, as the morbid matter became concocted, an abſceſs was formed, and the *pus* or *ſanies*, which was at length diſcharged from it, was deemed a proof of the exiſtence of the morbid ferment. In this way the buboes, which occur in the plague,—the abſceſſes in the different glandular, membranous, and muſcular parts,—the eruptions in the ſkin in ſmall-pox, meaſles, &c.—the formation of chalk-ſtones, after inflammatory gout,—and the expectoration of purulent and mucus ſputa, in conſequence of inflammation in the lungs and bronchial paſſages,—all theſe phenomena were believed to be concluſive proofs of the correctneſs of the humoral theory. And a ſtill ſtronger proof appeared to exiſt in the well-known fact, that in ſmall-pox, the plague, &c., the matter thus diſcharged was as completely a *ferment*, when received into the healthy humours of another perſon, as barm or yeaſt, introduced into a caſk of infuſion of malt or grape-juice. But this was not all: a ſort of ocular demonſtration of the exiſtence of a morbid humour in the circulating fluids appeared to be deduced from the condition of the blood, which was drawn from perſons labouring under inflammatory diſeaſes; and which, when it had cooled, exhibited a thick, tenacious *ſize* upon the ſurface of the coagulum, which has been called the *buff* or *buffy-coat* of the blood, and is not found on blood taken away, when no fever is preſent. Some collateral evidence was likewiſe deduced from other phenomena of diſeaſes, and eſpecially from the occaſional occurrence of what is termed a *metaſtaſis*, or the ſudden tranſlation, as it were, of a diſeaſe from one part of the body to another. As this was moſt commonly obſerved to take place between an external and internal part (as the gout, for inſtance, diſappearing on the foot was tranſferred to the ſtomach;—or when an eruption faded on the ſkin, and vomiting or diarrhœa ſucceeded in the alimentary canal); ſo it was concluded, that the efforts of nature to expel the morbific matter had either been too feeble, or had been counteracted by improper treatment, and that the matter had fallen back upon the internal organs, where it excited the new ſtruggle of nature to get rid of it by another channel.

This hypotheſis, however, which is founded upon a coarſe and vulgar analogy between a merely chemical proceſs, and the operations of the living body, could only remain plauſible, ſo long as the nature both of chemical combinations and of the properties of the animal economy had been the ſubject of very limited inveſtigation: upon a more accurate inquiry, we find the points of analogy do not exiſt. The various changes, which take place in the fluids of the living body, do not occur from mere chemical action, as in the caſe of fermentation of the elementary parts upon each other; but ariſe from ſome peculiar action of the veſſels, through which they circulate. Thus, the veſſels of the liver alone elaborate the blood into bile; thoſe of the kidnies form the urine; and thoſe of the teſtes produce the ſeminal liquor. No admixture of the parts of the blood, in any other ſituation, is capable of generating theſe peculiar humours. In a ſimilar manner, the morbid humours are the reſult of certain inordinate and irregular action of the veſſels of particular parts. Thus, when any organ is in a ſtate of inflammation, which, in fact, conſiſts in an undue diſtention and activity of its veſſels, the *pus*, or other matter, which is formed in conſequence, is *generated in the inflamed part*, is the *effect* of the inflammatory action, and is not brought by the circulating blood, and depoſited there, to be the *cauſe* of the inflammation. In ſmall-pox, for example, or meaſles, the contagious matter is not found circulating with the maſs of blood, but is *generated* by the action of the *veſſels of the ſkin*, where alone it appears; if it contaminated the circulating maſs, it would, doubtleſs, be depoſited in the internal parts: but no puſtules were ever found in theſe diſeaſes, in any of the viſcera or internal organs. No ſuch change, as that occaſioned by a ferment, therefore, takes place. This is farther proved by the fact, that by augmenting the action of the cutaneous veſſels, on any particular part of the ſurface, (as by the application of heat, or any ſtimulating ſubſtance); on that particular portion, the quantity of puſtules, in ſmall-pox, will be augmented, and *vice verſâ*. In a word, it appears that, as neither bile, urine, nor ſaliva, is found circulating in the blood, ſo neither is the matter of contagious diſeaſes exiſting there: juſt as in the diabetes *mellitus*, when the kidnies are conſtantly throwing out large quantities of ſaccharine matter, no traces whatever of ſugar, or its elements, can be detected by the chemiſt in the circulating blood.

On the other hand, the inference drawn from the *ſizy cruſt*, which is found upon the coagulum of blood, drawn under the circumſtances of fever, is incorrect. For that *ſize* is ſimply the fibrin or coagulable lymph, which conſtitutes a part of the blood under all circumſtances, and which ſhews itſelf apparently more or leſs according to the leſs or greater rapidity of coagulation; which again is influenced by the force or rapidity of the action of the veſſel from which it flows, or by its manner of flowing: inſomuch that if the blood be received into different veſſels, during the ſame bleeding, the buffy coat will appear on ſome, and not on the others. It may be likewiſe added, that many fevers terminate in health, where no *criſis* or ſenſible diſcharge has preceded recovery.

With regard to the argument deduced from the occurrence of *metaſtaſis*, little can be inferred from it in ſupport of any poſition: the fact is very difficult of explanation by any hypotheſis. It is at leaſt equally eaſy, and conſiſtent with our knowledge of the animal economy, to refer the tranſition of morbid *action* to the communication of certain internal and external parts by nervous ſympathy; as to conceive that a morbid *matter* is mechanically transferred, through the medium of the circulating maſs of fluids, from one organ to another. The exiſtence of a morbific matter is hypothetical; whereas the exiſtence of a ſympathetic connection, through the medium of nerves, is a matter of obſervation and experiment: of which the connection between the ſkin and the alimentary canal may be mentioned as an example. If we excite nauſea or vomiting in the ſtomach, we induce a perſpiration on the ſkin; and by moiſtening the ſurface, we ſpeedily relieve the ſenſation of thirſt, &c. Beſides, there is no proof of the actual tranſlation of the morbid matter, or the ſame form of diſeaſe in caſes of *metaſtaſis*: for, to inſtance gout, we do not find the chalky matter of the hands or feet appearing in the ſtomach, when the diſeaſe is transferred to that organ, but what is inflammation on the ſurface, is commonly ſpaſm in the ſtomach; and, on the principle of nervous ſympathy, the identity of the diſeaſes, thus excited in diſtant parts, is not a neceſſary ſuppoſition.

The arguments for the contrary doctrine, which refer the phenomena of life, whether in a ſtate of health or diſeaſe, to the agency of the nervous energy or ſenſorial power, reſident in the living ſolids, and to the various action of the moving fibres, have been deduced from a long ſeries of obſervations and experiment. See LIFE, EXCITABILITY, &c.

The pernicious reſults of the practice, however, to which this humoral pathology led its advocates, afford an additional refutation of its principles. The doctrine, that nature inſtituted all morbid actions, for the purpoſe of expelling from the conſtitution certain offenſive and dangerous matter, either conduced, on the one hand, to ſanction a very feeble and inert practice, leſt the ſalutary operations of nature ſhould be impeded or deranged; or, on the other, to enforce an active practice, by which it was intended to aid and co-operate with nature in her ſuppoſed two-fold endeavours, firſt to concoct or duly ferment the morbific matter, which annoyed her, and ſecondly, to expel it by the proper emunctories. Of theſe two practical ſyſtems, the firſt, or *la medécine expectante*, as the French have emphatically called it, is, doubtleſs, the leaſt miſchievous. It conſiſted in doing nothing, with the appearance of doing ſomething; and, therefore, obtained the confidence of the patient, and tranquillized his mind, which conſtitutes one ſtep towards a cure. The remedies conſiſted of what have been termed demulcents, diluents, humectants, &c. or aqueous liquors, with various vegetable mucilages, ſugars, and ſtarches, all abundantly harmleſs in their qualities, and certainly not interfering with any proceſs of the conſtitution, whether ſalutary or deleterious. But if this be the higheſt reach of the medical art, (which, indeed, is rather the rejection of all art,) to what purpoſe have the ſtudies of ſcientific men been directed, the ſtructure and functions of the human body been inveſtigated, and a particular claſs of mankind devoted to the practice of medicine? *La medécine expéctante* is ſurely the weakeſt of all empiriciſm.

It has always been a popular doctrine, and it is one that carries a great deal of plauſibility in the face of it, that the main object, and the ſum total of the powers of medicine, conſiſt in aiding the natural efforts of the conſtitution for the removal of diſeaſes. But this propoſition requires conſiderable qualification. If it be merely meant, that medicine can only operate through the medium of the powers or energies of the living body, and that, independently of theſe vital energies, medicine has no operation, the poſition is a *truiſm* which cannot be queſtioned. But if it be meant, that the ſole power and object of the medical art are limited to the furthering of all morbid excitement, and to the removal of obſtacles to the completion of the purpoſes of that excitement; *i. e.* to aſſiſting the efforts of nature or guarding them from interruptions, the aſſertion appears to be altogether gratuitous, and nothing leſs than an abuſe of language. In the firſt place, it is founded on the aſſumption, that all diſeaſed action is ſalutary; which the effects of numerous diſeaſes directly contradict, and which has no better foundation than two other gratuitous aſſumptions, namely, the exiſtence of a morbid ferment in the blood, and of an *archeus*, or rational ſoul, governing all the operations of the animal economy. But, ſecondly, admitting the ſalutary tendency of diſeaſed actions, conſidered as the efforts of nature, by what ſigns are we to interpret her intentions, or to diſcover when ſhe requires aſſiſtance, and when reſtraint? On this point the greateſt practical errors are likely to be committed, and have, in fact, been conſtantly and extenſively committed, by thoſe humoral pathologiſts, who have preſumed upon their knowledge of the intentions of nature. Had they been unbiaſſed obſervers of nature's indications, they would have attended, probably, to the ſuggeſtions of thoſe ſenſations and inſtinctive feelings in the ſick, which are generally deemed ſufficient directions to the healthy, and which appear to be the univerſal guides to the phyſical conduct of the whole animal creation. They would have allowed the thirſty to drink, the hot to be cooled; and would have attempted to relieve the various painful ſenſations, according to the cravings which they ſuggeſted. But their practice was commonly the very reverſe of this: for they deduced their inferences, not from theſe unequivocal guides, but from their *hypothetical* conceptions of the proceedings of nature. Their own proceedings, therefore, were directed to encourage the increaſe of the diſeaſe. Thus in all fevers, even in thoſe where there was conſiderable inflammatory affection of the whole ſkin, (as in ſmall-pox,) they accumulated the heat of the patient, already almoſt intolerable, with a view to perfect the fermentation or concoction, which they ſuppoſed nature was labouring to accompliſh; and hence they rendered mild fevers ſevere, and ſevere ones certainly fatal. At the ſame time, they ſtimulated the action of the heart and arteries, by cordial, volatile, and aromatic medicines, and by heat conveyed internally in the drink, and thus ſtill farther multiplied the evil. And it was particularly unfortunate for the patient, and for medicine, that this augmentation of the original diſeaſe, (as in the increaſe of the eruption in ſmall-pox, ſcarlet fever, &c.) and even the actual excitement of new diſeaſes, (as in the miliary eruption over the ſkin, which this heating practice frequently produced in all fevers,) were conceived by theſe pretended interpreters of nature, to be nothing leſs than new and ocular proofs of the truth of their doctrine, and of the efficacy of their practice! They had *brought out* the morbid matter! But the multitudes who periſhed notwithſtanding this happy event, but too fully demonſtrated that both nature and art were guilty of perpetual miſtakes. The ſagacious Sydenham, although under the influence of the humoral pathology, detected the fallacy of the heating and concocting practice, in reſpect to the cure of ſmall-pox, while his contemporaries continued to be the ſlaves of hypothetical error. But it remained for the preſent age, not only to eſtabliſh the practice, which he ſuggeſted, but to extend it to all febrile diſeaſes, and to purſue it to a degree far beyond any conception which he had formed upon the ſubject.

It cannot be doubted, that one of the greateſt improvements ever made in the medical art, is the diſcovery of the circumſtances, under which a free application of *cold* may be made in febrile diſeaſes, aided by the early uſe of purgatives, and the removal of every other ſpecies of irritation on the living ſolid, which conſtitute what has been called the antiphlogiſtic plan of treatment. For the eſtabliſhment of this practice, in regard to the free uſe of cold, upon clear and philoſophical grounds, we are principally indebted to the late Dr. Currie of Liverpool. So far from experiencing any injury or danger from not encouraging the ſuppoſed concoction, or from repelling the morbid matter, it is aſcertained, by innumerable obſervations, that it is moſt ſalutary to reduce the temperature of the ſurface of the body, in the height of the eruptive fever of ſcarlatina, for inſtance, and that this otherwiſe formidable diſeaſe may be thus cut ſhort in its duration, mitigated in its ſeverity, and conducted mildly to a ſafe termination. (See Cold, *as a remedy:* alſo Heat, Fever, and *Scarlet* Fever.) In a word, it is now aſcertained, that that practice, in febrile diſeaſes, which is founded on the principle of removing or diminiſhing the excitement of the ſenſible and irritable ſolids, and thus of leſſening the increaſed action of the veſſels, generally and locally, without any reference to a peccant ſtate of the humours, is attended with a degree of ſucceſs, not to be compared with that of the humoral pathologiſts; and that man is more correctly treated as a being poſſeſſed of ſenſorial powers, than as a barrel of fermenting fluids.

It were unneceſſary to enter into other practical abſurdities of the humoraliſts; ſuch as the frequent letting of blood, even in chronic diſeaſes, upon the ſuppoſition that the morbific matter, which is believed to contaminate the whole circulating maſs, ſhould be all diſcharged with the ſmall portion of this fluid, that eſcapes through the orifice made by the lancet, and leave the remaining maſs thoroughly depurated;—the uſe of purgatives on the ſame principle:—the interdiction of purgatives in the early ſtage of febrile diſeaſes, becauſe the peccant matter is ſuppoſed to be yet in a crude or unconcocted ſtate;—and laſtly, the numberleſs farragos of uſeleſs and inert herbs, mixed together upon ſome fanciful notion of their properties for correcting various modifications of *cacochymia*, which they conſtantly preſcribed in chronic maladies; the qualities both of the bane and antidote, the morbid humour and its corrector, being equally gratuitous and hypothetical.

We have ſaid nothing on the ſubject of that humoral theory, which referred diſeaſes to the two oppoſite conditions of the fluids, the *acid* and the *alkaline* cacochymia, upon which Boerhaave and ſome others reaſoned with conſiderable ingenuity: for this doctrine was never generally received; and, except in ſo far as the contents of the ſtomach and firſt paſſages exhibited a tendency to one or other of theſe qualities, according to the modifications of indigeſtion, it is obviouſly founded in miſapprehenſion: (ſee Boerhaave, Praxis Medica, vol. i. p. 122. et ſeq.) and further, as Dr. Cullen remarks, it is not conſiſtent with what Boerhaave himſelf has delivered elſewhere. (Firſt Lines, pref. p. xxx.) The doctrine of a *ſpontaneous gluten* in the blood, inculcated by that celebrated author, (*loc. cit.* p. 145.) is alſo gratuitous. Some of the proofs adduced for its exiſtence are manifeſtly founded on a miſtake with reſpect to what has been called the buffy coat, or inflammatory cruſt; and the many examples given by Boerhaave of a *gluten* appearing in the human body, are all of them nothing more than inſtances of collections or concretions, found out of the courſe of the circulation.

To conclude with the words of Dr. Cullen, although the fluids of the human body may undergo various changes, we muſt "maintain that the nature of theſe changes is ſeldom underſtood, and more ſeldom ſtill is it known when they have taken place; that the reaſonings concerning them have been, for the moſt part, purely hypothetical; have therefore contributed nothing to improve, and have often miſled, the practice of phyſic. In this, particularly, they have been hurtful, that they have withdrawn our attention from, and prevented our ſtudy of, the *moving powers* of the animal ſyſtem, upon the ſtate of which the phenomena of diſeaſes do more certainly and generally depend." Firſt Lines, pref. p. xxxii.

HUMORISTS, *gli* Humoristi, the title of a celebrated academy of learned men at Rome. See Academy *of Humoriſts.*

HUMOROSI, the name of an academy eſtabliſhed at Cortona in Italy.

The Humoroſi of Cortona muſt not be confounded with the Humoriſti of Rome.

HUMOUR, or Humor, in its general ſenſe, ſignifies the ſame as liquor, or liquid.

Humour, in *Medicine*, is applied to any fluid part of the animal body, as to the blood, bile, mucus, ſerum, ſaliva, &c. as well as to the pus, ſanies, &c. which reſult from diſeaſe. The ancient phyſicians, and after them the moderns down to a late period, conſidered health and diſeaſe as ariſing from a due proportion or diſproportion of *four* humours in the body; namely, of blood, phlegm, yellow bile, and black bile. (See Galen.) This doctrine, reſpecting the origin and nature of diſeaſes, as dependent altogether on the ſtate of the *humours* of the body, has been denominated the Humoral *Pathology*; which ſee.

Humours *of the Eye.* Anatomiſts and opticians diſtinguiſh three particular humours of the eye (ſee Eye); which they call the aqueous, cryſtalline, and vitreous.

Theſe three humours have each their ſhare in the refraction of the rays of light neceſſary to viſion.

Authors, both ancient and modern, ſpeak of the regeneration of the humours of the eye; and give us inſtances of their reproduction, when, by any accident, they had been let out; but their inſtances, ſtrictly conſidered, generally go no farther than to the aqueous and vitreous humours.

Borri only, in a letter to Bartholine, ſays as much of the cryſtalline. He affirms, that he has ſlit the pupil of the eye of divers animals, and ſqueezed out all the humours, even the cryſtalline, and has afterwards perfectly reſtored them again to ſight; and that the eyes of the birds, whereon the operation had been performed, inſtead of being damaged thereby, were rendered more lively and vigorous than uſual. He adds, that he had performed the ſame experiment on divers perſons, with ſo much ſucceſs, that there remained not the ſmalleſt appearance of a cicatrix in the eye. See Cataract.

HUMOUR is alſo uſed, in *Dramatic Poetry*, for a ſubordinate ſpecies of what the critics call manners.

Humour is uſually looked on as peculiar to the Engliſh drama, at leaſt our comic poets have excelled therein, and carried it beyond thoſe of any other nation; and our's is, perhaps, the only language that has a name for it. The nature of ſuch a free government as our's; and that unreſtrained liberty which our manners allow to every man, of living entirely after his own taſte, afford full ſcope to the diſplay of ſingularity of character, and to the indulgence of humour in all its forms. Hence comedy has a more ample field, and can flow with a much freer vein in Britain than in France, where a much greater uniformity has been ſpread, at leaſt in former times, over the outward behaviour and characters of men, by the influence of a deſpotic court, ſubordination of ranks, and the rigid obſervance of the forms of politeneſs and decorum. As to our Engliſh dramatiſts, who does not acknowledge the tranſcendent excellence of Shakſpeare in the province of humour? Of the later comic writers, Congreve has an exuberance of wit, but Farquhar has more humour. It has been obſerved, however, with too much truth, that, to the diſcredit of our ſtage, as well as of the national delicacy and diſcernment, obſcenity has too often in Engliſh comedy been made to ſupply the place of wit, and ribaldry the place of humour. It ſhould be acknowledged at the ſame time, that a conſiderable reformation has taken place in this reſpect.

Humour is uſually conſidered by critics as a fainter or weaker habitual paſſion peculiar to comic characters, as being chiefly found in perſons of a lower degree than thoſe proper for tragedy.

Every paſſion may be ſaid to have two different faces; one that is ſerious, great, formidable, and ſolemn, which is for tragedy, and another that is low, ridiculous, and fit for comedy; which laſt is what we call its humour.

Wit only becomes few characters; it is a breach of character to make one half the perſons in a modern, or indeed in any comedy, talk wittily and finely; at leaſt at all times, and on all occaſions. To entertain the audience, therefore, and keep the dramatic perſons from going into the common, beaten, familiar ways and forms of ſpeaking and thinking, recourſe is had to ſomething to ſupply the place of wit, and divert the audience, without going out of character; and this end is attained by humour; which therefore is to be looked on as the true wit and humour.

A very good judge, the duke of Buckingham, makes humour, to be all in all; wit, according to him, ſhould never be uſed, but to add an agreeableneſs to ſome proper and juſt ſentiment, which, without ſome ſuch turn, might paſs without its effect.

HUMOUR, or *continued wit*, in *Oratory*, is a certain ſprightlineſs and vivacity of thought, which runs through a diſcourſe, and ſhews itſelf in agreeable images, beautiful turns, and a facetious manner of expreſſion, ſuited to the ſubject, and affecting the hearers with pleaſure and delight, though not to that degree as to excite laughter, or any great emotion of the paſſions.

The nature and efficacy of humour are unravelled by Dr. Campbell, in his "Philoſophy of Rhetoric," in the following manner. A juſt exhibition of any ardent or durable paſſion, excited by ſome adequate cauſe, inſtantly attaches ſympathy, the common tie of human ſouls, and thereby communicates the paſſion to the breaſt of the hearer. But when the emotion is either not violent or not durable, and the motive not any thing real, but imaginary, or at leaſt quite diſproportionate to the effect; or when the paſſion diſplays itſelf prepoſterouſly, ſo as rather to obſtruct than to promote its aim; in theſe caſes a natural repreſentation, inſtead of fellow-feeling, creates amuſement, and univerſally awakens contempt. The portrait in the former caſe we call "pathetic," in the latter "humorous." The paſſion which humour addreſſes as its object is contempt; and the ſubject of humour is always character, but not every thing in character; its foibles, generally, ſuch as caprices, little extravagancies, weak anxieties, jealouſies, childiſh fondneſs, pertneſs, vanity, and ſelf-conceit. In expreſſing paſſion as it appears in the more trivial occurrences of life, we commonly uſe this term, as when we talk of good humour, ill humour, peeviſh or pleaſant humour; hence it is that a capricious temper we call humourſome, the perſon poſſeſſed of it a humoriſt, and ſuch facts or events as afford ſubject for the humorous, we denominate comical. Accordingly, the term humour is uſed to expreſs any lively ſtrictures of ſuch ſpecialities in temper and conduct, as have neither moment enough to intereſt ſympathy, nor incongruity enough to excite contempt. In this caſe humour, not being addreſſed to paſſion but to fancy, muſt be conſidered as a kind of moral painting, and differs from wit only in theſe two things; firſt, in that character alone is the ſubject of the former, whereas all things whatever fall within the province of the latter; ſecondly, humour paints more ſimply by direct imitation, wit more variouſly by illuſtration and imagery. Of this kind of humour, merely graphical, Addiſon hath given us numberleſs examples in many of the characters he hath ſo finely drawn, and little incidents he hath ſo pleaſantly related in his Tatlers and Spectators. We might remark of the word *humour*, as well as of the term *wit*, that we ſcarcely find in other languages a word exactly correſponding. The Latin *facetiæ* ſeems to come the neareſt. Thus Cicero, "Huic generi orationis aſpergentur etiam ſales, qui in dicendo mirum quantum valent; quorum duó genera ſunt, unum facetiarum, alterum dicacitatis; utetur utroque, ſed altero in narrando aliquid venuſté, altero in jaciendo mittendoque ridiculo; cujus genera plura ſunt." Orator. 48. Here one would think, that the philoſopher muſt have had in view the different provinces of wit and humour, calling the former *dicacitas*, and the latter *facetiæ*: nevertheleſs theſe two words are often confounded both by him and other Latin authors.

Mr. Pope, in the ſecond Canto of his "Rape of the Lock," has furniſhed us with an inſtance of wit and humour combined, where they reciprocally ſet off and enliven each other;

"Whether the nymph ſhall break Diana's law,
Or ſome frail China jar receive a flaw,
Or ſtain her honour, or her new brocade;
Forget her prayers, or miſs a maſquerade;
Or loſe her heart, or necklace at a ball;
Or whether heaven has doom'd that Shock muſt fall."

This is humorous, as it is a lively ſketch of the female eſtimate of miſchances, as our poet's commentator rightly terms it, marked out by a few ſtriking lineaments. It is likewiſe witty, for not to mention the play on words like a trope familiar to this author, you have here a compariſon of a woman's chaſtity to a piece of porcelain—her honour to a gaudy robe—her prayers to a fantaſtical diſguiſe—her heart to a trinket;—and all theſe together to her lap-dog, and that founded on one lucky circumſtance, (a malicious critic would perhaps diſcern or imagine more,) by which theſe things, how unlike ſoever in other reſpects, may be compared, the impreſſion they make on the mind of a fine lady. Hudibras abounds in all the varieties of wit, nor is his poem deſtitute of humour, exhibited in the characters of the knight and his ſquire, and more eſpecially in the conſultation of the lawyer, part iii. canto 3. But there is perhaps no book in any language, in which the humorous is carried to a higher pitch of perfection, than in the adventures of the celebrated knight of La Mancha.

Humour, ſays Dr. Campbell, when we conſider the contrariety of its effects, contempt and laughter, (which conſtitute what in one word is termed *deriſion*,) to that ſympathy and love, often produced by the pathetic, may in reſpect of theſe be aptly compared to a concave mirror, when the object is placed beyond the focus: in which caſe it appears by reflection, both diminiſhed and inverted, circumſtances which happily adumbrate the contemptible and the ridiculous.

Humour, *Cryſtalline, Diſeaſe, and Opacity of.* See Cataract.

HUMP, in *Geology*, is applied by Dr. Townſon and others to expreſs a ſudden riſing or bump in the terreſtrial ſtrata, in ſome inſtances, called ridges, horſe-backs, &c. by practical miners. It ſeems probable, that many denudated patches of ſtrata, like the limeſtone of *Crich*, (ſee that article,) in Derbyſhire, Breedon, and Cloud's-hill, in Leiceſterſhire, Dudley Caſtle, Wren's-neſt, and other adjacent hills in or near Staffordſhire, &c. owe their origin to humps previouſly exiſting in the ſtrata, thus locally expoſed by the denudating or carrying off the thinner parts of the ſuperincumbent ſtrata, which covered theſe ſudden limeſtone hills.

Hump, *Naked, North-weſt, South*, and *South-eaſt*, in *Geography*, ſmall iſlands in the Mergui Archipelago, in N. lat. 10° 23′—10° 19′—10° 9′,—and 10° 12′, reſpectively.

HUMPH, in *Mining*, ſignifies, in ſome parts of Scotland, a blind or foul ſort of coal, of little value.

HUMPHREY, Pelham, in *Biography*, was brought up with Blow and Mich. Wiſe, in the Chapel Royal, under Capt. Cook, who was appointed maſter of the children at the Reſtoration. When Humphrey loſt his treble voice, he was admitted in 1666 a gentleman of his majeſty's chapel, and on the death of Capt. Cook, 1672, was appointed maſter of the children. He did not, however, long fill this honourable ſtation, as he died, very much regretted, at the early age of twenty-ſeven, in 1674.

His choral compoſitions are numerous for ſo ſhort a life; as, beſides his ſeven full and verſe anthems, printed by Dr. Boyce, there are five preſerved in ſcore by Dr. Aldrich, in Chriſt-church, Oxford; and ſix in Dr. Tudway's collection, Britiſh Muſeum, that have never been printed.

As French muſic was much better known in England during the reign of king Charles II. than Italian, there are in the melody of this compoſer, and in that of Purcell, paſſages which frequently remind us of Lulli, whom king Charles pointed out to his muſicians as a model. Indeed, it is ſaid that Humphrey was ſent to Paris by the king, in order to ſtudy under Lully; and that, beſides his merit in compoſition, he was an excellent performer on the lute. Indeed, he ſeems to have been the firſt of our eccleſiaſtical compoſers who had the leaſt idea of muſical pathos in the expreſſion of words, implying ſupplication or complaint.

His anthem for three voices, "Have Mercy upon me O God," has great merit on the ſide of expreſſion, for the time in which it was compoſed, as well as harmony, in which there are ſeveral combinations that ſeem new and boldly hazarded for the firſt time, at leaſt in choral muſic.

In his verſe anthems many new effects are produced by modulation and notes of taſte and expreſſion.

The favourite interval in the melody of this compoſer is the falſe 5th, and, if it be true, as related by Dr. Boyce, that Humphrey ſtudied under Lulli at Paris, he probably acquired his partiality for this interval there, as it has long been in great favour in the ſerious French opera.

It is ſomewhat remarkable, that all the ſeven-verſe anthems which Dr. Boyce has inſerted in his collection, by this plaintive compoſer, ſhould be in flat keys; moſt of them in C and F minor, which are much out of tune on the organ by the uſual temperament of that inſtrument; however, if well ſung, theſe crude chords may add to the melancholy caſt of the compoſitions.

HUMPHREYS, Laurence, was born at Newport Pagnell, Bucks, about the year 1527. He was educated partly at Cambridge, and partly at Oxford. In 1549 he was admitted to the degree of B.A. and was elected fellow of Magdalen college, Oxford. In the year 1555 he obtained the permiſſion of his college to travel for improvement for a year, on condition that he ſhould avoid heretical company and places. This licence furniſhed him with means of withdrawing from the reach of queen Mary's perſecution, and of purſuing his religious enquiries in company with men whoſe opinions were congenial with his own. He therefore wiſely ſtaid abroad till the death of the queen rendered his return ſafe. Upon his arrival in England, he was reſtored to his fellowſhip, which had been taken from him for his diſobedience to the injunctions of the licence which had been granted him; in 1560 he was appointed the queen's profeſſor of divinity at Oxford, and in the following year he was elected preſident of his college. He ſuffered a ſhort impriſonment for refuſing to take the ſacrament in a kneeling poſture, and though he was ſoon ſet at liberty, yet he got no preferment till he ſurmounted thoſe ſcruples which amounted to non-conformity. After this he was created dean of Glouceſter, and in 1580 he was removed to the deanery of Wincheſter, which was the higheſt preferment to which he ever attained. He died in 1590. His writings are very numerous, among which the following may be noticed: "Epiſtola de Græci literis et Homeri Lectione et Imitatione:" "De Religionis conſervatione et reformatione deque primatu Regum:" "De ratione interpretandi Auctores:" "Optimates ſive de nobilitate, ejuſque antiqua Origine:" the Life of biſhop Jewel, and ſermons. Dr Humphreys was a great and general ſcholar, an able linguiſt, and a deep divine.

HUMPHRIES, John, a young Engliſh muſician of promiſing abilities, and a good performer on the violin, publiſhed, before he was twenty years of age, ſix ſolos for that inſtrument, which manifeſted more genius than experience. However, they were well received by dilettanti performers, from being natural and eaſy. His ſucceſs in that publication encouraged him to further attempts, and in the year 1728 he publiſhed, by ſubſcription, twelve ſonatas for two violins and a baſe, which had ſome originality and agreeable imitations of Corelli, that made them the delight of muſical clubs and provincial concerts in our own memory.

Humphries died about the year 1730, and left in MS. twelve concertos on Corelli's model, which were printed after his deceaſe, by Cooke, muſic-ſeller, in New-ſtreet, Covent Garden; but the more fanciful works of Vivaldi, Alberti, Teſſareni, and Albinoni, being in circulation, and the

the more ſolid productions of Handel and Geminiani having refined our taſte, the poſthumous work of poor Humphries followed him down the ſtream of Oblivion, unnoticed by the inhabitants of Earth.

HUMPOLETZ, in *Geography*, a town of Bohemia, in the circle of Czazlau; 8 miles S.W. of Teutſch-Brod.

HUMPPILA, a town of Sweden, in the province of Tavaſtland; 30 miles W. of Tavaſthus.

HUMULUS, in *Botany*, the Hop. This name is derived by Linnæus from *humus*, moiſt earth, ſuch as the plant in queſtion prefers; but however ingenious this explanation may be, it appears that *Humulus* originated by corruption from *Humela*, a barbarous Latin word, of one common origin with *Umula*, or *Humle*, under which appellations, or ſomething like them, the hop is known amongſt various nations of the north.—Linn. Gen. 522. Schreb. 689. Willd. Sp. Pl. v. 4. 769. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 1077. Juſſ. 404 Lamarck. Illuſtr. t. 815. (Lupulus; Gærtn. t. 75.)—Claſs and order, *Dioecia Pentandria*. Nat. Ord. *Scabridæ*, Linn. *Urticæ*, Juſſ.

Gen. Ch. Male, *Cal.* Perianth of five, oblong, concave, obtuſe leaves. *Cor.* none. *Stam.* Filaments five, capillary, very ſhort; anthers oblong, burſting by a pore on each ſide, at the ſummit.

Female, *Cal.* the ſcales of a catkin, ovate, large, tubular at the baſe, each containing two flowers, and at length ſcarioſe, permanent. *Cor.* of one petal, ſmall, obtuſe, lateral, enfolding the germen of each flower on one ſide. *Piſt.* Germen ſmall, roundiſh, compreſſed; ſtyles two, very ſhort; ſtigmas long, awl-ſhaped, downy. *Peric.* none, except the permanent ſcales and corolla. *Seed* one, roundiſh, with a ſpiral embryo.

Eſſ. Ch. Male, Calyx of five leaves. Corolla none. Anthers with two pores at the ſummit.

Female, Calyx the ſcales of a catkin, two-flowered. Corolla of one petal, lateral. Styles two. Seeds ſolitary, inveſted with the corolla.

1. H. *Lupulus*, the only ſpecies of this very natural and diſtinct genus. Linn Sp. Pl. 1457. Engl. Bot. t. 427. Mill. Illuſtr. t. 88. Bulliard. t. 234.—Native of hedges and buſhy places in a moiſt deep ſoil, in various parts of Europe, as well as in North America, bloſſoming in July. The *roots* are perennial, branching. *Stems* annual, twining, angular, rough, with deflexed prickles, leafy. *Leaves* oppoſite, ſtalked, heart-ſhaped, undivided or three-lobed, often five-lobed, ſerrated, veiny and harſh. *Footſtalks* ſtrong, angular, prickly. *Stipulas* between the footſtalks, reflexed, ovate, entire, ſmooth. *Flowers* green; the males panicled, numerous; females on a ſeparate plant, in axillary, ſtalked, ovate, drooping catkins, of an aromatic ſcent, and bitter narcotic quality.

Humulus, in *Gardening*, comprizes a well-known plant of the more hardy, twining, perennial kind; of which the ſpecies is the cultivated hop (H. lupulus.)

There are plants of this kind which bear only male flowers, that grow in long cluſters; and others which bear female flowers only, that are produced in roundiſh, ſcaly, and leafy cluſters. The latter is the ſort moſtly grown; and which is diſtinguiſhed into the early white, the long white, the oval, and the ſquare garlic hop.

The hop-plant is principally grown in gardens, for the ornament and variety which it affords by twiſting round different kinds of ſupport to a very conſiderable height.

Method of Culture.—The hop is a plant which is uſually increaſed by planting portions of the ſuckers taken from the roots of the old ſtocks. They are commonly cut ſix or ſeven inches in length, each having three or four eyes or buds to throw out ſhoots from. And ſuch as are of proper ſorts ſhould conſtantly be ſelected for this purpoſe, removing from each ſet every part of the old vine, as well as every portion that is hollowed or decayed in any way. The ſets may be planted out in the autumn in any open place where the ground is well prepared and in a mellow condition.

The hop may alſo be raiſed by laying down the young ſhoots in the ſummer ſeaſon, taking off their tops at the time the work is performed. Theſe ſoon ſtrike root, and form ſets for uſe in the enſuing ſpring. See Hop.

Hop clumps have a good effect in many caſes, in large gardens or pleaſure grounds.

HUMUS, in *Natural Hiſtory*, a term formerly uſed for the decayed vegetable and mineral mixtures, more commonly known by the name of virgin mould, and forming the ſuperficial cruſt of the earth. Parkinſon's Organic Remains, vol. i. p. 83.

HUN, in *Geography*, a town of Africa, in Fezzan; 20 miles N. of Mourzouk.

HUNARY, two ſmall iſlands near the W. coaſt of Hindooſtan; 85 miles S. of Bombay. N. lat. 18° 47'. E. long. 72° 38'.

HUNAULD, Francis Joseph, in *Biography*, an eminent anatomiſt and phyſician, was born at Chateau-Briant, in February 1701. His father was a phyſician, and practiſed at St. Malo. He ſtudied firſt at Rennes, and afterwards at Angers and Paris, and received the degree of M. D. at Rheims in 1722. On his return to Paris he ſtudied anatomy and ſurgery with great aſſiduity, under the celebrated teachers Winſlow and Du Verney, and was admitted into the Academy of Sciences in 1724. Having been honoured with the appointment of phyſician to the duke of Richelieu, he accompanied that nobleman in his embaſſy to the court of the emperor Charles VI. at Vienna, and ever afterwards retained his entire confidence, and had apartments in his houſe. On the death of Du Verney, in 1730, Hunauld was appointed his ſucceſſor, as profeſſor of anatomy in the king's garden, where he ſoon acquired a reputation little ſhort of that of his predeceſſor, and found the ſpacious theatre overflowing with pupils. Having been admitted a member of the faculty of medicine of Paris, he practiſed his profeſſion with great ſucceſs, and attracted the notice of the court. He took a journey into Holland, where he became acquainted with the celebrated Boerhaave, with whom he ever afterwards maintained a friendly correſpondence; and, in 1735, he viſited London, where he was elected a member of the Royal Society, at one of the meetings of which he read ſome "Reflections on the Operation for Fiſtula Lacrymalis," which were printed in the Tranſactions. He was cut off in the vigour of life by a putrid fever, in December 1742, being in his forty-ſecond year. The greater part of his writings conſiſt of papers, which were publiſhed in various volumes of the memoirs of the Academy of Sciences, between the years 1729 and 1742 incluſive. Oſteology was a favourite ſubject of his enquiry, and ſome of the moſt curious of his obſervations relate to the formation and growth of the bones of the ſkull. He likewiſe traced with great accuracy the lymphatics of the lungs to the thoracic duct, and the progreſs of ſome of the nerves of the thoracic viſcera. He publiſhed anonymouſly, in 1726, a critique, in the form of a letter, on the book of Petit, relative to the diſeaſes of the bones, which occaſioned ſome controverſy, and received the formal diſapproval of the academy. Hunauld had collected a conſiderable anatomical muſeum, which was eſpecially rich in preparations illuſtrative of oſteology and the diſeaſes of the bones, and which came into the poſſeſſion of the academy after his death. Eloy Dict. Hiſt. Gen. Biog.

HUNBERGS, in *Geography*, a town of Denmark, in North Jutland; 8 miles S.W. of Aalborg.

HUNDERBUHL, a town of Tranſylvania; 12 miles S. of Scheſburg.

HUNDRED, Centum, *Cent.* the number of ten times ten or the ſquare of ten.

The place of hundreds makes the third in order in the Arabic numeration.

We uſually expreſs the proportion of the profits made in the way of commerce. &c. by the hundred.

Hundred *of Lime*, a denomination of meaſure, in ſome places denoting 35, and in others 25 heaped buſhels or bags of lime.

Hundred, in denomination of weights, of books is 104lb. avoirdupoiſe = .9285715 great cwts. (112) = .8684646 long cwts. (120.)

Hundred *of Coals*, at Aſbourn, in Derbyſhire, &c. = 128lb. = 8 ſtone of 16lb. = 1.142857 great cwts. = 1.0666 long cwts.

Hundred *of Ling, Cod, &c.* = 124lb. = 1.107143 great cwts. = 1.03333 long cwts.

Hundred, *Great*, or *Standard*, = 112lb. avoirdupoiſe = 112lb. = 4 quarters = 7 ſtone (of 16lb.) = 8 ſtone horſeman's, (of 14lb.) = 14 ſtone, London (8lb.) = 14 cloves (8lb.) = 16 cloves (7lb.) = 1792 ounces avoirdupoiſe = 20,672 drams = .93333 long cwts. (120lb.) = 103lb. 2½oz. Dutch Scotch weight. This is the legal hundred-weight of the cuſtom-houſe in London, and all the ſouthern parts of England.

Hundred, *Long*, or *Northern*, = 120lb. = $8\frac{4}{7}$ ſtones (14lb.) = 12 rationes (10lb.) = 1.0714286 great cwts. (112lb.) This is the hundred-weight legalized on all or moſt of the canals and navigable rivers in the north of England, and of the midland counties; by their acts for collecting tolls, &c.

Hundred is alſo uſed as a meaſure to expreſs a certain quantity or number of things. A hundred of ſalt at Amſterdam is fourteen tuns.

Deal boards are ſold at ſix ſcore to the hundred, called the *long* hundred. Pales and laths are counted at five ſcore to the hundred, if five feet long; and ſix ſcore if three feet long.

Hundred *Weight*, or the great hundred. See Quintal.

Hundred, *Docimaſtic.* See Centner.

Hundred, *Hundredum, Centuria*, is alſo a part or diviſion of a ſhire or county. It was ſo called, according to ſome, becauſe each hundred found a hundred fidejuſſors, or ſureties of the king's peace, or a hundred able men of war.

Others rather think it to have been ſo called, becauſe originally compoſed of a hundred families. It is true, Brompton tells us, that a hundred contains *centum villas*; but then Giraldus Cambrenſis writes, that the iſle of Man hath three hundred and forty-three villas. In both theſe places the word *villa* muſt be taken for a country family; for it cannot mean a village, becauſe there are not above forty villages in that iſland.

So, where Lambard tells us, that a hundred is ſo called, *a numero centum hominum*, it muſt be underſtood of a hundred men who are heads and chiefs of ſo many families. Hundreds were firſt ordained, or rather introduced, by king Alfred, the twenty-ninth king of the Weſt Saxons: "Alfredus rex (ſays Lambard, verbo *centuria*) ubi cum Guthruno Dano fœdus inierat, prudentiſſimum olim a Jethrone Moiſi datum ſecutus concilium, Angliam primus in ſatrapias, centurias, et decurias partitus eſt. Satrapiam, ſhyre, a *Scyrian* (quod partiri ſignificat) nominavit, centuriam *hundred*; et decuriam teothing ſive tienmantale; *i. e.* decemviralo collegium, appellavit; atque iiſdem nominibus vel hodie vocantur, &c." See County and Tithing.

We have already ſaid that the inſtitution of hundreds was rather introduced than invented by Alfred. For they ſeem to have obtained in Denmark; and we find that in France a regulation of this ſort was made above 200 years before; ſet on foot by Clotharius and Childebert, with a view of obliging each diſtrict to anſwer for the robberies committed in its own diviſion. Theſe diviſions were, in that country, as well military as civil; and each contained 100 freemen, who were ſubject to an officer called the *centenarius*; a number of which *centenarii* were themſelves ſubject to a ſuperior officer called the *count* or *comes*. (Monteſq. Sp. Laws. 30. 17.) And indeed ſomething like this inſtitution of hundreds may be traced back as far as the ancient Germans, from whom were derived the Franks, who became maſters of Gaul, and the Saxons who ſettled in England; for both the thing and the name, as a territorial aſſemblage of perſons, from which afterwards the territory itſelf might probably receive its denomination, were well known to that warlike people. "Centeni ex ſingulis pagis ſunt, idque ipſum inter ſuos vocantur; et quod primo numerus fuit, jam nomen et honor eſt." Tacitus de Mor. Germ. 6.

Such is the original of hundreds, which ſtill retain the name, though the juriſdiction be devolved to the county-court; ſome few excepted, which have been by privilege annexed to the crown, or granted to ſome great ſubject, and ſo remain ſtill in the nature of a franchiſe.

This has been ever ſince the ſtat. 14 Edw. III. whereby theſe hundred courts, formerly farmed out by the ſheriff to other men, were all, or moſt part, reduced to the county-court, and ſo remain at preſent; ſo that where we read now of hundred-courts, they are to be underſtood of ſeveral franchiſes, wherein the ſheriff has nothing to do by his ordinary authority, except they of the hundred refuſe to do their office. See *Hundred* Court.

If any homicide be committed, or dangerous wound given in the day-time, and the offender eſcape, the town ſhall be amerced. And if out of a town the hundred ſhall be amerced. (2 Hawk. 74.) The hundred ſhall alſo make good the damage in caſe of robbery (ſee Hue-and-Cry), cutting banks or hop-binds; burning houſes, barns, outhouſes, hovels, cocks, mows, or ſtacks of corn, ſtraw, hay, or wood; mines or pits of coal; deſtroying granaries or corn intended for exportation; deſtroying turnpikes or works of navigable rivers, &c. 1 Geo. I. cap. 5. 9 Geo. I. cap. 22. 29 Geo. II. cap. 36. 8 Geo. II. cap. 22. 10 Geo. II. cap. 32. 11 Geo. II. cap. 22. 22 Geo. II. cap. 46.

Hundred, or *Hundredum*, is ſometimes alſo uſed for an immunity or privilege, whereby a man is quit of the hundred-penny, or cuſtom, due to the hundred.

Hundred-*court.* See Court.

Hundred *Lagh*, ſignifies the hundred court, from which all the officers of the king's foreſt were freed by the charter of Canutus.

Hundred *Suit*, the payment of perſonal attendance, ordering ſuit and ſervice at the hundred court.

HUNDREDERS, or Hundredors, *Hundredarii*, are men impanelled, or fit to be impanelled, of a jury, upon any controverſy, dwelling within the hundred where the land in queſtion lies.

By the policy of the ancient law, the jury was to come *de vicineto*, from the neighbourhood of the vill or place where the cauſe of action was laid in the declaration; and therefore ſome of the jury were obliged to be returned from the hundred in which ſuch vill lay; and if none were returned, the array might be challenged for defect of hundredors. This was ſuppoſed to qualify thoſe who compoſed the jury for forming a proper judgment of the evidence adduced, as they were ſuppoſed to know before-hand the characters of the parties and witneſſes. But this convenience was overbalanced by another very natural and almoſt unavoidable inconvenience; that juries coming out of the immediate neighbourhood, would be apt to intermix their prejudices and partialities in the trial of rights. This our law has been ſo ſenſible of, that for a long time it has been relinquiſhing this practice; the number of neceſſary hundredors in the whole panel, which in the reign of Edward III. were conſtantly *ſix*, being in the time of Forteſcue reduced to *four*. Afterwards, indeed, the ſtatute 35 Hen. VIII. c. 6. reſtored the ancient number of *ſix*, but that clauſe was ſoon virtually repealed by ſtatute 27 Eliz. c. 6. which required only *two*. And ſir Edward Coke alſo (1 Inſt. 157.) gives us ſuch a variety of circumſtances, whereby the courts permitted this neceſſary number to be evaded, that it appears they were heartily tired of it. At length by ſtatute 4 & 5 Ann. c. 16. it was entirely aboliſhed upon all civil actions except upon penal ſtatutes; and upon thoſe alſo, by the 24 Geo. II. c. 18. the jury being now only to come *de corpore comitatus*, from the body of the county at large, and not *de vicineto*, or from the particular neighbourhood. See ARRAY and CHALLENGE.

HUNDREDER is alſo uſed for him who hath the juriſdiction of a hundred, and holds the hundred-court. See HEADBOROUGH.

Sometimes it is alſo uſed for the bailiff of a hundred. See BAILIFF.

HUNDREDS, in the conſtruction of reeds for weavers, denote the number of diviſions in any given length of the reed. A thorough knowledge of the adaptation of yarn of a proper degree of fineneſs to any given meaſure of reed conſtitutes one of the principal arts of the manufacturer of cloth, as upon this depends entirely the appearance, and in a great degree the durability of the cloth when finiſhed. The art of performing this properly is known by the names of *examining*, *ſetting*, or *ſleying*, which are uſed indiſcriminately, and mean exactly the ſame thing. The reed conſiſts of two parallel pieces of wood of any given length, as a yard, a yard and quarter, &c. The diviſions of the yard being into halves, quarters, eighths and ſixteenths, the breadth of a web is generally expreſſed by a vulgar fraction, as $\frac{3}{4}$, $\frac{4}{4}$, $\frac{5}{4}$, $\frac{6}{4}$, and the ſubdiviſions by the eighths or ſixteenths or *nails*, as they are uſually called, as $\frac{7}{8}$, $\frac{9}{8}$, $\frac{11}{8}$, &c. or $\frac{13}{16}$, $\frac{15}{16}$, $\frac{17}{16}$, &c. In Scotland the ſplits of cane which paſs between the longitudinal pieces or ribs of the reed are expreſſed by hundred porters or ſplits. The porter is 20 ſplits, or $\frac{1}{5}$th of an hundred. In Lancaſhire, Cheſhire, and the other manufacturing counties of England, the diviſions of the reed are different. A comparative table of the differences by which they are reduced, to the ſame ſtandard as nearly as is poſſible, that is to ſay, within one ſplit or diviſion by which the Scotch or Engliſh manufacturer may at one glance aſcertain the relation which the other modes of counting reeds bear to his own, is annexed to this article. In counting reeds by the number of hundreds in a determinate length, which is common to the manufacturers of the continent, as well as to thoſe of Scotland, different lengths are uſed for the ſtandard of fineneſs. In that part of France ſituated around Cambray, which is, or was, the principal ſeat of the cambric manufacture, the ſtandard length of a reed, by which the fineneſs of the ſplits is aſcertained, is 34 inches. In Holland, where the heavier fabrics of linen are chiefly produced, the ſtandard of meaſure is 40 inches, and in Scotland the ſtandard is 37 inches, or the Scottiſh ell. Now it is plain, that if 2000 or twenty hundred diviſions or ſplits be contained in each of theſe reſpective meaſures, thoſe which are contained in 34 inches muſt be finer and cloſer than thoſe contained in 37, and ſtill more ſo than thoſe contained in 40. For the practical purpoſes of manufacture in this country it can be of little importance to aſcertain with preciſion the relative proportions which theſe ſtandards bear to each other, but to the wholeſale purchaſer it muſt be uſeful to have ſome correct idea of the mode by which both the value and quality of the commodity which he purchaſes may be aſcertained with conſiderable preciſion merely by inſpection.

In Lancaſhire and Cheſhire a different mode is adopted both as to the meaſure and diviſions of the reed. The Mancheſter and Bolton reeds are counted by the number of ſplits, or, as they are there called, dents contained in $24\frac{1}{2}$ inches of the reed. Theſe dents, inſtead of being arranged in hundreds, porters, and ſplits, as in Scotland, are calculated by what is there termed *bares* or *bears*, each containing 20 dents, or the ſame number as the porter in the Scotch reeds. Formerly the number of dents in a *bare* was frequently 19, a number ſo ill calculated for any eaſy arithmetical calculation, that it is difficult to conjecture the cauſes which could have ſuggeſted its adoption, unleſs we ſuppoſe that the number 19, in place of 20, was adopted to leave room for the ſhrinking-in breadth when firſt immerſed in any liquid, to which all newly woven cloth is liable. The Cheſhire or Stockport reeds again receive their deſignation from the number of ends or threads contained in one inch, two ends being allowed for every *dent*, that being the almoſt univerſal number in every ſpecies and deſcription of plain cloth, according to the modern practice of weaving, and alſo for a great proportion of the fanciful articles. The number of threads in the warp of a web is generally aſcertained with conſiderable preciſion by means of a ſmall magnifying glaſs fitted into a ſocket of braſs, under which is drilled a ſmall round hole in the bottom plate of the ſtandard, the number of threads viſible in this perforation aſcertaining the number of threads in the ſtandard meaſure of the reed. Thoſe uſed in Scotland have ſometimes four perforations over any one of which the glaſs may be ſhifted. The firſt perforation is $\frac{1}{4}$ of an inch in diameter, and is therefore well adapted to the Stockport mode of counting, that is to ſay, for aſcertaining the number of ends or threads per inch. The ſecond is adapted for the Holland reed, being $\frac{1}{200}$dth part of 40 inches. The third is $\frac{1}{185}$dth of 37 inches, and is adapted for the now almoſt univerſal conſtruction of Scotch reeds, and the fourth, being $\frac{1}{170}$dth of 34 inches, is intended for the French cambrics. Every thread appearing in theſe reſpective meaſures, of courſe, repreſents 200 threads or 100 ſplits in the ſtandard breadth, and thus the quality of the fabric may be aſcertained with conſiderable preciſion, even after the cloth has undergone repeated wettings, either at the bleaching ground or dye work. By counting the other way, the proportion which the woof bears to the warp is alſo known, and this forms the chief uſe of the glaſs to the manufacturer and operative weaver, both of whom are previouſly acquainted with the exact meaſure of the reed.

Comparative Table of 37-inch reeds, being the ſtandard uſed throughout Europe, for linens, with the Lancaſhire and Cheſhire reeds, and the foreign reeds uſed for Holland and cambric.

Scotch.	Lancaſhire.	Cheſhire.	Dutch Holland.	French Cambric.
600	20	34	550	653
700	24	38	650	761
800	26	44	740	870
900	30	50	832	979
1000	34	54	925	1089
1100	36	60	1014	1197
1200	40	64	1110	1300
1300	42	70	1202	1414
1400	46	76	1295	1464
1500	50	80	1387	1602
1600	52	86	1480	1752
1700	56	92	1571	1820
1800	58	96	1665	1958
1900	62	104	1757	2067
2000	66	110	1850	2176

In the above table the 37-inch reed is placed firſt. It is called Scotch, not becauſe it either originated, or is excluſively uſed, in that country. It is the general linen reed of all Europe, but in Scotland it has alſo been adopted as the regulator of her cotton manufactures. In the table it is only compared with the neareſt Engliſh reed actually in uſe, for in moſt caſes there is ſome ſmall difference, which, however, is not material for practical purpoſes For the Holland and cambric reeds, the exact number of ſplits or dents is given merely for compariſon, as theſe reeds are not at all uſed in Britain.

The art of proportioning the yarn to the reeds, for different fabrics, has been always regulated by the practical experience of the manufacturer, and the taſte or fancy of his cuſtomers. Some attempts have been made to reduce it to a ſtandard, and it is evidently a matter of no difficulty. Without analyzing particularly the plans which have been propoſed, and the arguments for and againſt each of them, it ſeems that the following may, in general, be taken as a good approximation.

Every ſpecies of yarn uſed in the manufacture of cloth, may be aſſumed to be a cylindrical body of ſtuff of a certain diameter. Now as the area of every circle is as the ſquare of its diameter, and as the cubical content of every cylinder is found by multiplying the area of its baſe by its height, we may reaſonably infer, that if the diameter of a thread is ſquared, and that ſquare multiplied by its length, it will give the ſolid content, and *vice verſâ;* that the ſquare root of the number which aſcertains the weight of yarn, is a ſymbol of its diameter. If this be granted, it follows, that when any particular denomination of yarn is found to produce a proper fabric of cloth when woven in a reed of any given dimenſion, the proper denomination for any other reed may be found. Or if the yarn is at hand, and the proper reed wanted, it may be found by exactly the converſe of the former analogy. Upon this hypotheſis the analogy will be

As the ſquare root of the given yarn,
Is to the given dimenſions of the reed;
So is the ſquare root of another kind,
To the dimenſions of the reed required.

But as few practical manufacturers or weavers are accuſtomed to the extraction of roots, the real deſcription of the yarn may be taken, and the reed ſquared, or multiplied into itſelf, which will give exactly the ſame reſult. It may be neceſſary to obſerve, however, in this place, that as the fineneſs of cotton yarn is aſcertained by progreſſive numbers; and that of moſt other kinds of yarn, by the weight of certain quantities, the proportion or analogy in the former caſe muſt be direct, and in the latter inverſe, becauſe a diminution of weight in a given quantity neceſſarily implies an increaſe of fineneſs. The two following examples will, it is hoped, render this ſufficiently obvious.

If a manufacturer finds, by experience, that a fabric of goods, ſuch as pleaſe his cuſtomers, is produced by weaving N 60 of cotton yarn in a reed of 1200 by the linen or Scotch reed, and wiſhes to aſcertain what deſcription of yarn he ought to employ for a web to be woven in a 1500 reed; the proportion will be

As 144, the ſquare of the 1200 reed,
Is to 60, the number of the given yarn,
So is 225, the ſquare of the 1500 reed,
To 94, the neareſt integral number by calculation.

In the converſe he would find the ſquare of the reed, and would ſtill find extraction of the root neceſſary.

But if a manufacturer of linen finds that a fabric of yarn, of any number of ounces to the ſpindle, is well adapted to a 1200 reed, and wiſhes to aſcertain the weight or denomination of yarn fit for a 1500 reed as before, his proportion muſt be inverted.

The chief objection which practical men are apt to make to the above theory of adaptation, which is perhaps the beſt that has hitherto been found, is the following. That in finer fabrics of goods it is not found to produce the deſired effect, and that experience proves, that were a practical manufacturer of cloth to adopt this rule implicitly, either his fine goods would be wanting in that ſhow and elegance which is their chief recommendation, or that his coarſe articles would be flimſy and deficient both in warmth and durability. Allowing to this objection, which is unqueſtionably well founded, in ſome reſpects, all the weight which it deſerves, the anſwer to it is very eaſy. The chief recommendations of coarſe goods are thickneſs and ſtrength, thoſe of fine goods lightneſs and elegance. Theſe are not, nor can be regulated by any exact mathematical rule, as they are much dependant on fancy. No lady would expect, in a fine dreſs, the ſtrength and durability of a ſack, nor would any miller ſtore his flour in a bag, poſſeſſing the principal requiſites of a ſieve. It is ſufficient, if the manufacturer is enabled to obtain a fair proportion for the real fabric, and this he muſt afterwards vary, to ſuit his goods to the market for which they are intended.

HUNDSHUBEL, in *Geography*, a town of Saxony, in the territory of Erzgebirge; 23 miles S.S.W. of Chemnitz.

HUNDSMARCK, a town of the duchy of Stiria, on the Muehr; 14 miles W S.W. of Judenburg.

HUNDSRUCK, a diſtrict of Germany, between the Rhine, the Moſelle, and the Nahe; now a part of France.

HUNE, La, a bay on the S. coaſt of Newfoundland; 90 miles E. of cape Ray.

HUNEFELD, a town of Germany, in the biſhopric of Fulda; eight miles N.N.E. of Fulda.

HUNERWASSER, a town of Bohemia, in the circle of Boleſlau; 10 miles N. of Jung-Buntzel.

HUNG-TEAP, a term applied in ſome diſtricts to a ſmall ram, in contradiſtinction to that of a *cloſe-teap*, or one whoſe teſticles are not come properly down into the cod. It is proper to attend well to theſe ſtates of male ſheep. See Ram.

HUNGARIAN Machine, in *Hydraulics*, is repreſented in *Plate* XIII. *Hydraulics*, *fig.* 1. In this figure, A A is the ſide of a hill cloſe by the brink of the ſhaft or mine-pit B B, which is 104 feet deep below the ſurface of the ground C at the foot of the hill. In this hill is a large ſpring of water, 143 feet above the ſurface of the ground at C (taken in perpendicular meaſure) and the ſpring affords much more water than what the ſpring D, under ground, lets into the mine.

A pipe E F G lets the water down from the ſpring in the hill, into a cloſe air-tight veſſel H that ſtands at the foot of the hill, and contains 57½ cubic feet, or 430 gallons in wine meaſure. In this pipe is a cock *a*, which being opened or ſhut, lets the water of the ſpring run into H, or ſtops it, as occaſion requires: and in H are two cocks *b* and *c*, the uppermoſt of which is for letting air into H, and the lowermoſt for letting the water out of it.

A ſmall pipe I goes from the veſſel H on the ſurface of the ground to a veſſel K, in the bottom of the mine, and terminates in the top thereof. The veſſel is air-tight, and contains 27½ cubic feet, or 205¼ gallons in wine meaſure, which is forced up the aſcending pipe L M, and runs off to waſte, at N, above ground. The lower end of this pipe goes down ſo far into the veſſel K, as almoſt to touch its bottom.

From this veſſel, a pipe O goes to the ſpring D under ground, which lets water into the mine, and would overflow it if the water was not forced up or raiſed from the mine through the pipe L M. The pipe O lets this water into the veſſel K when the cock *d* is turned open, and keeps back the water when the cock is ſhut,

The operation is as follows: the cock *b* being open, and the cocks *a* and *c* ſhut, and no water in the veſſel K, open the cock *d* to let the veſſel K fill with water from the ſpring in the mine. As this veſſels fills, the water will drive the air out of it, up through the ſmall pipe I into the veſſel H, and all that air will go out of the veſſel H by the open cock *b*, and then H will remain, as it was before, full of air in the ſame ſtate of denſity as the common air is on the outſide of H. When K is full of water, ſhut the cocks *b* and *d*, and open the cock *a*, to let water run down from the ſpring in the hill by the pipe E F, into the veſſel H. As the water riſes in that veſſel, the air will thereby be driven out of it, down through the pipe I, into the veſſel K: and as this air is compreſſed by the weight of the running water in the pipe E F, the compreſſed air will force all the water out of the veſſel K, up through the pipe L M, from which it will run off at N on the ſurface of the ground; and then the compreſſed air will ruſh out, after the water.

When the veſſel K in the mine is emptied of water, and the air is heard to begin to ruſh out, ſhut the cock *a* to ſtop the water from the ſpring, and open the cocks *b* and *c*: then the water that came from the ſpring will run out of the veſſel H by the cock *c*, and air will go in by the cock *b*: at the ſame time, open the cock *d* in the mine to let the veſſel K fill with water from D the ſpring in the mine; and as H empties above-ground, K will fill below it; and the air that remained in K will (by the riſing of the water in it) be driven back into the veſſel H through the pipe I.

When H is empty of water, and K full, ſhut the cocks *b*, *c*, and *d*, and open the cock *a*: then H will fill with water from the ſpring in the hill; and this water, as it riſes in H, will force the air out of H, down the pipe I, upon the water in K; and the force of the compreſſed air will drive all the water out of K, up the pipe L M, from which it will run off at N, as before.

And thus, wherever there is a ſpring in a hill, near a mine that affords more water than what flows into the mine from a ſpring under-ground; and the perpendicular height of the ſpring in the hill is greater than the depth of the mine, water may be thus raiſed from the mine, in a moſt ſimple and eaſy manner by an engine in which there are neither pumps, piſtons, nor valves: and ſuch an engine will not be liable to be out of order, nor need repairs in many years.

But as there are very few mines that have hills near them with high ſprings, water cannot then be raiſed from them in this manner; and therefore Mr. Blakey propoſed another method, which was, to make H an air-veſſel, with a pipe going from it to another veſſel in which is water, kept boiling by a fire under it, and this veſſel to have a cock to let out the ſteam occaſionally that riſes from the ſurface of the boiling water. When the cock is ſhut, the ſteam will go off from the boiler into the air-veſſel H, and drive the air out of it, down through the pipe I into the veſſel K in the mine: and the force of the air compreſſed by the elaſticity of the ſteam, will raiſe the water from K, up through the pipe L M, till K be emptied of water. Then the cock in the boiler is to be turned open, to let out the ſteam, and the cock *d* to be opened to let the veſſel K fill from the ſpring in the mine; and when it is full, both theſe cocks are to be ſhut, and the operation will go on as before.

That Blakey's ſcheme would do, the Hungarian machine puts beyond all doubt. In both of them the veſſels muſt be made very ſtrong, becauſe every part of each veſſel, equal in ſurface to the bore of the aſcending pipe L M, will ſuſtain an outward preſſure equal to the whole weight of water in that pipe. It will not anſwer for ſuch depths as the common fire-engine will, nor will it raiſe ſo much water; but it may be built for leſs than a third part of the expence, and would anſwer very well where the depth is not above a hundred feet.

Hungarian *Muſic*. There is no doubt (ſays Mr. Laborde) but that the Hungarians, in abandoning Aſia, about the ninth century, in order to inhabit Europe, made uſe of Aſiatic muſical inſtruments during their firſt year's reſidence there.

Theſe were almoſt all wind inſtruments; of which their names, that ſtill retain their Hungarian appellations, and are of that kind, is a proof. As the trumpet, *buccina*, is called *kuxt* in the Hungarian dialect, and the flute, *ſip*, &c. Other inſtruments have names, derived from other languages, as *izimlalom* ſignifies cymbalum; *orgona organum*; *trombita tuba*. All theſe words are of Greek, Latin, or German extraction, whence we conclude that the Hungarians, in quitting Aſia, had only wind-inſtruments. If they had had others, they would have had words to expreſs them. We ſee likewiſe that the pike, the bow, arrow, and ſabre, are the only arms of which the names are Hungarian, as theſe were the only arms which this people knew when they arrived in Europe: their other military weapons are expreſſed by foreign words.

Hungarian muſic remained in its priſtine ſtate of mediocrity till the reign of Corvinus, who was proclaimed king of Hungary at the age of 15, in 1458, and afterwards conquered the kingdom of Bohemia, and died at 47, in 1490.

This prince rendered Hungary equal to other countries in arts and ſciences, by his patronage and by cultivating them himſelf. The pope's nuncio, who came to Buda in 1483, to make peace between the emperor Frederic and Corvinus, in a letter to his holineſs, ſays, " the ſingers of this prince's chapel are the beſt of all thoſe I have ever heard."

Muſic was cultivated with the ſame eaſe under king Ladiſlaus VI. and Lewis II., but not with the ſame pomp, the number of the muſicians of the houſhold was conſiderably diminiſhed. It appears likewiſe by the ſtate of muſic which is ſtill preſerved, that wind inſtruments have the precedence over all others.

The Hungarians, like all people not quite civilized, had tunes without time or key, to which they ſung their coarſe national ballads without harmony; however, though almoſt all uncultivated people love high tones and noiſy muſic of a light and vulgar caſt, the Hungarians preferred ſoft ſounds and ſlow meaſures: which has rendered their muſic more of the feminine than the maſculine gender. And we ſtill ſee among the peaſants who preſerve their primitive manners longer than the higher orders of the people, that the girls aſſemble on great feſtivals, and ſing in chorus odes and ancient poetry, which is never done by boys. Men, however, cultivated muſic: but it was only to celebrate the proweſs of their anceſtors in patriotic ſongs. It is related that in a repaſt given by Attila, the Enckeſius, or director of the muſic, had a ſeat on the right hand of the throne; and that after the ſervice two men ſung verſes compoſed in honour of Attila's victories. Part of the audience wept, and, adds the hiſtorian, the reſt grew furious and deſired to be led to battle. Two ſtanzas of theſe ſongs have been preſerved in their original language, and in Latin, to the following purport.

" Let us ever remember thoſe ancient domains,
Which our anceſtors left when they flew
To a climate more mild, from the Scythian plains,
Where dread mountains of ſnow are in view.

" To Hung'ry they haſten'd, with God for their guide,
And choſe Tranſylvania for home;
Be their force and their courage for ever our pride,
But, like them, let us ne'er again roam."

The knowledge of muſic was introduced into Hungary by the Chriſtian religion and belles lettres.

As to the time when muſic was firſt in uſe at court, there appears, in a diploma granted by king Bela III. in 1192, that a perſon was ſent to Paris of the name of Elvin, to learn the French melody.

It likewiſe appears in the Journals of the kings of Hungary, that the Hungarians, who came from Aſia into Europe, brought to their new habitations the Aſiatic manners, airs, dances, and ſongs; but that in proceſs of time they cultivated the muſic and dancing of the neighbouring nations of Europe, till at length theſe two arts, practiſed by the ſovereigns themſelves, were held in great favour throughout the kindom of Hungary. Eſſais ſur la Muſique.

HUNGARICA Bolus, in the *Materia Medica*, a medicinal earth, commonly known by the name bolus Toccavienſis.

HUNGARICUS Morbus, or *Febris Hungarica*, the *Hungarian diſeaſe*, an epidemic and fatal fever, which originated in the camp of the emperor Maximilian II. in Hungary, in the year 1566, and ſpread through the greater part of Europe, cauſing every where a terrible mortality, and almoſt depopulating Vienna, where the returning army halted in order to recruit. In ſome inſtances it ſeems to have put on the form of a remittent fever; but in general was a ſevere and malignant typhus, reſembling the hoſpital or goal fever. (See Fever and Typhus.) Conſult Sennert. lib. iv. cap. 14. De Morbo Hungarico. Ruland. De Lue Hungarica:— Jordan, De Peſtis phænom. cap. 19. Pringle on Diſ. of the Army, part iii. chap. 4. § 4.

HUNGARY, in *Hiſtory* and *Geography*, a country of Europe, formerly regarded as an independent kingdom, is bounded on the north by Poland, from which it is ſeparated by the Carpathian mountains, on the eaſt by Tranſylvania and Walachia, on the ſouth by Sclavonia, and on the weſt by Moravia, Auſtria, and Stiria. Many authors comprehend under the general name of Hungary, Sclavonia, Dalmatia, Boſnia, Servia, Tranſylvania, Moldavia, and Walachia. The ancient inhabitants of the weſtern parts of Hungary were Pannonians, thoſe of the northern Jazygians. The Romans reduced Pannonia, and kept it almoſt 400 years, till they were driven out by the Vandals, who held it till the year 395, when the Goths took poſſeſſion of their ſettlements, who, in their turn, yielded to the Huns. In the year 888, the Huns, under the name of Hungarians, made another irruption into Pannonia, againſt the Bulgarians and Sclavonians, whom they reduced. They had ſeven commanders, and Germany and many parts of Italy felt the effects of their ſavage ferocity. By degrees they became more civilized, and in the 10th century their prince Geyſa embraced the Chriſtian religion. His ſon Stevin was the firſt king of Hungary, and he completed the eſtabliſhment of the Chriſtian religion about the year 1000. He erected biſhoprics, abbeys, and churches; annexed Tranſylvania as a province to Hungary, and at his death he was canonized. After him followed a ſucceſſion of kings, natives of the country, of whom may be mentioned Andrew II. who conferred great privileges on the nobility, and even empowered them to oppoſe the king if he ſhould attempt any thing hoſtile to the laws of the country. In 1342 Louis I., ſurnamed the Great, ſubdued a part of Dalmatia, and carried his arms into Italy. He was ſucceeded by his daughter Mary, who was ſtyled *King* of Hungary. She died in 1392, and the ſucceſſion, which was ſome time controverted, at length terminated in the election of Sigiſmund, marquis of Brandenburg, who, in 1411, was choſen emperor of Germany. Albert of Auſtria, having married Elizabeth the heireſs of Sigiſmund, was, with her, crowned king and queen of Hungary in 1438, an event which is ſaid to form the earlieſt baſis of the Auſtrian claim to the Hungarian monarchy. Upon the death of Albert, Ladiſlaus, king of Poland, was choſen king of Hungary, but periſhed in the battle of Werna againſt the Turks. The celebrated John Hunniades was appointed regent of the kingdom. In 1458 Matthias Corvinus, ſon of Hunniades, was proclaimed king of Hungary by the ſtates, and in 1485 he ſeized Vienna, and the other Auſtrian ſtates, and retained them till his death in 1490. Matthias was the moſt renowned prince that ever ſat on the Hungarian throne: he was the friend and patron of letters, and founded a magnificent library at Buda, and furniſhed it with the beſt Greek and Latin books, and many valuable manuſcripts. After repeated conteſts, the houſe of Auſtria again filled the throne of Hungary, in the perſon of Ferdinand, 1527, but towards the end of his reign the Turks ſeized the greater part of this kingdom. On his being choſen emperor of Germany, Ferdinand retained the crown of Hungary till 1563, when he reſigned it to Maximilian his ſon; and it has ſince continued a conſtant appanage of the houſe of Auſtria. The grand duchy of Tranſylvania was conſidered as a part of Hungary till the year 1540, when it began to be regarded as a diſtinct ſtate. Stephen Battori was elected prince of Tranſylvania in 1571, and his family held the ſovereignty till 1602, after which it continued ſubject to ſeveral elective princes, of whom the moſt diſtinguiſhed was Bethlem Gabor, a noble Hungarian and Calviniſt, who conquered great part of Hungary in 1619, and died in 1629. The laſt prince of Tranſylvania was Michael Abaffi, who gave up the ſovereignty to the emperor in 1694, ſince which period this country has formed a part of the Auſtrian dominions. In the year 1722, in the diet of Preſburg, the hereditary ſucceſſion of Hungary was ſecured to the houſe of Auſtria, and in caſe of failure of male heirs, it was enacted that females ſhould be capable of holding the crown. Such are the hiſtorical epochs of this country. With reſpect to its ſurface, it is mountainous and barren towards the north: the air is cold but healthy. Towards the Danube the ſoil is level and ſandy, and the climate very temperate. In the ſouth the marſhes are hot, moiſt, and unwholeſome. Hot days, with cold nights, and habitual intemperance, occaſion diſeaſes, particularly what is called the Hungarian fever. The level country bears abundance of corn, excellent fruit, and almoſt all kinds of vegetables. The foreſts are beautiful, and the meadows feed numerous herds of cattle. The ſides of the mountains are covered with vines, and in their bowels are found all kinds of metals and mineral ſubſtances. The chief mountains are the Carpathian or Crapack: the principal rivers are the Danube and Drave. The Hungarians and Sclavonians are regarded as the only native inhabitants, though the Croats, Ruſſians, Walachians, Vandals, Greeks, Jews, and Turks, likewiſe abound. Proteſtants are more numerous than Roman Catholics. Hungary is governed by the king and ſtates: the latter are divided into four claſſes; to the firſt belong the prelates and other high orders of the church: to the ſecond claſs belong the great barons, bans, or viceroys: to the third claſs belong the gentry, and to the fourth the royal free cities. Upon every view of the ſubject there appears to be between ſeven and eight millions of inhabitants, which are about one-third of the population of the Auſtrian dominions, and it yields about one-fifth of the whole revenue. The annual exports are equal in value to 1,600,000*l.* ſterling, and its imports to little more than a million. The ſtanding military force amounts to nearly ninety thouſand men. Preſburg is the capital. The Hungarians are tinctured with the manners of the Germans, but they remain a ſpirited people, and affect to deſpiſe their maſters. The nobility are numerous, well informed, and warlike. Their lands owe their ſovereigns no ſervice. The peaſant poſſeſſes nothing, he can be nothing but a farmer, and the proprietor can diſmiſs him at his pleaſure. Anciently the peaſants might change their maſters; they cannot do ſo now: they once had particular tribunals to which they might have recourſe, but this privilege is no longer allowed. The Hungarian dreſs is well known to be peculiar, and is copied by our huſſars. This dreſs, conſiſting of a tight veſt, mantle, and furred cap, is graceful; and the whiſkers add a military ferocity to the appearance. The languages ſpoken are numerous and diſcrepant: they belong chiefly to three grand diviſions; the Gothic or German; the Sclavonic; and laſtly, the Hungarian proper, which has been conſidered as a branch of the Finnic.

Hungary-*Town*, a poſt-town of America, in Lunenburgh country, Virginia; 215 miles from Virginia.

Hungary *Water*, *Aqua Hungarica*, a diſtilled water, ſo denominated from a queen of Hungary, for whoſe uſe it was firſt prepared, and who was cured by the continued uſe of it, of a paralytic diſorder.

Hungary-water is one of the diſtilled waters of the ſhops; and is directed in the college diſpenſatory, to be made of roſemary flowers infuſed ſome days in rectified ſpirit of wine, and the ſpirit then diſtilled. The college of Edinburgh directs a gallon of rectified ſpirit to be drawn over in the heat of a water-bath from two pounds of the flowers as ſoon as they are gathered; that of London takes the tops and a ſpirit not quite ſo ſtrong; putting a gallon of proof ſpirit to a pound and a half of the freſh tops, and drawing off in the heat of a water-bath five pints.

It is an agreeable perfume, and its virtues are much the ſame as thoſe of the ſimple it is drawn from. The Hungary water brought from France is more fragrant than ſuch as is generally prepared among us.

HUNGEN, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and county of Solms-Braunfels; 14 miles S.E. of Wetzlar.

HUNGER, Fames, a natural appetite or deſire for food. For the ſymptoms, proximate cauſe, &c. of hunger, ſee Digestion. See alſo Abstinence, Bulimy, Diet, &c.

Hunger, in *Biography*, in 1772 organiſt of the Duomo, or Frauen-Kirche, at Dreſden, of which church the organ was built by Silberman, and is regarded as one of the largeſt and moſt complete in Germany. The longeſt pipe in the pedals is 32 feet, and there are 48 ſtops.

Though M. Hunger poſſeſſed neither great fancy nor finger, his performance was truly maſterly, and manifeſted a perfect knowledge of his inſtrument.

Hunger *Creek*, in *Geography*, a ſtream which ſupplies the water-machinery in the new and thriving manufacturing town of Hamilton, between Albany and Schenectady.

Hunger *Rot*, the name of a morbid affection in ſheep, which is commonly produced by poor ſtinted keep, eſpecially in the winter ſeaſon. It is known with facility by the peculiar appearance of the ſheep, which becomes extremely thin, lean, ragged, and emaciated. The principal means of reſtoring ſuch animals, are thoſe of changing them to drier paſtures, and the gradual introduction of them into thoſe of richer and better kinds. See Rot.

It is ſometimes termed the hunger, or hungry evil.

HUNGERFORD, in *Geography*, is a market-town and pariſh, ſituated principally in the hundred of Kintbury Eagle, in the county of Berks, England, though a conſiderable part of the pariſh is in the hundred of Kinwardſtone, in the adjoining county of Wilts. The town ſtands on the banks of the river Kennet, near the road from London to Bath. Its ancient name, according to Camden, was Ingleford-Charnam-ſtreet; which Gough ſuppoſes to be a corruption from the ford of the Angles on Herman-ſtreet; a Roman road that croſſes the town, the name of which appears to be yet preſerved in one of its avenues, called Charman-ſtreet. The name of Hungerford, as now ſpelt, occurs in a record of the year 1204. At ſome diſtance weſt of the town is the church, an ancient ſtructure, which appears to have been erected at different periods. It contains ſome old monumental memorials to the family of Hungerford, who derived their name and origin from this town. The civil government of Hungerford is veſted in a conſtable, who is aſſiſted in the execution of his office by twelve feoffees and burgeſſes, a bailiff, ſteward, town-clerk, &c. The market, which is on Wedneſdays, has been held from time immemorial; it is mentioned as an eſtabliſhed market in a record dated 1297. The market-houſe and ſhambles, which were erected in 1787, are roomy and commodious. Over the latter is a large room, uſed as a town-hall, for the diſpatch of public buſineſs. In this room is depoſited a curious relict of antiquity, denominated the Hungerford-horn, given, with an extenſive right of fiſhery, by John of Gaunt to the inhabitants of the town. Here are three annual fairs. The town, by means of its canal navigation, has a conſiderable traffic; but no eſtabliſhed manufactures. Hungerford is 64 miles from London: in the year 1801 it contained 454 houſes, and 2292 inhabitants. At a ſhort diſtance S.E. of the town is

Hungerford-park, the property of John Willes, eſq. who purchaſed it of Mr. Dalbiac in the year 1796, ſince which time ſeveral improvements have been made to the houſe. Lyſons's "Magna Britannia," vol. i. Beauties of England, vol. i.

HUNGERFORD, a townſhip of Upper Canada, in the county of Haſtings, lying in the rear and N. of the Mohawk tract. —Alſo, a townſhip in Franklin county, Vermont, containing, in 1790, 40 inhabitants; 7 miles S. of the Canada line, and 14 E. of lake Champlain.

HUNGRY EVIL, a term uſed among the farriers for the ſame diſtemperature in horſes, which in men we call a canine appetite. It manifeſts itſelf ſufficiently in an inordinate deſire to eat, and is ſometimes the effect of long ſtarving, ſometimes of cold, or ſome other internal or external cauſe. In the latter caſe the horſe not only eats a large quantity, but he devours it in a very remarkable manner, chopping it up, as if he would eat the very manger. The method of cure is to give him large toaſts of bread, ſteeped in ſack, or ſome other ſweet wine; or give him a quantity of wheat flour in wine, or in milk, a quart or more at a time. Theſe are very good remedies in caſe of extremity, but otherwiſe he may be cured by feeding him moderately with bean-bread ſeveral times a-day, allowing no other food.

HUNGRY *Hill*, in *Geography*, a high mountain in the county of Cork, Ireland, on the north ſide of Bantry bay, which is a remarkable landmark, and on which ſome alpine plants have been found, as ſalix herbacea, empetrum nigrum, &c. A fine cataract falls from it, eſpecially after heavy rain.

HUNGRY *Point*, a cape on the E. coaſt of the iſland of St. Vincent. N. lat. 13° 28′. W. long. 61° 11′.

HUNGTONG, a town of Meckley; 35 miles S.E. of Munnypour.

HUNINGUE, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diſtrict of Altkirch, ſituated on the Rhine; 14 miles E. of Altkirch. The place contains 774, and the canton 13,089 inhabitants, on a territory of 140 kiliometres, in 23 communes.

HUNNARYD, a town of Sweden, in the province of Smaland; 18 miles S.W. of Jonkioping.

HUNNEINE, a town of Algiers, near the coaſt; 10 miles N.N.W. of Tackumbreet.

HUNNERIC, in *Biography*, king of the Vandals, in Africa, ſucceeded his father Genſeric in 477. He was a violent Arian, and though he at firſt gave his opponents toleration, he afterwards commenced a perſecution againſt them, which, for ſavage barbarity, is ſaid to have exceeded the perſecutions under the heathen emperors. He died in 484.

HUNNIADES, JOHN CORVIN, one of the moſt conſiderable captains of his age, who contended with and defeated the Turks in 1442 before Belgrade and in Tranſylvania. When the peace which ſucceeded was violated by the Hungarians, Hunniades accompanied Uladiſlaus to the battle of Varna in 1444, in which the Chriſtian army was entirely defeated, with the death of the king. Hunniades drew off the remainder of the forces, and by his vigour put himſelf in a condition to act offenſively with ſucceſs againſt the Turks. He was declared governor of Hungary for the minor king Ladiſlaus, then educating at the court of the emperor Frederic, who refuſed to give him up to the ambaſſadors of the nation. For a conſiderable time he was a terror of the Turks, but was at length defeated by them in 1448. In 1456 he compelled Mahomet II. to raiſe the ſiege of Belgrade. At this time Ladiſlaus, who had been reſtored to his ſubjects, fled in alarm to Vienna, and the hoſtile torrent would have been irreſiſtible, had not Hunniades, after defeating a Turkiſh fleet on the Danube, thrown himſelf into Belgrade. Capiſtran, a monk, by his ſucceſs in preaching a cruſade, was inſtrumental in bringing him large reinforcements; by the aid of which Mahomet was repulſed with great ſlaughter. Not long after this glorious ſucceſs, Hunniades was ſeized with a fever, of which he died, at Zemlin, in September 1456, regarded as the hero of Chriſtendom. Univ. Hiſt. Moreri.

HUNNIUS, GILES, a Lutheran divine, was born at Winende, in the duchy of Wirtemberg, in 1550. He was educated at Tubingen, and became profeſſor of divinity at Marpurg, from whence he removed to Wirtemberg. In theſe ſituations his zeal for Lutheraniſm led him to act in a manner that reflects much infamy on his memory. He eſtabliſhed a kind of inquiſition which deprived many perſons of their employments, and drove them from their country. If they refuſed to ſign a formulary dictated by Hunnius and his colleagues, they were inſtantly regarded as Calviniſts, and found no mercy. Hunnius, after a ſeries of atrocious perſecutions, died in 1603, in the 53d year of his age. He was a man of conſiderable learning and abilities, but bigotted and intolerant. He was author of many controverſial pieces: alſo of commentaries on the goſpels; homilies, &c. His moſt celebrated work is entitled "Calvinus, Judaizans, &c." in which, ſays Bayle, Calvin was accuſed of ſo many heretical crimes that he might have been afraid of being treated like Servetus, had he lain at Hunnius's mercy. His works have been collected and publiſhed in five volumes, folio. Bayle.

HUNNOVER, in *Geography*, a town of Hindooſtan, in Myſore; 13 miles E.N.E. of Cheneroypatam.

HUNS, in *Ancient Geography* and *Hiſtory*, one of the northern nations, which, under the reign of Valens, threatened the empire of Rome, had been formidable, in a much earlier period, to the empire of China. Their ancient, perhaps their original ſeat, was an extenſive, though dry and barren, tract of country, immediately on the north ſide of the great wall. Theſe narrow limits, however, were extended by their valour; and their ruſtic chiefs, who aſſumed the appellation of "Tanjou," gradually became the conquerors and the ſovereigns of a formidable empire. Towards the eaſt, their victorious arms were ſtopped only by the ocean; and the tribes, which are thinly ſcattered between the Amoor and the extreme peninſula of Corea, adhered with reluctance to the ſtandard of the Huns. On the weſt, near the head of the Irtiſh, and in the vallies of Imaus, they found a more ample ſpace, and more numerous enemies. One of the lieutenants of the Tanjou ſubdued, in a ſingle expedition, 26 nations; and the Igours, or Vigours, diſtinguiſhed above the Tartar race by the uſe of letters, and conſiſting of three claſſes, of hunters, ſhepherds, and huſbandmen, were in the number of his vaſſals. On the north, the ocean was the limit of the power of the Huns. The pride of the Tanjou might be flattered by the ſubmiſſion of ſo many diſtant nations; but the valour of the Huns ſought the richer recompence of the wealth and luxury of the empire of the ſouth. In the third century before the Chriſtian era, a wall of 1500 miles in length was conſtructed in order to defend the frontiers of China againſt the inroads of the Huns; but this was an inſufficient defence to an unwarlike people. The cavalry of the Tanjou frequently conſiſted of two or three hundred thouſand men, formidable by the matchleſs dexterity with which they managed their bows and their horſes; by their hardy patience in ſupporting the inclemency of the weather; and by the incredible ſpeed of their march, ſeldom checked by torrents or precipices, by the deepeſt rivers, or by the moſt lofty mountains. They ſpread themſelves over the face of the country; and notwithſtanding the elaborate tactics of the Chineſe, directed in their operation by the emperor Kaoti, whoſe merit had raiſed him to the throne, were conſtrained to ſurrender to the victorious arms of the barbarians, B. C. 201. The ſucceſſors of Kaoti, whoſe lives were dedicated to the arts of peace, or the luxury of the palace, ſubmitted to a more permanent diſgrace, and to purchaſe a temporary and precarious peace by the regular payment of a tribute of money and ſilk. Beſides, a ſelect band of the faireſt maidens of China was annually devoted to the rude embraces of the Huns; and the alliance of the haughty Tanjous was ſecured by their marriage with the genuine or adopted daughters of the imperial family, which vainly attempted to eſcape the ſacrilegious pollution. At length, however, the pride of the Huns was humbled, and their progreſs checked by the arms and policy of Vouti, the fifth emperor of the powerful dynaſty of the Han. (B. C. 141—87.) Intimidated by the arms, or allured by the promiſes of Vouti and his ſucceſſors, the moſt conſiderable tribes of the eaſt and of the weſt diſclaimed the authority of the Tanjou. (B. C. 70.) The Tanjou was compelled to renounce the dignity of an independent ſovereign, and the freedom of a warlike and high-ſpirited nation. From this period the monarchy of the Huns gradually declined, till it was broken, by civil diſſenſion, into two hoſtile and ſeparate kingdoms. (A. D. 48.) One of the princes of the nation was urged, by fear and ambition, to retire towards the ſouth with eight hords, which compoſed between forty and fifty thouſand families. He obtained, with the title of Tanjou, a convenient territory on the verge of the Chineſe provinces; and his conſtant attachment to the ſervice of the empire was ſecured by weakneſs and the deſire of revenge. From the time of this fatal ſchiſm, the Huns of the north continued to languiſh about 50 years, till they were oppreſſed on every ſide by their foreign and domeſtic enemies. The Sienpi, a tribe of oriental Tartars, retaliated the injuries which they had formerly ſuſtained; and the power of the Tanjous, after a reign of 1300 years, was utterly deſtroyed before the end of the firſt century of the Chriſtian era. (A. D. 93.) The era of the Huns is placed, by the Chineſe, 1210 years before Chriſt, but the ſeries of their kings does not commence till the year 230. About this period more than 100,000 perſons of the pooreſt condition, and moſt puſillanimous temper were contented to remain in their native country, and to mingle with the victorious nation of the Sienpi. Fifty-eight hords, conſiſting of about 200,000 men, ambitious of a more honourable ſervitude, retired towards the ſouth, and were permitted to inhabit and to guard the extreme frontiers of the province of Chanſi and the territory of Ortous. But the moſt warlike and powerful tribes of the Huns maintained, in their adverſe fortune, the undaunted ſpirit of their anceſtors; and reſolved to explore the weſtern world, and diſcover ſome remote country, inacceſſible to the arms of the Sienpi, and to the laws of China. In the courſe of their emigration they ſoon paſſed the mountains of Imaus and the limits of the Chineſe geography. Of theſe formidable exiles two diviſions directed their march towards the Oxus, and towards the Volga. The firſt of theſe colonies eſtabliſhed their dominion in the fruitful and extenſive plains of Sogdiana, on the eaſtern ſide of the Caſpian, where they preſerved the name of Huns, with the epithet of Euthalites, or Nepthalites. Their manners were ſoftened, and even their features were improved, by the mildneſs of the climate, and their long reſidence in a flouriſhing province, which might ſtill retain a faint impreſſion of the arts of Greece. Theſe *white* Huns, a name which they derived from the change of their complexion, ſoon abandoned the paſtoral life of Scythia, and though their vicinity to the provinces of Perſia involved them in frequent conteſts with the power of that monarchy, they reſpected, in peace, the faith of treaties; and, in war, the dictates of humanity. The *ſecond* diviſion of their countrymen, the Huns, who gradually advanced towards the north-weſt, were exerciſed by the hardſhips of a colder climate, and a more laborious march. Their independent ſpirits ſoon rejected the hereditary ſucceſſion of the Tanjous; and while each hord was governed by its peculiar murſa, their tumultuary council directed the public meaſures of the whole nation. As late as the 13th century, their tranſient reſidence on the eaſtern banks of the Volga was atteſted by the name of Great Hungary. (See HUNGARY.) A chaſm occurs in their hiſtory after theſe Huns of the Volga were loſt in the eras of the Chineſe, and before they appeared to thoſe of the Romans, which is not eaſily filled up. There is reaſon, however, to apprehend, that the ſame force which had driven them from their native ſeats, ſtill continued to impel their march towards the frontiers of Europe. The Huns, whoſe martial ſpirit had not been impaired by a long reſidence in China, with their flocks and herds, their wives and children, their dependents and allies, were tranſported to the coaſt of the Volga; and they boldly advanced to invade the country of the Alani, a paſtoral people who occupied, or waſted, an extenſive tract of the deſerts of Scythia. (See ALANS.) The Huns united with the Alani in their invaſion of the Gothic empire. (A. D. 375.) The numbers, the ſtrength, the rapid motions, and the implacable cruelty of the Huns were felt, and dreaded, and magnified by the aſtoniſhed Goths, who beheld their fields and villages conſumed with flames, and deluged with indiſcriminate ſlaughter. To theſe real terrors they added the ſurpriſe and abhorrence which were excited by the ſhrill voice, the uncouth geſtures, and the ſtrange deformity of the Huns. Theſe ſavages of Scythia were compared (and the picture had ſome reſemblance) to the animals who walk very awkwardly on two legs; and to the miſ-ſhapen figures, the "Termini," which were often placed on the bridges of antiquity. They were diſtinguiſhed from the reſt of the human ſpecies by their broad ſhoulders, flat noſes, and ſmall black eyes deeply buried in the head; and as they were almoſt deſtitute of beards, they never enjoyed either the manly grace of youth, or the venerable aſpect of age. A fabulous origin was aſſigned to them, worthy of their form and manners; that the witches of Scythia, who, for their foul and deadly practices, had been driven from ſociety, had copulated in the deſert with infernal ſpirits; and that the Huns were the offspring of this execrable conjunction. The Goths greedily embraced the tale, and were the more eaſily induced to exert themſelves in repelling the invaſion of ſuch enemies. (See GOTHS.) Such is the character, with the addition of many other particulars, which Ammianus Marcellinus and Jornandes give of theſe Scythian and Sarmatian Huns, who anciently inhabited that part of Aſiatic Sarmatia, which bordered on the Palus Mæotis and the Tanais, the ancient boundary between Europe and Aſia. They are repreſented as the moſt ſavage and cruel of all the barbarous nations. Their cheeks were mangled and countenances diſtorted in their earlieſt infancy, with a view, in maturer age, of ſtriking terror into their enemies. They lived in the open air, without houſe or even huts, and ſubſiſted upon roots and raw meat; and inured themſelves, in the woods and on the mountains which they inhabited, to every kind of privation and hardſhip. They were accuſtomed to eat and to ſleep on horſeback, ſcarcely ever diſmounting; and they covered their nakedneſs with goat-ſkins, or the ſkins of a ſort of mice ſewed together. They had no law, nor any kind of religion; nor did they obſerve any diſtinction between good and evil, or ſubmit their inclinations and paſſions to any kind of reſtraint. In war, they began the battle with great fury and a hideous noiſe; but after the firſt onſet, their fury abated and they fled, when reſiſted, in the greateſt confuſion. They were notoriouſly faithleſs, ſo that they diſregarded the moſt ſolemn treaties. Sometimes they made incurſions into the Roman empire in defiance of the moſt ſacred oaths and engagements; and at other times they joined the Romans in fighting againſt the Goths, and other barbarous nations. They have fought againſt each other when they had proſpect of gaining any advantage to themſelves by ſuch conduct. Of their diſpoſition in this reſpect, Juſtinian was ſo fully appriſed, that by promiſing a large ſum to the Uturgurian Huns, who inhabited the ſouth ſide of the Palus Mæotis, he prevailed upon them to fall upon the Cuturgurians, another tribe, which had occupied the territory north of the others, towards the Tanais. Their form of government was not ſtrictly monarchical; but they were headed and conducted by ſome of their chiefs. It was about the year 376 that they entered the country of the Alans, and, obliging thoſe who ſurvived their cruelty to enliſt under their ſtandard, fell upon the Goths, called by Ammianus Greuthongi, and by Jornandes Oſtrogoths, and drove them out of their country. The Viſigoths were afterwards treated in the ſame manner. The Gothic nations, alarmed by the ſudden and unexpected irruptions of the Huns, determined to abandon their territories, and to ſeek ſhelter within the Roman dominions, ſeparated by the Danube from the countries which had been over-run by the Huns. Upon ſubmiſſive application to Valens, the Goths were admitted into Thrace, and their number was ſo conſiderable, that Ammianus compares them to the ſparks which at that very time iſſued out of Mount Ætna, and to the ſands of the Libyan ſhore. Thus the Huns, in the year 376, not only ſettled in Europe, but made themſelves maſters of that immenſe country, which extends from the Tanais to the Danube, and which, before their arrival, was poſſeſſed by the Alans, the Goths, and ſeveral other barbarous nations, whom they either drove out, or forced to ſubmit to their victorious arms. In the year 388 many of the Huns, who had ſettled in Europe, were induced by large ſums to enliſt under the Roman banner of Theodoſius I., who was then emperor, and they were thus prevented from raiſing diſturbances on the frontiers of the empire. In 391 they paſſed the Danube, and being joined by the Goths and other barbarians, committed dreadful havoc in Mœſia and Thrace; but their progreſs was reſtrained by the vigorous and ſucceſsful attack of Stilicho. About four years after, *viz.* in 395, the Huns made an unexpected inroad into the eaſtern provinces, and penetrated as far as Antioch, deſtroying the country with fire and ſword, and committing every where deplorable cruelties. Having over-run and plundered ſeveral provinces, they voluntarily returned home, loaded with ſpoils, and carrying with them an incredible number of captives. After this irruption they remained quiet for nine years, or till the year 404, when paſſing the Danube in great multitudes, they entered Thrace, and having traverſed that province, penetrated into Eaſt Illyricum, committing whereſoever they went dreadful ravages. In the following year great numbers of them entered the Roman ſervice, and joined Stilicho's army, in its march againſt Radagaiſus, who had invaded Italy. They were led by Uldin, one of their chiefs, and contributed to the victory gained by Stilicho in Etruria; but in two years after the ſignal victory, obtained chiefly by his means over Radagaiſus, Uldin became an irreconcileable enemy to the Romans; and paſſing the Danube, entered Thrace at the head of a numerous army; but having offended ſome of his principal officers, who joined the Romans, he was forced to recroſs the Danube after having loſt many of his men. From this period the Huns ſeem to have continued quiet till the year 423, when, upon the death of the emperor Honorius, John, his chief ſecretary, aſſumed the purple, and the celebrated Aetius (ſee his article) was prevailed upon to eſpouſe the cauſe of the uſurper. Aetius engaged 60,000 Huns to march to the aſſiſtance of the new emperor; but hearing of his death, the prudent leader ſubmitted to Theodoſius, and perſuaded the Huns, not without diſtributing among them conſiderable ſums, to return home. Soon after this event, which happened in 423, we find the Huns in poſſeſſion of Pannonia. As they were much indebted to Aetius for the lands they held in this country, Roas, their chief or king, received this able commander with the greateſt demonſtrations of kindneſs and friendſhip, upon his being diſgraced at the court of Placidia, mother of Valentinian III. and ſent him back at the head of a powerful army of Huns, which ſo terrified Placidia, that ſhe reſtored Aetius to all his employments, and raiſed him to the rank of patrician. In 435 a ſtrong body of Huns marched through Germany and Gaul, and joined Aetius againſt the Burgundians, who, having been allowed to ſettle in that part which bordered on the Rhine, had revolted from the Romans, and ravaged Belgic Gaul. On this occaſion 20,000 Burgundians, with their commander Gondicacius, were cut off. Soon after the Burgundians marched againſt the Huns, and ſurpriſing them when they were left deſtitute of a leader, by the ſudden death of Uptar, their king, deſtroyed 10,000 of them, and obliged the ſurvivors to ſave themſelves by a precipitate flight. The Huns, notwithſtanding this defeat, marched either in the ſame or the following year to the aſſiſtance of the Romans againſt the Goths, who had been allowed to ſettle in Aquitain, but who, not contented with the territory allotted them, had taken poſſeſſion of ſeveral cities belonging to the Romans, and had laid ſiege to Narbonne. The Huns, having in the preceding year ſignalized themſelves againſt the Goths in Armorica, marched againſt the Goths of Aquitain. In 425 Rouas, or Roas, king of the Huns, concluded a peace with Theodoſius II., of which one of the conditions was, that the emperor ſhould pay him a yearly penſion of 350 pounds weight of gold. Soon after Rouas died, and was ſucceeded by his two nephews, Bleda and Attila. For the principal events that occurred under the reign of Attila, we refer to his biographical article. With the death of Attila the empire of the Huns is ſaid to have terminated: for after this event they were ſo weakened by inteſtine wars and by the irruptions of the Gepidæ and Goths, that they continued quiet till the year 466, when paſſing the Danube on the ice, they made an incurſion into Dacia, and committed dreadful ravages in that country. But their progreſs was interrupted by Anthemius the Roman commander, and in a pitched battle they were totally defeated. The Huns, diſpirited by their loſſes and the death of their leader, were not in a condition to moleſt either the Romans or their neighbours for about 60 years. In 526 Boarex, queen of the Huns, took part with the Romans againſt the Perſians, and led to the aſſiſtance of the emperor Juſtinian an army of 100,000 men, and obtained a victory, in the 13th year of Juſtinian's reign. The Huns, paſſing the Danube in great multitudes, laid waſte Thrace, Greece, Illyricum, and all the provinces from the Ionian ſea to the ſuburbs of Conſtantinople; and having croſſed the Helleſpont, extended their ravages to Aſia, whence, after practiſing unheard-of cruelties, they returned home loaded with an immenſe booty. Juſtinian, in order to keep them quiet, allowed them ſome lands in Thrace, and agreed to pay them an annual penſion, upon their promiſing to ſerve when wanted in the Roman armies. Theſe were the Cuturgurian Huns; the Uturgurians retired with their booty to their own country bordering on the Euxine ſea, and enlarged their territory by encroaching on that of their neighbours, without giving any further moleſtation to the Romans. But the Cuturgurians, notwithſtanding the penſion annually paid them by the emperor, made ſeveral inroads into the neighbouring provinces. Whilſt they were buſily plundering the provinces lying on the Danube, the Uturgurians, at the inſtigation and bribe of the emperor, fell upon them unexpectedly, defeated them with great ſlaughter, obliged them to quit their booty, and drove them entirely out of the empire. In a few years after, *viz.* A. D. 558, the Cuturgurian Huns, availing themſelves of the froſt, paſſed the Danube, and laid waſte a great part of Myſia and Thrace; but whilſt they were purſuing their ravages, they were put to flight by the aged Beliſarius, and by an youth of great promiſe, called Germanus. The next event in which the Huns were concerned was the war that took place between the two tribes of the Uturgurians and Cuturgurians, and which, after laſting many years, haſtened their deſtruction. In the reign of Charles the Great the Huns were maſters of Dacia, New Tranſylvania, and Walachia; of Upper Mœſia, New Servia, and of the two Pomeranias, namely, the Upper containing the preſent provinces of Carniola, Carinthia, and the greater part of Auſtria: and the Lower, compriſing Boſnia, Sclavonia, and that part of Hungary which lies beyond the Danube. In the year 776, two princes of the Huns ſent ambaſſadors to Charles, while he was in Saxony, deſiring his friendſhip and alliance. But as they proved unfaithful by entering into an alliance with Taſſilo, duke of Bavaria, the enemy of Charles, he raiſed two armies, which, in 794, laid waſte the territories of the Huns, burnt their villages, and took ſeveral of the ſtrong holds to which they had fled for ſecurity. In the ſpace of eight years, this warlike nation was entirely ſubdued, and almoſt wholly extirpated. The entire reductions of the Huns happened, according to the beſt chronologers, in the year 794. Some authors aſſert that by this long war the whole race of the ancient Huns was cut off; and that the country was afterwards peopled by the neighbouring nations, to whom the preſent Hungarians owe their origin. Anc. Un. Hiſt. vol. xvii. Gibbon's Rom. Emp. vol. iv. v. vi.

HUNT, JEREMIAH, in *Biography*, was born in London in 1678. He was educated under Mr. Thomas Rowe, and after he had finiſhed his courſe with him, he went firſt to Edinburgh and then to Leyden; at the latter place he applied himſelf moſt diligently to the ſtudy of the Hebrew language and the Jewiſh antiquities. In Holland he preached to a ſmall Engliſh congregation, and upon his return he officiated ſome time at Tunſtead, in Norfolk, from whence he removed to London about 1710, and was appointed paſtor of the congregation at Pinner's hall. In 1729 the univerſity of Edinburgh conferred on him the degree of D.D. He died in the year 1744. He was author of ſeveral ſingle ſermons; and likewiſe of "An Eſſay towards explaining the Hiſtory and Revelations of Scripture in their ſeveral Periods, to which is annexed a Diſſertation on the Fall of Man." After his death four volumes of his "Sermons," with tracts, were publiſhed, to which was prefixed Dr. Lardner's Funeral Sermon for him: to this the reader is referred for farther particulars.

HUNT, MRS. ARABELLA, a lady much celebrated the latter end of the 17th century, for her beauty, fine voice, and muſical talents. Congreve has left a rapturous and extatic ode on her performance, which, if not ſeraphically exquiſite, his verſes muſt be the moſt *mendacious*, that is, the moſt *poetical*, that ever were written. It ſeems the moſt animated of all the author's fugitive pieces; and we ſhould ſuppoſe that he felt ſtrongly what he ſo warmly deſcribes.

If matters of fact in our biographical articles were not more our buſineſs than amuſement of our readers, we ſhould inſert this whole poem, as it ſurpaſſes in intelligible panegyric all that ancient poets have ſaid of the miraculous powers of Orpheus, Amphion, or Linus. We cannot help giving the firſt ſtrophe as a ſpecimen of auricular rapture.

On Mrs. Arabella Hunt ſinging,

"Let all be huſht, each ſofteſt motion ceaſe,
Be every loud tumultuous thought at peace,
And every ruder gaſp of *breath*
Be calm as in the *arms* of death.

"And thou moſt fickle, moſt uneaſy part,
Thou reſtleſs wanderer, my heart,
Be ſtill; gently, ah, gently leave,
Thou buſy idle thing, to heave.
Stir not a pulſe, and let my *blood*,
That turbulent unruly flood,
Be ſoftly ſtaid.

"Let me be all, but my attention, dead.
Go, reſt, unneceſſary ſprings of life,
Leave your officious toil and ſtrife,
For I would hear her voice, and try
If it be poſſible to die, &c."

Whether this ſiren was a profeſſional ſinger, or a lady, does not appear; ſhe was contemporary with Purcell, and gained her muſical fame chiefly by her admirable performance of his compoſitions. She taught the princeſs Anne of Denmark to ſing; and was in ſuch favour with queen Mary, that ſhe beſtowed on her an employment in the houſhold, for the ſake of having her near her perſon, and was frequently entertained by her performance in private, even in ſinging to her majeſty common popular ſongs and ballads.

Old Mr. Goſtling of Canterbury, uſed to relate a ſtory which he had from his father, (one of the prieſts of the chapel royal, ſubdean of St. Paul's in the time of Charles II. and in the reign of king William, a favourite ſinger at court,) that queen Mary having expreſſed herſelf warmly in favour of the old Scots tune of "Cold and raw the wind doth blow," Purcell made it a perpetual baſe to an air in the next birth-day ode, 1692; beginning "May her bleſt example chaſe:" a piece of pleaſantry occaſioned by her majeſty aſking for this tune, after he, (Goſtling,) and Mrs. Arabella Hunt, with Purcell to accompany them on the harpſichord, had exerted all their talents and abilities to amuſe ſo great a perſonage with compoſitions which they miſtakenly thought of a ſuperior claſs.

Mrs. Hunt died in 1705, when Congreve, under her picture playing on the lute by ſir Godfrey Kneller, furniſhed the following lines, which in his works are called an epigram.

"Were there on earth another voice like thine,
Another hand ſo bleſt with ſkill divine;
The late afflicted world ſome hopes might have,
And harmony retrieve thee from the grave."

HUNTEBURG, in *Geography*, a town of Weſtphalia, in the biſhopric of Oſnabruck, ſituated on the river Hunte, which riſes in the Dummer ſee, and runs into the Weſer, about 20 miles N.E. of Oldenburg; 18 miles N.E. of Vorden.

HUNTER, WILLIAM, M. D. in *Biography*, an eminent anatomical teacher and phyſician, was born on the 23d of

May, 1718, at Kilbride, in the county of Lanerk, in Scotland. His father, John Hunter, was deſcended from the family of Hunter of Hunterſtown, and reſided on a ſmall eſtate, called Long Calderwood, in the pariſh of Kilbride. William, the ſeventh of ten children, was of a quiet and diligent diſpoſition, and was ſent to the univerſity of Glaſgow, at the age of fourteen, as a ſtudent of divinity. But after a ſedulous ſtudy of theology, he conceived a repugnance to the ſubſcribing to the articles of the Scotch church; and in this ſtate of mind becoming acquainted with Mr Cullen (afterwards the celebrated profeſſor at Edinburgh), who had juſt ſettled in practice at Hamilton, he was led to give a preference to the profeſſion of phyſic, and in 1737 went to reſide with this excellent friend and preceptor, with the conſent of his father. The three years which he paſſed at Hamilton, he often declared were the happieſt in his life. Mr. Cullen and he entered into partnerſhip, with this liberal agreement, that each of them ſhould alternately purſue further improvement in ſome medical ſchool. Hunter, in conſequence, went to Edinburgh in November 1740, where he attended the winter courſe of lectures, and among others thoſe of the firſt Dr. Alexander Monro. In the ſummer of 1741, he arrived in London, with a recommendation to Dr. James Douglas, who was at that time engaged in a great anatomical work on the bones, which he did not live to complete. He was deſirous of engaging a young man of abilities and induſtry to aſſiſt him in his diſſections, and being favourably impreſſed with the converſation of Mr. Hunter, invited him to reſide in his family for that purpoſe, and alſo to ſuperintend the education of his ſon. Dr. Cullen readily gave his aſſent to a change of plan ſo favourable to his friend's advancement; and his venerable father, then near his end, reluctantly conſented; he died in October of the ſame year. Mr. Hunter was immediately enabled, by Dr. Douglas's friendly aſſiſtance, to enter himſelf as a ſurgeon's pupil at St. George's hoſpital, and as a diſſecting pupil of Dr. Frank Nichols, an anatomiſt of conſiderable reputation. He purſued his diſſections with ſuch aſſiduity and ſucceſs, that Dr. Douglas was at the expence of having ſeveral of his preparations engraved. But he ſoon had the misfortune to loſe this generous friend, who died in April 1742. He continued, however, to reſide with the doctor's family, and to purſue his ſtudies with the ſame diligence: for while he was convinced that he muſt now depend upon his own exertions for profeſſional ſucceſs, he alſo began to feel a conſciouſneſs of his own powers. In the following year, 1743, he communicated to the Royal Society a paper "On the Structure and Diſeaſes of articulating Cartilages," which was printed in their Tranſactions, vol. 42, and was admired for the ingenuity of the obſervations on a ſubject not much inveſtigated before. He now determined to become a teacher of anatomy; but difficulties at firſt preſented themſelves, and he was diſcouraged by Dr. Nichols, who about that time declined giving lectures in favour of Dr. Lawrence. A circumſtance, however, ſoon occurred, which called forth his abilities in this way. A ſociety of navy-ſurgeons had engaged Mr. Samuel Sharpe to deliver to them a courſe of lectures on the operations of ſurgery, at an apartment which they had in Covent-Garden. Mr. Sharpe at this time declined the taſk, and Mr. Hunter was ſolicited to continue it, which he did ſo much to their ſatisfaction, that they requeſted him to extend his plan to anatomy: and in the winter of 1746, he began his courſe of anatomical lectures in their room. At firſt he experienced conſiderable ſolicitude in ſpeaking in public; but at length his diffidence was overcome, and he acquired that facility for which he was peculiarly diſtinguiſhed, and which rendered the delivery of lectures a ſource of real pleaſure to him. We may here mention, that on returning home after his introductory lecture, accompanied by a young friend, Mr. Hunter, who had received about ſeventy guineas from his pupils, and had got the money in a bag under his cloak, obſerved, that it was a larger ſum than he had ever been maſter of before: an anecdote which, as Dr. Simmons remarks, deſerves to be recorded as an encouragement to young men, who with great merit poſſeſs but little advantages of fortune. Conſiderable as the emoluments of his two firſt courſes were, by contributing to the wants of different friends, he found himſelf, at the return of the next ſeaſon, obliged to defer his lectures for a fortnight, merely becauſe he had not money enough to defray the neceſſary expence of advertiſements. This produced a reſolution to be in future as cautious in lending money, as he was averſe to borrowing it. His own habits were ſtrictly economical, and laid the foundation of that ample fortune, which he ſo freely expended upon ſubjects of public utility.

In the ſpring of 1748, he ſet out on a tour through Holland to Paris, with his pupil young Douglas. The only circumſtance recorded of this journey, is his introduction to the celebrated Albinus at Leyden; whoſe admirable injections inſpired him with a ſtrong emulation to excel in that curious and important part of anatomy. Although admitted into the corporation of ſurgeons in the preceding year, he now relinquiſhed that branch of practice, to which he had always a ſtrong averſion, and directed his views to the practice of midwifery, in which his patron Dr. Douglas had acquired conſiderable reputation. His advancement in this department was accelerated by his being elected ſurgeon-accoucheur firſt to the Middleſex, and ſoon afterwards to the Britiſh Lying-in-hoſpital, as well as by the delicacy of his perſon and manners, which gave a great advantage over his countryman, Dr. Smellie. He was likewiſe recommended by ſeveral of the moſt eminent ſurgeons of that time, from a reſpect for his anatomical talents; and the death of ſir Richard Manningham, and the retirement of Dr. Sandys, (who then had the moſt lucrative practice in that branch,) concurred to aſſiſt Mr. Hunter's progreſs. In 1750, he obtained the degree of M. D. from Glaſgow; and as his reputation increaſed, he was much conſulted as a phyſician, both in caſes connected with his particular branch of practice, and in thoſe which required peculiar anatomical ſkill in their inveſtigation. About this time he quitted the family of Mrs. Douglas, and took a houſe in Jermyn-ſtreet.

In 1751, Dr. Hunter reviſited his native country; but with the exception of this journey, to which he devoted only a few weeks, he was never abſent from London but under profeſſional engagements. In 1756 he was admitted a licentiate of the College of Phyſicians, and ſoon afterwards was elected a member of the Medical Society, recently inſtituted; the "Medical Obſervations and Inquiries" of which he enriched by many valuable communications, and of which he was deſervedly choſen preſident on the death of Dr. Fothergill. It will be ſufficient here to notice the moſt important of the contributions to medical ſcience, of which Dr. Hunter was the author, in the excellent volumes publiſhed by this ſociety. In his hiſtory of an aneuriſm of the aorta, contained in the firſt volume, 1757, he was the firſt to notice a peculiar form of this diſeaſe, occaſioned by the wounding of an artery through a vein, with which veſſel, after healing externally, the artery continues to maintain a communication. Of this diſeaſe he afterwards treated more at large (ſee Med. Obſ. and Inquir. vol. ii. and iv.); and it has been ſince named an *aneuriſmal varix*, at the ſuggeſtion of

Dr. Cleghorn. (Ibid. vol. iii.) In the ſecond volume, among ſeveral other papers, is the deſcription of a caſe of emphyſema, followed by ſome judicious practical remarks on the cellular membrane and its diſeaſes. He here maintained the opinion that the veſicles, in which the fat is depoſited, are different from the cells that contain water in anaſarca. In the fourth and fifth volumes he communicated his valuable obſervations relative to the retroverſion of the uterus, which ſometimes occurs in pregnancy, and is liable to produce a fatal event, if not remedied in time; a diſeaſe not underſtood till accurately deſcribed by Dr. Hunter. All his papers, publiſhed in the volumes alluded to, are worthy of attention.

In the year 1762 Dr. Hunter came forward as a controverſialiſt, and with a degree of aſperity, which has very commonly attended anatomical controverſies, maintained his claims to different anatomical diſcoveries. In his "Medical Commentaries," to which a "Supplement" was afterwards added, he ſupported the priority of his diſcoveries over thoſe of Dr. Monro, jun. profeſſor of anatomy at Edinburgh, in reſpect to the ducts of the lachrymal glands, injections of the teſticle, the origin and uſe of the lymphatic veſſels, and abſorption by veins. There is nothing more difficult to aſcertain, as Dr. Aikin has juſtly obſerved (Gen. Biog.), than the exact ſhare in the improvements of a progreſſional ſcience, due to the individuals who are ſimultaneouſly purſuing it, with equal ardour and advantages; nor is the determination of any conſequence to the ſcience itſelf. The great doctrine of the abſorbent action of the lymphatic ſyſtem, which is now fully received, at leaſt by the anatomiſts of Great Britain, was taught and illuſtrated at the ſame time in the ſchools of London and of Edinburgh, and exerciſed the ingenuity of Hunter, Monro, Hewſon, Cruickſhank, and other anatomiſts. Dr. Simmons has ſhewn, however, that the principal points of this ſyſtem had been ſtated, ſo long ago as the year 1726, by Mr. Noguez, in the ſecond edition of a work entitled "L'Anatomie du Corps de l'Homme en abrégé," printed at Paris. Who may have firſt ſucceeded in a lucky injection ſeems a matter ſcarcely worthy of conteſt; but Dr. Hunter was extremely tenacious of any claims of this kind, and would not ſuffer the interference even of his own brother. Some papers, in which a claim of Mr. John Hunter, relative to the connection between the placenta and uterus, was diſputed by the doctor in 1780, are preſerved in the archives of the Royal Society. In the "Commentaries" there are alſo ſome obſervations on the inſenſibility of the dura mater, perioſteum, tendons, and ligaments, as taught with ſome ſlight difference by Haller; and likewiſe "Obſervations on the State of the Teſtis in the Fœtus, and on the Hernia Congenita, by Mr. John Hunter."

The profeſſional reputation which Dr. Hunter had already attained was evinced by his being conſulted in the pregnancy of the queen, in 1762. Two years afterwards he was appointed phyſician extraordinary to her majeſty; a diſtinction for which he was indebted ſolely to his perſonal merit. In 1767 he was elected a fellow of the Royal Society; and in the following year he communicated to that body ſome obſervations on the bones found near the river Ohio, in America, which were commonly ſuppoſed to belong to the elephant. But he proved, chiefly from the ſtructure of the teeth, that they belonged to ſome unknown quadruped, of a different ſpecies. (Phil. Tranſ. vol. 58.) In the 60th and 61ſt volumes of the ſame publication, were printed a memoir on ſome foſſil bones, found in the rock of Gibraltar, and an account of the Nyl-ghau, a non-deſcript Indian animal. In 1768, Dr. Hunter was elected into the Society of Antiquaries, and was appointed by his majeſty to the office of profeſſor of anatomy to the Royal Academy of Arts, on its firſt inſtitution. This appointment opened a new field for the application of his anatomical knowledge, in relation to external form, as the object of painting and ſculpture. He engaged in it, as in every other purſuit of his life, with unremitting zeal, and the novelty and ingenuity of his obſervations diſplayed the extent and verſatility of his talents. Finally, he received other literary honours from learned ſocieties abroad; being choſen a foreign aſſociate of the Royal Medical Society of Paris in 1780, and of the Royal Academy of Sciences, in the ſame city, in 1782.

So early as the year 1751, Dr. Hunter had commenced a work, upon which he continued to beſtow inceſſant attention and great expence for ſeveral ſubſequent years; this was his ſplendid publication, "The Anatomy of the Gravid Uterus," which appeared in 1775, illuſtrated by 34 large engravings, executed from capital drawings of ſubjects and preparations, by the firſt maſters. This great work, not leſs admirable for its accuracy than for its magnificence, exhibited all the principal changes that occur in the nine months of pregnancy, in a degree of perfection which had never before been approached. In this work he firſt delineated the retroverted uterus, and the membrana decidua reflexa, which he himſelf diſcovered. He drew up a detailed anatomical deſcription of the figures, which he did not live to finiſh, but which was completed and publiſhed by his nephew, Dr. Baillie, in 1794, under the title of "Anatomical Deſcription of the Gravid Uterus and its Contents." In 1778 he publiſhed his "Reflections on the Section of the Symphyſis Pubis," an operation introduced by the French, but which the cooler judgment of Engliſh practitioners rejected upon the moſt ſolid grounds. Among Dr. Hunter's papers were found "Two Introductory Lectures" to his anatomical courſe, correctly written out, which were publiſhed in 4to. in 1785, and which complete the catalogue of his publications.

Having followed the courſe of Dr. Hunter's labours as a teacher and writer, we muſt go back a little in order to trace his progreſs in the foundation of a muſeum, which he deſtined for public uſe. His firſt deſire, when he commenced the practice of midwifery, was to acquire a ſufficient fortune to ſecure him eaſe and independence; and in a few years he found himſelf in poſſeſſion of this competency. As his wealth continued to accumulate, he formed the laudable deſign of employing his ſuperfluity in ſome ſcheme of public utility; and the foundation of an anatomical ſchool in the metropolis naturally ſuggeſted itſelf. About the year 1765, therefore, he preſented a memorial to the miniſter, Mr. Grenville, requeſting a grant of ground in the King's Mews, on which he offered to build a proper edifice at the expence of ſeven thouſand pounds, and to endow a profeſſorſhip of anatomy in perpetuity. This offer was received coldly; and after ſome delay Dr. Hunter purchaſed a ſpot of ground in Great Windmill ſtreet, on which he built a houſe, together with an anatomical theatre, and a muſeum, and removed thither from Jermyn ſtreet in 1770. The firſt furniture of the muſeum conſiſted of an extenſive collection of anatomical preparations, formed with great labour and expence; to which, however, he now added foſſils, ſhells, and other objects of natural hiſtory; a great treaſure of Greek and Latin books in the rareſt editions; and, laſtly, a cabinet of ancient coins and medals, which was collected progreſſively at the expence of upwards of 20,000*l.* A deſcription of part of the coins, in this collection, ſtruck by the free Greek cities, was publiſhed by his friend Mr. (now Dr.) Combe, under the title of "Nummorum Veterum Populorum et Urbium, qui in Muſeo Gulielmi Hunter aſſervantur, deſcriptio, figuris illuſtrata Opera et ſtudio Caroli Combe, S. R. et S. A.

Soc." 4to. 1783. An eaſy acceſs was always given to perſons who wiſhed to view and conſult this muſeum, and its reputation among foreigners reflected honour upon the capital containing it.

Dr. Hunter continued to teach and to practiſe in his profeſſion, with unabated aſſiduity, until March 1783, when an attack of a wandering gout, to which he was ſubject, obliged him to keep to the houſe for ſome days. A partial recovery induced him, contrary to the advice of his friends, to deliver a lecture; but the effort ſo much exhauſted him that he fainted away, and a ſlight paralytic attack followed in the night. His intellects remained clear, however, until death, and he ſurveyed its approach with ſo much tranquillity, that in his laſt moments he ſaid to Mr. Combe, "If I had ſtrength enough to hold a pen, I would write how eaſy and pleaſant a thing it is to die." He expired on the 30th of March 1783.

In perſon Dr. Hunter was ſlender, and rather below the middle ſtature. He was a man of mild and ſedate character, eaſy in converſation, engaging in his addreſs, ſteady in the purſuit of his objects, ſimple and regular in his mode of life. As a practitioner he was cautious, perhaps to the verge of timidity; but ſingularly qualified to inſpire confidence in his patients. As a lecturer he peculiarly excelled in the clearneſs of his demonſtrations. No man has ſo much contributed to the propagation of anatomical knowledge in this kingdom, and to the reputation of London as a ſchool for that ſcience. By his will he bequeathed to his nephew, Matthew Baillie, M. D. (his ſucceſſor as a teacher of anatomy, and now the moſt eminent phyſician in the metropolis, 1810,) his muſeum, for a term of 30 years, with a ſum for its augmentation, and annuities to three truſtees for the care of it, while in London. At the end of that period it was to go to Glaſgow: but Dr. Baillie has already had it removed to that univerſity ſome years before the completion of that term. See an Account of the life, &c. of Wm. Hunter, M. D. by Dr. S. F. Simmons, 1783. Gen. Biog.

Hunter, John, a very eminent ſurgeon, brother of the preceding, and youngeſt of the family, was born in July 1728. Being his mother's favourite, and his father, through age and indiſpoſition, being unable to pay much attention to him, he was brought up in a courſe of indulgence, which proved injurious both to his temper and his progreſs in learning. It was late and with great difficulty that he was taught to read; and after his father's death, he was left, at the age of 10, an ill-governed boy, neglecting his education, and ſpending his time in idleneſs and country amuſements. Yet he exhibited marks of an acute underſtanding and of a bold diſpoſition. As he appeared to have a mechanical turn, and ſome manual dexterity, he was ſent to Mr. Buchanan, a brother-in-law, lately ſettled in Glaſgow, as a carpenter and cabinet-maker; but the want of ſucceſs in this perſon's buſineſs left young Hunter again unemployed. Having heard of the reputation which his brother William was now acquiring in London, he wrote to requeſt permiſſion to viſit him, and to try to make himſelf uſeful as an anatomical aſſiſtant, or, if that ſhould be refuſed, to enter the army. The offer was readily embraced by William, and John arrived in London in September 1748, juſt before the commencement of the winter courſe of lectures. His firſt eſſays in diſſection ſatisfied his brother of the certainty of his ultimate proficiency in anatomy, which he cultivated with ſuch ſucceſs, as to be capable of undertaking the demonſtrations to the pupils in the diſſecting room in the following winter. In the ſummer months he attended the practice of ſurgery at the Chelſea hoſpital, under Mr. Cheſelden, and afterwards at St. Bartholomew's and St. George's hoſpitals, of which laſt he was appointed houſe-ſurgeon in 1756. It does not appear with what intention he was entered as a gentleman-commoner at St. Mary's hall, Oxford, in 1753. Literary diſtinction ſeems never to have been his ambition, nor indeed within his reach. This probably he ſoon diſcovered; for we find no intermiſſion of his profeſſional purſuits in London. In the winter of 1755, Dr. Hunter admitted him to a partnerſhip in his lectures. He applied himſelf to diſſection, and to making anatomical preparations, with unexampled ardour and perſeverance, in which he was highly uſeful to his brother's collection. Having thus laboured for ten years in the inveſtigation of human anatomy, he turned his inquiries to the anatomy of other animals, with a view to elucidate the uſe of the different organs, by a comparative view of their ſtructure, and thus to acquire a more certain knowledge of the general principles of the animal economy. He proſecuted theſe reſearches with the ardour of an enthuſiaſt, and ſuffered no opportunity of examining animals of every deſcription to eſcape him. His health was ſo much impaired, however, by this exceſſive application, that in the year 1760 he went abroad as ſurgeon on the ſtaff, and ſerved during the war in Belle-iſle and in Portugal, where he acquired his knowledge of gun-ſhot wounds. On his return in 1763, he ſettled as a ſurgeon in London, and added to the ſcanty income derived from his practice, by teaching practical anatomy and operative ſurgery for ſeveral winters. His ardour for comparative anatomy continued unabated; and for the greater facility of carrying on his experiments, he purchaſed a piece of ground at Earl's Court, Brompton, where he built a houſe. Here he kept ſeveral foreign animals, of whoſe manners and habits he was a ſedulous obſerver, and ſubſequently made his obſervations and experiments relative to the economy of the bee, the ſilk-worm, and other inſects; to the progreſs of incubation in the egg; to the growth of vegetables; to the tranſplanting of teeth into the combs of cocks, &c. &c. with the deſcription of which he enriched the volumes of the Philoſophical Tranſactions, and with his preparations formed that unrivalled muſeum, of which we ſhall preſently ſpeak. He was elected a member of the Royal Society in 1767; and, in order to promote ſcientific improvement more effectually than could be done by formal meetings, he was the means of aſſociating ſome of the moſt active members in a converſation party at a coffee-houſe, after the public buſineſs of the ſociety was ended. This at firſt conſiſted only of Dr. G. Fordyce, Mr. Cumming, and himſelf; but they were ſoon joined by ſir Joſeph Banks, Dr. Solander, Dr. Maſkelyne, &c.

When Dr. Hunter removed to his new eſtabliſhment in Windmill-ſtreet, he aſſigned the leaſe of his houſe in Jermyn-ſtreet to Mr. Hunter. About the ſame time Mr. Hunter became a member of the corporation of ſurgeons, and, through his brother's intereſt, was elected one of the ſurgeons to St. George's hoſpital. In 1771, finding his buſineſs increaſing with his reputation, he married a lady to whom he had been long engaged, the eldeſt daughter of Mr. Home, a military ſurgeon, and ſiſter to the preſent Mr. Everard Home. She was a perſon of elegant accompliſhments, and has lately obliged the public with a volume of poems. His houſe was now frequented by medical ſtudents, who came to finiſh their education in London, and who were deſirous of a reſidence in a ſituation ſo favourable to their improvement. Among others of his pupils, who have ſince attained to profeſſional eminence, we may mention the name of Jenner, immortalized by the diſcovery of the preventive powers of the cow-pox. In 1771 he publiſhed his firſt work, "On the Natural Hiſtory of the Teeth," in 4to. It diſplayed great accuracy of reſearch, and was illuſtrated with excellent plates. In 1773 he commenced a courſe of lectures on the theory and principles of ſurgery, in which he brought forward many peculiar opinions, expreſſed in a peculiar language, which he introduced into phyſiological and pathological ſcience. Part of the peculiarity of his language, however, muſt be attributed to his want of a regular literary education, and aroſe from his miſconception of its proper uſe; and to the ſame defect muſt be aſcribed his failure to acquire that methodical arrangement of his ideas, and clearneſs and facility in expreſſing them, for which his brother was ſo much diſtinguiſhed. However, he was a real improver of his profeſſion, both in a theoretical and practical view. He ſuggeſted new methods of treatment in ruptures of the tendo Achillis, in the operation for hydrocele, and for fiſtula lachrymalis, &c.; but the moſt important of his chirurgical improvements was the method of operating for the popliteal aneuriſm, by taking up the femoral artery on the anterior part of the thigh.

In the year 1776, Mr. Hunter was appointed ſurgeon-extraordinary to his majeſty. In 1778 he publiſhed the ſecond, or practical part, of his "Treatiſe on the Teeth," in which their diſeaſes were conſidered. Soon afterwards, he was elected a member of the Royal Society of Gottenburgh, and of the Royal Medical Society, and Royal Academy of Surgery, at Paris. In the year 1783, the term of his leaſe in Jermyn-ſtreet expiring, and his collection being now too large to be contained in his dwelling-houſe, he purchaſed the leaſe of a large houſe on the eaſt ſide of Leiceſter-ſquare, with premiſes extending to Caſtle-ſtreet, on which he erected a ſpacious building for his muſeum, at a coſt much beyond the dictates of prudence. Had his age and ſtate of health, indeed, juſtified the expectation of a long continuance of the emoluments which were beginning to flow in upon him, no expenditure connected with his fame could have been thought cenſurable. At this period his faculties of body and mind ſeem to have been exerted to the utmoſt, and every moment had its full employ. He was now engaged in a very extenſive private practice; he was ſurgeon to St. George's hoſpital; he was giving a long courſe of lectures in the winter; he was carrying on his inquiries in comparative anatomy, and adding to his muſeum; he had a ſchool of practical anatomy in his own houſe, and was conſtantly employed in ſome experiments reſpecting the animal economy. The poſt of deputy ſurgeon-general to the army was conferred upon him in 1786; and in the ſame year his great and long-expected work "On the Venereal Diſeaſe" made its appearance. Few medical performances have been more read; but it underwent ſome ſevere criticiſms, both theoretical and practical: nevertheleſs it will ever remain a monument to his extraordinary ſagacity and talent of obſervation. He alſo publiſhed in this year, "Obſervations on various Parts of the animal Economy," chiefly compoſed of papers already printed in the Philoſophical Tranſactions. In the ſpring of this year Mr. Hunter was ſeized with a ſevere illneſs, from which he recovered ſlowly, and which left his conſtitution impaired; he became ſubject eſpecially to an affection of the heart, which came on upon every violent agitation of the mind, or ſudden exertion of the body. In 1790 he was appointed inſpector-general of hoſpitals, and ſurgeon-general to the army, which gave him much additional occupation; and he then reſigned his courſe of lectures to his brother-in-law, Mr. Home, ſtill employing all his little leiſure in ſcientific purſuits. From the autumn of this year, however, the ſeries of ſpaſmodic and other uneaſy ſymptoms, connected with the affection of the heart, and conſtituting what is named angina pectoris, which had for ſome time haraſſed him, increaſed conſiderably in violence, and to himſelf and others portended a ſuddenly fatal termination. During the years 1791 and 1792, he had many ſevere attacks, but of not more than a few hours duration. On the 16th of October 1793, when in his uſual ſtate of health, he went to St. George's hoſpital, where ſomething occurred which irritated him, but of the circumſtances of which he was not perfectly maſter. He therefore withheld his ſentiments, and withdrew into the next room, where, in the act of turning round to one of the phyſicians, he gave a deep groan, and dropped down dead.

On diſſection, the heart was found to be the principal ſeat of diſeaſe. That organ appeared as if ſhrunk in its ſize; the coronary arteries, which ramify in its ſubſtance, were completely oſſified, or in the ſtate of bony tubes; and the valves were in a ſtate of incipient oſſification.

Mr. Hunter was a man of a warm and impatient temper, but open and undiſguiſed. He was naturally cheerful and ſocial; and his countenance bore the ſtamp of frankneſs and animation, though in his latter years it was deeply impreſſed with thoughtfulneſs. The admirable print of him, from a portrait by ſir Joſhua Reynolds, ſtrongly confirms the judgment made of it by Lavater: "This man thinks for himſelf." In originality of genius and powers of inveſtigation, he appears to have ſurpaſſed his brother; induſtry and perſeverance equally belonged to both.

In order to avoid interruption to the biographical narrative, we have omitted to notice the very numerous and important papers which Mr. Hunter preſented to the Royal Society, in rapid ſucceſſion, eſpecially between the years 1773 and 1783, chiefly relating to comparative anatomy and phyſiology; nor have we room at preſent to enumerate their titles. His fame, however, will principally reſt upon his various diſcoveries in this branch of ſcience; and it would be injuſtice to his character not to deſcribe, as amply as our limits will admit, the anatomical muſeum, the formation of which may be regarded as having been the main object of his life. In its plan it was abſolutely unique, and the perfection to which he brought it rendered it the admiration of all who were capable of judging of its value. It embraced the grand deſign of expoſing to view the gradations of nature, from the moſt ſimple ſtate in which life is found to exiſt, to the moſt perfect and complete piece of animal mechaniſm, that of man. This collection of anatomical facts is arranged according to the functions they are intended to illuſtrate, the different parts of animal bodies intended for ſimilar uſes being brought together in ſeries, ſo that the various links in the chain of perfection are readily followed, and clearly underſtood. This arrangement comprehends four great orders: the *firſt*, parts conſtructed for motion; *ſecond*, parts eſſential to animals reſpecting their own internal economy and preſervation; *third*, parts ſuperadded for purpoſes connected with external objects; and, *fourth*, parts for the propagation of the ſpecies, and the maintenance of the young. The *firſt order* exhibits the fluids of living bodies in a ſeries, from the ſimple colourleſs ſap of ſome vegetables to the coloured and coagulating blood;—the muſcles, from the ſtraight ſimple muſcle to the moſt complicated ſtructure with elaſtic ligaments;—the growth of bone, horn, ſhell, &c.;—and the varieties of joints. The *ſecond order* comprehends the organs of digeſtion, beginning with the hydatid, which is itſelf a ſimple pouch, and paſſing to the polypus, the leech, and more complicated animals, including a ſeries of ſtomachs, of inteſtinal canals, and of the glands connected with them, as livers, ſpleens, &c. After the organs of digeſtion follows the ſyſtem of abſorbing veſſels, from the roots of plants up to the lacteals and lymphatics of different animals. The next ſtep is to the heart, which, in the caterpillar is a ſimple canal, and receives various additions as we aſcend in the ſcale, until we find it a double heart in man and quadrupeds: this leads to the ſtructure of arteries and veins. Then the lungs are ſhewn in all their gradations, from the ſimple vaſcular lining of the egg-ſhell, which ſerves as lungs for the chicken, to thoſe of the more perfect animals, including gills, &c. The windpipe and organs of voice are ſhewn under their different forms. And, laſtly, the kidnies are exhibited, which ſeparate the ſuperfluous fluids from the circulation. The *third order* takes up the brain from its ſimpleſt ſtate in the leech, to the ſnail, inſects, fiſh, &c. upwards;—the varieties of all the organs of ſenſe in the different tribes of living things; and, laſtly, the external coverings of hair, feathers, ſcales, &c.; the weapons of offence and defence, as ſpurs, hoofs, horns, ſtings, and electric organs. As an appendix to this order, ſome peculiar ſtructures are added, ſuch as the air-bladder in fiſh, &c. The *fourth order* includes all the variety of parts connected with the proceſs of generation in plants and animals, from the polypus and coral, to the perfect animals;—thoſe of females in the maiden and impregnated ſtate, including the products of ſeeds, ſpawn, eggs, &c.; the progreſs of incubation; the peculiarities of the fœtus; and the various organs for the nouriſhment of the young. This ſketch gives a very inadequate idea of the amazing number of objects, from every department of nature, which the collection compriſed; but it contains, beſides, a large ſeries of whole animals, arranged according to their internal ſtructure, many of them the rareſt ever brought into this country; ſuch as the camelopard, hippopotamus, &c. It comprehends, moreover, a ſeries of ſkulls of different animals, and ſkeletons of almoſt every known genus;—an immenſe number of calculi, urinary, biliary, and inteſtinal;—a large collection of ſhells and inſects;—and a moſt complete aſſortment of extraneous foſſils. By his will, Mr. Hunter directed that this muſeum ſhould be offered to the purchaſe of government; and, after ſome negociation, it was bought for the public uſe for the ſum of 15,000*l.* and given to the college of ſurgeons, on condition of expoſing it to public view on certain days in the week, and giving a ſet of annual lectures explanatory of its contents. A large building for its reception has been completed in Portugal-ſtreet, connected with the college of ſurgeons, in Lincoln's-Inn-Fields; and in the ſpring of the preſent year (1810) the firſt courſe of lectures was delivered by Mr. Home and ſir William Blizard.

At the time of his death, Mr. Hunter had made conſiderable progreſs in the printing of "A Treatiſe on the Blood, Inflammation, and Gun-ſhot Wounds," which was publiſhed in 1794, under the inſpection of Mr. Home, who prefixed a biographical account of the author. See this Account; alſo Gen. Biog.

HUNTER, HENRY, a popular preacher and writer, was born at Culroſs, in Perthſhire, in the year 1741. He had the beſt education that the circumſtances of his parents would permit, and at the age of thirteen was ſent to the univerſity of Edinburgh, where, by his talents and proficiency, he attracted the notice of the profeſſors, and at the age of ſeventeen he was appointed tutor to Mr. Boſwell, afterwards one of the lords of ſeſſion. When he left Edinburgh he accepted the office of tutor to lord Dundonald's ſons at Culroſs abbey. In 1764 he was licenſed to preach, having paſſed the ſeveral trials with great applauſe; and very quickly became much followed on account of his popular pulpit talents. He was ordained in 1766, and was appointed miniſter of South Leith. On a viſit to London in 1769, he preached in moſt of the Scotch meeting-houſes with great acceptance, and ſoon after his return he received an invitation to become paſtor of the Scotch church in Swallow-ſtreet, which he declined; but in 1771 he removed to London, and undertook the paſtoral office in the Scotch church at London Wall. He appeared firſt as an author in 1783, by the commencement of his "Sacred Biography," which was at length extended to ſeven volumes octavo. While this work was in the courſe of publication, he engaged in the tranſlation of Lavater's "Eſſays on Phyſiognomy," and in order to render his work as complete as poſſible, he took a journey into Swiſſerland, for the purpoſe of procuring information from Lavater himſelf. He attained, in ſome meaſure, his object, though the author did not receive him with the cordiality which he expected, ſuſpecting that the Engliſh verſion muſt injure the ſale of the French tranſlation. The firſt number of this work was publiſhed in the year 1789, and it was finiſhed in a ſtyle of reſpectability worthy the improved ſtate of the arts. From this period Dr. Hunter ſpent much of his time in tranſlating different works from the French language. In the year 1790 he was elected ſecretary to the correſponding board of the "Society for propagating Chriſtian Knowledge in the Highlands and Iſlands of Scotland." He was likewiſe chaplain to the "Scotch Corporation," and both theſe inſtitutions were much benefited by his zealous exertions in their behalf. In the year 1795, he publiſhed two volumes of ſermons, and in 1798 he gave the world eight "Lectures on the Evidences of Chriſtianity," being the completion of a plan begun by Mr. Fell. The whole contains a popular and uſeful elucidation of the proofs in favour of the Chriſtian religion, ariſing from its internal evidence, its beneficial influence, and the ſuperior value of the information which it conveys with reſpect to futurity. During the latter years of his life, Dr. Hunter's conſtitution ſuffered the ſevereſt ſhocks from the loſs of three children, which, with other cauſes, contributed to render him unable to withſtand the attacks of diſeaſe. He died at the Hot-Wells, Briſtol, on the 27th of October 1802, in the 62d year of his age. Dr. Hunter was a man of learning: his writings are eloquent, and ſhew how well he had ſtudied human nature. In the pulpit his manner was unaffected, ſolemn and impreſſive. He indulged his liberal and friendly heart in the exerciſe of hoſpitality, charity, and the pleaſures of ſocial intercourſe, frequently beyond the limits which a regard to prudence and economy ſhould have preſcribed. He was the tranſlator of "Letters of Euler to a German Princeſs, on different Subjects in Phyſics and Philoſophy;" "The Studies of Nature by St. Pierre;" "Saurin's Sermons;" "Sonnini's Travels." Miſcellaneous pieces and ſermons of his own have been publiſhed ſince his death, to which are prefixed Memoirs: from theſe the foregoing particulars have been taken. Dr. Hunter, about the year 1796 or 7, begun "A Hiſtory of London and its Environs," which came out in parts, and which has lately been finiſhed by other editors. It makes two large quarto volumes.

HUNTER, a name given to a horſe qualified to carry a perſon in the chaſe. The ſhape of the horſe deſigned for this ſervice, ſhould be ſtrong and well knit together, as the jockies expreſs it. Irregular or unequal ſhapes in theſe creatures are always a token of weakneſs. The inequalities in ſhape which ſhew a horſe improper for the chaſe, are the having a large head and a ſmall neck, a large leg and a ſmall foot, and the like. The head of the hunter ſhould, indeed, always be large, but the neck ſhould alſo be thick and ſtrong to ſupport it. The head ſhould be lean, the noſtrils wide, and the wind-pipe ſtraight.

The whole ſhape of a horſe intended for a hunter ſhould be this: the ears ſhould be ſmall, open, and pricked; or though they be ſomewhat long, yet if they ſtand up erect, and bold, like thoſe of a fox, it is a ſign of toughneſs or hardineſs. The forehead ſhould be long and broad, not flat; or, as it is uſually termed, mare-faced, but riſing in the middle like that of a hare; the feather ſhould be placed above the eye, the contrary being thought by ſome to threaten blindneſs. The eyes ſhould be full, large and bright; the noſtrils not only large, but looking red and freſh within; for an open and freſh noſtril is always eſteemed a ſign of a good wind. The mouth ſhould be large, deep in the wicks, and hairy. The wind-pipe ſhould be large, and appear ſtraight when he bridles his head; for if, on the contrary, it bends like a bow on his bridling, it is not formed for a free paſſage of the breath. This defect in a horſe is expreſſed among the dealers by the phraſe cock-throppled. The head ſhould be ſo ſet on to the neck, that a ſpace may be felt between the neck and the chine; when there is no ſuch ſpace, the horſe is ſaid to be bull-necked, and this is not only a blemiſh in the beauty of the horſe, but it alſo occaſions his wind not to be ſo good. The creſt ſhould be ſtrong, firm, and well riſen; the neck ſhould be ſtraight and firm, not looſe and pliant; the breaſt ſhould be ſtrong and broad; the ribs round like a barrel, the fillets large; the buttocks rather oval than broad; the legs clean, flat, and ſtraight; and, finally, the mane and tail ought to be long and thin, not ſhort and buſhy, the laſt being counted a mark of dulneſs. When a hunter is thus choſen, and has been taught ſuch obedience, that he will readily anſwer to the rider's ſignals, both of the bridle and hand, the voice, the calf of the leg, and the ſpurs; that he knows how to make his way forward, and has gained a true temper of mouth, and a right placing of his head, and has learned to ſtop and to turn readily, if his age be ſufficiently advanced, he is ready for the field. It is a rule with all ſtaunch ſportſmen, that no horſe ſhould be uſed in hunting till he is full five years old; ſome will hunt them at four, but the horſe at this time is not come up to his true ſtrength and courage, and will not only fail at every tough trial, but will be ſubject to ſtrains and accidents of that kind, much more than if he were to be kept another year firſt, when his ſtrength would be more confirmed.

When the hunter is five years old, he may be put to graſs from the middle of May till Bartholomew-tide; for the weather between theſe is ſo hot, that it will be very proper to ſpare him from work. At Bartholomew-tide the ſtrength of the graſs beginning to be nipped by froſts and cold dews, ſo that it is apt to engender crudities in the horſe, he ſhould be taken up while his coat is yet ſmooth and ſleek, and put into the ſtable. When he is firſt brought home, he ſhould be put in ſome ſecure and ſpacious place, where he may evacuate his body by degrees, and be brought, not all at once, to warm keeping; the next night he may be ſtabled up. It is a general rule with many not to clothe and ſtable up their horſes till two or three days after they are taken from graſs, and others who put them in the ſtable after the firſt night, yet will not dreſs and clothe them till three or four days afterward; but all this, except the keeping the horſe one day in a large and cool place, is needleſs caution.

There is a general practice among the grooms, in many places, of giving their hunters wheat-ſtraw as ſoon as they take them up from graſs. They ſay they do this to take up their bellies; but there ſeems much reaſon to diſapprove of this. The change is very violent, and the nature of the ſtraw ſo heating and drying, that there ſeems great reaſon to fear that the aſtringent nature of it would be prejudicial, more than is at firſt perceived. It is always found that the dung is hard after this food, and is voided with pain and difficulty, which is in general very wrong for this ſort of horſe. It is better, therefore, to avoid this ſtraw-feeding, and to depend upon moderate airing, warm cloathing, and good old hay, and old corn, than to have recourſe to any thing of this kind.

When the horſe has evacuated all his graſs, and has been properly ſhod, and the ſhoes have had time to ſettle to his feet, he may be ridden abroad, and treated in this manner: the groom ought to viſit him early in the morning, at five o'clock in the long days, and at ſix in the ſhort ones; he muſt then clean out the ſtable, and feel the horſe's neck, flank, and belly, to find the ſtate of his health, if the flank feels ſoft and flabby, there is a neceſſity of good diet to harden it, otherwiſe any great exerciſe will occaſion ſwellings and goutineſs in the heels. After this examination, a handful or two of good old oats, well ſifted, ſhould be given him; this will make him have more inclination to water, and will alſo make the water ſit better on his ſtomach than if he drank faſting. After this he is to be tied up and dreſſed. If in the doing of this he opens his mouth, as if he would bite, or attempts to kick at the perſon, it is a proof that the teeth of the curry-comb are too ſharp, and muſt be filed blunter. If after this he continues the ſame tricks, it is through wantonneſs, and he ſhould be corrected for it with the whip. The intent of currying being only to raiſe the duſt, this is to be bruſhed off afterwards with a horſe-tail nailed to a handle, or any other light bruſh. Then he is to be rubbed down with the bruſh, and duſted a ſecond time; he ſhould then be rubbed over with a wet band, and all the looſe hairs, and whatever foulneſs there is, ſhould be picked off. When this is done, and he is wiped dry as at firſt, a large ſaddle-cloth is to be put on, reaching down to the ſpurring-place; then the ſaddle is to be put on, and a cloth thrown over it, that he may not take cold; then rub down his legs, and pick his feet with an iron picker, and let the mane and tail be combed with a wet mane-comb. Laſtly, it is a cuſtom to ſpurt ſome beer into his mouth juſt before the leading him out of the ſtable. He ſhould then be mounted, and walked a mile at leaſt to ſome running water, and there watered; but he muſt only be ſuffered to take about half his water at one drinking.

It is the cuſtom of many to gallop the horſe at a violent rate as ſoon as he comes out of the water, but this is extremely wrong for many reaſons. It endangers the breaking a horſe's wind more than any other practice, and often has been the occaſion of burſting very good horſes. It uſes them alſo to the diſagreeable trick we find in many horſes, of running away as ſoon as ever they come out of the water; and with ſome it makes them averſe to drinking, ſo that they will rather endure thirſt, and hurt themſelves greatly by it, than bring on the violent exerciſe which they remember always follows it. The better way is to walk him a little after he is out of the water, then put him to a gentle gallop for a little while, and after this to bring him to the water again. This ſhould be done three or four times, till he will not drink any more. If there is a hilly place near the watering-place, it is always well to ride up to it; if otherwiſe, any place is to be choſen where there is free air and ſun. That the creature may enjoy the benefit of this, he is not to be gallopped, but walked about in this place an hour, and then taken home to the ſtable. The pleaſure the horſe himſelf takes in theſe airings, when well managed, is very evident, for he will gape, yawn, and ſhrug up his body; and in theſe, whenever he would ſtand ſtill to ſtale, dung, or liſten to any noiſe, he is not to be hindered from it, but encouraged in every thing of this kind.

The advantages of theſe airings are very evident; they

purify

purify the blood, teach the creature how to make his breathing agree with the reſt of the motions of his body, and give him an appetite to his food, which hunters and racers, that are kept ſtalled up, are otherwiſe very apt to loſe. On returning from airing, the litter of the ſtable ſhould be freſh, and by ſtirring this, and whiſtling, he will be brought to ſtale. Then he is to be led to his ſtall, and tied up, and again carefully rubbed down; then he ſhould be covered with a linen cloth next his body, and a canvas one over that, made to fit him, and reaching down to his legs. This, as the duke of Newcaſtle obſerves, is a cuſtom which we learnt of the Turks, who are, of all people, the moſt nice and careful of their horſes. Over this covering there ſhould be put a body-cloth of ſix or eight ſtraps; this keeps his belly in ſhape, and does not hurt him. This cloathing will be ſufficient while the weather is not very ſharp, but in ſevere ſeaſons, when the hair begins to riſe and ſtart in the uncovered parts, a woollen cloth is to be added, and this will always prove fully ſufficient.

Different horſes and different ſeaſons make a variety of the degree of cloathing neceſſary; but there always is an obvious rule to point out the neceſſary changes, the roughneſs of the coat being a mark of the want of cloathing, and the ſmoothneſs of it a proof that the cloathing is ſufficient. Therefore, if at any time the hair is found to ſtart, it is a notice that ſome farther cloathing is to be added.

If the horſe ſweat much in the night, it is a ſign that he is over-fed, and wants exerciſe; this, therefore, is eaſily remedied. An hour or more after the horſe is come in from his airing, the groom ſhould give him a whiſp of clean hay, making him eat it out of his hand: after this let the manger be well cleaned out, and a quartern of oats clean ſifted be given him. If he eats up this with an appetite, he ſhould have more given him; but if he is ſlow and indifferent about it, he muſt have no more. The buſineſs is to give him enough, but not to cloy him with food.

If the horſe gets fleſh too faſt on this home feeding, he is not to be ſtinted to prevent it, but only his exerciſe increaſed; this will take down his fleſh, and at the ſame time give him ſtrength and wind. After the feeding in the morning is over, the ſtable is to be ſhut up, only leaving him a little hay on his litter. He need be no more looked at till one o'clock, and then only rubbed down, and left again till the time of his evening watering, which is four o'clock in the ſummer, and three in the winter. When he has been watered, he muſt be kept out an hour or two, or more, if neceſſary, and then taken home and rubbed as after the morning watering. Then he is to have a feed of corn at ſix o'clock, and another at nine at night; and being then cleaned, and his litter put in order, and hay enough left for the night, he is to be left till morning. This is the direction for one day, and in this manner he is to be treated every day for a fortnight, at the end of which time his fleſh will be ſo hardened, his wind ſo improved, and his mouth ſo quickened, and his gallop brought to ſo good a ſtroke, that he will be fit to be put to moderate hunting. During the time that he is uſed to hunting, he muſt be ordered on his days of reſt exactly as he is directed for the fortnight when he is in preparation; but as his exerciſe is now greatly increaſed, he muſt be allowed a more ſtrengthening food, mixing ſome old ſplit beans at every feeding with his oats.

And if this is not found to be ſufficient, the following bread muſt be given: let two pecks of old beans, and one peck of wheat be ground together, and made into an indifferently fine meal; then knead it into dough, with ſome warm water, and a good quantity of yeaſt: let it lie a time that it may riſe and ſwell, which will make the bread the lighter; then make it into loaves of a peck each, and let it be baked in a ſlow oven, that it may be thoroughly done, without being burnt; when it is taken out of the oven, it muſt be ſet, bottom upwards, to cool; when it is one day old, the cruſt is to be chipped off, and the crumb given him for food. When this is ready, he ſhould have ſome of it at leaſt once in the day; but it is not to be made the only food, but ſome feeds are to be of oats alone; ſome of oats and this bread, and ſome of oats and beans mixed together. The making a variety in this manner, being the beſt of all methods of keeping up the appetite, which is often apt to fail.

The day before the horſe is to hunt, he muſt have no beans, becauſe they are hard of digeſtion, but only ſome oats with this bread; or if he will be brought to eat the bread alone, that will be beſt of all. His evening feed ſhould, on this day, be ſomewhat earlier than uſual; and after this, he is only to have a whiſp of hay out of the groom's hand till he return from hunting.

The hunter, in order to his behaving well in the field, ought to have great care and indulgence in the ſtable: he ought to have as much reſt and quiet as may be, to be kept well ſupplied with good meat, clean litter, and freſh water by him; he ſhould be often dreſſed, and ſuffered to ſleep as much as he pleaſes. He ſhould be ſo fed that his dung may be rather ſoft than hard, and it muſt be of a bright and clean colour. All this may be eaſily managed by the continual obſervance and change of his food, as occaſion requires. After his uſual ſcourings he ſhould have exerciſes and maſhes of ſweet malt, or bread and beans; or wheat and beans mixed together, are to be his beſt food, and beans and oats his worſt.

Some very great ſportſmen are for keeping their horſes out at graſs all the buck-hunting ſeaſon, never taking them up into the ſtable at all, but allowing them in the field as much oats with their graſs as they will eat. The horſe may be thus rid three days in the week for the whole ſeaſon, and never damaged by it, nor ever ſhewing any marks of harm afterwards.

Hunter's *Bay*, or *Rigg bay*, in *Geography*, a bay of Scotland, on the E. coaſt of the county of Wigton.

Hunter's *Town*, a town, or village, of Pennſylvania, ſituated in York county; 25 miles W. by S. of York town.

HUNTERDON, a county of New Jerſey, in America, bounded N. by that of Morris, E. by Somerſet, S.E. by Burlington, S.W. and W. by Delaware river, which ſeparates it from the ſtate of Pennſylvania, and N.W. by Suſſex county; about 40 miles long and 32 broad, divided into 10 townſhips, containing 21,261 inhabitants, including 1220 ſlaves. On Muſkonetcong mountain in this county, is a ſtrong chalybeate ſpring, to which many perſons reſort; it iſſues from the ſide of an eminence into an artificial reſervoir, for the accommodation of thoſe who wiſh to bathe in, as well as to drink, the waters. The chief town of the county is Trenton.

HUNTING, the art, or act, of purſuing and chaſing beaſts of game. See Game.

In its general ſenſe, hunting includes the purſuit both of hairy and feathered game; but in its more proper and reſtrained ſignification, it is only applicable to beaſts of venery and chaſe.

F. De Launay, formerly profeſſor of the French laws, has an expreſs treatiſe of hunting.

The antiquity of hunting may be traced back upwards of

2600 years before the Chriſtian era. The ſacred hiſtory deſcribes the firſt warriors under the name of hunters. Thus Nimrod is repreſented as "a mighty hunter before the Lord." (Gen. x. 9.) In the ſequel, he made ſoldiers of his companions, who had aſſiſted him in hunting and deſtroying the ſavage beaſts that laid waſte the country about Babylon, and employed them in extending and eſtabliſhing his conqueſts.

> "Bold Nimrod firſt the lion's trophies wore,
> The panther bound, and lanc'd the briſtling boar:
> He taught to turn the hare, to bay the deer,
> And wheel the courſer in his mid career." Tickell.

We find, that among the more civilized nations, as the Perſians, Greeks, and Romans, it always made one of their genteeler diverſions; and as to the wilder and more barbarous, it ſerved them with food and neceſſaries. The Roman juriſprudence, which was formed on the manners of the firſt ages, made a law of it, and eſtabliſhed it as a maxim, that as the natural right of things which have no maſter belongs to the firſt poſſeſſor; wild beaſts, birds, and fiſhes, are the property of him, whoever he be, that can firſt take them.

But the northern nations of barbarians, who over-ran the Roman empire, bringing with them a ſtronger taſte for the diverſion, and the people being now poſſeſſed of other, and more eaſy means of ſubſiſtence from the lands and poſſeſſions of thoſe they had vanquiſhed; their chiefs and leaders began to appropriate the right of hunting, and, inſtead of a natural right, to make it a royal one. Thus it continues to this day, the right of hunting, among us, belonging only to the king, and thoſe who derive it from him.

And hence have ariſen all our laws and charters of the foreſt, laws and regulations for preſervation of the game, &c. See Forest, Game, and Trespass.

The hunting uſed by the ancients was much like that now practiſed for the rein deer; which is ſeldom hunted at force, or with hounds; but only drawn with a blood-hound, and foreſtalled with nets and engines. Thus did they with all beaſts; whence a dog is never commended by them for opening, before he has diſcovered where the beaſt lies: hence they were not in any manner curious as to the muſic of their hounds, or the compoſition of their kennel or pack, either for deepneſs, loudneſs, or ſweetneſs of cry, which is become a principal point in the hunting of our days.

Their huntſmen, indeed, were accuſtomed to ſhout and make a great noiſe, as Virgil obſerves in the third of his Georgics: "ingentem clamore premes ad retia cervum." But that clamour was only to bring the deer to the nets laid for him.

The Sicilian way of hunting had ſomething in it very extraordinary. The nobles or gentry being informed which way a herd of deer paſſed, gave notice to one another, and appointed a meeting; every one bringing with him a croſs-bow or long-bow, and a bundle of ſtaves, ſhod with iron, the heads bored, with a cord paſſing through them all: thus provided they came to the herd, and caſting themſelves about in a large ring, ſurrounded the deer. Then, each taking his ſtand, unbound his faggot, ſet up his ſtake, and tied the end of his cord to that of his next neighbour, at the diſtance of ten feet from one another. Then taking feathers dyed in crimſon, and faſtened on a thread, they tied them to the cord; ſo that with the leaſt breath of wind they would whirl round. Which done, the perſons who kept the ſtands withdrew, and hid themſelves in the next covert. Then the chief ranger entering within the line with hounds to draw after the herd, rouſed the game with their cry; which flying towards the line, were turned off; and ſtill gazing on the ſhaking and ſhining feathers, wandered about as if kept in with a real wall or pale. The ranger ſtill purſued, and calling every perſon by name, as he paſſed by their ſtand, commanded him to ſhoot the firſt, third, or ſixth, as he pleaſed; and if any of them miſſed, or ſingled out another than that aſſigned him, it was counted a grievous diſgrace. By ſuch means, as they paſſed by their ſeveral ſtations, the whole herd was killed by the ſeveral bands.

Hunting conſtituted a great part of the employment of the ancient Germans and alſo of the Britons, when the more furious occupations of war did not engage their attention. This was not merely an amuſement to which, in many caſes, the ferocity of their temper actually inclined them, but it was the principal means by which, in the uncultivated ſtate of the countries which they inhabited, they procured their ſubſiſtence. Such was the caſe ſo late as the third century with thoſe unconquered Britons who lived beyond Adrian's wall. With the Celtic nations hunting, to which they were inordinately attached, ſerved as a preparatory diſcipline for war; and it has anſwered the ſame purpoſe in many other nations, which we have been accuſtomed to denominate barbarous. So general and ſo ardent was the attachment to hunting among the ancient Britons, that, whilſt the chieftains practiſed it in order to prepoſſeſs their miſtreſſes with a favourable opinion of their valour and agility, young ladies of diſtinguiſhed rank and beauty devoted much of their time to the chaſe. On account of the general prevalence of this paſtime, and its apprehended injury to the general intereſts of ſociety, the liberty of the chaſe has been more or leſs reſtrained from early ages, and kings and princes have ſucceſſively augmented their aſſumed rights in hunting; claiming to themſelves the primitive and ſole title to hunt, and controlling their nobles, and all perſons of inferior rank, from enjoying this amuſement, unleſs, as we have before obſerved, the privilege was granted by them, and liable to be revoked at their will. Hence aroſe the numerous and ſevere reſtraints and penalties of the game laws. See Game.

Among the Mexicans hunting was a favourite exerciſe; and in purſuing it they uſed, with ſingular dexterity, bows and arrows, darts, nets, ſnares, and a kind of tubes, through which they ſhot out, by blowing, little balls at birds. Thoſe inſtruments, of this kind, that were uſed by their kings and great men, were curiouſly carved and painted, and adorned with ſilver and gold. Beſides their private hunting exerciſes, in which they engaged for amuſement or ſubſiſtence, they had alſo hunting matches, either appointed by the king, or undertaken with a view of providing victims for their ſacrifices. A wood, not far from the capital, was ſelected for this purpoſe; and it was encloſed by ſome thouſands of hunters, who formed a circle of ſix, ſeven, or eight miles, according to the number of animals which they propoſed to take. Fire was then ſet to the graſs in a number of places, and a terrible noiſe was made with drums, horns, ſhouting and whiſtling. The hunters at the ſame time gradually contracted their circle, and thus encloſed the game in a very ſmall ſpace, and it was taken in the ſnares that had been previouſly ſet, or killed by the hunters. The number of animals, comprehending deer, wild goats, hares, rabbits, &c. collected and deſtroyed on theſe occaſions, is almoſt incredible.

Hunting was alſo much practiſed by the ſavage and bloody conqueror Genghiz-Khan; and his method of employing his ſoldiers in a kind of warfare with the beaſts, when they had no human enemies with whom to contend, was ſimilar to that of the Mexicans. The chaſe is ſtill an object to which the Eaſt Indian princes are much inclined, Mr. Blane, who attended the hunting excurſions of Aſoph ul Dowlah, viſir of the Mogul empire, and nabob of Oude in 1785 and 1786, gives the following account of them.

The time choſen for the hunting party is about the beginning of December; and the diverſion is continued till the heats, which commence about the beginning of March, oblige them to ſtop. During this time a circuit of between 400 and 600 miles is generally made; the hunters bending their courſe towards the ſkirts of the northern mountains, where the country is wild and uncultivated. The viſir takes along with him not only his court and ſeraglio, but a great part of the inhabitants of his capital. His immediate attendants may amount to about 2000; but beſides theſe he is alſo followed by 500 or 600 horſe, and ſeveral battalions of regular ſepoys with their field-pieces. Four or five hundred elephants are alſo taken along with him: of which ſome are uſed for riding, others for fighting, and ſome for clearing the jungles and foreſts of the game. About as many ſumpter horſes of the beautiful Perſian and Arabian breeds alſo accompany him. A great many wheel carriages drawn by bullocks likewiſe attend, which are uſed chiefly for the convenience of the women; ſometimes alſo he has an Engliſh chaiſe or two, and ſometimes a chariot; but all theſe, as well as the horſes, are merely for ſhow, the viſir himſelf never uſing any other conveyance than an elephant, or ſometimes, when fatigued or indiſpoſed, a palanquin. The animals uſed in the ſport are principally gre-hounds, of which there may be about 300; he has alſo about 200 hawks, and a few trained leopards for hunting deer. There are a great number of markſmen, whoſe profeſſion it is to ſhoot deer; with many fowlers, who provide game: as none of the natives of India know how to ſhoot game with ſmall ſhot, or to hunt with ſlow hounds. A vaſt number of matchlocks are carried along with the company with many Engliſh pieces of various kinds, 40 or 50 pairs of piſtols, bows and arrows, beſides ſwords, daggers, and ſabres without number. There are alſo nets of various kinds, ſome for quail, and others very large, for fiſhing, which are carried along with him upon elephants, attended by fiſhermen, ſo as always to be ready for throwing into any river or lake that may be met with. Every article that can contribute to luxury or pleaſure is likewiſe carried along with the army. A great many carts are loaded with the Ganges water, and even ice is tranſported for cooling the drink. The fruits of the ſeaſon and freſh vegetables are daily ſent to him from his gardens by bearers ſtationed at the diſtance of every ten miles; by which means each article is conveyed day or night at the rate of four miles an hour. Beſides the animals already mentioned, there are alſo fighting antelopes, buffaloes, and rams in great numbers; alſo ſeveral hundred pigeons, ſome fighting cocks, with a vaſt variety of parrots, nightingales, &c.

To complete the magnificence or extravagance of this expedition, there is always a large bazar, or moving town, which attends the camp; conſiſting of ſhop-keepers and artificers of all kinds, money-changers, dancing-women; ſo that, on the moſt moderate calculation, the whole number of people in his camp cannot be computed at fewer than 20,000. The nabob himſelf, and all the gentlemen of his camp, are provided with double ſets of tents and equipage, which are always ſent on the day before to the place to which he intends to go; and this is generally eight or ten miles in whatever direction moſt game is expected; ſo that by the time he has finiſhed his ſport in the morning, he finds his whole camp ready pitched for his reception.

The nabob, with the attending gentlemen, proceed in a regular moving court or durbar, and thus they keep converſing together and looking out for game. A great many foxes, hares, jackals, and ſometimes deer, are picked up by the dogs as they paſs along: the hawks are carried immediately before the elephants, and let fly at whatever game is ſprung for them, which is generally partridges, buſtards, quails, and different kinds of herons; theſe laſt affording excellent ſport with the falcons or ſharp-winged hawks. Wild boars are ſometimes ſtarted, and either ſhot or run down by the dogs and horſemen. Hunting the tyger, however, is looked upon as the principal diverſion, and the diſcovery of one of theſe animals is accounted a matter of great joy. The cover in which the tyger is found is commonly long graſs, or reeds of ſuch an height as frequently to reach above the elephants; and it is difficult to find him in ſuch a place, as he commonly endeavours either to ſteal off, or lies ſo cloſe to the ground that he cannot be rouſed till the elephants are almoſt upon him. He then roars and ſkulks away, but is ſhot at as ſoon as he can be ſeen; it being generally contrived that the nabob ſhall have the compliment of firing firſt. If he be not diſabled, the tyger continues to ſkulk along, followed by the line of elephants; the nabob and others ſhooting at him as often as he can be ſeen till he falls. The elephants themſelves are very much afraid of this terrible animal, and diſcover their apprehenſions by ſhrieking and roaring as ſoon as they begin to ſmell him or hear him growl; generally attempting to turn away from the place where he is. When the tyger can be traced to a particular ſpot, the elephants are diſpoſed of in a circle round him; in which caſe he will at laſt make a deſperate attack, ſpringing upon the elephant that is neareſt, and attempting to tear him with his teeth or claws. Some, but very few, of the elephants, can be brought to attack the tyger; and this they do by curling up their trunks under their mouths, and then attempting to toſs, or otherwiſe deſtroy him with their tuſks, or to cruſh him with their feet or knees. It is conſidered as good ſport to kill one tyger in a day; though ſometimes, when a female is met with her young ones, two or three will be killed.

The other objects of purſuit in theſe excurſions are wild elephants, buffaloes, and rhinoceroſes. Our author was preſent at the hunting of a wild elephant of vaſt ſize and ſtrength. An attempt was firſt made to take him alive by ſurrounding him with tame elephants, while he was kept at bay by crackers and other fire-works; but he conſtantly eluded every effort of this kind. Sometimes the drivers of the tame elephants got ſo near him, that they threw ſtrong ropes over his head, and endeavoured to detain him by faſtening them around trees; but he conſtantly ſnapped the ropes like pack-threads, and purſued his way to the foreſt. Some of the ſtrongeſt and moſt furious of the fighting elephants were then brought up to engage him; but he attacked them with ſuch fury that they were all obliged to deſiſt. In his ſtruggle with one of them he broke one of his tuſks, and the broken piece, which was upwards of two inches in diameter, of ſolid ivory, flew up into the air ſeveral yards above their heads. Orders were now given to kill him, as it appeared impoſſible to take him alive; but even this was not accompliſhed without the greateſt difficulty. He twice turned and attacked the party who purſued him; and in one of theſe attacks ſtruck the elephant obliquely on which the prince rode, threw him upon his ſide, but then paſſed on without offering farther injury. At laſt he fell dead, after having received, as was ſuppoſed, upwards of 1000 balls into his body. See ELEPHAS.

Hunting, conſidered as an exerciſe, is perhaps the beſt that can poſſibly be contrived for ſtrengthening the general habit, and procuring health and vigour. The ſeaſon of the year, the time of the day deſtined for this amuſement, and the motion neceſſary on this occaſion, are all admirably adapted to the reſtoration and continuance of health. It is, beſides, of no ſmall importance to have the mind recreated at the time the body is exerciſed; for this admirably aſſiſts the due circulation of the fluids through the minute canals deſtined for their conveyance; and there are few people not utterly abandoned to idleneſs and debauchery of ſome kind or other, who do not perceive a ſpontaneous flow of ſpirits when they ride at or about the riſe of the ſun, when they reſpire the pureſt air, when variety of perpetually changing ſcenes preſent themſelves, and when the mind is agreeably agitated concerning the event of the chaſe.

If we advert to the character of thoſe nations in ancient times, which were moſt addicted to this exerciſe, we ſhall find that they delighted in war, and in oppreſſing and enſlaving their own ſpecies. Nimrod, the mighty hunter, was a tyrant. The Lacedæmonians indulged themſelves without controul in this exerciſe, whilſt they cruelly oppreſſed thoſe whom they had in their power. (See Helots.) The wiſe legiſlator Solon reſtrained the Athenians from gratifying themſelves in this way, leſt they ſhould be led to neglect the mechanic arts. The Egyptians, Perſians, and Scythians, &c. were fond of hunting and of war. As mankind became more civilized, hunting became leſs prevalent: ſuch was in a degree the caſe with the Romans, although they continued to a late period to make death and ſlaughter familiar to the citizens, by the diverſions of the amphitheatre and circus, which conſiſted of exhibitions of wild beaſts, and of human gladiators, deſtroying one another. Thoſe who think the exerciſe of hunting incompatible with the principles of humanity, allege that it is allowable only when an uncultivated country is over-run with noxious animals, or when it is neceſſary to kill wild animals for food. For a defence of this diverſion, and an attempt to reconcile it with the ſentiments and feelings of humanity, ſee Mancheſter Tranſactions, vol. i. p. 341, &c.

Hunting is practiſed in a different manner, and with a different apparatus, according to the nature, genius, and addreſs, of the particular beaſt which is the object of it. Theſe beaſts are, the hart, hind, hare, boar, wolf, buck, doe, fox, marten, and roe; the five firſt of which are denominated beaſts of the foreſt, or venery, *ſylveſtres;* and the five latter, beaſts of the field, or of chaſe, *campeſtres*.

The gentlemen, and maſters of the ſport, have framed a new ſet of terms, which may be called the *hunting language;* a conciſe vocabulary of which we ſhall here give the reader.

The terms, then, uſed for beaſts of venery and chaſe, as they are in company, are theſe: they ſay, a *herd* of harts, and all manner of deer; a *bevy* of roes; a *ſounder* of ſwine; a *rout* of wolves; a *richeſs* of martens; a *brace* or *leaſh* of bucks, foxes, or hares; a *couple* of rabbits or conies.

There are alſo terms for their lodging; a hart is ſaid to *harbour;* a buck *lodges;* a roe *beds;* a hare *ſeats*, or *forms;* a coney *ſits*; a fox *kennels;* a marten *trees;* an otter *watches;* a badger *earths;* a boar *couches*.

Hence, to expreſs their diſlodging, they ſay, *unharbour* the hart; *rouſe* the buck; *ſtart* the hare; *bolt* the coney; *unkennel* the fox; *untree* the marten; *vent* the otter; *dig* the badger; *rear* the boar.

The terms for their noiſe at rutting time are as follows: a hart *belleth;* a buck *growns* or *troats;* a roe *bellows;* a hare *beats* or *taps;* an otter *whines;* a boar *freams;* a fox *barks;* a badger *ſhrieks;* a wolf *howls;* a goat *rattles*.

Terms for their copulation: a hart or buck goes to *rut;* a roe goes to *tourn;* a bear goes to *brim;* a hare or coney goes to *buck*; a fox goes to *clicketing*; a wolf goes to *match* or *make;* an otter *hunteth* for his kind.

Terms for the footing and treading: of a hart we ſay, the *ſlot;* of a buck, and all fallow deer, the *view;* of all deer, if on the graſs, and ſcarce viſible, the *foiling;* of a fox, the *print;* and of other the like vermin, the *footing;* of an otter, the *marks;* of a boar, the *track;* the hare, when in open fields, is ſaid to *ſore;* when ſhe winds about to deceive the hounds, ſhe *doubles;* when ſhe beats on the hard highway, and her footing comes to be perceived, ſhe *pricketh;* in ſnow, it is called the *trace* of the hare.

The tail of a hart, buck, or other deer, is called the *ſingle;* that of a boar, the *wreath;* of a fox, the *bruſh* or *drag;* and the tip at the end, the *chape;* of a wolf, the *ſtern;* of a hare and coney, the *ſcut*.

The ordure or excrement of a hart, and all deer, is called *fewmets* or *fewmiſhing;* of a hare, *crotiles* or *crotiſing*; of a boar, *leſſes;* of a fox, the *billeting;* and of other the like vermin, the *fuants;* of an otter the *ſpraints*. As to the heads of deer, ſomething has already been ſpoken under the article Head.

For the attire or parts thereof, thoſe of a ſtag, if perfect, are, the *bur*, the *pearls*, the little *knobs* on it, the *beam*, the *gutters*, the *antler*, the *ſur-antler, royal, ſur-royal*, and all at top, the *croches;* of the buck, the *bur, beam, brow-antler, back-antler, advancer, palm*, and *ſpellers*.

If the croches grow in the form of a man's hand, it is called a *palmed head*. Heads bearing not above three or four, and the croches placed aloft, all of one height, are called *crowned heads*. Heads having double croches, are called *forked heads*, becauſe the croches are planted on the top of the like forks.

They ſay a *litter* of cubs; a *neſt* of rabbits; a ſquirrel's *dray*.

The terms uſed in reſpect to the dogs, &c. are as follow: of grey-hounds, two make a *brace;* of hounds, a *couple;* of grey-hounds, three make a *leaſh;* of hounds, a *couple* and *half:*—they ſay, let *ſlip* a grey-hound; and *caſt off* a hound: the ſtring wherein a grey-hound is led is called a *leaſh;* and that of a hound a *lyome:* the grey-hound has his *collar*, and the hound his *couples:* we ſay a *kennel* of hounds, and a *pack* of beagles.

Hunting, *ſtyles or manners of*, are various, according to the country, the beaſt, and the means whereby he is to be caught.

Hunting, as practiſed among us, is chiefly performed with dogs; of which we have various kinds, accommodated to the various kinds of game: *hounds, grey-hounds, ſtaunch-hounds, blood-hounds, terriers*, &c. See Dog, Hound, &c.

In the kennels or packs, they generally rank them under the heads of *enterers, drivers, flyers, tyers*, &c.

On ſome occaſions, nets, ſpears, and inſtruments for digging the ground are alſo required: nor is the hunting-horn to be omitted. See Horn.

The uſual chaſes among us are, the *hart, buck, roe, hare, fox, badger*, and *otter*. We ſhall here give ſomething of what relates to each of theſe.

With regard to the ſeaſons of hunting: hart and buck hunting begins at the end of fence-month, which is a fortnight after Midſummer, and laſts till Holy-rood-day. The hind and doe come in courſe on Holy-rood-day, and laſt till Candlemas. Fox hunting comes in at Chriſtmas and holds till Annunciation.

Roe hunting begins at Michaelmas and ends at Candlemas. Hare hunting commences at Michaelmas, and goes out at the end of February. Where the wolf and boar are hunted, the ſeaſon for each begins at Chriſtmas; the firſt ending at the Annunciation, the ſecond at the Purification.

Here, too, is the place for ſome general terms and phraſes, more immediately uſed in the progreſs of the ſport itſelf; what belongs to the ſeveral ſorts of game in particular, being reſerved for the reſpective articles.

When the hounds, then, being caſt off, and finding the ſcent of ſome game, begin to open and cry, they are ſaid to *challenge;* when they are too buſy before the ſcent be good, they are ſaid to *babble;* when too buſy where the ſcent is good, *bawl;* when they run it end-ways orderly, holding in together merrily, and making it good, they are ſaid to be in *full cry;* when they run along without opening at all, it is called *running mute.*

When ſpaniels open in the ſtring, or a grey-hound in the courſe, they are ſaid to *lapſe.*

When beagles bark and cry at their prey, they are ſaid to *yearn.*

When the dogs hit the ſcent the contrary way, they are ſaid to *draw amiſs.*

When then they take freſh ſcent, and quit the former chaſe for a new one, it is called *hunting change.*

When they hunt the game by the heel or track, they are ſaid to *hunt counter.*

When the chaſe goes off, and returns again, traverſing the ſame ground, it is called *hunting the ſoil.*

When the dogs run at a whole herd of deer inſtead of a ſingle one, it is called *running riot.*

Dogs ſet in readineſs where the game is expected to come by and caſt off after the other hounds are paſſed, are called a *relay.* If they be caſt off before the other dogs be come up, it is called a *vauntlay.*

When, finding where the chaſe has been, they make a proffer to enter, but return, it is called a *blemiſh.*

A leſſon on the horn to encourage the hounds is named a *call* or *recheat.* That blown at the death of a deer is called the *mort.* The part belonging to the dogs of any chaſe they have killed is the *reward.* They ſay, *take off* a deer's ſkin; *ſtrip* or *caſe* a hare, fox, and all ſorts of vermin; which is done by beginning at the ſnout, and turning the ſkin over the ears down to the tail.

HUNTING, *Laws relating to.* See GAME.

Notwithſtanding all the game laws, and the various qualifications for hunting pointed out by ſtatutes, which imply a power for perſons ſo qualified to hunt, yet, according to judge Blackſtone, no man but he who has a chaſe, or free-warren, by grant of the crown or preſcription, which ſuppoſes one, can juſtify hunting or ſporting upon another man's ſoil; nor indeed, in thorough ſtrictneſs of common law, either hunting or ſporting at all. By ſtat. 1 Hen. VII. c. 7. unlawful hunting in any legal foreſt, park, or warren, not being the king's property, by *night,* or with *painted faces,* was declared to be ſingle felony. But now by the ſtatute 9 Geo. I. c. 22. to appear armed in any encloſed foreſt or place where deer are uſually kept, or in any warren for hares or conies, or in any high road, open heath, common, or down, by day or night, with faces blacked or otherwiſe diſguiſed, or (being ſo diſguiſed) to hunt, wound, kill, or ſteal any deer, to rob a warren, or to ſteal fiſh, or to procure by gift or promiſe of reward any perſon to join them in ſuch unlawful act, is felony without benefit of clergy. Perſons ſo hunting are liable to actions of treſpaſs by the poſſeſſors of the land. Comment. vol. ii. p. 418, and vol. iv. p. 174. See TRESPASS.

HUNTING, *Badger.* A badger is called by ſeveral names *viz.* a *grey, brock, boreſon,* or *bauſon:* the male is called a *badger,* or *boar-pig,* and the female a *ſow.* See URSUS *Meles.*

This beaſt is very frequent in Italy, Sicily, the Alpine, and Helvetian coaſts; and is not uncommon in France and England. It is found alſo as far north as Norway and Ruſſia; in Siberia, about the rivers Tom and Lena; it inhabits China, and is expoſed to ſale for food in the markets of Pekin.

The badger is a very ſleepy beaſt, eſpecially in the day-time, ſeldom ſtirring abroad but in the night; whence the denomination *lucifuga,* q. d. *avoider of the light.* It burrows under ground like the fox, and forms ſeveral different apartments, though with only one entrance, carrying in its mouth graſs in order to form a bed for its young. It is ſo cleanly an animal, that it never obeys the call of nature in its apartments, but goes out for that purpoſe. It breeds only once in a year, and brings four or five at a time.

The badger is a deep biting beaſt, having very ſharp teeth; to guard againſt the effects of which, it is uſual to put great broad collars about the dogs' necks. He fights on his back, and by this means is at liberty to uſe both his teeth and nails. He has a faculty of blowing up his ſkin after a ſtrange manner, by which he defends himſelf againſt any blow or bite of the dogs; ſo that you may threſh on his back till you are weary to no purpoſe: but a ſmall ſtroke on the noſe diſpatches him preſently. The ſkin of the badger, when dreſſed with the hair, is uſed for piſtol furniture. The Highlanders make their pendant pouches of it. The hair is often uſed for making bruſhes to ſoften the ſhades in painting, called ſweetening tools. Theſe animals are alſo hunted in the winter nights for the ſake of their fleſh, for the hind quarters may be made into hams, not inferior in goodneſs to the beſt bacon. The fat is much valued for ointments and ſalves.

The method of hunting the badger is thus: ſeek the earth and burrows where he lies, and in a clear moonſhine night go and ſtop all the holes but one or two, and therein place ſacks, faſtened with drawing ſtrings, which may ſhut him in as ſoon as he ſtrains the bag. The bags thus ſet, caſt off your hounds, and beat all the groves, hedges or tufts within a mile or two: the badgers that are abroad being alarmed by the dogs, will ſtraight repair to their earths, and ſoon be taken. He that ſtays to watch the ſacks muſt ſtand cloſe, and upon a clear wind, or elſe the badger will find him, and fly ſome other way for ſafety. If the hounds either encounter him, or undertake the chaſe before he can get into his earth, he will ſtand at bay like a boar, and make excellent ſport.

If the badger be attacked in his earth, as ſoon as he perceives the terriers yearn him, he will ſtop the hole between the dogs and himſelf; and if the dogs continue baying, he removes his baggage with him, and goes into another apartment or chamber, of which he uſually has half a dozen in the burrow; thus retreating from one to the other, till he can go no farther, and barricading the way as he goes. In hunting the badger as well as the fox, a man cannot juſtify breaking the ſoil, and digging him out of his earth.

Another mode of catching badgers is by a "pit-fall" acroſs their accuſtomed path. This ſhould be five feet deep and four feet long, narrow at the top and bottom, and wide in the middle. This pit muſt be covered with ſmall boughs or ſticks, which retain their leaves (either withered or green, according to the ſeaſon): they muſt be ſo laid, that the weight of the badger when he treads upon them will inſtantly make them give way. The digging of badgers is, without very good terriers, a work of time: for if terriers do not keep conſtantly at him, from his facility in penetrating and throwing back the earth (which he poſſeſſes beyond any other animal) he will, in looſe ſand, bury himſelf faſter than the workmen can ſink pits, by which he may be got into an angle.

HUNTING, *Boar*. See BOAR.

HUNTING, *Buck*, or *hunting fallow deer*. See BUCK, and CERVUS *Dama*.

The female is called *doe*, or *doo*: the firſt year a *fawn*; ſecond, a *togg*; the third, a *doe*. See DEER.

Leſs art and ſkill are required in lodging a buck, than in harbouring a hart or ſtag; nor does there need ſo much drawing after; it is ſufficient that you judge by the view, and mark what grove or covert he enters; for he does not wander and rove ſo often as a hart, nor ſo frequently change his layer. When hard hunted he uſually takes to ſome ſtrong hold or covert, with which he is acquainted; not flying far before the hounds, nor croſſing nor doubling, nor uſing any of the ſubtleties the hart is accuſtomed to.

The buck will beat a brook, but ſeldom a great river as the hart, nor can he ſtay ſo long at ſoil.

The greateſt ſubtilty a huntſman need uſe in hunting the buck, is to beware of hunting counter or change, becauſe of the plenty of fallow deer, which uſe to come more directly upon the hounds than the red deer do.

The buck herds more than the hart, and lieth in the drieſt places; but if he be at large, unconfined in a park, he herds but little from May to Auguſt, becauſe the flies trouble him. He takes delight in hilly places, but chooſes the dales to feed in.

HUNTING, *Fox*. See FOX. His nature, in many reſpects, is like that of a wolf; and both bring the ſame number of cubs at a litter: but the fox litters deep under ground, which the wolf does not.

The fox ſleeps much and ſound during the day, and, like the dog, lies in a round form, and may be approached without waking him; but he is in motion and ſeeking his prey the whole night. When only repoſing himſelf he ſtretches out his hind legs, and lies on his belly: in this poſition he ſpies the birds, as they alight near him, and is ready to ſpring upon ſuch as are within his reach. Crows, magpies, and other birds, which conſider the fox as a common enemy, have ſuch an antipathy to him, that they often give notice of his retreat, by the moſt clamorous notes. Jays and blackbirds, in particular, will inceſſantly repeat the watch cries; and when the hounds are in chaſe of him, crows and magpies will follow him with their ſcreams from tree to tree to a conſiderable diſtance, and not unfrequently, when hounds are at a check, indicate which way the fox has ſhaped his courſe. The fox has proverbially a ſtrong and offenſive ſmell; he has alſo a yelping kind of bark, which conſiſts of a quick ſucceſſion of ſimilar tones, at the end of which he generally raiſes his voice, like the cry of the peacock. In winter, and eſpecially during froſt and ſnow, and when going to clicket, he yelps much; but in ſummer he is almoſt entirely ſilent; and during this ſeaſon he caſts his hair.

A bitch fox is hard to take when breeding and with cub, in regard ſhe lies near her burrow, into which ſhe runs upon hearing the leaſt noiſe: indeed it is no eaſy matter to take her at any time, as being a beaſt of exceeding ſubtilty. After littering, if ſhe perceives her retreat is diſcovered, ſhe carries off her cubs, one by one, to a more ſecure ſituation.

What makes fox-hunting the more entertaining, is the ſtrong hot ſcent this creature affords, which keeps up an excellent cry; but as his ſcent is hotter at hand, ſo it dies ſooner than that of a hare, &c. Add, that he never flies far before the hounds, as not truſting to his legs or the champaign ground, but has recourſe to the ſtrongeſt coverts. When he can no longer ſtand up before the hounds, he takes earth, and muſt be dug out. When courſed by grey-hounds on a plain, his laſt refuge is uſually to piſs on his tail, and ſlap it in their faces as they come near him; ſometimes ſquirting all his thicker excrement upon them, to make them give over their courſe.

When a bitch fox goes a clicketing, and ſeeks the dog, ſhe cries with a hollow voice, not unlike the howling of a mad dog; and the like noiſe ſhe makes when ſhe miſſes any of her cubs: but ſhe never cries at all when ſhe is about to be killed, but defends herſelf in ſilence to the laſt gaſp.

The fox is taken with hounds, grey-hounds, terriers, nets, and gins. Of terriers there are two ſorts: the one crook-legged, and commonly ſhort-haired, which take earth well, and lie long at fox or badger; the other is ſhagged, and ſtraight-legged, which will not only hunt above ground as others, but alſo enter the earth with great fury, though theſe cannot ſtay in ſo long on account of their vehemence.

The fox chuſes to earth in ground hard to dig: as in clay or ſtony ground, or amongſt the roots of trees; and his earth has commonly but one hole, which goes ſtraight along in, before it comes at their couch: he ſometimes by craft poſſeſſes himſelf of a badger's old burrow, which has variety of chambers, holes, and angles. Geſner relates, that he frequently cheats the badger of his habitation, by laying his excrement at the mouth of the other's burrow.

The modes of hunting the fox formerly, and that practiſed at preſent, are very different. In the earlieſt days, when this country was far more woody, and foxes ſo much abounded, as to be in a degree like wolves a general nuiſance, what was then termed fox-hunting was effected by a great number of people, with dogs of all kinds, who aſſembled at the coverts where the foxes harboured. And whilſt ſome beſet the place, others went into the woods with ſome of the dogs and forced them out, to be either courſed by the reſt of the dogs, which were held ready to be ſlipped at them, or they were taken in nets and hays ſet on the outſides for that purpoſe.

As the covers were reduced in ſize and number, this ſyſtem of ſelf-defence againſt the fox's depredations, gave riſe to the chaſe as an object of amuſement; the ſeaſon for hunting them began in November and ended in March, as in the cold weather the fox was ſuppoſed to leave a ſtronger ſcent; the earths were ſtopped in the courſe of the night before hunting, (which is perhaps the *only* point in which the fox-hunting of the former and preſent time concurs,) a huntſman was appointed, whoſe buſineſs was to take all his dogs in *couples* and *hardled*, early the following morning to the wood deſigned to be tried, there to throw off his ſure finders or *ſtaunch hounds*, that would undertake no other ſcent, but that of the fox; if they ſtruck upon a drag, he caſt off more of his beſt hounds, and ſo continued to do until they ran the drag up to the fox's kennel, which was the moſt opportune moment to throw off the major part of the coupled hounds; the fox, finding himſelf thus hotly purſued, after trying to hunt the hounds, was compelled to forſake the cover and truſt to his feet, fleeing from wood to wood, and ſometimes extending his courſe for twenty miles; the huntſman on *foot* was to croſs (with what hounds he had in reſerve) the neareſt cut from cover to cover, and to be as much as poſſible in the way to throw off thoſe freſh hounds, either as an encouragement to the finders or ſtaunch hounds that might begin to run lag, and which he was alſo to encourage by all poſſible means, or he was to keep back this *corps de reſerve*, to have them, as occaſion might offer, ready for a dead ſcent, or, as he judged prudent, for the latter end of the day. When the fox was killed the pack was to be all hallooed in to bay him, but they were not allowed to eat him, becauſe his *fleſh was hurtful* to them; his fat was however in high eſteem for ſhrunk ſinews.

If the fox ran to ground, the huntſman, who was to be provided with good terriers, was to lay him up in the earth, which, in the opinion of ſome, was ſooner done by putting a collar of bells on the terrier's neck; when dug out, he was ſometimes given to the hounds to be killed on the earth as an encouragement, and alſo to make them lie when they came to a ſtrange wood and to an unknown earth, at other times he was reſerved alive for a future day's ſport; if the earth proved ſo deep that it was impoſſible to dig him out, ſteel-traps were ſet at the mouth of the hole, or hay nets pitched round it, to take him at his going off, and theſe implements were to be carefully watched.

The whole art of fox-hunting, ſays Daniel in his "Rural Sports," is to keep hounds (ſee HOUND) well in blood; and therefore every advantage is taken of the fox. Sport is a ſecondary conſideration with a true fox-hunter: his firſt motive is the killing of the fox, by which he makes his hounds: preſent ſucceſs is almoſt a ſure fore-runner of future ſport, and he is better pleaſed with an indifferent chaſe with death at the cloſe of it, than with the beſt chaſe poſſible, if it terminates with the loſs of the fox. Good chaſes are, generally ſpeaking, long ones, and if unſucceſsful, do more harm than good to hounds. It will be an advantage to hounds when out of blood to go out early. The morning is the part of the day which uſually affords the beſt ſcent, and the animal itſelf, which you are at this time more than ever deſirous of killing, is then leaſt able to eſcape; the want of reſt, added perhaps to a full belly, gives hounds a decided ſuperiority over an early-found fox. Hounds ſhould never be taken out in a very windy or bad day, becauſe ſcent is at ſuch times extremely precarious. (See SCENT.)

Two things, ſays Mr. Daniel (ubi ſupra), are ever to be remembered and accompliſhed in fox-hunting; the one is, to make hounds *ſteady*, the other to teach and compel them all to *draw*; never ſuffer *any* hounds *out of cover*, it is the effect of bad management if they attempt to be ſo; hounds once become ſteady will be more likely to draw well than if they were not, their eagerneſs is then to find their proper game, and they are indifferent to the ſcent or view of any other. Many huntſmen are fond of having hounds at their *horſe's heels*, and it is a modern faſhion for the huntſman and whippers-in to *ride into* the cover, and by their noiſe, in ſome meaſure, to *find* the fox for their hounds; but this proceeding invariably renders hounds *bad* drawers, independent of the great chance of ſtubbing the horſes, which in an incloſed country too often occurs, without needleſsly courting the danger; it is liable alſo, where there are but few finders, to have a fox found by them, which goes down the wind, and they are heard of no more that day; beſides, hounds never get ſo well or ſo ſoon together as when they ſpread the cover.

There is infinite pleaſure, ſays a ſportſman, in hearing when a fox is well found, the chorus increaſing from the firſt challenge, and the correſponding "Hark to Chirper" inſpires a joy more eaſy to be felt than deſcribed; and one fox found with a good drag in this lively manner, ſurpaſſes the beſt hare chaſe that was ever ran.

Much alſo depends on the firſt finding a fox, who, if well found, may be ſaid to be half killed. The huntſman ſhould draw quietly, and *up the wind*; this is material; the fox, by drawing up the wind, does not hear the approach of the hounds, who by this means are alſo within hearing; beſides, ſhould the fox turn down the wind, as moſt probably he will, it lets the hounds all in. If covers are ſmall, and from which a fox cannot break unſeen, *noiſe* can then do no hurt, but late in the ſeaſon foxes are wild, particularly in covers that are often hunted, and ſhould there be any noiſe, they will ſlink their kennels and get too much advantage; the whipper-in, where this is ſuſpected to happen, ſhould get the oppoſite ſide of the cover, *before* the hounds are thrown into it.

Judicious huntſmen will obſerve where foxes like beſt to lie; this muſt of courſe vary in different countries, and a knowledge of the country will beſt direct them in this reſpect. Where there are large tracts of cover, ſuch obſervation will ſave time in finding; generally ſpeaking, foxes prefer covers that lie high, are dry and thick at bottom, that are out of the wind, and are on the ſunny ſide of hills. The cover where a fox is found, when it has remained ſtill any time, will probably produce a ſecond. In nutting time, *furze brakes* and two or three years coppices are then the only quiet places for a fox to kennel in; when pheaſant ſhooting begins, older covers are more likely. The ſeaſon when foxes are moſt wild and ſtrong, is near Chriſtmas; a huntſman muſt at that ſeaſon loſe no time in drawing, and be as ſilent as poſſible; three or four years coppices, with *heath or furze at bottom*, are then moſt likely. The *male* foxes, about Chriſtmas, travel miles after the *females*, and when hunted, generally run directly for the country *from whence* they came; the huntſman has at that ſeaſon, in the courſe of three weeks, killed two brace of dog foxes from one cover, where the leaſt diſtance was twelve, and in one of the four chaſes was extended to double the number of miles, from the place of unkennelling, to the ſpot where the fox was killed.

When a ſtring of ſmall covers have plenty of foxes in them, ſome caution is neceſſary to prevent them being all diſturbed in one day. Foxes are ſaid to go *down wind to their kennel*, but however that may be, the huntſman ſhould begin drawing at the fartheſt cover down the wind, and proceed from cover to cover *up the wind*, till he finds; theſe advantages will attend it, he will draw the covers more ſpeedily, there will be leſs difficulty in getting hounds away, and as the fox moſt likely will run the covers already drawn, there is the leſs probability of *changing*, and the covers which are up the wind, *beyond* where the fox is found, remain perfectly undiſturbed.

Never hunt the ſmall, until the large covers have been well rattled; for it would be bad policy to drive from the former to the latter to increaſe the number. If foxes are meant to be thinned and diſperſed, hounds muſt throw off at the ſame cover, ſo long as a fox can be found. Hounds that come away with the firſt fox that breaks, do not diſturb the cover, and may expect to find there again the next day; but where foxes are ſcarce, the ſame cover ſhould never be drawn *two days following*.

Furze covers cannot be drawn too cloſe, and if a fox is there found, he ſhould never be hallooed until *quite clear* of them; from ſuch places, hounds are ſure to go off well with him, and it would be the height of cruelty to head him back into the hounds mouths.

Long drags in large covers give advantage to the fox, who frequently takes the hint and ſets off; this may be prevented, by throwing hounds into that part of the cover where he is moſt likely to kennel, the huntſman ſhould then be careful not to take the *heel* of the drag. When a fox gets ſo far the ſtart of hounds, that they are obliged to hunt after him with a bad ſcent, if foxes are in plenty, they had better be ſtopped, and find another; yet if this was a conſtant practice, it might make the hounds indifferent when upon a *cold ſcent*, and hounds ſhould be made to believe, they are to kill *that game* which they are *firſt* encouraged to purſue.

When hounds approach a cover intended to be drawn, and daſh away towards it, whippers-in ride to ſtop them; they had better let them alone, it checks their drawing, and it will be ſoon enough to rate, when they have found and hunt improper game. Some hounds will in this daſhing ſtyle break away from the huntſman, ruſh to the cover ſide, and then ſtop and not go into it; but hounds under ſuch good command as not to break off from the huntſman until he encourages them, will be then ſo confident, that they will not return to him again, but proceed to find their game with an eager ſteadineſs.

Whilſt hounds are drawing, the company ſhould place themſelves ſo that a fox cannot go off unſeen. Gentlemen ſhould take this neceſſary part of fox-hunting to themſelves; upon thoſe occaſions, when two gentlemen are ſeen *together*, it is a reaſonable concluſion, that one of them at leaſt knows nothing of the matter. The greater number of thoſe who ride after hounds are no ſportſmen; few gentlemen will take pains to ſtop a hound, although he ſhould run riot cloſe beſide them, or will ſtand quiet a moment although it is to halloo a fox, and thereby to promote the amuſement they are come in ſearch of.

The firſt day a cover is hunted, where there is plenty of foxes, and blood is wanted, let them not be headed back into the cover, which is the uſual practice, but allow ſome of them to get off, otherwiſe with continual *changing*, and ſometimes running the *heel*, it is probable the hounds will not kill any. Another precaution may be alſo neceſſary, that is, to ſtop ſuch earths *only as cannot* be digged; if ſome foxes go to ground, and blood be wanted at laſt, it will then be known where to get it.

Covers *near the kennel* ſhould not be drawn while foxes can be found elſewhere, it will render them certain places when hounds go out late, or may otherwiſe be in want of foxes; they ſhould not be much diſturbed after Chriſtmas, foxes will then reſort to, and breed in them, and there they can be preſerved with little trouble.

Before hounds are drafted, let the huntſman determine within himſelf the number it will be proper to take out, and alſo what young hounds he can venture in the country he is going into. Much accuracy is required in drafting hounds properly, nor can it be done with any expedition, without ſome method. Too many huntſmen deem it immaterial, which they take or which they leave, provided they have the number requiſite. A perfect knowledge in feeding and drafting hounds, is the moſt eſſential part of fox-hunting; good hounds will need but ſmall aſſiſtance afterwards. By *feeding*, is meant the bringing the hound into the field in his higheſt vigour, and this can be done but by a diſcernment of the different conſtitutions of ſo many animals, ſome of which muſt be fed ſparingly, and yet frequently, to maintain the full force of their powers. By *drafting*, is particularly meant the taking out no unſteady hound, nor any that are not likely to be of ſervice to the pack. To hunt two days following with a ſmall pack, calls forth the greateſt nicety to make the moſt of it; ſome conſideration is alſo neceſſary to place hounds to the greateſt advantage, where foxes are either plentiful or very ſcarce; a huntſman ſhould be able to marſhal every hound, giving to each his proper rank; without this knowledge, he cannot make a draft as he ought. There are in moſt packs ſome hounds that aid little in *killing* the fox; it is the *judicious drafting off* ſuch hounds, that is a certain ſign of an *intelligent* huntſman.

When foxes are numerous, there is no occaſion for an early hour, and when they are weak, by hunting late, they give better chaſes; when foxes are ſtrong, hounds ought then to have the advantage which hunting early affords them. When hounds go out late, they ſhould immediately proceed where it is likely to find, which, for the moſt part, is that cover where hounds have been leaſt in; if a fox is not ſoon found, a long and tireſome day is generally the conſequence; when the cover is thick, particularly if it be *furzy*, it ſhould be drawn ſlowly, a fox at a late hour will keep his kennel, until hounds come cloſe upon him.

A huntſman, although he ought to be as ſilent as poſſible when his hounds go into a cover, cannot be too noiſy at their coming out of it again; and if at any time he ſhould turn back ſuddenly, let him give as much notice of it as he can to his hounds, or many will be left behind, and ſhould he turn *down* the wind he may ſee no more of them.

Gentlemen are generally in too great haſte when a fox is firſt found, hounds are always mad enough when they find, and the enthuſiaſm attending this diverſion, is at this criſis particularly to be reſtrained; it is quite time enough for it to appear when hounds are away, and well ſettled to the ſcent. The huntſman ſhould ſet off with the foremoſt hounds, no hounds can then ſlip down the wind, and get out of his hearing; but in preſſing hounds forward whilſt the ſcent is good, care is to be taken that they are not hurried beyond it when it is bad; he ſhould keep ſo cloſe to them as to enable him to ſee how far they carry the ſcent, without this, he can never make a caſt with any certainty. It is the huntſman's buſineſs to be ready at all times to lend that aſſiſtance, which when they are firſt at a fault is then moſt critical, a fox-hound at that moment will exert himſelf moſt, he afterwards becomes more indifferent about his game. Thoſe huntſmen who do not get forward enough to take advantage of this eagerneſs, and direct it properly, are ſeldom ſufficiently ſkilled in hunting to be of much uſe to hounds afterwards.

With a high ſcent, hounds cannot be puſhed on too much; ſcreams keep the fox forward, the hounds together, or let in the tail hounds, they enliven the ſport, but in cover, ſhould be given with the greateſt caution; halloos are of ſervice when hounds are running up the wind, for then none but the *tail hounds* can hear them; when running down the wind, there ſhould be no more halloos than are neceſſary to bring the tail hounds forward, for hounds that know their buſineſs, when upon a ſcent, rarely want encouragement.

When hounds are at a check, every one ſhould be ſilent and ſtand ſtill; the huntſman had better let the hounds alone, or content himſelf with holding them forward, without taking them off their noſes; ſhould they continue at fault after having made their own caſt, (in which not a word ſhould be ſaid to them, and which the huntſman ſhould always firſt encourage them to do, as they will of themſelves ſpread more, and try better for the ſcent than he can make them;) it is then his buſineſs to aſſiſt them, but except in ſome very particular inſtances, ſuch as to get beyond the *taint of ſheep*, or where a fox has been *courſed* by farmers' dogs; (in the former caſe, much time is ſaved in keeping hounds forward, and not ſuffering them to try through a flock of ſheep; and in the latter it is the only chance of getting hounds to hit upon the ſcent, or its at all ſerving them to hunt up to their fox afterwards;) without theſe reaſons, or others equally urgent, hounds ſhould never be caſt ſo long as they are inclined to hunt. It is the judiciouſly preventing hounds from loſing time by hunting when they might run, and the encouraging them to hunt when they cannot run, that ſhows a good ſportſman; for though too much help will make them ſlack, too little will make them tye on the ſcent and hunt back the heel. The huntſman ſhould obſerve the tail hounds, they are leaſt likely to over-run the ſcent, by them he may ſee how far they brought it; in moſt packs there are ſome hounds that will ſhew the point of a fox, which, if attended to, may direct his caſt; when ſuch hounds follow ſlowly and unwillingly, he may be certain the reſt are running without a ſcent; but a huntſman ſhould by no means turn back on ſeeing hounds at head when firſt at a check, of which he has no opinion; they may be right, and he ſhould by a ſhort caſt forward be ſure they are wrong, before his own ſuppoſitions of the fox being gone another way, are to be indulged.

When hounds are at fault, ſtaring about and truſting to their eyes and ears, a forward caſt is the leaſt likely to regain the ſcent; the place where they left, is the moſt probable ſpot for them to hit the ſcent, and hounds knowing where they left the ſcent will there try to recover it, nor is a wide caſt often to be made without good reaſon; the ſcent ſhould be tried to be retrieved by *croſſing the line* of it, and a huntſman, by attending to this, will not fail to make a good caſt, if he obſerves the point of the fox. When hounds cannnot hit off a fault by themſelves, the firſt caſt ſhould be ſpeedy, the ſcent is then good, and hounds not likely to go over it. Every huntſman ſhould adopt theſe rules; with a good ſcent his caſt ſhould be *quick*, with a bad ſcent, *ſlow*, and when hounds are picking along a cold ſcent, *he is not to caſt them at all.*

When a fox is killed, hounds ſhould eat him ravenouſly: he ſhould be flung acroſs the branch of a tree, and the hounds ſuffered to bay him for ſome minutes before he is thrown amongſt them, it will ſhew hounds the meaning of *tally ho*, and learn them to fly like lightning to it; it will alſo make the hounds more eager, will let them all in, they will recover their wind, and eat him more readily.

When a fox is ſuſpected to be gone to ground, the huntſman ſhould try all round, and be perfectly ſatisfied that the fox is not forward, *before* he tries the earth, as a fox will frequently run over an earth, and ſometimes go into, and not ſtay in it. When a fox goes to ground, after a long chaſe, and hounds want blood, it is beſt to kill him *on the earth*, the holes ſhould be all ſtopped whilſt digging, leſt he ſhould bolt: when this happens, it cauſes no ſmall confuſion, the hounds are diſperſed and aſleep in different places, the horſes often at a diſtance, and many a fox by taking this advantage of the moment has ſaved his life.

With reſpect to the digging of foxes which hounds run to ground, if the hole be ſtraight and earth ſlight, follow it, and in following the hole, by keeping below its level, it cannot be loſt; but in a ſtrong earth, the beſt way is to let the terrier fix the fox in an angle of it, and a pit be then ſunk as near to him as can be, a terrier ſhould always be kept at the fox, who otherwiſe may move, and in looſe ground dig himſelf further in; in digging keep plenty of room, and take care to throw the earth where it may not have to be moved again.

The time for leaving off hunting, as much depends upon the quantity of foxes as on the country hunted; no good country ſhould be hunted after *February*, nor ſhould there, where hounds regularly hunt in the ſeaſon, be any hunting *at all after March.* Spring hunting is ſad deſtruction to foxes, and ought not to be attempted but in countries never viſited by hounds in the hunting ſeaſon, or where the foxes are wiſhed to be deſtroyed by wholeſale; in one week, hounds by killing a brace or two of bitch foxes, either in cub, or that have juſt littered, murder as many as would ſhew diverſion for a whole ſeaſon.

Notwithſtanding the *common* law allows of the hunting of foxes and badgers (being beaſts of prey) in another mans' ground, becauſe their deſtruction is a public benefit, and by the old law the pariſh officers are to give a certain ſum by the head for both male and female, to promote it;) yet the digging and breaking the ground to unearth them, is held to be unlawful, and in the caſe of Gedge v. Minne, it was determined, that the defendant could not juſtify digging for a badger; the breaking ground to *ſtop* an earth is alſo illegal, and the owner of the ground may maintain an action of treſpaſs; it was alſo decided in the aforementioned caſe, that if a perſon goes into the ground of another, to beat or draw for a fox or a badger in order to hunt it, this action for treſpaſs lies. Daniel's Rural Sports, p. 84—133.

HUNTING, *Hare.* A hare the firſt year is called a *leveret;* the ſecond year, a *hare;* the third, a *great hare.* See HARE.

Each part and member of the hare is formed for celerity. The head is round and ſhort, of a convenient length; the ears long and lofty, to hear the enemy at a diſtance, and ſave itſelf in time; the lips continually move, ſleeping and waking; and the eye is too big and round for the lid to cover it, even when aſleep; ſo that the creature ſleeps as it were on the watch. Straight forward there is a deficiency in the hare's ſight, ſo that when cloſely purſued ſhe will run againſt objects in her way. The breaſt is capacious, and fitted to take more breath than that of any other beaſt. They feed abroad, to conceal their forms; and never drink, but content themſelves with the dew. The hare's ears lead the way in her chaſe; for with one of them (it has been ſaid) ſhe hearkeneth to the cry of the dogs, the other being ſtretched forth like a ſail to promote her courſe.

Others, however, have aſſerted that this notion is ridiculous. Whenever the hare pricks her ears on end, or draws one apart from or more forward than the other, it is to liſten more diſtinctly on that ſide the forwardeſt ear inclines; had Nature deſigned any ſingular aid to her *feet* from ſtretching forth the ears, ſhe would have ſupplied her with *two pair*, one to lie flat upon the ſhoulders for liſtening, whilſt ſhe ſailed by the other, and never would ſhe have had more occaſion for *both*, than when ſeverely courſed, at which time, the ears ſhe has may be obſerved to lie cloſe to the neck; and although ſhe is compelled, when thus preſſed, to try every ſhift to eſcape, this quality of *ſailing* by the ears is never ſeen; both ears are very ſtrictly applied to catch the ſmalleſt ſound of the greyhound *behind*, by which ſhe accordingly retards or increaſes her celerity.

The hares of the mountains often exerciſe themſelves in vallies and plains, and through practice grow acquainted with the neareſt way to their forms; thoſe which frequent buſhes and brakes are not able to endure labour; nor are very ſwift, being tender footed, and growing fat through diſcontinuance of exerciſe.

When the hare has left the dogs far behind, ſhe goes to ſome hill or riſing ground, where, rearing on her hinder legs, ſhe obſerves at what diſtance her purſuers are.

The trail, *i. e.* the path which the hare takes in going to her ſeat is long, ſays Xenophon, in his Obſervations upon Hare-hunting, in proportion to the length of the night. In the winter, he ſays, there is no ſcent early in the morning, when either a hoar or a hard froſt occurs. The trail is alſo ſpoiled by much dew, and by ſhowers after a long drought.

The ſcent is naturally ſtronger in wood-hares than field-hares; but in all ſorts it is ſtrongeſt when they feed on green corn. The ſcent of young hares is ſaid to be ſtronger than that of thoſe full-grown, the weakneſs of their limbs ſuffering the whole body to touch the ground. In winter mornings, the ſcent does not lie till the froſt be a little thawed ; and it may be added, that a hare always leaves more ſcent when ſhe goes to relief, than when ſhe goes to form.

Her footſteps are more ſeen in winter than ſummer ; becauſe, as the nights are longer, they travel farther. Their prints are very uncertain at the full moon, at which time they leap and play together. The young, it is to be obſerved, tread heavier than the old, becauſe their limbs are weaker. A buck, or male hare, is known by his beating the hard highways, feeding farther out in the plains, and making his doublings of a greater compaſs than the female, who keeps cloſe by ſome covert ſide ; turning, winding, and croſſing in the buſhes, like a coney, and rarely running out an end ; whereas the buck, having once made a turn or two about his form, runs ſtraight forward for four or five miles, or more, without once turning his head. Add, that the buck is known, at his riſing out of form, by his hinder parts, which are more white, and his ſhoulder, which is redder than the doe's. His head is alſo ſhorter, and his ears more grey.

The hare regulates its conduct according to the weather. In a moiſt day ſhe holds the highways more than at any other time, becauſe the ſcent is then moſt apt to lie ; and if ſhe come at the ſide of any young grove or ſpring, ſhe forbears to enter, but ſquats down at the ſide, till the hounds have overſhot her ; upon which ſhe returns the ſame way ſhe came, without turning into any covert, for fear of the wet and dew hanging on the boughs.

Regard is alſo to be had to the place where the hare ſits, and upon what wind ; for if her form be either upon the north or ſouth wind, ſhe will not willingly run into the wind, but aſide, or down the wind ; on the contrary, if ſhe form on the ſide of the water, it is a ſign ſhe is foul and meaſled, and in the courſe will make all her doubling and croſſing about brook-ſides and near plaſhes ; for her ſcent, under this condition, being very ſtrong, ſhe needs a place that will take but little. Sometimes, when hunted down, ſhe will ſtart a freſh hare, and ſquat in the ſame form ; at other times, ſhe will creep under the door of a ſheep-cote, and hide among the ſheep, or run among a flock of ſheep, and will not, without the utmoſt difficulty, be taken from among them. Add, that ſome will take the ground like a coney : this is called going to *vault*.

Some hares will go up one ſide of the hedge, and come down the other ; and it is ſaid that a hare, being ſorely hunted, has got upon a quickſet hedge, and ran a good way on the top of it, and then leaped off upon the ground ; and that it is no unuſual thing for them to take themſelves to furze-buſhes, and leap from one to another, whereby the hounds are frequently in default. Theſe accounts, however, are diſregarded by ſome as fabulous.

A hare, it is ſaid, does not live above ſeven years at moſt, eſpecially the buck ; and if he and the doe keep one quarter, they will not ſuffer any ſtrange hare to ſit by them : whence the proverb, "The more you hunt, the more hares you ſhall have ;" ſince, having killed one hare, another comes and poſſeſſes his form.

In entering a young kennel of hounds, regard muſt be had to the nature of the country and of the quarry ; for, according to the place wherein they are entered, and the game firſt given them, will they afterwards prove. Thus, if they be entered in a champaign country, they will ever after more delight to hunt there than on any other ground. The beſt time, it is ſaid, for the entering of hounds is in the heat of the day, and about October or November, the weather being then temperate, and young hares that have not been hunted, are more eaſily taken for their encouragement. Hounds, after the age of two years, ſhould be hunted three times a week, if they feed well, and may be kept out the greateſt part of the day, to try their ſtrength. See ENTRANCE and HOUND.

Having found where a hare hath relieved in ſome paſture, or corn-field ; to find her form, the ſeaſon of the year, and the ſtate of the weather are to be conſidered. In the ſpring or ſummer, a hare will not ſit in the buſhes, becauſe frequently offended with piſmires, ſnakes, and adders ; but will ſit in corn-fields, and open places. In winter they chooſe to ſit near towns and villages, in tufts of thorns and brambles, eſpecially when the wind is northerly or ſoutherly. According to the ſeaſon, and nature of the place where the hare is accuſtomed to ſit, there beat with your hounds, and ſtart her : which is better ſport than trailing of her from her relief to her form. Having ſtarted her, ſtep in, and halloo in the hounds till they have undertaken it : crying, *that, that,* or *there, there,* and go on with full cry ; then recheat them, and follow at a diſtance, taking care not to forward them too much at firſt, as being apt, if the firſt heat, to overſhoot the game. Some of the early ſportſmen never permitted the hare to be hallooed, or the hounds to be aſſiſted when they were at fault, but ſuffered them to work it out by themſelves, which, though tedious, was conſidered as a ſure way to aſcertain the goodneſs of the hounds. Above all things, mind the firſt doubling the hare makes, which is to be a key or direction for the whole day ; all the other doublings ſhe afterwards makes being like the firſt. According to the policies you ſee her uſe, and the place where you hunt, make your compaſs, to help the defaults, great or little, long or ſhort ; always ſeeking the moiſteſt and moſt commodious place for the hounds to ſcent in.

A young huntſman, ſays an ingenious ſportſman, ſhould take care, when the ſcent lies well, always to keep himſelf far behind. At ſuch a time, eſpecially if it be againſt the wind, it is impoſſible for the hare to hold forward, nor has ſhe any mode of eſcaping, but to ſtop ſhort, and when all are paſt, to ſteal immediately back. This is often the occaſion of an irrecoverable fault in the midſt of the warmeſt ſport, and is the beſt trick the hare has for her life in ſcenting weather. If the huntſman, therefore, is not too forward, he will have the advantage of ſeeing her manœuvre, and of aſſiſting his hounds at this critical moment.

Upon ſight of the hare, avoid, above all things, the vile practice of hallooing hounds off *a ſcent*, to lay them on after a *view*, it not only ſpoils the dogs, by accuſtoming them at every fault to liſten for, and expect the halloo, but it is foul ſporting ; equally unfair and to be condemned is, the ſuffering the pricks of the hare's footing to be ſmoothed when ſhe runs the foil ; for although it is admitted that by ſuch pricking and diſcovering her ſteps, no hare can eſcape, yet it is an unmanly mode of aſſiſting hounds, which no huntſman, who is a *ſportſman*, will ever be guilty of himſelf, or condeſcend to make uſe of when done by others.

The huntſman ſhould never be noiſy when a hare is firſt ſtarted ; let him not only check his own forwardneſs, but that likewiſe of the inexperienced ſportſman. Hounds are apt enough in the firſt heat of their mettle to overſhoot their game, and hours of ſad ſport have happened from driving them too faſt. Too many people think a chief part of hunting conſiſts in *hallooing loud* and *riding hard*, but they are miſtaken, and muſt not be offended ſhould the huntſman ſwear at their performances. No tongue can be allowed but his, nor, at this peculiar time, ought any one to be more forward.

The chief conſiderations for the huntſman, when the hounds are at default, are, how long the hare has been on foot, and how far the hounds make it good; if ſhe has *not* been long and hard preſſed, he muſt expeditiouſly try a wide circle, and ſo perſiſt in contracting his circles, until he returns to the place where the dogs threw up. Should the hare have been drove hard, or be nearly dead run, the huntſman need only try a ſmall compaſs, and that ſlowly and cautiouſly, for ſhe will only leap off a few rods and *quat*, until one or other of the dogs jumps upon her.

A huntſman ſhould be careful of talking too loud to hounds, and in a *key* which inſtead of cheering confounds them. Give me, ſays this author, a fellow of everlaſting patience and good temper, who does not conſider hunting merely as his *buſineſs*, but who naturally loves it, one with a clear, moderate voice, that ſpeaks to an old hound when at fault frequently and with quickneſs, and cheriſhes him in a tone that enforces courage, and induces him to ſtoop perpetually to recover the ſcent. It is by no means the huntſman's buſineſs to endeavour by pricking the hare to hit her off; in the firſt place it is unfair, and, ſecondly, whilſt he is poring with his eyes upon the ground, not one in twenty of the hounds will have his noſe to it. If there is a long *default*, the huntſman ſhould attend to the tender-noſed dog, which perhaps he diſregarded in the morning as a *babbler*, and whom he pronounced worthy of a halter for opening at nothing; his ſuperior excellence of ſcenting may now ſhew itſelf to have merited a different judgment, and may encourage ſome ſtauncher hound to ſtoop, which he would not otherwiſe do.

A huntſman is never to give up a default whilſt day-light and weather permit; if the hare is not killed and taken up, there is no good reaſon why it is not to be recovered, and it ſhould be a ſtanding maxim, that it is always as eaſy to recover a *loſt* hare as to ſtart a *freſh* one.

In the opinion of Mr. Beckford, the number of hounds ſhould not exceed twenty couple in the field, from the difficulty of getting a greater number to run well together, and a pack of harriers (as well as fox-hounds,) are incomplete if they do not. A hound that runs too faſt for the reſt ought not to be kept. Some huntſmen load them with heavy collars, or tie a long ſtrap round their necks; a better way would be to part with them. Whether they go too *ſlow* or too *faſt*, they ought equally to be drafted. The hounds moſt likely to ſhow ſport are between the large, ſlow hunting harrier, and the little fox beagle; the former are dull, heavy, and too ſlow; the latter are lively, light, and too fleet. The firſt ſort have moſt excellent noſes, and will kill their game at laſt, if the day be long enough. The other, on the contrary, daſh and are all alive, but every cold blaſt affects them, and in a deep and wet country it is not impoſſible but that ſome of them may be drowned. His opinion reſpecting the huntſman is, that he ſhould not be young, and for *patience* he ſhould be a very *Grizzle*; the quieter he is the better, and he ſhould have perſeverance and never give up a hare when it is poſſible to hunt her, as ſhe is ſure to ſtop, and therefore may always be recovered; he jocularly remarks, that were it cuſtomary to attend to the breed of huntſmen as well as to that of hounds, the family of the *ſilent gentleman*, mentioned by the Spectator, would furniſh an excellent croſs, and that a female of his lineage, married to a knowing huntſman, would probably produce a perfect hare-hunter. The whipper-in to a pack of harriers ſhould not be allowed to ſtop a hound or ſmack his whip, without the huntſman's order. Noiſe and rattle are directly adverſe to the firſt principle of hare-hunting, which is to be quiet and leave the hounds to themſelves. If a long fault makes the huntſman's aſſiſtance neceſſary, and the hare ſhould have headed back, he will obſerve whether ſhe has turned of her own accord, or has met any thing in her courſe to turn her. When he caſts his hounds, let him begin with a ſmall circle, if that is unſucceſsful, try a larger, and as a hare generally reviſits her old haunts, and returns to the place where ſhe was firſt found, if the ſcent be quite gone, and the hounds can no longer hunt, *that* is as likely a caſt as any to recover her. Let him remember in all his caſts, that the hounds are not to follow his horſe's heels, nor are they to carry their noſes in the air. At theſe times they muſt try for the ſcent, or they will never find it; and he is to make his caſt either quick or ſlow, as he perceives his hounds try, and according to the goodneſs or badneſs of the ſcent.

When hounds are at a check, the huntſman ſhou'd not move his horſe one way or the other. Hounds lean naturally towards the ſcent, and if nothing be ſaid, will ſoon recover it: if a hound is ſpoken to at ſuch a time, calling him by his name, (which is too much practiſed,) he ſeldom fails, ſays Mr. Beckford, to look up, as much as to ſay, *What the deuce do you want?* Had he the faculty of ſpeech, he would add, before he ſtooped to the ſcent again, *You fool, let me alone.* When hounds are at fault, not a word ſhould be ſaid; no other tongue ſhould be heard but that of a hound; and ſo inflexible was a friend of Mr. Beckford who kept harriers, in this particular, that a gentleman accidentally coughing whilſt his hounds were at fault, he rode up to him immediately, and ſaid "*I wiſh, ſir, with all my heart, that your cough was better.*"

When the hare is firſt ſtarted, ſays Mr. Beckford, ſportſmen cannot be too quiet. Hounds through the whole chaſe ſhould be left almoſt entirely to themſelves, and never be much hallooed; when the hare doubles, they ſhould hunt through theſe doubles; nor is a hare hunted *fairly* if hunted otherwiſe; they ſhould follow every ſtep ſhe takes, as well over greaſy fallows, as through flocks of ſheep, nor ſhould they be ever caſt, if able to do any thing without it. On high roads and dry paths, the huntſman ſhould always be doubtful of the ſcent, nor give them much encouragement; but when a hit is made on either ſide, it is then right to cheer them as much as you pleaſe. A hare generally deſcribes a circle in her flight, larger or ſmaller, according to her ſtrength and the openneſs of the country. In encloſures and where there is much cover, the circle is ſo ſmall that it is a conſtant puzzle to the hounds. Beſides running the foil, they frequently make doubles, which is going forward, to tread the ſame ſteps, back again, on purpoſe to confuſe their purſuers; and the ſame manner in which the firſt double is made, they moſtly continue, whether long or ſhort. This information, ſays Mr. Beckford, if properly marked by the huntſman, may be uſeful in his caſts. When hares make their doubles on a high-road, or dry path, and then leave it with a ſpring, it is often the occaſion of a long fault: the *ſpring* which a hare takes on theſe occaſions, is hardly to be credited, any more than her ingenuity in thus trying to eſcape. Often, after running a path a conſiderable diſtance, ſhe will make a double, and ſtop until the hounds are paſt her, ſhe will then ſteal away, and return the ſame way ſhe came; this is the greateſt of all trials for hounds. It is ſo hot a foil, that in the beſt packs there are not many hounds that can hunt it; thoſe hounds muſt be followed that can, and the foil when ſhe breaks it, (which in all probability ſhe will ſoon do, as ſhe now thinks herſelf ſecure,) be tried to be hit off. When the ſcent lies bad in cover, ſhe will ſometimes ſeem to hunt the hounds. Particular directions, ſays Mr. Beckford, ſhould be given to the huntſman, to prevent the hounds all in his power, from *chopping* hares. In furze they lie very cloſe, hedges are alſo dangerous: the beſt way is to have the hedge well beaten ſome diſtance before the hounds, for if the huntſman beats the hedge himſelf, as is the general practice, the hounds are always upon the watch, and a hare muſt have great luck to eſcape them all. Hares ſeldom run ſo gallantly as when they do not know where they are; in a fog they run well; if they ſet off down the wind, they rarely return, and hounds cannot then be puſhed on too much; when the hare is ſinking, the old hounds will get forward; they, *then*, will run at *head*.

Keep no *babblers* or hounds that run falſe; the loſs of one hare is more than ſuch dogs are worth.

HUNTING, *Hart* or *Stag*. (See CERVUS *Elaphus*.) This animal the firſt year is called a *calf*, or *hind-calf*; the ſecond year, a *knobber*; the third, a *brock*; the fourth a *ſtaggard*; the fifth a *ſtag*; the ſixth a *hart*.

The female is called a *hind*. The firſt year ſhe is a *calf*; the ſecond a *hearſe*, and ſometimes a *brocket's ſiſter*; the third a *hind*.

Terms occurring more eſpecially in hunting the hart, and not yet explained, are as follow. The print or impreſſion, where a deer has lain, is called a *layer*; if it be in covert, or a thicket, it is called his *harbour*; where a deer has paſſed into a thicket, leaving marks whereby his bulk may be gueſſed at, it is called an *entry*; when they caſt their heads they are ſaid to *mew*; when they rub their heads againſt trees, to bring off the peels of their horns, they are ſaid to *fray*; when a deer, hard hunted, takes to ſwimming in the water, ſhe is ſaid to go to *ſoil*; when they turn head againſt the hounds, they are ſaid to *bay*; when the hounds touch the ſcent, and draw on till they put up the hart, they are ſaid *to draw on the ſlot*.

As to the nature and qualities of the hart, it is to be obſerved that he is an excellent ſwimmer; there being inſtances, when ſore hunted, of his plunging in the ſea, and being killed by fiſhermen twelve miles from land. When, in going to rut, they have occaſion to croſs a great river, or arm of the ſea, it is ſaid they aſſemble in great herds; the ſtrongeſt goes in firſt, and the next of ſtrength follows; and ſo one after the other, relieving themſelves by ſtaying their heads on the buttocks of each other.

The hind commonly carries her calf eight or nine months, which uſually falls in May: ſome have two at once; and they always eat up the ſkin wherein the calf lay. As the young grow up, the old one teacheth it to run and leap, and how to defend itſelf from the hounds.

The hart is amazed at hearing any one call, or whiſtle, in his fiſt; if you cry *ware, ware*, or *take heed*, you will ſee him inſtantly turn back, and make ſome little ſtand. His ſenſe of hearing is very perfect when his head and ears are erected; but very imperfect when he holds them down: hence when he pricks up his ears, he is known to be apprehenſive of danger. When he is on foot, and not afraid, he wonders, and takes a pleaſure to gaze at every thing he ſees.

The hart is long lived, but leſs ſo than ſome perſons have conceived. (See CERVUS *Elaphus*.) The principal marks of his age are taken from his head, yet this is ſomewhat precarious; ſome having more croches thereon at the ſame age than others.

The capture of this beaſt requires great art and attention. When the hunter goes for ſport, he is firſt to encompaſs the beaſt *en ſon giſte*, in her own layer, and thus unharbour her in the view of the dogs, ſo that they may never loſe her ſlot or footing. But note, a conſiderable degree of choice and diſcretion is here required; for he may not ſet off upon every one, either of the herd, or thoſe which wander ſolitary; the young, the ſmall, &c. are to be paſſed over; and partly by ſight, and partly by the footing, fewmets, the largeneſs of the layer, &c. he muſt make judgment of the game, ſingling out for that purpoſe the largeſt head in the whole herd.

There are divers means for knowing an old hart; *viz.* by the *ſlot*, the *entries*, the *abatures*, and *foils*, the *fumets*, *gait*, and *walks*, *fraying-ſtocks*, and the *head* and *branches*. 1. As to the ſlot. The treadings of the hart's foot are to be carefully noted: if you find the treadings of two, the one long, and the other round, yet equally big, the longeſt ſlot declares the largeſt hart; add, that the old hart's hind foot never over-reaches the fore-foot, as that of the young one does. 2. The fewmiſhing is chiefly to be judged of in April or May: if it be large and thick, it ſignifies the hart to be old. 3. To know the height and thickneſs of the hart, obſerve his entries and galleries into the thickets, and what boughs he hath over-ſtridden, and mark from thence the height of his belly from the ground; for a young deer uſually creeps low, as he paſſes to his harbour, and goes through places which the old one, being ſtiff and ſtately, will not ſtoop to. 4. By his gait it may be known whether the hart be large, and whether he will ſtand long before the hounds: if he have a long ſtep, he will ſtand long, being ſwift, light, and well breathed; if he have a great ſlot, which is the ſign of an old deer, he will be a laſter. As to his fraying-poſt, note, that the older the hart is, the ſooner he goeth to fray, and the greater is the tree he chooſes to fray upon; it being neceſſary it be ſuch as may not bend. Now, to ſeek or find out a hart in his haunt, or feeding-place, it is to be obſerved, that he changes his manner of feeding every month. From the concluſion of the ruttiug time, which is in November, they feed in heaths and broomy places. In December they herd together, and withdraw into the ſtrength of the foreſts, to ſhelter themſelves from the ſevere weather, feeding on holm-trees, elder-trees, brambles, &c. The three following months they leave the herding, but keep four or five in a company, and in the corners of the foreſt will feed on the winter paſture, ſometimes making their excurſions into the neighbouring corn-fields, if they can perceive the blades of wheat, rye, &c. appear above ground. In April and May they reſt in thickets and ſhady places, ſtirring very little till rutting time, unleſs diſturbed. The three ſucceeding months they are in their pride of greaſe, and reſort to ſprings, copſes, and corn-fields. In September and October they leave the thickets, and go to rut; during which ſeaſon, they have no certain place either for food or harbour.

Having found out the game, the hunters diſcouple and caſt off the dogs; and ſome on horſeback, others on foot, follow the cry with the utmoſt art, obſervation, and ſpeed, remembering and preventing the ſubtle turning and headings of the hart; ſtanding with dexterity and intrepidity to leap hedge, pales, ditch, &c.

The utmoſt addreſs and circumſpection are to be uſed to keep to the beaſt firſt attempted, and to prevent the dogs from purſuing any other: this, in effect, makes one of the principal difficulties and glories of the chaſe; the beaſt having a hundred devices to put off ſome other head for his own: ſometimes he will ſend forth ſome other little deer in his ſtead into the dogs' way, laying cloſe at this time himſelf; on which occaſion the huntſman is to ſound a retreat, and break off the dogs, and take them in leam, till the game be recovered.

Sometimes he will purpoſely ſeek out other deer at layer, and rouſe them to make the hounds hunt change, himſelf lying down flat in ſome of their layers upon his belly, to make the hounds over-ſhoot him: add, that they may neither ſcent nor vent him, he will gather up his fore-feet under his belly, and blow or breath on ſome moiſt place of the ground, ſo that the hounds ſhall paſs within a yard, without apprehending him. He will break into one thicket after another, to find deer, rouſing, gathering them together, and herding with them, and even beating ſome of them into his treads, that he may the more eaſily eſcape. Finding himſelf ſpent, he will break herd, and fall to doubling and croſſing in ſome hard beaten highway, always running againſt the wind, not only to cool himſelf, but the better to hear the voice of his purſuers.

The laſt refuge of a hart ſorely hunted, is the ſoil; keeping the middle for fear, leaſt by touching a bough, or the like, he may give ſcent to the hounds. He always ſwims againſt the ſtream; whence the old rule, "He that will his chaſe find, let him try up the river, and down the wind." In taking ſoil, he will ſometimes cover himſelf under water, ſo as to ſhew nothing but his noſe.

Where opportunity of water fails, he will fly into herds of cattle, as cows, ſheep, &c. and will ſometimes leap on an ox, cow, or the like, laying the fore part of his body thereon, that ſo touching the earth with his hinder feet, he may leave a ſmall or no ſcent behind. What is farther ſtill, the chief huntſman of Lewis XII. relates, that a hart which they were in hard chaſe of, leaped into a great tall white thorn, which grew in a ſhadowy place, and there ſtood aloft till he was run through by a huntſman, rather than he would ſtir.

The hart being killed the huntſman with his horn windeth the fall of the beaſt; upon which every one approaches: the ſkilfulleſt opens the breaſt, rewarding the hounds with what properly belongs to them; the huntſman, at the ſame time, dipping bread in the ſkin and blood of the beaſt to give the hounds their full ſatisfaction.

The hart is known to be ſpent by his running ſtiff, high, and lampering, by his mouth being black and dry, without foam on it, and his tongue hanging out; though he will ſometimes cloſe his mouth to deceive the ſpectators; and by his ſlot, for he will ſometimes cloſe his claws together, as if he went at leiſure, and immediately again open them wide, making great glidings, and hitting his dewlaps upon the ground, &c. When quite ſpent, and cloſe beſet, or intercepted on all ſides, the hart uſually takes to bay, and makes force with his head againſt the firſt man or dog that cloſes in upon him, unleſs prevented with a ſpear, ſword, or the like. Hence it is very dangerous going in to a hart at bay, either on land or in the water, eſpecially at rutting time, for then they are more than ordinarily fierce.

The hart being killed, his death is ſolemnized with great ceremony. The firſt thing, when the huntſmen come in, is, to cry, *Ware haunch*, that the hounds may not break into the deer: having ſecured this, they cut his throat, and blood the younger hounds, to make them love deer; and learn to leap at his throat; then having blown the mort, and all the company being come in, the moſt diſtinguiſhed perſon, who has not taken *ſay* before, takes up the knife, and lays it acroſs the belly of the deer, (ſome of the aſſiſtants holding by the fore-legs, and at the ſame the huntſman drawing down the pizzle,) and thus he draws the knife along the middle of the belly, beginning near the briſket, cutting deep enough to diſcover how fat he is. Then the moſt ſkilful perſon breaks up the deer, by firſt ſlitting the ſkin from the cutting of the throat downwards, making the arber, that the ordure may not break forth, and then paunching him, and rewarding the hounds with it.

Laſtly, the perſon that took the *ſay*, being preſented with a drawn hanger, he is to cut off the head; which done, and the hounds rewarded with it, the concluding ceremony, if a buck, is a double; if a ſtag, a treble mort, blown by one, and a recheat in concert by all that have horns: the whole is then concluded with a general *whoop, whoop*.

HUNTING, *Otter*. See OTTER.

The otter is to be hunted by particular dogs, called *otter hounds*, and alſo with ſpecial inſtruments, called *otter ſpears*. To find him out, ſome are to go on one ſide of the river, and ſome on the other, beating all the way on the banks, with the dogs following. Thus it is ſoon found if there be an otter in that quarter; for the otter cannot endure long in the water, but muſt come forth to make his ſpraints, (excrements,) and in the night ſometimes to feed on graſs and other herbs. If the hounds find an otter, look in the ſoft and moiſt places, to learn by the prints which way he bent his head: if theſe make no diſcovery, it may be partly perceived by the ſpraints. This done, follow the hounds, and lodge him as a hart or deer.

The otter always endeavours to keep to the water, where he is maſter. In hunting him, therefore, you are to be ready with your ſpears, to watch its vents; for that is the chief advantage: if you perceive where he ſwims under water, ſtrive to ſet a ſtand before him, where you expect he will vent, and there endeavour to ſtrike him with the ſpear; if you miſs, purſue him with the hounds; which, if they be good, and well entered, will come chaunting and trailing along the river-ſide and beat every tree, root, every oſier-bed, and tuft of bulruſhes; nay, ſometimes they will take the water, and beat it like a ſpaniel; by which means the otter can hardly eſcape.

If the beaſt find himſelf wounded with a ſpear, he uſually makes to land, where he will maintain a furious battle with the dogs.

HUNTING, *Roe-buck*. See ROE-BUCK, *Roe* DEER, and CERVUS *Capreolus*.

We have no roe-deer in England; but they abound in the Highlands of Scotland, Germany, Africa, &c. And it ſhould ſeem that they have been more common among us, our huntſmen ſtill retaining the proper terms for the chaſe.

They make good chaſe, ſtand long, and fly end-way. When a roe croſſes and doubles, it is called *trapyning*. Their ſwiftneſs appears not only on the earth, but in waters, through which they cut their way as with oars; whence they love lakes and ſtreams, breaking the floods to come at freſh paſture, feeding on ruſhes, &c.

Horns grow only on the male; being ſet with ſix or ſeven branches not palmed, but branchy, yet ſhorter than fallow-deer. After rutting he caſts his head.

They are ſaid never to wink, not even when aſleep; for which conceit their blood is by ſome fanciful people preſcribed to perſons dim-ſighted or purblind. The tail of this beaſt is leſs and ſhorter than that of a fallow-deer, inſomuch that it is queſtioned whether it ought to have that denomination.

They keep moſtly in mountains among the rocks: and when hunted; Martial tells us, will hang on them with their horns, to delude the dogs. They are often taken by counterfeiting their voice, which the huntſman does by the aſſiſtance of a leaf in his mouth.

When hunted, they turn much and often, and will come back on the dogs directly. When they can no longer endure, they alſo take ſoil, as the hart; and will ſometimes hang by a bough in ſuch a manner, as that nothing ſhall appear above the water but their ſnout.

HUNTING-*match*. The firſt thing that is to be conſidered

By one who deſigns to match his horſe for his own advantage, and his horſe's credit, is not to flatter himſelf with the opinion of his horſe, by fancying that he is a ſwift, when he is but a ſlow gallopper; and that he is a whole running horſe (that is, that he will run four miles without a ſob at the height of his ſpeed) when he is not able to run two or three. Very probably ſome gentlemen are led into this error, by their being miſtaken in the ſpeed of their hounds, who, for want of trying them againſt other dogs that have been really fleet, have ſuppoſed their own to be ſo, when, in reality, they are but of a middling ſpeed; and becauſe their horſe, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a falſe concluſion, that their horſe is as ſwift as the beſt; but upon trial againſt a horſe that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear; therefore it is adviſable for all lovers of hunting to procure two or three couple of tried hounds, and once or twice a week to follow after them a train-ſcent, and when he is able to top them on all ſorts of earth, and to endure heats and colds ſtoutly, then he may better rely on his ſpeed and toughneſs.

That horſe which is able to perform a hare-chaſe of five or ſix miles briſkly and courageouſly, till his body be as it were bathed in ſweat: and then after the hare has been killed, in a nipping froſty morning, can endure to ſtand till the ſweat be frozen on his back, ſo that he can bear being pierced with the cold as well as the heat, and then even in that extremity of cold to ride another chaſe as briſkly and with as much courage as he did the former, that horſe which can thus endure heats and colds is moſt valued by ſportſmen. Therefore, in order to make a judgment of the goodneſs of a horſe, obſerve him after the death of the firſt hare, if the chaſe has been in any degree briſk; if when he is cold he ſhrinks up his body, and draws his legs up together, it is an infallible ſign of want of vigour and courage; the like may be done by the ſlackening of his girths after the firſt chaſe, and from the dulneſs of his teeth, and the dulneſs of his countenance, all which are true tokens of faintneſs, and being tired; and ſuch a horſe is not to be relied on, in caſe of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by running ſo many train-ſcents after hounds, as were agreed upon between the parties concerned, and a bell-courſe, this being found not ſo uncertain, but more durable than hare-hunting; and the advantage conſiſted in having the trains laid on earth moſt ſuitable to the qualifications of the horſes. But now others chooſe to hunt the hare till ſuch an hour, and then to run this *wild-gooſe* Chase (which ſee), a method of racing that takes its name from the manner of the flight of wild-geeſe, which is generally one after another: ſo the two horſes, after running of twelveſcore yards, had liberty, which horſe ſoever could get the leading, to ride what ground he pleaſed, the hindmoſt horſe being bound to follow him, within a certain diſtance agreed on by articles, or elſe to be whipped up by the triers or judgers which rode by; and whichever horſe could diſtance the other, won the match.

But this chaſe was found by experience ſo inhuman, and ſo deſtructive to good horſes, eſpecially when two good horſes were matched; for neither being able to diſtance the other, till both were ready to ſink under their riders through weakneſs, that oftentimes the match was fain to be drawn and left undecided, though both the horſes were quite ſpoiled.

This brought up the cuſtom of train-ſcents, which afterwards was changed to three heats, and a ſtraight courſe; and that the lovers of horſes might be encouraged to keep good ones, plates have been erected in many places of England. The fewer of theſe before you come to the courſe, if your horſe be fiery and mettled, the better, and the ſhorter the diſtance the better. Alſo, above all things, be ſure to make your bargain to have the leading of the firſt train, and then make choice of ſuch grounds where your horſe may beſt ſhow his ſpeed, and the fleeteſt dogs you can procure: give your hounds as much law before you as your triers will allow, and then, making a looſe, try to win the match with a wind; but if you fail in this attempt, then bear your horſe, and ſave him for the courſe; but if your horſe be ſlow, but well winded, and a true ſpurred nag, then the more train-ſcents you run before you come to the ſtraight courſe, the better. But here you ought to obſerve to gain the leading of the firſt train; which in this caſe you muſt lead upon ſuch deep earths, that it may not end near any light ground; for this is the rule received among horſemen, that the next train is to begin where the laſt ends, and the laſt train is to be ended at the ſtarting place of the courſe; therefore remember to end your laſt on deep earths, as well as the firſt.

Hunting *Cap*, in the language of the *Sportſman*, is a cap made of leather, and covered with black velvet, fitting cloſe to the head behind, and having a ſemi-circular peak before, for the protection of the face in caſe of falls, as well as in paſſing through ſtrong coverts during the chaſe. In the ſporting world it is termed a "daſher."

Hunting *Whip*, is of different lengths in the handle or ſtock, and has at one end a long thong and laſh, to aſſiſt occaſionally in managing the hounds, and at the other a hook, hammer, or claw, for the purpoſe of holding or opening gates.

Hunting *Saddle*. See Saddle.

Hunting *Creek*, in *Geography*, a river of America, in Virginia, which runs E. into Potowmack river, at the S. corner of the territory of Columbia.

Hunting *Iſlands*, a cluſter of ſmall iſlands in the Atlantic ocean, near Port Royal, in the ſtate of South Carolina. N. lat. 32° 24′. W. long. 80° 35′.

Hunting *Sound*, a narrow channel on the coaſt of North Carolina, between Core bank and the continent.

HUNTINGDON, the principal town in Huntingdonſhire, England, is ſituated on the northern ſide of the river Ouſe, and is nearly connected, by three bridges and a cauſeway, with the village of Godmancheſter, whence, according to Camden, it ſprung. This place is called Huntandene in the Saxon chronicle, and Huntantun in other ancient writings. Henry of Huntingdon, the archdeacon and hiſtorian, deſcribes it as "ſurpaſſing all the neighbouring towns in pleaſantneſs of ſituation, beauty of buildings, nearneſs to the fens, and plenty of game and fiſh." Moſt writers agree with Camden reſpecting the origin of this town; and like him, have placed the Duroliponte of Antoninus at Godmancheſter; yet the nature of the ground affords almoſt deciſive evidence that the Roman ſtation could not have been at that village, but was rather at Huntingdon, where the entrenchments, yet remaining, ſhew the works to have been very ſtrong and extenſive; and even Camden's own teſtimony may be urged in ſupport of the opinion, that theſe fortifications had a far more remote origin than is commonly aſſigned. "On the river near the bridge," he obſerves, "which is fair built of ſtone, are to be ſeen the mount and ſcite of a caſtle, which, in the year 917, king Edward the Elder built anew; and David the Scot, (to whom, according to an ancient hiſtorian, king Stephen gave the borough of Huntingdon, for an augmentation of his eſtate,) enlarged

enlarged with many works." Now, the re-building of the caſtle by Edward evinces, in a great meaſure, its previous antiquity; and its ſcite, as in Camden's time, ſtill remains to prove, that no ſpot of ground in this neighbourhood could be better adapted for a ſtation or fortreſs. On the ſouth it is bounded by the river, from which it riſes very abruptly to a conſiderable height; the outer ramparts incloſe an area of ſeveral acres, of a ſquare form, with the angles rounded off, and the whole was environed by a deep ditch; the banks on the ſouth, and ſouth eaſt, are ſtill very bold. Not any veſtiges of buildings now remain, but the foundations may, in various places, be traced from the unevenneſs of the ſurface; the artificial mount, on which moſt probably ſtood the keep of the caſtle, was alſo ſurrounded by a ditch. Below the high ground, to the ſouth-weſtward of the entrenchments, is an extenſive and fertile meadow, called Portholm, which Camden deſcribes as "the moſt freſh and beautiful that the ſun ever ſhone upon." This meadow is partly ſurrounded by the Ouſe river; and here the Huntingdon races are held; a ſmall part of it, which belonged to the protector Cromwell, and is now the property of the earl of Sandwich, ſtill bears the appellation of Cromwell's-Acres.

Huntingdon is a borough by preſcription, and the only one in the whole county. In the time of Edward the Confeſſor, as appears from the Domeſday book, there were in "this burgh, four ferlings, in two of which were 116 burgeſſes, paying cuſtom and geld, and under them 100 bordarii, who help to pay the geld; in the other two ferlings were 140 burgeſſes, ſubject to all cuſtoms, and the king's geld."

Scarcely any hiſtorical events are recorded as happening in this town. During the civil war, in the time of Charles I., it was pillaged by the king's troops, who were commanded by the king in perſon.

The religious houſes, of which there were formerly four of different deſcriptions, are almoſt as entirely obliterated as the buildings of the caſtle. The moſt ancient was a priory of Auſtin canons founded on the ſpot where St. Mary's church now ſtands, before the year 973, as appears from a charter of that date, granted by king Edgar to Thorney abbey. The buildings have long been demoliſhed; but the lanes which ſeparated the cloſes ſtill retain their ancient appellation. The next foundation in order of time, was an hoſpital for a maſter and brethren, and ſeveral leprous and infirm people, to which Malcolm IV. king of Scotland, and earl of Huntingdon, was a great benefactor. Another hoſpital, for leprous and poor people, was founded by David, earl of Huntingdon, in the time of Henry II. A houſe of Auguſtine friars was alſo eſtabliſhed at the north end of the town, previous to the nineteenth year of Edward I. Huntingdon is generally ſtated to have been once much larger than at preſent; and ſir Robert Cotton, as quoted by Speed, aſcribes its decay to ſome alterations made in the river by one Grey, a minion of the time, by which its navigation was impeded. Leland ſays, that ſome ages before it had fifteen churches, though, in his time, reduced to four; the reſt fallen through time and neglect, but traces of their walls and yards remaining. There are now only two churches, thoſe of St. Mary and All Saints; but the town ſtill conſiſts of four pariſhes; that of St. John being connected with All Saints, and that of St. Benet with St. Mary's. The church of St. Mary, which is the corporation church, was rebuilt in the reign of James I., between the years 1608 and 1620, as appears from thoſe dates over the north door-way: on the tower is the date 1613. It conſiſts of a nave, chancel, and aiſles, with a handſome embattled tower at the weſt end, having ſtrong buttreſſes with ornamental niches at the angles. The chancel contains ſeveral monuments to the Sayer family, one of whom, George Sayer, gent. contributed largely towards the internal repairs of this edifice, and beſides ſeveral other donations, gave 500*l.* to purchaſe lands, the rents to be appropriated to the miniſters of the two churches. Nearly oppoſite to St. Mary's church is a reſpectable manſion, now the property and ſeat of ſir John Arundel, bart. All Saints church, which ſtands on the north ſide of the market place, appears, from the character of its architecture and ornaments, to have been built in the time of Henry VII. It is an embattled edifice with a ſmall tower at the north-weſt angle; below the battlements is a bold cornice, charged with a multiplicity of ſculptures, repreſenting human and animal heads, flowers, &c., and among them the Tudor roſe and the portcullis.

The principal charitable eſtabliſhments in this town are, a free grammar ſchool, well endowed; and a green coat ſchool, wherein twenty four boys are cloathed and educated. This is called Walden's charity, from Lyonel Walden, eſq. who, by will dated July 1719, left a ſufficient endowment for the purpoſe of ſupporting it. Among various other donations for charitable uſes in Huntingdon, was the ſum of 2000*l.* bequeathed by Richard Fiſhbourn, a citizen of London, who died in 1625; this money was to purchaſe lands, the rents of which were to be appropriated to the uſe of the poor: he made ſimilar bequeſts to other places, the amount of the whole being 11,000*l.* The market place is a ſpacious area, on the ſouth ſide of which ſtands the town-hall, a modern brick building, ſtuccoed, with a ſort of piazza in front and at the ſides for the market people; and behind it the butchers' ſhambles. The aſſizes for the town and county are held here twice a-year; the lower part of the building being divided for the purpoſe into two courts; one for criminal, and one for civil cauſes. Above is a ſpacious aſſembly room, ornamented with full length portraits of their majeſties, George II. and III. with their reſpective queens; and alſo a well painted picture of John, earl of Sandwich, who died in 1792. The market, which is held on Saturdays, is well ſupplied with proviſions in general; and great quantities of corn are ſold. Huntingdon had its firſt charter about the year 1206; king John granted it a peculiar coroner, a recorder, town-clerk, and two bailiffs, with the receipt of tolls and cuſtoms. Charles II., by a new charter, veſted the government in a mayor, twelve aldermen, and an indefinite number of burgeſſes or common council, choſen from the principal inhabitants. This borough ſent members to parliament *ab origine*, from the twenty-third of Edward I.; the right of returning the two members is generally underſtood to be poſſeſſed by the freemen and inhabitant houſholders, paying ſcot and lot; the number of voters is about 200; both the repreſentatives are however nominated by the earl of Sandwich. The town principally conſiſts of one ſtreet, extending, in a northweſterly direction, from the banks of the Ouſe, to nearly the diſtance of a mile, and having ſeveral lanes branching off at right angles. The ſtreets are paved, and lighted in the winter by a ſmall aſſeſſment levied on the houſholders. The ancient town appears to have ſpread further eaſtward; yet whatever might formerly have been the extent of Huntingdon, the population ſeems to be nearly the ſame as it was a century paſt; as biſhop Gibſon ſtates the number of families it contained in 1717 to be 400, whilſt the return made to parliament in 1801, records their amount to be 350, conſiſting of 2035 perſons, inhabiting 356 houſes.

Among the more eminent natives of this town, was Henry, ſurnamed *de Huntingdon*, from the place of his birth, a diſtinguiſhed eccleſiaſtic and hiſtorian; who lived in the reigns of Henry III. and Edward I.; and wrote a hiſtory of the Saxon heptarchy, with accounts of the ſucceeding kings to the reign of Stephen. Richard Fiſhbourn, gent. who has been already mentioned for his charities, was alſo a native. Huntingdon was likewiſe the birth-place of one of the moſt extraordinary characters that ever lived, the protector Oliver Cromwell, who, though prevented by conſiderations of policy from aſſuming the regal title, enjoyed all the eſſentials of ſovereignty, and ruled this country with more than regal power. (See CROMWELL.) Beauties of England and Wales, vol. vii.

HUNTINGDON, an extenſive and mountainous county in Pennſylvania, bounded N. and N.W. by Lycoming county, E. and N.E. by Mifflin, S.E. by Franklin, S. and S.W. by Bedford and Somerſet, and W. by Weſtmoreland. It is about 75 miles long, and 39 broad; comprehending 1,432,960 acres of land, divided into 18 townſhips, containing 3068 inhabitants. In this county are found limeſtone, iron ore, and lead. Works have been eſtabliſhed for the manufacture of iron and lead.

HUNTINGDON, the capital of the above county, which is a poſt-town, ſituated on the N.E. ſide of Juniatta river, and at the mouth of Standing-ſtone creek, 50 miles from the mouth of Juniatta, and containing about 90 houſes, a court-houſe, gaol, and 1251 inhabitants; 184 miles W.N.W. of Philadelphia. About ſix miles N.N.E. of the town is a mineral ſpring, celebrated for relieving rheumatiſm, and curing cutaneous diſorders. N. lat. 40° 26′. W. long. 78° 2′.—Alſo, a poſt-town on the N. ſide of Long iſland, New York, at the head of a bay in Suffolk county, containing about 70 houſes, a Preſbyterian and an epiſcopal church; 38 miles E. by N. of New York city, containing 3892 inhabitants.—Alſo, a poſt-town in Fairfield county, Connecticut, containing 2792 inhabitants.

HUNTINGDON, *North* and *South*, two townſhips, in Weſtmoreland county, Pennſylvania, the former containing 1484, and the latter 2317 inhabitants.

HUNTINGDONSHIRE, one of the inland counties of England, is bounded on the ſouth-eaſt and north-eaſt ſides by Cambridgeſhire, on the north and north-weſt by Northamptonſhire, and on the ſouth-weſt by Bedfordſhire. Its limits are chiefly artificial: the river Nene, on the Northamptonſhire border, with the King's Delf, the Old Weſt Water, and the Ouſe river, on the Cambridgeſhire ſide, being the principal exceptions. The general form of this county is an irregular ſquare: its extent, from north to ſouth, is nearly thirty miles; its greateſt breadth, from eaſt to weſt, twenty-three; and its circumference about one hundred: its ſuperficial contents have been eſtimated at from 220,000 to 240,000 acres. It contains four hundreds, ſix market towns, 107 pariſhes, 6976 houſes, and 37,568 inhabitants, *viz.* 18,521 males, and 19,047 females, according to the late returns made under the population and poor acts. It ſends four members to parliament; two for the ſhire, and two for the town of Huntingdon. The government of this county is very peculiar; Cambridgeſhire being joined to it under one ſheriff, who is choſen out of that county one year, out of the iſle of Ely the ſecond, and out of this county the third: and in the iſle of Ely alternately out of the north and ſouth parts. The whole of this county is in the dioceſe of Lincoln.

Ancient Hiſtory.—Huntingdonſhire, with the adjacent counties of Cambridge, Norfolk, and Suffolk, originally compoſed the territory of the Iceni; and in the Roman diviſion of the kingdom was included in the diſtrict named Flavia Cæſarienſis. The principal Roman ſtations in Huntingdonſhire, were Duroliponte at Huntingdon, and Durobrivæ, near Dornford Ferry, about midway between Cheſterton in this county, and Caſtor in Northamptonſhire. The principal ancient roads, of which there appear to have been three, interſected each other near Huntingdon: one of them has been called the Britiſh Ermin. This ſeems to have entered the county from the vicinity of Cæſar's camp, or Salenæ, in Bedfordſhire, and to have proceeded by Cranehill, in the track ſince known by the name of Hell-lane, whence paſſing through Toſeland, Godmancheſter, and Huntingdon, it continued by Alconbury, Weſton, and Upton; and entered Northamptonſhire at Wandsford. The Roman Ermin-ſtreet came into this county from Cambridgeſhire, near Papworth St. Agnes, and proceeded to Godmancheſter; branching off to the eaſtward, it croſſed Northamptonſhire, and entered Rutlandſhire, near Stamford. The Via Devana, the third and laſt of theſe roads, entered this county from Cambridgeſhire in the neighbourhood of Fenny Stanton, and quitted it for Northamptonſhire in the vicinity of Clapton. In the early Saxon times, this diſtrict formed a part of the kingdom of Eaſt Anglia, and was then called Huntedunefcyre, and Huntandunefcyre. It was afterwards ſubjugated by the Mercian ſovereigns, and continued under their dominion till the union of the Saxon ſtates into one monarchy, by Egbert. "In the decline of the Saxon government," Camden obſerves, "this county had an officiary earl, Siward; for earldoms were not yet hereditary in England, but the governors of ſhires were, according to the cuſtom of that period, called earls, with the additional title of the ſhires they preſided over: as this Siward, while governor here, was called earl of Huntingdon, but afterwards having the government of Northumberland conferred upon him, he was called earl of Northumberland." The principal land owners in this county in the Norman times, as recorded in the Domeſday book, were the king, the biſhops of Lincoln and Conſtance; the abbots of Ely, Croyland, Ramſey, Thorney, and Peterborough; the counteſs Judith, ſheriff Euſtace, earl Euſtace, earl of Ow, earl Hugh, Walter Giffard, William de Warren, Hugh de Bolebec, Eudo Fitz-Hubert, Swain of Eſſex, Roger de Iveri, Arnulf de Heſding, Gilbert de Gaunt, Aubrey de Ver, Ralph Fitz-Oſmund, and Rothais, wife of Richard Fitz-Gilbert.

Surface, Fens, Soil, &c.—Huntingdonſhire, Leland ſays, "in old time, was much more woody than it is now, and the dere reſorted to the fennes; it is full long ſins it was deforeſtid." Camden corroborates this, and ſtates, "that the inhabitants ſay it was once covered with woods; and it appears to have been a foreſt, till Henry II., in the beginning of his reign, disforeſted the whole, as ſet forth by an old perambulation, except Waybridge, Sapple, and Herthei, which were the lord's woods and remain foreſt." Sir Robert Cotton ſays, "this country was not completely diſafforeſted till the time of Edward I., when that ſovereign, in his twenty-ninth year, confirmed the great charter granted by Henry III., and left no more foreſt than his own demeſne." This deſcription of foreſt land cannot be ſuppoſed to apply to the fens, of which there are 44,000 acres in this county, excluſive of about 5000 acres of what are called ſkirty lands. Theſe conſtitute nearly a ſeventh part of what is called the Great Bedford Level, but they belong to that diviſion called the Middle Level, and are principally found on the north and north-eaſtern parts of the county. About 8000 or 10,000 acres of the fen-lands are productive, yet the expence of keeping them from inundation amounts to almoſt one-third of the rents, through the imperfect ſtate of the drainage. "It may ſeem paradoxical," ſays Mr. Maxwell, "that the fens of Huntingdonſhire, whoſe ſurface is comparatively high, ſhould be worſe drained than thoſe that lie between them and the ſea, the ſurface of which laſt is conſiderably lower; the natural ſuppoſition being, that water will inevitably fall from the higher to the lower level. But this is the caſe with all the fens that are upon the ſkirts of the high land, and proves only, that the general drainage was executed upon principles fundamentally wrong. The fact is, that there was not a proper outfal to the ſea, at the time of the general undertaking to drain the fens, nearly a century and a half ago; and ingenious men employed themſelves not in obtaining an outfal, as they ought to have done, but in conſtructing large drains, and high banks, within the boundaries of the fens, expecting the water would force its own paſſage, in ſpite of every impediment; though the diſtance between the fens and the ſea was from ten to fifteen miles. This not proving to be the caſe, ingenuity was ſet to work, to invent engines for the purpoſe of throwing the water out of the lands into the internal rivers. Still it did not find its way to the ſea, but overtopped the banks, or broke them down with the weight of its preſſure; even to this moment, inſtead of reſorting to the outfal, the engines have been increaſed in ſize, and the banks raiſed ſtill higher, ſo that the water, which, if there had been an outfal, would have found its way to the ſea, and left to itſelf, would have reſted on the loweſt of the land, has been forced in a retrograde motion, over the ſurface of the higher lands; and hence the deplorable ſtate of the fens in Huntingdonſhire." The ſkirty lands are thoſe which border on the fens, and partake of the properties of moor, combined with whatever ſoil, whether clay, gravel, or loam, that may be prevalent in the adjacent uplands. Theſe lands, in general, afford luxuriant grazing. The meadow lands, which are the next in order on the ſcale of elevation, conſiſt of about twelve or fourteen hundred acres, bordering on the rivers Nene and Ouſe, but chiefly on the latter. Theſe are extremely productive, but the produce is frequently damaged by the floods, and the crops ſometimes totally carried away; this chiefly happens along the banks of the Ouſe from St. Neots to Erith; and the numerous water-mills which are placed upon this ſtream increaſe the riſk of damage. The ſoils in the upland parts of the county are various, but principally conſiſt of a ſtrong deep clay, more or leſs intermingled with loam, or of a deep gravelly ſoil, with loam. Of what are called the deep-ſtapled lands, great part is ſtill in an open field ſtate, where each particular occupier is neceſſarily obliged to purſue whatever courſe of tillage is practiſed by the pariſh at large. The woodlands are but of inconſiderable extent; and the country is thin of timber: this is attributed to the very great demand for it in the fens; and the underwood is ſold at a higher price by the pole, than in moſt other countries. The high roads are in general pretty good; the croſs roads are but indifferent; and in the winter ſeaſon many of them become impaſſable. No manufactures of note are carried on in this county, nor hardly any thing that bears reference to them, except wool-ſtapling and ſpinning yarn: the latter is the chief buſineſs of the women and children in the winter ſeaſon; in ſummer they ſeek a more profitable employ in the fields.

Rivers.—The principal rivers connected with Huntingdonſhire, are the Ouſe, and the Nene or Nen. The Ouſe enters the county from Bedfordſhire, and in its courſe towards Huntingdon is increaſed by a combination of ſmall ſtreams: having paſſed that town, it becomes the boundary between this county and Cambridgeſhire, till it enters the Great Level of Fens near Erith: this river is navigable along its whole line acroſs the county. The Nene riſes in Northamptonſhire, and flowing through a delightful vale, reaches Huntingdonſhire near Elton, where it becomes the boundary between both counties: afterwards winding to the eaſt, it purſues a devious courſe to Peterborough, below which it ſinks into the Fens, and paſſes onward to the ſea. Some ſmaller ſtreams water the north-eaſt ſide of this county; together with ſeveral large *meres*, or pools of water; namely, Whittleſea Mere, Ramſey Mere, Ugg Mere, &c.: of theſe, Whittleſea Mere is by far the largeſt, and covers an area of ſeveral miles in extent: it affords excellent ſailing and fiſhing, and is in the ſummer ſeaſon much frequented by parties of pleaſure. Moſt of the meres are viſited by abundance of wild-fowl. Maxwell's General View of the Agriculture of Huntingdonſhire. Beauties of England. vol. vii.

HUNTINGTON, ROBERT, in *Biography*, an Engliſh divine, was born at Deerhurſt, in Glouceſterſhire, in 1636, and educated at Briſtol, from whence he was removed to Merton college, Oxford, of which he became fellow. In 1662-3, he was admitted to the degree of M. A.; after this he applied himſelf moſt diligently to the ſtudy of divinity and the Oriental languages. In 1670 he was appointed chaplain to the factory of Aleppo, where he improved himſelf in the Oriental languages, and collected many curious manuſcripts. Having carefully viſited almoſt the whole of Galilee and Samaria, and examined the opinions, cuſtoms, and religious books, he went to Jeruſalem, from thence he embarked for Cyprus, for the purpoſe of examining the library of Hilarion Cigala, the primate of the iſland, but on his arrival at Cyprus he found the prelate had been obliged to ſeek his ſafety from the Turks in flight. In the following year he undertook the difficult journey of 150 miles to view the ruins of Palmyra, which he was prevented from examining, and was himſelf in conſiderable danger of his life from two Arab chiefs, who had taken poſſeſſion of that diſtrict. He next went to Egypt, and continued during his whole reſidence in the Eaſt to improve himſelf, and benefit his country and the world, by reſcuing from oblivion curious copies of the Goſpels, and other books relating to polite literature. In the year 1682 he ſet out on his return home, and viſited in his journey Rome, Naples, and other moſt conſiderable places in Italy. From Italy he went to Paris, thence he arrived ſafe in England, and was, almoſt immediately after his return, raiſed to the degree of D. D., and at the ſame time appointed maſter of Trinity college, Dublin. This promotion he very much diſliked, regarding it as a kind of baniſhment: but he was perſuaded by his friends to undertake the duties attaching to the office, which he performed very much to the benefit of the inſtitution, and to the intereſts of literature in general. In 1691 he returned to England, reſigned his maſterſhip, and reſolved never more to quit his country. He made a preſent to the Bodleian library of many valuable MSS., the curators of which purchaſed his others, to the number of about 600, for the ſum of 700*l*. In the following year he was preſented to the rectory of Great Hallingbury, in Eſſex. About the ſame time he was offered the biſhopric of Kilmore and Ardagh, in Ireland, which he refuſed: but in 1701, notwithſtanding his former determinations, he accepted the biſhopric of Raphœ, in that kingdom. He ſurvived his conſecration but a few days, and died in the forty-ſixth year of his age. Some of his obſervations are in Ray's Collection of Voyages and Travels; and in the Philoſophical Tranſactions he gave an "Account of the Porphyry Pillars of Egypt." Biog. Brit.

HUNTINGTON, in *Geography*, a poſt-town in Chittenden county, Vermont, on the S. ſide of Onion river, 15 miles S. E. of Burlington, containing 405 inhabitants.

HUNTLY, is a conſiderable town and pariſh in Aberdeenſhire, Scotland, ſituated on the point of land formed by the confluence of the rivers Bogie and Deveron. The former conſiſts of two large ſtreets, which croſs each other at right angles, and form a ſpacious ſquare, in which the markets are held. The town has greatly increaſed in population and active trade within the laſt ſixty years: in the year 1792, here were fifty-two flax-dreſſers, whoſe manufactures, at an average, amounted to 16,224*l.* annually, and 209 weavers, whoſe labours produced yearly 73,150 yards of cloth. The return to parliament, in 1801, ſtated the number of houſes to be 498; of inhabitants 2863. Three fairs are held annually. Near the town, on the banks of the Deveron, is the elegant reſidence of the marquis of Huntly, eldeſt ſon of the duke of Gordon: and adjoining to Deveron bridge ſtand the ruins of Huntly caſtle, the magnificent manſion of that ancient family, built in 1602 by George, firſt marquis of Huntly. The pariſh of Huntly is about ſix miles in length and four in breadth; and was formed, in 1727, by uniting the two ancient pariſhes of Dumbenan and Kinore. Sinclair's Statiſtical Account of Scotland, vol. xi.

HUNTORP, a town of Germany, in the county of Oldenburg; 9 miles N. E. of Oldenburg.

HUNT's Bay, a bay on the S. coaſt of Jamaica. N. lat. 17° 52′. W. long. 79° 49′.

Hunt's *Town*, the ſeat of juſtice in Jefferſon county, Miſſiſippi territory, ſituated on an elevated plain, near the middle fork of Cole's creek, about 25 miles N. from the town of Natchez, about 10 miles from the confluence of Cole's creek with the Miſſiſippi river. This town is in the midſt of a healthy and fertile country, ſettled by induſtrious and wealthy inhabitants. An elegant court-houſe, gaol, ſeveral ſtore and dwelling houſes have been built in this place.

HUNTSBURG, a poſt-town of America, in Franklin county, Vermont, ſituated on the Canada line, and containing 280 inhabitants.

HUNTSMAN, a perſon whoſe buſineſs it is to ſuperintend every department of a hunting eſtabliſhment, as well as to conduct a pack of hounds with ſkill and ſucceſs in the field. According to the deſcription given of ſuch a perſon by Mr. Beckford, he ſhould be ſtrong, active, ſenſible, good-tempered, fond of the diverſion of hunting, and indefatigable in the purſuit of it. He ſhould alſo be ſober, exact, civil, and cleanly; he ſhould be a good groom, and an excellent horſeman; his voice ſhould be clear and ſtrong; and he ſhould have an eye ſo quick as to perceive which hound carries the ſcent, when all are running, and an ear ſo excellent, as always to diſtinguiſh the foremoſt hounds, when he does not ſee them; he ſhould be patient, quiet, and without conceit. Theſe excellencies, which conſtitute a good huntſman, he ſhould not be too fond of diſplaying, until occaſion calls them forth. Hounds ſhould be let alone while they can hunt; and the huntſman ſhould diſplay his talents in aſſiſting them, when they cannot. Subordinate to the huntſman is the "Whipper-in," who ſhould poſſeſs nearly the ſame qualities with the huntſman, to whom he ſhould be attentive and obedient. His ſtation in the field is on the ſide of the cover oppoſite to the huntſman, whoſe halloo he ſhould be near enough to hear, and ready to obey. More foxes, it is ſaid, will be killed with an excellent whipper-in and a moderate huntſman, than with the beſt of huntſmen without ſuch an aſſiſtant, becauſe hounds oftener need the one than the other.

HUNTSVILLE, in *Geography*, a poſt-town of America, in North Carolina; 16 miles from Rockford.

HUNYAD, a town of Tranſylvania, on a ſmall river, which runs into the Maros; 54 miles E. N. E. of Temeſvar. N. lat. 45° 51′. E. long. 22° 44′.

HUPPOOAH, a town of Bengal; 47 miles N. W. of Ramgur.

HURA, in *Botany*, a name of barbarous origin, but, contrary to his uſual practice, adopted by Linnæus. It appears to be the name of the tree in queſtion among the inhabitants of Guiana, not, as profeſſor Martyn reports, of Mexico, where it is ſaid, in Hernandez, to be diſtinguiſhed by the ſeſquipedalian appellation of *Quaubtlatlatzin*, which, it ſeems, means a *cracking tree*. Linn. Gen. 504. Schreb. 660. Willd. Sp. Pl. v. 4. 592. Mart. Mill. Dict. v. 2. Juſſ. 391. Lamarck. Illuſtr. t. 793. Claſs and order, *Monœcia Monadelphia*. Nat. Ord. *Euphorbiæ*, Juſſ.

Gen. Ch. Male, *Cal.* Catkin oblong, drooping, obtuſe, covered with ſeſſile florets; ſcales oblong, with a pair of very ſhort internal abrupt ones beſides. *Cor.* none. *Stam.* Filament cylindrical, rather longer than the ſcales, rigid, peltate, with two or three whorls of tubercles near the top; anthers two ſunk in each tubercle, oval, cloven.

Female, *Cal.* Perianth of one leaf, inferior, cylindrical, furrowed, abrupt, entire, cloſely enfolding the germen. *Cor.* none. *Piſt.* Germen roundiſh, within the calyx; ſtyle long, cylindrical; ſtigma large, peltate, convex, coloured, in twelve equal reflexed lobes. *Peric.* Capſule woody, orbicular, depreſſed with twelve furrows and twelve cells, each with two elaſtic, ſemi-lunar, pointed valves. *Seeds* ſolitary, orbicular, compreſſed, large.

Eſſ. Ch. Male, Catkin imbricated, with three ſcales to each floret. Corolla none. Stamen peltate at the top.

Female, Calyx cylindrical, entire. Corolla none. Stigma peltate, in twelve ſegments. Capſule of twelve cells, with two elaſtic valves to each. Seeds ſolitary.

1. H. *crepitans.* Sand-box tree. Linn. Sp. Pl. 1431. Hort. Cliff. 486. t. 34. Trew. Ehret t. 34, 35. f. 1.—Native of South America.—A *tree* of conſiderable height. The *leaves* are large, alternate, ſtalked, heart-ſhaped, ſerrated, rugged, rough. *Flowers* ſmall and inconſpicuous, except for their purple ſtigma, from the forks of the branches. *Fruit* large, often brought to Europe, and uſed as a ſand-box, but if ſuffered to hang too long before gathering, it will, in a dry warm room, explode with great violence and noiſe, like the ſound of a piſtol. The *ſeeds* are emetic and purgative.

HURCHUNCHUCK, in *Geography*, a town of Bengal; 25 miles E. S. E. of Boglipour.

HURCHUNDY, a town of Bengal; 10 miles S. of Chimary.

HURCHURNPOUR, a town of Bengal; 17 miles N. of Rajemal.

HURCOS, or Urcos, a town of Peru, in the dioceſe of Cuſco; 21 miles S. of Cuſco.

HURDAH, a town of Hindooſtan, in the Candeiſh country, on the S. of the Nerbuddah river; 22 miles S.S.E. of Hindia. N. lat. 22° 23′. E. long. 77° 19′ 45″.

HURDES, or Hards, *of flax* or *hemp*, the coarſer parts, ſeparated in the dreſſings from the tear or fine ſtuff. See Hemp and Flax.

HURDLE is the name of the ſledge uſed to draw traitors to the place of execution.

Hurdle, in *Agriculture*, the name of a light wooden frame, formed of ſmall bars, or otherwiſe, ſomewhat in appearance ſimilar to the low common field gate. It is principally employed for the purpoſe of conſtituting a ſort of moveable fence for incloſing and confining ſheep, and other kinds of live ſtock, during the time they are conſuming ſome ſort of rich green, or other luxuriant food. The uſual materials for the forming of hurdles are thoſe of ſome ſort of light ſplit wood, or hazel rods of rather young growth. In the former caſe they are commonly put together by means of framing or nailing, and in the latter by wattling the rods in between a ſort of ſmall ſtakes. Hence they are often denominated *framed* or *wattled* hurdles by way of diſtinction.

Beſides the above uſes, hurdles are neceſſary in folding ſheep on arable lands, and alſo in feeding off turnips, either by them or neat cattle, on the land, in order to keep them upon a certain ſpace of ground, and thus afford them a limited portion of food at a time, by which a conſiderable ſaving is effected in its being eaten up more cleanly and with leſs waſte, than would be the caſe if they ranged over the whole. And on the tillage lands the ſheep, by being ſo cloſely confined, contribute in a very high degree to its fertility and improvement.

It has been lately obſerved, that "in the grazing of a large field, for inſtance, when the ſheep or cattle are turned upon it early in the ſpring, they tread down and deſtroy a great deal of the graſs; and by dropping their dung and urine upon the remainder, injure it ſo much as to render it unpalatable to the ſtock. In this way a great proportion of the graſs is loſt in every field of conſiderable extent: whereas when the ſtock is firſt put upon the field, if hurdles or flakes were run acroſs a ſmall part of it, as is the caſe with turnips, and the grazing ſtock kept there till they had eaten the herbage clean up, they would then, from neceſſity, eat a great deal that is entirely loſt, when they are permitted to range over the whole field. In this way conſiderably more ſtock might be fed upon a given ſpace, than is done at preſent. It is to be obſerved, however, that the firſt ſpace divided off by the flakes ſhould be next the water, eſpecially if the field is grazed by black cattle or horſes, and that progreſſively, as the ſtock is removed from the watering place, a lane ſhould be left, by which the cattle may travel to the pond. It is alſo to be noticed, that after the firſt ſpace allowed to the grazing ſtock is eaten clean up, and as ſoon as they are ſhifted to a new place, a courſe of flakes ſhould be placed behind them, to prevent them from going backward upon the paſture that has been already eaten bare. By this management the whole of the herbage, upon every ſpace allotted to the ſtock, will not only be completely eaten up, but, by dividing or fencing off that part which has been eaten, the plants are allowed to recover; and, long before the whole field is gone over, the ſpace firſt eaten will be in a ſituation to receive the ſtock a ſecond time. By this method the dung and urine of the ſtock, inſtead of rendering the herbage nauſeous and unpalatable, and thereby preventing them from eating it, will, by its fertiliſing powers, aſſiſt its growth, and render it ſooner fit for being eaten a ſecond time, and by that means afford three or four crops in the ſpace of a year inſtead of one. Experience has ſufficiently evinced the great profit and advantage that attend the practice of teddering cattle or horſes upon good paſture, or of feeding them in the houſe with cut graſs. The benefit in both theſe caſes ariſes from the whole of the herbage being completely eaten up, without any part of it being loſt. The ſame benefit, but with infinitely leſs trouble, may be reaped from *hurdling* or *flaking* graſs fields: every poſſible advantage will be made of them in this way; and in very many inſtances it will happen, that before a half or two-thirds of the field are gone over by flaking, the part firſt eaten will be in a ſituation again to receive the ſtock. By that means a part of the field may be ſaved for hay; or, if the views of the occupier be of another kind, the number of the grazing ſtock may be increaſed in a proper degree."

The writer is "aware, however, that it may, and no doubt will be argued by many, that this management will be attended with much trouble and expence; and after all, that the profit reſulting therefrom will be but ſmall, and ſcarcely prove equivalent to the trouble and extra expence. From the acknowledged value of hurdling, however, in the conſumption of turnips, cabbages, &c., and the great profit which ariſes from giving the ſtock only a certain quantity of food at once, and withholding any more from them till that is eaten up, ſome idea may be formed of the vaſt advantage that would attend the flaking of a graſs-ſtock in different caſes. He by no means, however, wiſhes theſe obſervations to be underſtood as applying to graſs paſtures of every deſcription; quite the contrary, as there are many ſituations where the expence and trouble of flaking would prove more than an equivalent for any advantage that could be reaped from the practice. But upon all rich paſtures, the benefit ariſing from the practice of flaking will be found very conſiderable, and a ſingle experiment will be ſufficient to convince the moſt incredulous."

It is obvious that in parks, pleaſure-grounds, and other ornamented places, the eating of the graſs may be the moſt conveniently and economically accompliſhed by means of hurdles, as, in this way, the danger of injuring the trees and ſhrubs is moſt effectually prevented; and from the hurdles being capable of a ready removal, any portion can at pleaſure be eaten down in the moſt deſirable manner.

In regard to the expence of hurdles, thoſe of the framed kind are uſually from about 12*s.* to 18*s.* or 20*s.* the dozen, according to the manner of making them, and the nature of the wood employed. The wattled ſort are commonly much cheaper, being ſeldom higher than from 10*s.* to 12*s.* the dozen. A repreſentation of a framed hurdle is given in the plates on fences. See Fence.

It is found from actual trials, that a dozen and a half are ſufficient for folding thirty ſheep; and that about twelve dozen will anſwer the purpoſe for one thouſand in moſt caſes.

Hurdle, *lamb*, the title of another ſort of hurdle, conſtructed for the purpoſe of protecting and preſerving lambs ſoon after they have been dropped, and while they continue in a weakly ſtate. It is ſuggeſted in the ſurvey of Lincolnſhire, that "vigilance in the lambing ſeaſon prevents much of the danger in bad weather, but that in addition," a proviſion againſt the loſs of lambs in the ditches of the breeding paſtures, has there been made at a ſmall expence, by means of lamb-hurdles.

Theſe are conſtructed of two thin rails, with heads at the ends and proper braces; the ſpace between the rails being cloſed in by having tarpauling nailed ſecurely to each of the rails, &c. But it is hinted, that "as the tarpauling would require many nails, and as canvas is a dear article," the ſpace may perhaps "be better filled, by a ſlit deal held in its place by having braces on both ſides, one of which might be moveable, and fix with nuts on the rivets, by which means the board might be put in only occaſionally when wanted." This deſcription of hurdle is repreſented in the plates on fences. See Fence.

It is further noticed, that this hurdle, "when the lower rail touches the ground, is a perfect defence againſt the wind, and of a ſufficient height to prevent the lambs driving before a ſtorm into the ditches; ſo that it anſwers two good purpoſes." And that, "at other ſeaſons alſo, theſe hurdles may come into uſe for guarding the brows of banks againſt ſheep.

Hurdles, in *Fortification*, twigs of willows or oſiers, interwoven cloſe together, in the form of a long ſquare, five or ſix feet long, and three or three and a half broad, ſuſtained by ſtrong ſtakes, and uſually laden with earth. Hurdles, called alſo *clayes*, ſerve to render batteries firm, to conſolidate the paſſage over muddy ditches, and cover traverſes and lodgments, for the defence of the workmen againſt the artificial fires or ſtones that may be caſt upon them.

HURDLING, a term ſignifying the art or practice of dividing land by the uſe of hurdles, in the view of improving the grounds or conſuming the food with greater economy and advantage, by the confining of different ſorts of live ſtock, within certain limits. It is a highly beneficial method of management in a great number of inſtances. See Folding *of Sheep*, and Hurdle.

HURDS, in *Rural Economy*, a name given to the coarſer parts of flax and hemp, which in the dreſſing of them are ſeparated from thoſe of the fine ſtuff of either of ſuch matters.

HURDWAR, in *Geography*, a town of Hindooſtan, in the northern part of the country of Delhi, on the Himmaleh, near the W. coaſt of the Ganges, where it enters the plains of Hindooſtan, on the borders of Thibet; 86 miles N. of Delhi. N. lat. 29° 55′. E. long. 78° 23′. See Ganges.

HURDY-GURDY. See Monochord.

HURÉ, Charles, in *Biography*, an eminent French divine, was ſon of a labourer at Champigny-ſur-Yone, where he was born in the year 1639. As he ſhewed a ſtrong inclination for learning, his father cauſed him to have a good education, and obtained for him aſſiſtance from the archbiſhop of Sens, who gave him an exhibition in the college des Graſſins at Paris, where he diſtinguiſhed himſelf greatly among his contemporaries. Having completed his academical ſtudies he was admitted into holy orders, and appointed one of the preachers of his college. He was afterwards made profeſſor of the belles lettres; and at length became principal of the college of Boncourt, where he died in 1717, in the ſeventy-eighth year of his age. His principal works are, "A Dictionary of the Bible," in two volumes folio. "A Tranſlation of the New Teſtament into the French Language with Notes," and "A Sacred Grammar," intended to illuſtrate the New Teſtament. He was a man of great ſimplicity of manners, who united to much candour, ardent piety and a ſolid judgment. Moreri.

HUREEPOUR, in *Geography*, a town of Hindooſtan, in Lahore; 95 miles E.N.E. of Lahore. N. lat. 32° 5′. E. long. 75° 42′.

HURENHUTTERS, in *Eccleſiaſtical Hiſtory*. See Herrnhuters.

HURFWA, in *Geography*, a town of Sweden, in the province of Skone; 10 miles N.E. of Lund.

HURIEL, a town of France, in the department of the Allier, and chief place of a canton, in the diſtrict of Montluçon; ſix miles N.W. of it. The place contains 1628, and the canton 10,178 inhabitants, on a territory of 400 kiliometres, in 16 communes.

HURKUTTA, a town of Bengal; 40 miles S.S.E. of Curruckdeah.

HURLE Bone, in a horſe, is a bone near the middle of the buttock; very apt to go out of its ſockets with a ſlip or ſtrain.

HURLERS, a number of large ſtones, ſet in a kind of ſquare figure near St. Clare, in Cornwall, ſo called from an odd opinion held by the common people, that they are ſo many men petrified, or changed into ſtones, for profaning the ſabbath-day by hurling the ball, an exerciſe for which the people of that county have been always famous.

The hurlers are oblong, rude, and unhewed. Many authors ſuppoſe them to have been trophies erected in memory of ſome battle; others take them for boundaries to diſtinguiſh lands. Laſtly, others, with more probability, hold them to have been ſepulchral monuments.

HURLEY, in *Geography*, a townſhip of America; in Ulſter county, New York; containing 1159 inhabitants.

HURLOCK, in *Mining*, ſignifies the harder beds of chalk in the lower parts of the ſeries N. of Dunſtable, which is principally uſed for burning lime, for mortar-making in that diſtrict, for the uſe of lime in agriculture is there almoſt unknown. The hurlock is without layers of flints, and contains very minute grains of ſilex diſtributed through its maſs; ſome large cornu ammonias and others of an oval figure, according to Mr. Parkinſon, and other ſhells are found in it; the lower beds are moſtly ſiliceous, and they terminate below in the Totternhoe freeſtone, of which Woburn abbey, the Swan Inn at Bedford, and many other good houſes are built; this, at the foot of the North Downs, near Ryegate, Godſtone, &c. is a fire-ſtone; at the foot of the South Downs in a ſimilar ſituation it has not been diſcovered, becauſe not ſought after, we believe.

HURLY-BURLY, in *Vulgar Language*, denotes confuſion, or tumult, and is ſaid to owe its origin to two neighbouring families, Hurleigh and Burleigh, which filled their part of the kingdom with conteſt and violence. Johnſon.

HURON, in *Geography*, one of the five principal lakes of North America; lying between 43° 30′, and 47° 30′ N. lat. and between 80° 45′, and 84° 45′ W. long., and reckoned upwards of 1000 miles in circumference. The fiſh of this lake are ſimilar to thoſe of lake Superior, with which it communicates by the ſtraits of St. Mary, about 40 miles in length, and in ſome places only one or two miles in breadth, with a rapid towards the N.E. extremity, which may however be deſcended by canoes, and the proſpects are here delightful. Another ſhort ſtrait leads into the lake called Michigan, and it communicates with lake Erie on the S. It is of a triangular ſhape; and on the S.W. part is Saguinum or Sagana bay, 80 miles long and about 18 or 20 broad. The other moſt remarkable bay is Thunder bay. On the banks of the lake are found great quantities of ſand cherries. The land on the weſtern ſhore is much inferior in quality to that on lake Erie. It is mixed with ſand and ſmall ſtones, and is covered chiefly with pines, birch, and ſome oaks; but at a little diſtance from the lake the ſoil is very luxuriant. Some few years ago, a part of the Indian nations, called Chepaways and Ottaways, who inhabited round Sanguinum bay, and on the banks of the lake, could furniſh 200 warriors; and thoſe of the latter nation, who lived on the E. ſide of lake Michigan, 21 miles from Michillimackkinack, could furniſh 200 warriors. Thoſe who lived on the E. ſide were called Hurons.—Alſo, a ſmall river of the north-weſt territory, which, after a courſe of 38 miles, falls into lake St. Clair from the N.W.—Alſo, another ſmall river in the ſame territory, which runs north-eaſtward into lake Erie; 40 miles weſtward of Cayahoga, and 15 S.E. of the mouth of Sanduſky lake.

HUROUNG, a town of Bengal; 35 miles S.S.E. of Iſlamabad.

HURPEYA, a town of Hindooſtan, in Moultan; ſix miles N.W. of Shawanaz.

HURPLE, in *Rural Economy*, a term applied in many places to cattle, when they ſet up their backs in the cold ſevere winter ſeaſon.

HURPOIS, in *Geography*, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 63° 18′. E. long. 21° 34′.

HURRAI, a town of Hindooſtan, in Oude, on the left bank of the Ganges; 12 miles S. of Corah.

HURRERS, in our *Old Writers*. The cappers and hat-makers of London, formerly one company of the haberdaſhers, were called by this name.

HURRIAPOUR, in *Geography*, a town of Hindooſtan, in Bahar; 13 miles N. of Durbungah.

HURRICANE, a very violent wind, ſuch as to blow down trees, unroof houſes, and produce other deſtructive effects. Though hurricanes are obſerved occaſionally in moſt parts of the earth, it is in the torrid zone, and particularly in the Weſt Indies, where their devaſtations are more peculiarly obſerved. In Long's hiſtory of Jamaica, we find a chronological table of the moſt remarkable hurricanes which took place in the Weſt Indian iſlands for more than a century. The times and places are as follow:

	Hurricanes.	
	1670	at Barbadoes,
	1674	Do.
	1675	Do.
	1691	Antigua,
	1700	Barbadoes,
	1702	Do.
	1707	Caribbee iſlands in general,
	1712	Jamaica,
	1720	at Barbadoes,
	1722	Jamaica,
	1733	Caribbees in general,
	1744	Jamaica,
	1764	Martinico, Carthagena, and particularly at ſome of the Caribbee iſlands,
	1772	Moſt of the Caribbee iſlands,
To which may be added	1780	October 3d, Jamaica.

The one that happened Aug. 31, 1722, was very terrible and deſtructive, it extended 700 leagues or upwards.

Few people of ſcientific obſervation have had opportunities of marking the phenomena which attend theſe Weſt Indian hurricanes. A writer, giving an *Account of the European Settlements in America*, obſerves, "It is in the rainy ſeaſon, principally in the month of Auguſt, more rarely in July and September, that they are aſſaulted by hurricanes, the moſt terrible calamity to which they are ſubject from the climate. This deſtroys at one ſtroke the labour of many years, and fruſtrates the moſt exalted hopes of the planter, and often juſt at the moment when he thinks himſelf out of the reach of fortune. It is a ſudden and violent ſtorm of wind, rain, thunder, and lightning, attended with a furious ſwelling of the ſea, and ſometimes with an earthquake; in ſhort, with every circumſtance which the elements can aſſemble that is terrible and deſtructive. Firſt they ſee as a prelude to the enſuing havock, whole fields of ſugar-canes whirled into the air, and ſcattered over the face of the country. The ſtrongeſt trees of the foreſt are torn up by the roots and driven about like ſtubble. Their wind-mills are ſwept away in a moment. Their works, their fixtures, the ponderous copper-boilers and ſtills of ſeveral hundred weight, are wrenched from the ground and battered to pieces. Their houſes are no protection, the roofs are torn off at one blaſt, whilſt the rain, which in an hour riſes five feet, ruſhes in upon them with an irreſiſtible violence. There are ſigns which the Indians of theſe iſlands taught our planters, by which they can prognoſticate the approach of a hurricane. It comes on either in the quarters or at the full or change of the moon. If it will come on at the full moon, you being at the change, obſerve theſe ſigns. That day you will ſee the ſky very turbulent. You will obſerve the ſun more red than at other times. You will perceive a dead calm, and the hills clear of all thoſe clouds and miſts which uſually hover about them. In the clefts of the earth, and in the wells, you will hear a hollow rumbling ſound like the ruſhing of a great wind. At night the ſtars ſeem much larger than uſual, and ſurrounded with a ſort of burs. The north-weſt ſky has a black and menacing look, and the ſea emits a ſtrong ſmell and riſes into vaſt waves, often without any wind. The wind itſelf now forſakes its uſual ſteady eaſterly ſtream, and ſhifts about to the weſt, from whence it ſometimes blows with intermiſſions violently and irregularly for about two hours at a time. You have the ſame ſigns at the full of the moon. The moon itſelf is ſurrounded with a great bur, and ſometimes the ſun has the ſame appearance." Another author, Captain Langford, (ſee Philoſ. Tranſ. abridged, vol. ii. p. 105.) makes the following obſervations amongſt others: "It is to be obſerved, that all hurricanes begin from the N. to the weſtward, and on thoſe points that the eaſterly wind doth moſt violently blow, doth the hurricane blow moſt fiercely againſt it; for from the N.N.E. to the E S.E. the eaſterly wind bloweth freſheſt, ſo doth the W.N.W. to the S.S.W. in the hurricane blow moſt violent, and when it comes back to the S E. which is the common courſe of the trade-wind, then it ceaſeth of its violence and ſo breaks up.

Though hurricanes may be deemed extraordinary events, and therefore may be aſcribed to the operations of extraordinary cauſes, it is more probable that they ariſe principally from the ordinary cauſes of wind, which are the unequal temperature of the earth's ſurface in the different parallels of latitude, or rather of the incumbent atmoſphere, and the diurnal rotation of the earth; to which may be occaſionally added the precipitation of uncommon quantities of rain, accompanied with thunder and lightning. See Wind.

It has been the cuſtom of late times to aſſign electricity as the cauſe of every inexplicable phenomenon in meteorology. Not only hurricanes but winds in general have been referred to electricity as their cauſe; but it will be time enough to introduce this cauſe when the common principles of the mechanical philoſophy have been fairly applied and found inadequate to the explication.

Swiſſerland is ſubject to very violent hurricanes, which do great miſchief, and that in a very ſingular manner. Thunder and lightning are frequent with them in winter as well as in ſummer; and the more violent ſtorms of theſe are ſometimes attended with whirlwinds and hurricanes, which will raiſe the waters of ſome lakes in form of a thick pillar up to the clouds, and carrying on before the wind this vaſt body of water, will ſometimes fall on other places on dry land, and drown the houſes and gardens where it chances to fall.

HURRIERS, in *Mining*, are thoſe perſons employed in a coal-pit, who hurry or drag the corves of coals from the banks where they are dug to the bottom of the winding ſhaft to be drawn up.

HURRIES, in *Engineery*, is ſometimes applied, at Newcaſtle and other places, to the ſtrong ſtages of wood erected by the ſides of the navigable rivers and harbours, on to which the rail-ways are conducted from the coal-pits; by which means the load is at once emptied, by help of a ſpout, from the rail-way waggons into the holds of the ſhips. See Staith.

HURRY, in *Agriculture*, a term often applied in the ſouth-weſtern and other diſtricts of the kingdom, to a ſmall load of corn or hay.

HURRYAL, in *Geography*, a town of Bengal; 20 miles S.E. of Nattore. N. lat. 24° 18′. E. long. 89° 28′.

HURRYPOUR, a town of Hindooſtan, in Sanore; 17 miles S. of Ranny Bednore.

HURSALOO, a town of Hindooſtan, in the circar of Nagore; 12 miles W. of Catchwana.

HURST, or Hyrst, in our *Old Writers*, denotes a wood or grove of trees. Hence ſuch places as have this word for part of their names, have been ſituated near a wood. In Kent, Suſſex, and Hampſhire, there are many ſuch, becauſe formerly the great wood called Anderſwald extended itſelf through theſe counties.

HURTER, in *Artillery*, a flatted iron fixed againſt the body of an axle-tree, with ſtraps to take off the friction of the naves of wheels againſt the body.

Hurters, in *Fortification*, denote pieces of timber about ſix inches ſquare, placed at the lower end of the plat-form, next to the parapet, to prevent the wheels of the gun-carriages from damaging the parapet.

HURTS, in *Heraldry*, by ſome wrote *Heurts*, and by others *Huerts*, are azure or blue rundles.

The Engliſh heralds diſtinguiſh between the colours of rundles, and give them different names agreeable thereto: thoſe of other nations content themſelves to call thoſe *torteaux d'azure;* and in other caſes only add the reſpective colour to the term *torteaux*.

But theſe being blue, ſome will have them to ſignify bruiſes or contuſions in the fleſh, which often turn to that colour: others ſuppoſe them whortle berries.

HUS, or Hussu, in *Geography*, a town of European Turkey, in the province of Moldavia, the ſee of a Greek biſhop, ſituated on the Pruth; 70 miles S.W. of Bender. N. lat. 46° 35′. E. long. 28° 34′.

HUSACKER, one of the ſmall Shetland iſlands between Mainland and Yell. N. lat. 60° 48′. W. long. 1° 35′.

HUSBAND, Maritus, a man joined or contracted with a woman in marriage. See Coverture and Marriage. See alſo Divorce, Dower, Feme-*Covert*, &c.

Husband *Land*, a term uſed in Scotland for a portion of land containing ſix acres (= 7.624464 Engliſh ſtatute acres) of ſock and ſcythe land; that is, of land that may be tilled with a plough, and mown with a ſcythe.

HUSBANDMAN, in *Agriculture*, the common name of the labourer or perſon who is engaged in the tillage and cultivation of the ſoil. It has been, in general, too much the practice to deſpiſe and depreſs the habits and talents of this moſt valuable claſs of ſociety; as by ſuch means the neceſſary ardour and ſpirit of exertion are much abated, and the improvement of huſbandry greatly retarded.

The ingenious author of the "Wealth of Nations" has drawn the following curious and intereſting compariſon between this ſort of labourer, and the artizan or mechanic. He ſays, that "not only the art of the farmer, the general direction of the operations of huſbandry, but many inferior branches of labour require much more ſkill and experience than the greater part of mechanic trades. The man who works upon braſs and iron works with inſtruments, and upon materials of which the temper is always the ſame, or very nearly the ſame: but the man who ploughs the ground with a team of horſes or oxen, works with inſtruments of which the health, ſtrength, and temper are very different upon different occaſions. The conditions of the materials which he works upon, too, are as variable as that of the inſtruments he works with, and both require to be managed with great judgment and diſcretion. The common ploughman, though generally regarded as the pattern of ſtupidity and ignorance, is ſeldom defective in his judgment and diſcretion: he is leſs accuſtomed, indeed, to ſocial intercourſe than the mechanic who lives in town. His voice and language are more uncouth and more difficult to be underſtood by thoſe who are not uſed to them. His underſtanding, however, being accuſtomed to conſider a greater variety of objects, is generally much ſuperior to that of the other, whoſe whole attention, from morning to night, is commonly occupied in performing one or two ſimple operations. How much the lower ranks of people in the country are really ſuperior to thoſe of the town is well known by every man, whom either buſineſs or curioſity have led to converſe much with both. In China and Hindooſtan, accordingly, both the rank and the wages of country labourers are ſaid to be ſuperior to thoſe of the greater part of artificers and manufacturers. They would probably be ſo every where, if corporation laws and the corporation ſpirit did not prevent it."

There can be no doubt of the vaſt utility and national advantage of promoting the ſpirit, and encouraging the exertions of the labourers in agriculture; as, however high the benefits of commerce may be eſtimated, it is only the raiſing of the neceſſary food for the ſupport of the population of a nation within itſelf, that can render it truly great, happy, and independent.

HUSBANDRY, a general name applied to the art, buſineſs, or employment of the farmer, or of thoſe engaged in the tillage and cultivation of the ſoil. There are various deſcriptions of huſbandry depending on the particular views of the cultivator, and the methods of management which are adopted.

Hence, in regard to tillage or arable lands, theſe are the *broad-caſt* and *drill-huſbandry*, and it is often further divided by the way of diſtinction into what are termed the *old* and *new* huſbandry; the former of which is ſuppoſed to be that which has been had recourſe to from the moſt early periods; and the latter that which has been ſaid to have been introduced and inculcated by the intelligent Mr. Tull and his followers. This laſt is likewiſe occaſionally diſtinguiſhed by the title of the *horſe-hoeing* huſbandry. But though this huſbandry be generally denominated *new* in this country, there is reaſon to believe that it is not ſo modern as has been commonly ſuppoſed, as it has been aſcertained that in many of the eaſtern nations, where very few, if any, changes in their agricultural practices have occurred for many ages, it is for moſt ſorts of crops the moſt uſual mode. See Husbandry, *Drill*.

It may be further noticed here, that the broad-caſt huſbandry is that kind of arable management in which the ſeed is thrown and diſperſed over the ground by a ſort of caſt of the hand, without much regard being paid to the regularity of the crop, or the means of its after-culture. Beſides, it was ſuppoſed by ſome farmers, that in this mode much leſs preparation of the land was neceſſary, but the contrary has been fully proved by later and more extenſive experience.

And the drill-huſbandry is that in which the grain or other kinds of crops are ſown, ſet, or put into the ſoil, in rows, drills, or trenches, at different diſtances, by tools and machines contrived for the purpoſe, in order to be cultivated afterwards with implements particularly ſuited to them. In this way the ſeed is put into the ſoil with much more regularity and exactneſs, both in reſpect to evenneſs and depth, as well as the after-culture performed with much greater correctneſs and attention by the uſe of proper hoes and horſe labour.

In caſes where neither of theſe modes is exactly followed, but there is a kind of mixture of them both; or where two ſorts of crops of different deſcriptions are cultivated together, in alternate rows, there is what has been frequently denominated *half-huſbandry*: and where the ground is cultivated alternately in tillage and graſs, there is that ſort which is uſually called *convertible* huſbandry by modern farmers.

There are alſo particular methods of cultivation adopted on extenſive tracts of ground in the ſtate of commonage, which afford what is frequently denominated *common-field* huſbandry.

With reſpect to lands in the ſtate of graſs, there are likewiſe *dairy*, *grazing*, and *graſs* huſbandry, according as the grounds are appropriated to the keeping of cows for milk, butter, or cheeſe, the feeding or fattening of different ſorts of live-ſtock, and the making of graſs into hay to be uſed as fodder.

The culture of particular ſorts of crops alſo gives riſe to different terms of this nature; hence there is *turnip*, *cabbage*, *carrot*, and *potatoe* huſbandry, &c.

In theſe different points of view, huſbandry, of courſe, compriſes the whole of the numerous operations, proceſſes, and modes of management which are neceſſary in the extenſive buſineſs of cultivation, either in regard to tillage or graſs, or the breeding, rearing, and keeping all ſorts of live ſtock of the domeſtic kinds.

It is ſufficiently evident, that very great improvements have been accompliſhed in the various branches of huſbandry within theſe few late years by the introduction of more correct and better modes of cropping and managing lands, as well as by the gradual influence and adoption of better and more ſuitable tools and machines for executing the buſineſs of the farmer.

A late writer has laid down the following comparative eſtimates of the difference in the advantage between an acre of land cultivated under the old plan of fallowing once in every three years, or two crops and a fallow, which is ſuppoſed not to *run* out or exhauſt the ground; and that of the more modern ſyſtem of alternating green, or ſmothering crops, with thoſe of the grain kind.

Old Syſtem of Huſbandry.

1ſt Year, Fallow.

	£.	s.	d.
Four ploughings and harrowings, at 6*s*. each	1	4	0
Twelve loads of manure, at 8*s*. per load	4	16	0

2d Year, Barley.

	£.	s.	d.
Ploughing, harrowing, and ſowing	0	6	6
Weeding the crop	0	0	6

3d Year, Beans.

	£.	s.	d.
Ploughing, harrowing, and ſowing	0	6	6
Weeding	0	0	6

4th Year, Fallow.

	£.	s.	d.
Ploughing three times, and harrowing, 6*s*. each time	0	18	0

5th Year, Wheat.

	£.	s.	d.
Ploughing and ſowing	0	6	0
Weeding	0	0	6
Carry over	7	18	6

6th Year, Oats.

	£.	s.	d.
Brought over	7	18	6
Ploughing and ſowing	0	6	6
Weeding	0	0	6
	8	5	6

New Syſtem of Huſbandry.

1ſt Year, Turnips.

	£.	s.	d.
Ploughing an inch and a half deep	0	4	0
Harrowing, raking, rolling, &c.	0	3	6
Ploughing twice, harrowing, raking, &c.	0	13	0
Leading off refuſe	0	1	0
Seed and ſowing	0	1	6
Making of drills	0	2	6
Three times ploughing the turnips, and hoeing	0	8	6
Six loads of manure, at 8*s*. per load	2	8	0

2d Year, Barley.

	£.	s.	d.
Ploughing and ſowing, harrowing, &c.	0	6	6
Weeding	0	0	3

3d Year, Beans or Peas.

	£.	s.	d.
Two ploughings, harrowings, raking, &c.	0	13	0
Drill-making	0	2	6
Four loads of manure, at 8*s*. per load	1	12	0
Three times plouging, to mould the peas and deſtroy the weeds	0	4	9
Leading off refuſe	0	1	0

4th Year, Wheat.

	£.	s.	d.
Scarifying	0	2	6
Ploughing, ſowing, &c.	0	6	0
Weeding	0	0	3

5th Year, Clover.

6th Year, Wheat.

	£.	s.	d.
Ploughing and ſowing	0	6	6
Weeding	0	0	3
	7	17	6
Balance in favour of the new ſyſtem	0	8	0
	8	5	6

Hence it would appear that the expences of the new method of huſbandry are not only leſs by eight ſhillings the acre than thoſe of the old the firſt ſix years, but will ſomewhat decreaſe in the next ſix, except in manure, which will be more, as in the new mode the reſervoir and five crops of ſtraw will, it is ſuppoſed, produce nearly double the quantity. Beſides, in the firſt way, the manure is all raiſed from the produce of the land it is laid on: but to make the twelve loads, the old farmer robs the meadow, or any piece of freſh land he is permitted to plough up. This is ſuppoſed the principal cauſe why ſo many tenants are reſtricted from ploughing old ſwards, as they do not return the manure to its proper ſituation, or lay it on in ſuch a manner as is proper.

In all theſe eſtimates it is ſuppoſed that every acre of ſtraw, where the crop is a good one, is capable of affording two loads of manure; conſequently, by the old plan, even admitting the crop to be good, which is often not the caſe, there would be only eight loads of manure raiſed in ſix years; but, by the new, 10 loads, even without the aſſiſtance of the reſervoir; and in the following ſix years, where the new ſyſtem is purſued, 14 loads may be expected. In theſe ſtatements the manure is charged as an expence, which is not right, where it is not purchaſed but raiſed on the ground.

If theſe calculations can be depended upon, there can be no doubt of the great ſuperiority of the green-crop practice over that of the fallow method.

Other ſtatements, by the ſame writer, on the differences of theſe different ſyſtems of management, on farms of different kinds, render the matter ſtill more obvious.

I. *Tillage Farm-extent* 139 *Acres.—It is ſituated in a northern county, that of York.*

Old Method of Huſbandry.

Dr. to Expences.

	£.	s.	d.

Profit brought from account of 10 acres managed according to the new ſyſtem, as ſeen below	80	0	0
	932	0	0
Profit	452	10	0

It is imagined that the whole of the houſes, barns, buildings, and fences of the farm may occupy nine acres, which will leave 10 acres for the keep of the cows, horſes, &c. To anſwer which purpoſe they are adviſed to be cropped in this way: three acres and a half with winter tares; two and a half with ſummer cabbages, and potatoes under them; and the four that remain with ſpring tares, or a part of them with buck-wheat. Theſe 10 acres are to ſupply the place of the 59½ allowed for the ſame uſe under the old plan, conſtantly ſuppoſing the farm buildings to occupy the quantity above ſtated. Theſe 10 acres muſt neceſſarily coſt ſomething in cultivating; but when well managed, they will, it is ſuppoſed, keep 40 head of neat cattle and horſes in ſummer with cut ſtraw; and the farmer will thereby have 120 acres of ſtraw, clover, &c. where he had, under the old mode, only 59½; beſides, the crops will be much more bulky, and the quantity of manure conſtantly increaſe by the keeping ſo many cattle, horſes and pigs, in the yards, ſummer and winter; and as the food that is adviſed is too rich for breeding ſtock where ſix cows are kept, as already noticed, 26 feeding beaſts will be alſo wanted, which may afford an average profit of five guineas each, though more may be produced; as two returns may be made. But as theſe profits may be doubted by ſome, they are explained more fully by a debtor and creditor account; and the 10 are ſuppoſed to be ſet with potatoes at firſt, to clean and prepare the land for the tares, &c. carrying the profit on them to the general account, as being part of the crop of the firſt year of the improved huſbandry.

Under Potatoes 10 *Acres.*

It is ſuppoſed that in this caſe the potatoe crop is ſold upon the land, as it is not eaſy to eſtimate the expences when the potatoes are diſpoſed of at the market, or double the ſum ſtated would be made of them; as 100 ſacks, at 3*s.* each, would afford 15*l.* the acre, or 150*l.* in the whole; but if they were properly cultivated there would be 150 ſacks to the acre.

By the profit of 32 beaſts, at an average of 5*l.* 5*s.* per beaſt - - - - - -	168	0	0
Profit by this mode - - - - -	140	1	6

It is noticed that this return of profit ſeems great, but ariſes from the vaſt ſupply of food that is afforded by the 10 acres of land under tares and rye, when combined with cut ſtraw in the keeping of live ſtock. As 10 horſes have been found capable of being kept thirteen months on ſix acres of wheat-ſcouge, and the ſame extent of oats, it may be readily conceived that 10 acres of green fodder, in connection with the ſame number in wheat for ſtraw, will keep 40 head of neat cattle and horſes for the ſummer; conſequently, 40 acres of wheat ſtraw, 20 acres of clover twice mown, 20 acres of barley-ſtraw, and 20 acres of pea-ſtraw, in combination with 20 acres of turnips, will keep with facility 32 head of beaſts, and eight horſes, through the winter ſeaſon. It is evident, therefore, that the produce of the ten acres in green food, in connection with the ſtraw and clover of the other portions, will, under proper management, accompliſh what has been ſtated.

It may be added, that cabbages of the early kind will be ready to cut early in June, and may be kept in uſe all the ſummer, as, before one portion is cut over, the ſprouts of another will be in a ſtate to cut again. Theſe cabbages ſhould be given to ſuch beaſts as are the neareſt ready for the market. As ſoon as the winter tares and rye have been conſumed, Savoy cabbages ſhould be put in the land. The tares will be mown in ſummer, and the cabbages will ſerve the cattle in winter, and be ſoon enough off the ground to ſow it with tares in the ſpring. The land where the ſpring-cabbages have grown ſhould be ſown with winter-tares, in the drill method, in the autumn, uſing from four to ſix loads of dung to the acre for each crop. In the manner of the garden, therefore, theſe 10 acres are to be conſtantly covered with crops, for the uſe of neat cattle and other ſorts of live ſtock.

Though 20 acres have been put down for turnips, to be employed in feeding neat cattle in the yard, the whole will not by any means be wanted, ſo that one-half, or perhaps more, may often be converted to the uſe of the ſheep, and in that way a profit be afforded, which has not been taken into the account. Beſides, the quantity of manure ſtated under the improved huſbandry is ſuppoſed much leſs than will be produced.

But allowing, under the improved practice, an additional man and boy to look after the live ſtock, the former, at the expence of 12*s.* a-week, and the latter at 6*s.* per week; rejecting the fractional parts, and taking 52 weeks for the year, there will be 46*l.* 16*s.* to deduct, which will leave the balance of 405*l.* 14*s.* Thus the profit by the old method being 130*l.* 8*s.* 6*d.* which, taken from the 405*l.* 14*s.* leaves the net balance of profit in favour of the improved huſbandry to be 275*l.* 5*s.* 6*d.*

On the old plan, the profit of a horſe in two years was eſtimated at 16*l.* which, taken for one year only, or one half, is 8*l.* and for pigs 5*l.* as already ſtated, which ſums, added to 275*l.* 5*s.* 6*d.* make, in the whole, 288*l.* 5*s.* 6*d.*; and the 80*l.* for the potatoes being only brought to the account, though the net profit from the 10 acres, in green crops, is 140*l.* 1*s.* 6*d.* the aggregate ſum will be 348*l.* 7*s.* which ſeems a large amount.

But, in this improved management in tillage and live ſtock, manure is raiſed of ſo much better quality, in ſuch plenty, and at ſo much cheaper a rate, than by purchaſing it, as is the general cuſtom of the vicinity of the farm, that it is hardly worth fetching from the large towns; and as it is the very ſoul of huſbandry, every crop will be raiſed in far greater abundance.

It is however remarked, in concluſion, that there are different advantages, in regard to ſituation, that attend this farm, which, from their local nature, will not apply to thoſe afterwards noticed. It may be ſuppoſed that the profit on the beaſts is laid too high; for though, when cattle are fed on graſs, the ſeaſon may poſſibly vary ſo much that double the quantity of ſtock may be carried at one time to what the ſame land is capable of at another; of courſe, as it is common to put on the ſame number of cattle every year, it may, in ſome dry periods, be much overloaded with ſtock, while in others, which are more moiſt, there may be a deficiency, under either of which circumſtances there muſt be loſs ſuſtained; but where food is provided in the way juſt ſtated, the green-crops moſtly become ſo forward before the dry weather occurs, that they are not injured by it, and the ſtock, where properly choſen, by the uſe of the fold or ſtall-feeding, with certainty becomes quickly fat. Every thing is in this mode daily regular, and the animals daily increaſe to the profit of their owners. Advantages are alſo afforded, in different ways, by the contiguity of markets, as in the ſale of, and jobbing in neat cattle, horſes, &c. and likewiſe in the ſtrength of the teams that may be neceſſary.

It may be noticed, that, in theſe eſtimates, it is ſuppoſed that all the ploughing, ſowing, and leading ſhould be had and paid for. As the accounts are drawn out, they of courſe incline much in favour of the old plan of huſbandry, as the expences are leſs in number than will be actually incurred in that way, being made for the purpoſe of exhibiting at one view the vaſt diſparity which is really found to exiſt in the practice of the two different modes on farms of a ſimilar deſcription. That the profits can be aſcertained with exactneſs is probably impoſſible, in conſequence of the great fluctuation of markets, by which no perſon can be exact in the eſtimates of the value of corn or cattle for the ſpace of ſix months together. The expences have, however, been conſtantly eſtimated at a higher rate than it is known they can be done for, that the old method of huſbandry might not be ſuppoſed to be unfairly dealt with.

Theſe eſtimates of profits, whether they reſt upon the baſis of experience or not, ſufficiently point out, that vaſt benefits may be drawn from the culture of green and other cattle crops, and the converſion of them to the feeding and fattening of various kinds of domeſtic animals.

II. *A Mixed or Grazing, Breeding, and Tillage-Farm.*

Extent 314 *Acres.—It is ſituated in the county of Lincoln.*

The eſtimates here diſplay the benefits of different modes of management, where ſeveral kinds of huſbandry are carried on in combination.

At preſent part of the farm is divided into four diviſions for the plough, each diviſion conſiſting of twenty-four acres. And there is an additional diviſion of the ſame land, compriſing ſixteen acres, and about fourteen acres of clay land, which is alſo under the plough. The four large diviſions, and that of ſixteen acres, are on a lime-ſtone ſoil, but the remainder on clay, and liable to rot ſheep. Theſe together make 126 acres, all under the plough on the old plan. There is of courſe remaining 188 acres, which are wholly in graſs, and converted to the purpoſe of raiſing 140 lambs, or tupping 140 ewes, the hog ſheep being ſold off in the ſpring, and the drape ewes at Michaelmas, and the ſupport ing of twelve horſes and thirty head of beaſts. The manner of cropping is that of the old method, of turnips, barley, clover, and wheat, which perhaps is as good as any, the farm being converted to the breeding of ſheep, which is highly lucrative.

The expences and produce are thus ſtated.

Annual Mode of Huſbandry, under the old Syſtem.

This management is explained in this way.

100	Acres of graſs, three ſheep to every two acres	150 *ſheep*
10	Ditto, for feeding beaſts, and a few tups	4 *tups*
72	ditto, for ploughing (in three plats) as before deſcribed: with	
24	Ditto, ſown with graſſes to keep ſheep upon, five to an acre	120 *ſheep*
		274
84	Ditto clay ſoil, under rotation of crops	
16	Ditto of ſaintfoin for hay	
8	Ditto of meadow to cut green, for the purpoſe of ſoiling horſes in the fold or ſtable:	
314	Acres.	

which is conceived the moſt beneficial mode of keeping them, and beyond compariſon preferable to letting them run over the graſs, if it were only for the advantage of the manure, which is extremely valuable to the land.

It is hinted, that on ſuch a farm, at leaſt forty head of neat cattle and horſes ſhould be kept, winter and ſummer, in the yards and ſtable, but twice that number might be had; which, by the uſe of the green food, would furniſh a vaſt ſupply of good manure, far better than ſuch as is raiſed in the uſual way during the winter ſeaſon. And by blending the ſtraw with the green fodder, it may be eaten up with much more profit than in the uſual way; while the ſtock are kept in far better condition.

It is believed that the evil of the land rotting ſheep ſtock is remedied by the converſion of the eighty-four acres of clay land into tillage, and the cuſtom of eating off the ſeeds, ſaintfoin, ediſh, &c. The horſes may be ſoiled in the ſtalls and yards, to avoid the injury of poaching, and thereby moſt of them be kept up.

And as the ſtock of ſheep is increaſed by ſeventy, provided the ſtatement be accurate, in the place of ſelling the hog-ſheep, they may be kept for wedders. However, if danger from rot be apprehended, the cattle ſtock may be augmented, and be probably as profitable; the old number of ſheep (200) being only retained to clip; the ſeeds on the twenty-four acres, part of the ninety-ſix eſtimated to keep five ſheep per acre, by being ſown with graſs ſeeds, in the ſpring, being eaten by the proportion of four ſheep to the acre: but ſuppoſe the number to be a hundred, as fifty of the laſt ſheeder hogs, and the ſame quantity of ſhearling ewes, there only remain then a hundred ſheep for one hundred acres of graſs-land, and of courſe there muſt be the means of keeping a number of beaſts in addition, or of having ſome portion of the land under meadow.

And in the common cuſtom of ſelling off the drape-ewes by removing the lambs from them early in June, or the ſucceeding month, it is ſuppoſed the ewes may have ſufficient time to become fat before the ſetting in of the winter, and be ſold; and the ſixteen acres of ſaintfoin-ediſh being ſuppoſed to inſure a profit on the ſheep greater than that uſually obtained. Farther, that the lambs, by being put to the ſaintfoin, would be preſerved ſound, while the ewes were in a fattening ſtate.

Farm conſiſting of Open Tillage-land.

Extent ſeveral Hundred Acres.—It is ſituated in the north-riding of Yorkſhire, and managed on the old plan adopted in many parts of that diſtrict as the moſt beneficial.

The courſe of huſbandry purſued is one fallow and two crops, in this way.

Profit of one acre of land for ſix years	17	6	9

On theſe data it is concluded that under the old plan of management, the farmer obtains only 1*l.* 9*s.* 3*d.* profit per acre from his land in ſix years, or 4*s.* 10½*d.* per acre per annum. And the expence of labour is ſaid to be ſtated higher than it really is, or he could not ſupport his family and pay his rent: while under the improved huſbandry, in the ſame length of time, the profit is 17*l.* 6*s.* 9*d.* which is 2*l.* 17*s.* 9½*d.* per acre per annum, or more than 100 per cent. in its favour.

It is ſtated, that in this farm there is an open paſture, that is let at 2*s.* 6*d.* the acre, and the tenants conſider it of no uſe to them: but under proper management, it is ſuppoſed, that 5*l.* per acre of profit might be annually derived from it. Of courſe, the tenant may well be ſurpriſed at being charged a new rent of 1*l.* 8*s.* the acre, though he now pays only 15*s.* and is ſuppoſed highly rented according to his plan of management.

It is eſtimated, that the loſs ſuſtained at this rate on two thouſand acres, is 29,625*l.* in ſix years. If that number of acres were let at 1*l.* 8*s.* the acre yearly, there would be an advance of 13*s.* the acre, which would raiſe the ſum of 7000*l.* more for the tenants to pay in ſix years. And that ſum taken from 29,625*l.* would ſtill leave them a profit of 21,825*l.*

Though theſe eſtimates may appear extraordinary to thoſe not converſant with the buſineſs, they are founded in truth; and by purſuing proper courſes, ſuch profits as have been ſtated may be afforded to the landlord, as well as the tenant, independent of the benefit of green food during the ſummer. By a ſuperiority of management in this way, the farmers in Eaſt Lothian are enabled to pay three or four pounds the acre. And if a perſon who lives by garden culture were to dig his ground one year in three, and that year raiſe no crop, he would be ſuppoſed a madman. Yet the two crops and a fallow are worſe, as the land in this way is robbed of one-third of its manure. This may, indeed, be ſuppoſed to open the eyes of the landlord, but it is alſo much to the benefit of the tenant.

Theſe facts and ſtatements fully diſplay the vaſt benefits and improvements that are capable of being derived from the adoption of improved modes of huſbandry in all caſes where they can be admitted; though ſuch detailed ſtatements muſt neceſſarily have regard, in ſome degree, to the peculiar ſituations and other circumſtances of the farms and lands.

A Farm conducted under different Modes of Huſbandry.

In the view of diſplaying more fully the benefits of different modes of managing land, comparative ſtatements of the profits reſulting from a farm of four hundred acres employed under different modes of huſbandry, in different circumſtances, are given:

1ſt. *In the grazing ſyſtem.*
2d. — *the dairy practice.*
3d. — *the hay-ſelling cuſtom.*
4th. — *the tillage plan, near a large town.*
5th. — *the tillage plan more diſtantly ſituated.*
6th. — *the tillage plan with improved courſe of crops.*

Having noticed, that it is not rent that cauſes the poverty or riches of the farmer, but the difference in his mode of managing it, or the method of huſbandry purſued, as a good plan of management improves land, eſpecially under tillage in the moſt expeditious way of any; ſome eſtimates are given which clearly point out the great ſuperiority of the tillage plan over any other that is had recourſe to on the ſame ground in the way of a farm. In this caſe the rent is 50*s.* the acre, and the land ſufficiently rich for affording profitable crops under judicious management.

I. *Under the grazing Syſtem of Huſbandry.*

The extent of grazing land in this caſe is ſtated to be 300 acres, ſeventy in meadow, and thirty in tillage. The live ſtock on 200 acres, 150 oxen, bought in at 25*l.* per head, and ſold off at 30*l.* each: and on the remaining 100 acres, 75 cows at 17*l.* each, 4 milch cows; 300 ewes bought in at 45*s.* each, and ſold off at 70*s*, to breed lambs for market; and 3 tups, at 5*l.* each. The lambs produced 400, ſold at 35*s.* each; the wool of the ewes 5lb. each fleece, and ſold at 40*s.* the tod. Eight horſes and ſix pigs. Theſe are thus ſtated:

II. *Under the Dairy Practice.*

In this caſe the farm is ſuppoſed to be principally in the ſtate of graſs, and employed in dairying; in which there are 220 acres in paſture, 150 in meadow, and 30 in tillage. The cow ſtock allowing 1½ acre to each, will be 140; with a bull or two, and ſix horſes. The profit on cows, in calves, butter, and milk for the uſe of the hogs, 15*l.* each. The ſheep ſtock, one ewe to the acre, on the paſture land, is 200 ewes bought in to breed lambs; the ewes and lambs to be made fat, and ſold off, freſh ſtock being purchaſed annually; the produce in lambs will be 250, ſelling at 35*s.* each; and the ewes will coſt 45*s.* each, which, when fat, will ſell for 70*s.* each; their wool, at 5lb. each fleece, will make 35 tods of 20lb., ſelling at 40*s.* the tod. The cows, if bought in at three years old, will coſt 17*l.* each, and after having three calves, ſell for 20*l.* each: conſequently in this way, there will be about thirty-five cows to be changed annually. One horſe will alſo be to be ſold yearly, and one bought in. The tillage part, the ſame as in the grazing farm; 10 acres of wheat, 10 acres of beans, and 10 acres in ſummer fallow. The whole of the ſtatement is thus made out.

IV. *Under Tillage near a large Town.*

The farm in this inſtance conſiſts of 264 acres of land in tillage, thirty-ſix in meadow, and the remainder in grazing ground. The ſtock is ſuppoſed to be 12 horſes for market work, and ſix for the purpoſes of tillage. The 100 acres of grazing land being ſtocked with oxen, at the rate of three to four acres; alſo ſix milch cows; and 100 ewes, one to the acre, to produce lambs; the produce about 125 lambs; conſequently freſh ſtock will be yearly wanted. The oxen ſhould be bought in, in the ſpring ſeaſon at about 25*l.* a piece, being ſold off at about 30*l.* The lambs, when fattened, will fetch about 35*s.* each. The ewes are purchaſed in at about 45*s.* each; and diſpoſed of at about 75*s.* each, being fattened on rape or turnips, ſown on the land from which the garden peas had been taken. And the hay from the thirty-ſix acres of meadow land can, it is ſuppoſed, from the ſituation of the farm, be ſent to market with more profit than by conſuming it; there being two loads to the acre; the eddiſh being eaten off by oxen and ſheep ſtock.

The expences of making the hay are noticed to be eſtimated at 10s. the acre only, as the quantity being only 36 acres, it may be done wholly by the farmer's family; but where the buſineſs is hired, 20s. are as little as can be charged.

That part of the farm which is under tillage may be managed in ſuch a mode of cropping, as to produce 14 crops in the courſe of 11 years, ſomewhat in this way:—

Courſes of Crops.

1ſt. Year, Potatoes manured for with 12 loads of dung per acre.
2d. —— Wheat, limed with 30 buſhels, mixed with earth, per acre.
3d. —— Flax; rape being ſown after it is off, for feed.
4th. —— Rape for a crop, ſtraw burnt after it is taken off, for wheat.
5th. —— Wheat.
6th. —— Garden peas drilled, and manured with four loads of dung per acre, and turnips afterwards; eight loads of dung per acre broad-caſted, and drilled.
7th. —— Barley ſown with clover.
8th. —— Clover, manured with ſix loads of compoſt per acre.
9th. —— Wheat; limed with 30 buſhels, mixed with earth, per acre.
10th. —— Beans, manured with 12 loads of dung per acre, and hoed.
11th. —— Oats.

V. *Under the Tillage more diſtantly ſituated.*

This is ſimilar in all reſpects to the above, except in ſituation, which renders it neceſſary to conſume the hay and ſtraw upon the farm; conſequently the ſtatements demonſtrate the variations in value of different ſituations. It is ſuppoſed, as above, that 264 acres of the land are in tillage; 36 in meadow, and the remaining 100 in paſture. The laſt portion, ſtocked as before with 70 oxen; ewes, one to the acre, 100; theſe are ſuppoſed to afford 125 lambs, which are to be ſent to the market, and the ewes fattened on the rape after the peas. The profit on theſe articles is explained in account N° 2; the oxen 5*l.* each profit; the lambs 35*s.* each; the ewes bought in at 45*s.* and ſold off at 75*s.* being brought to the market in winter, when mutton is dear. Ten horſes only, as fewer will anſwer, there being only the corn to take to market; but more oxen ſhould be kept. Such as are bought in, in the ſummer, ſhould be fed on ſtraw in the winter; four or ſix being employed in carting dung, harveſt-work, &c. More pig-ſtock may likewiſe be kept; fifty being put in the yards. And as the clover hay is here to be eaten, the oxen ſhould have ſome in the ſpring in the yard, to forward them for fattening off in the paſtures. Conſequently there is no profit in the hay, only from the oxen. Six of the horſes to be annually ſold, and others bought in. The oxen ſhould be bought in, as there may be room in the ſummer; 88 being provided annually, and fattened, ſo as to have freſh ſtock every ſeaſon: 18 being fed out in winter, and 70 in the ſummer ſeaſon.

By a trifling miſtake in moſt of the above ſtatements, the houſe-keeping and expences have been put into one of the ſeparate accounts, inſtead of the general account, at the end of each farm; and in the ſame manner, the rent charged in account four, ſhould have been brought into account 5; but theſe are of little conſequence, as the ſums of *total profit* muſt have been the ſame.

The tillage-land in this caſe is under the ſame courſes as in the preceding farm.

Expence	796	2	11
Total profit	2737	15	4

It is ſhewn by theſe eſtimates, that the *annual* profit on *one acre* of land, under each of theſe different methods of huſbandry, is in the following ratio :

	£.	s.	d.
On grazing farm	0	6	6
— dairy-farm	0	14	6
— hay-farm	1	9	9
— tillage-farm, 1ſt ſituation	8	17	10
— tillage-farm, 2d ſituation	6	17	0

It is ſuppoſed, that in both the ſyſtems of management on the tillage-farm there are twelve horſes employed for the purpoſe of market-work, and bringing in return ſuch things as may be wanted ; and ſix of a lighter kind for the plough-teams, to be provided at leſs expence, and do more work in an equal portion of time.

And it is ſuggeſted, that by the improved manner of cropping employed there will never be more than twenty-four acres to manure at any one time, except at the wheat ſowing ſeaſon, and then even the quantity may be divided by that part of the land which has grown the potatoes being ſown firſt, at the time they are taken up. By pulling up all the tops, and depoſiting them in the farm yards as litter, they, as well as the earth that is carried with them, will be reſtored to the land. The ſmall potatoes ſhould be uſed for the pigs. And by ſowing the wheat immediately on the land cleared from the ſtems of the potatoes previous to their being ploughed up, an advantage is ſaid to be derived. But from the danger of froſt, no more of the tops ſhould be removed at a time than can be ploughed up during the day.

In following this method, the next ſowing of wheat will, it is ſuppoſed, be on the land that has grown rape for feed. It may likewiſe be ſown firſt, where the potatoes are not ready to be taken up. And the third time of ſowing wheat will be on the clover lay ; in which caſe there is plenty of time, as it may be done in winter, with nearly equal ſucceſs, as from September to January. This, however, is not the caſe with ſpring crops, as all thoſe of the grain kind ſhould be got in as ſpeedily as poſſible. But bean and pea crops may always be put in the ſoil a fortnight or three weeks previouſly to thoſe of the corn kind ; and it is noticed, that where the land is all prepared, and the teams taken off for the purpoſe, there will be nine pair of horſes, which will be capable of harrowing in the whole of theſe crops in three days. And the twenty-four acres of barley, and the twenty-four acres of wheat may be harrowed in the ſame ſpace of time. This is conſidered as one of the great benefits of large teams, as ſuch a great number being employed in carrying the produce, they are capable of being made uſe of for about twenty days in ſeed-time and harveſt, and, of courſe, to earn nearly what they coſt in keep in the whole of the year.

Other benefits are ſuppoſed to reſult from this ſcheme of cropping ; the harveſt labour is more divided ; the flax and pea crops are ready in July, afterwards the oats, then the wheat, and laſtly the beans. This, while it increaſes convenience, leſſens expence. The rape may be threſhed in the field, and ſold early in Auguſt, furniſhing money for the expences of the remaining harveſt. Beſides, there is hardly a month of the year, in which conſiderable returns of money are not coming in from one or other of the different operations. The flax may be ſold on the ground to pull in July by the purchaſer, which uſually affords from ſeven to nine guineas the acre, which, though apparently a ſmall ſum in compariſon with ſome other ſorts of crops, is ſtated as paying well for the time it occupies the ground ; which is only about three months, being ſown in April and pulled in July. By all theſe means the expences are diminiſhed, and of courſe larger profits afforded. In ſhort, theſe detailed accounts furniſh the cultivator with the means of judging of the moſt advantageous modes of employing his land in the view of profit. They ſeem to prove three of the methods of farming to be very indifferent concerns, tillage huſbandry having vaſtly the advantage over them ; and it is ſuppoſed that many further improvements are ſtill to be made in it ; for which various hints are thrown out, and different calculations introduced.

It muſt conſtantly be kept in mind that, in all the different ſchemes of huſbandry, the profits and benefits are to proceed, not only from the ſuperiority of the management that may be employed, but the nature of the ſituation in regard to the facility and cheapneſs of ſtocking the land, and the eaſe of cultivating it ; as in ſome places the expences of the former will not be more than from five to ſeven or eight pounds the acre; while, in others, it may be from ten to twelve or thirteen pounds the acre, as is the caſe in ſeveral parts of Eſſex; and conſequently the expences in the ſame proportions, though the variations in the markets for the diſpoſal of the produce may be but trifling.

It would be eaſy to introduce other calculations on arable, and farms of other kinds, where great improvements are to be effected by claying, chalking, marling, liming, &c.; but as they muſt invariably be regulated by the local nature of the different ſituations, they could be of but little utility in guiding the practice of the farmer.

It does not admit of a doubt, that huſbandry has been greatly improved in moſt of its different branches within theſe few late years in this country. Far better modes of cropping land, and of combining the feeding of cattle ſtock with arable management, have been introduced and adopted. More appropriate, cheap, and convenient tools for various purpoſes of tillage and other practices of farming have been invented; and moſt of the proceſſes and operations of the art rendered more ſimple and eaſily performed. Yet ſtill, if thoſe laws and regulations which repreſs the efforts of the cultivator were modified or removed; leaſes more generally and liberally granted, for moderate periods of time; and the diſſemination of uſeful information on rural buſineſs carefully attended to, the ſtate of cultivation would ſoon be advanced to a much higher degree of perfection than it has yet attained.

HUSBANDRY, *Broad-caſt.* See BROAD-CAST.

HUSBANDRY, *Drill*, that ſort in which the ſeed is depoſited in ſmall furrows, drills, or openings, in rows, at different diſtances, according to the nature and circumſtances of the ſoils and the crops by ſuitable machinery, and in which the after-culture is performed by the uſe of the horſe-hoe, or other tools of a ſimilar kind. See HOE, HOEING, and MACHINE *Drill.*

For the introduction and extenſion of this method of huſbandry in this country, we are principally indebted to Mr. Tull and his followers, who, in promoting it, ſeem to have conſidered it as altogether *new;* but this would appear from the account which has lately been publiſhed in the firſt volume of Communications to the Board of Agriculture, by Mr. Halcott, not to be the caſe, as it has been found to be the general practice in the Innacondah diſtrict in the Eaſt Indies, in the cultivation of all ſorts of grain, except thoſe of the horſe kind, as well as in the growth of hemp, tobacco, cotton, and even the caſtor oil plant. And it is aſſerted on good authority, that, in Arabia, China, and Japan, where the modes of huſbandry have not undergone any material change for thouſands of years, they not only drill, but dibble corn of every deſcription. It is of courſe probable, that the drill method of huſbandry is of conſiderable antiquity, and that it was brought to Europe from ſome of the eaſtern nations.

But though this method of huſbandry obviouſly poſſeſſes many advantages over that which is generally employed by farmers, it is far from being in general uſe in this kingdom; the reaſon of which is ſuppoſed to proceed from the difficulty of making common labourers acquainted with the nature of the practice; the incorrectneſs of the machinery that is made uſe of in delivering the ſeed, and the expence which is neceſſary for the firſt undertaking of the buſineſs. Other cauſes have likewiſe a tendency to impede its advancement, ſuch as the introduction of it on land that is not in a proper ſtate of preparation for its reception, either in regard to quality or the nature of the tillage, and the neglecting in ſome meaſure the after-culture of the crops, upon which ſo much of its ſucceſs depends. The attempting too great ſavings in the quantity of ſeed employed, by ſowing too thinly in the drills, as well as at too great diſtances between the rows, has alſo in many inſtances operated much againſt it.

The ſoils that are moſt proper for this ſort of huſbandry, are all thoſe of the more light and friable kinds, which are not ſo ſtrong, heavy, or wet, as to prevent the working of the machinery which is neceſſary in executing the buſineſs. It can ſcarcely ever be had recourſe to with much advantage; except for particular ſorts of crops, on the ſtiff, heavy, wet, clayey ſoils, as the work muſt conſtantly be liable to be performed in an incomplete manner; nor even in ſuch as are of a very ſtony quality, as thoſe obſtructions will conſtantly be apt to derange the operations of the machines, and thereby render the ſowing irregular and improper.

But whatever the nature or quality of the ſoil may be on which this ſort of huſbandry is attempted, it ſhould conſtantly be brought into a fine ſtate of tilth by repeated ploughing, and other modes of pulverization, before the crops are put into the ground.

In doing which it will alſo be neceſſary to ſuit them, and the proportion of ſeed to the nature and quality of the land, and the diſtance of the rows to their growths; as well as to preſerve a continued attention to their after-culture while on the ground.

In the practice of this mode of culture different diſtances in the rows and intervals have been adviſed, as diſadvantages muſt obviouſly proceed from their being either too narrow or too large; in the former little benefit being capable of being derived in the cultivation of the crops after they have been depoſited in the ſoil; while in the latter there will be great loſs ſuſtained in the over quantity of land that is taken up. It is probable, that in regard to diſtances, as well as the modes of drilling, much muſt conſtantly depend on the ſtate and quality of the land.

Upon dry light ſoils, whether of the loamy, gravelly, or chalky kinds, which can be conſtantly ploughed and preſerved on the flat, as is the caſe in Eaſt Kent, narrow diſtances are ſuppoſed the moſt proper. But where ridging up is required, they ſhould be ſomewhat wider. It was found by actual trials that drilling three rows eleven or twelve inches aſunder, on three bout ridges, generally ſucceeded in a perfect manner. In this way, the three bouts conſtitute a ridge about four and a half feet in breadth; the three rows as juſt mentioned occupying two feet, and the horſe-hoe going on the ſide of each outſide row, at the diſtance of three inches, leaves the ridge two and a half feet broad, and the intervals between them nearly two feet. But it has been ſuggeſted, that, in theſe caſes, as the outſide rows conſtantly afford the ſtrongeſt and moſt healthy plants, two rows only, on two-bout ridges, would be equally productive, and leave the ground in a better ſtate of tilth. However this may be, the very wide intervals of the more early drill practice are to be diſcarded as highly improper in all crops of the grain kind, not only in conſequence of the great loſs of ground that muſt neceſſarily be ſuſtained by ſuch wide intervals; but becauſe the ſpaces between the rows, when much narrower, can, in the improved mode of horſe-hoeing, be ſtirred with equal correctneſs and facility.

In practiſing this ſyſtem of huſbandry, it has been hinted by an experienced cultivator, that, with regard to wheat and barley, the diſtance of the rows ſhould greatly depend on the quality of the ſoil. In caſes where it is poor, the ſpaces between the rows ſhould not be more than about eight inches; where of a medium quality about nine inches, and where rich, not more than ten inches. The quantity of ſeed being made to vary in the ſame way, from about nine pecks to eight and ſeven. And the depth of depoſiting it from two inches and a half to two inches.

In the extenſive experience of the late Mr. Cloſe, nine inches was the diſtance that anſwered beſt for white corn crops. See Semination, and Sowing *of Grain.*

But for various ſorts of green crops, ſuch as thoſe of the potatoe, cabbage, rape, turnip, carrot, parſnip, bean, pea, tare, and other ſimilar kinds, much wider diſtances are required, as is ſufficiently ſhewn under the culture of theſe different deſcriptions of crops.

The great advantages of this method of huſbandry, are thoſe of its affording the means of diſtributing the ſeed with much greater correctneſs in regard to depth, as well as regularity in the rows, by which the growth of the crops is not only more uniform, but their after-culture capable of being more effectually executed, and at the ſame time ſome ſaving in ſeed effected. And as the ſeed grain in this way is neither too cloſely crowded together, nor too thinly ſcattered in the drills, there is leſs danger of injury in the weakneſs of the produce from the former cauſe, or of loſs from the too ſcanty number of ſtems in the latter, which is almoſt conſtantly the caſe in the common mode of management. Beſides, by the equality of the depth to which the ſeed is depoſited in this way, the crops become ripe in a more equal and uniform manner. Further benefits are likewiſe derived in different ways, by the frequent ſtirring and breaking down of the mould about the roots and ſtems of the plants, while the crops are upon the ground. By ſuch frequent turnings the ſoil becomes newly and fully aerated, in conſequence of which different nutritious matters are more abundantly formed and provided for the ſupport of the crops; and the earth at the ſame time rendered more eaſily penetrable by the ſuperficial roots of the grain, and its power of tillering increaſed by the mould being laid up to the joints of the ſtems, juſt above the ſurface of the land. There are alſo other ways in which benefit is derived in this mode of cultivation; as by the more effectual eradication of weeds that conſtantly takes place, the harveſting of the crops is more readily and certainly accompliſhed, and at leſs trouble and expence; while the land is left in a more mellow and fine ſtate for the production of future crops, as well as for the immediate putting in of ſucceeding ones. See Hoeing.

Husbandry, *Implements of,* the various ſorts of tools that become neceſſary in the cultivation and management of land, as thoſe of the tillage, dairy, and other kinds. See Implements *of Huſbandry.*

Husbandry, *Virgilian,* a term uſed by authors to expreſs that ſort of huſbandry, the precepts of which are ſo beautifully delivered in Virgil's Georgics. The huſbandry in England is Virgilian in general, as is ſeen by the method of paring and burning the ſurface, of raftering or croſs-ploughing, and of the care in deſtroying weeds upon the ſame principle, and by much the ſame means. In thoſe parts of England along the ſouthern coaſt, where the Romans principally inhabited, not only the practice, but the expreſſions are in many reſpects the ſame with thoſe of the ancient Romans, many of the terms uſed by the ploughmen being of Latin origin, and the ſame with thoſe uſed by thoſe people on the like occaſions. And on a ſtrict obſervation, more of Virgil's huſbandry is at this time practiſed in England than in Italy itſelf. This change in the Italian huſbandry is, however, much more to the credit of that people than the retaining the Virgilian ſcheme is to our's. Tull, who has eſtabliſhed a new method of huſbandry, obſerves that it is upon the whole ſo contradictory to this old plan, that it may be called the anti-Virgilian huſbandry; and adds, that no practice can be worſe than the Virgilian.

HUSBRECE, in our *Old Writers,* an offence now called burglary.

The word is Saxon, from *hus,* a *houſe,* and *brice,* a *breaking.* Blount, in voc.

HUSBY, in *Geography,* a town of Sweden, in Dalecarlia; nine miles N. of Hedemora.

HUSCANS, in our *Old Writers,* a ſort of boot or buſkin made of coarſe cloth, and worn over the ſtockings. We find them mentioned in the ſtat. 4 Edw. IV. cap. 7.

HUSET, in *Geography,* a town of Hungary; 24 miles E. of Munkacz.

HUSGABLE, Husgablum, in our *Old Writers,* denotes houſe-rents, or ſome tax or tribute laid upon houſes.

HUSHING, in *Mining,* is applied, in Cornwall, to a mode of diſcovering float and ſhoad tin, or alluvial collections of tin ore, by turning a ſtrong ſtream of water ſucceſſively over different parts of the ſurface, to waſh away all the vegetable ſoil and looſe earth. (William's Mineral Kingdom, vol. i. p. 313, 2d edit.) Around Merthyr Tydvil, and other places in South Wales, much of the iron ores are obtained by this deſtructive proceſs, equally depriving the ſides of hills of their ſoil, and covering valuable meadows with this earth and ſtones: many hundred acres of valuable meadows below Merthyr town have, within a few years paſt, been covered ſeveral feet deep with earth and ſtones, over which every flood of the river ſpreads and moves and diſturbs it, ſo that the whole width of the valley is without vegetation, and preſents a ſcene of devaſtation, nowhere elſe to be witneſſed, but on the ſand and beach of the flat ſhores of the ocean: already a ſtrong wall has been found neceſſary to confine the ſtream and this torrent of earth from overwhelming the lower part of the town, which is increaſingly in danger of the fate of Oſtia on the Tiber, if this deſtructive mode of diſpoſing of the rubbiſh from the iron-ſtone mines is ſuffered much longer to exiſt.

HUSK, among *Botaniſts,* the part which a flower grows out of. See Gluma.

The huſks or cups of the flowers of plants are not ſo much regarded with a view to their medicinal virtues as they deſerve. Petiver, in the Philoſophical Tranſactions, ſpeaking of the virtues of the verticillate claſs of plants, among which are included the ſage, roſemary, and the like, obſerves that it is an erroneous, though general opinion, that the flowers of theſe plants contain their principal virtues, for that the huſks are the part in which it is lodged. For inſtance, in the roſemary, the fine ſcent of the Hungary-water is not in the flowers, but huſks; and the flowers alone, when clean picked from them, yield very little odour. The cup, in this and other plants of the ſame claſs, is the only part in which their viſcous and ſulphureous qualities are lodged, and that ſomething of this kind is depoſited particularly there, may be perceived by the touch and ſmell; for they appear moiſt, and feel clammy; and this clammy matter, when received upon the fingers, is of a very ſtrong and agreeable ſmell, much more ſo than the reſt of the plant.

Husk denotes a diſeaſe of young bullocks. See Cough.

Husks, *Foſſil,* in *Natural Hiſtory.* The huſks, ſhivers, juli or catkins, and other light parts of hazel, alder, willow, &c. are found in great quantities deep in the alluvial earth and peat, of wide and flat valleys. Parkinſon's Org. Rem. vol. i. p. 94.

HUSO Germanorum, in *Ichthyology*, the name of a large fiſh of the ſturgeon or acipenſer kind, without tubercles, caught in the Danube, Boriſthenes, and other large rivers, and paſſing at times into the ſea. It has a very long ſnout, and under it either four or eight beards; it has one back-fin, which is placed near the tail, and two pair under the belly; its general ſhape ſomewhat reſembles that of the pike, and its back is black and its belly yellow; it has thirteen dorſal and forty-three caudal ſcales, and has cartilages inſtead of bones. It is caught in October and November, and in ſome places till January; and great numbers of them are uſually brought to market together in thoſe months in the countries where they are caught. They always ſwim in ſhoals. It grows to twenty-four feet long, and weighs one, two, three, or even four hundred pounds. The drug called iſinglaſs, and the food called cavear, are prepared from this fiſh.

HUSS, John, in *Biography*. See Hussites.

HUSSARS, Hussards, or *Huſſarts*, an order or ſpecies of ſoldiery in Poland and Hungary, commonly oppoſed to the Ottoman cavalry.

The huſſars are horſemen, whoſe uniform is a large furred cap, adorned with a cock's feather; thoſe of the officers with an eagle's or heron's; a very ſhort waiſtcoat with breeches and ſtockings in one piece: ſhort light boots; and a doublet, having five rows of buttons, which hangs looſely on the left ſhoulder. Their arms are, a long crooked ſabre, light carbines, and piſtols. Before they begin an attack, they lay themſelves flat on the necks of their horſes; but being come within piſtol ſhot of the enemy, they raiſe themſelves with ſuch quickneſs, and fall on with ſuch alertneſs, that it is very difficult for the troops they oppoſe to preſerve their order. In a retreat no other cavalry can pretend to follow them; as they leap over ditches, and ſwim through rivers with a ſurpriſing facility. Moſt of the princes on the continent have troops under this name.

HUSSEIANABAD, in *Geography*, a town of Aſiatic Turkey, in the government of Sivas; 42 miles S.W. of Amaſieh.

HUSSEINGUNGE, a town of Hindooſtan, in Rohilcund, on the Ganges; 26 miles W.S.W. of Budayoon.

HUSSES, a town of Arabia, in Yemen; ſeven miles E. of Sana.

HUSSEY, Giles, in *Biography*, a painter, born of a good family, in Dorſetſhire. He was the pupil of Richardſon in England, and afterwards of Damini and Ercole Lelli, in Italy, where, during a ſtay of ſome years at Rome and Bologna, he raiſed expectations which were grievouſly diſappointed on his return. Diſdaining portraiture, diſcountenanced in hiſtory, Huſſey was reduced to the ſolitary patronage of the then duke of Northumberland, who offered to receive him into his family, and give him a handſome penſion, with the attendance of a ſervant, upon the condition that he ſhould employ his talents chiefly, though not excluſively, for the duke. This offer he rejected, becauſe the duke did not comply with his requeſt of keeping a prieſt in the houſe for him. Huſſey, a bigot in religion, was attached to the creed of Rome; but had he not been ſo, commiſſions and patronage, almoſt confined to drawing copies, even from the antique, was certainly ſufficiently provoking for a man of an original turn of mind to be rejected. He afterwards became exceedingly diſtreſſed for the means of living; but upon making his wants known to his brother, who had ſucceeded to the family eſtate, he was treated in the moſt kind manner; and, after his generous brother's deceaſe, enjoyed himſelf the eſtate for ſome years, after which he diſpoſed of it, and retired to Beaſton, in Devonſhire, where he died, in 1788, at the age of 71. He was a complete inſtance of the danger of philoſophizing too much upon art, which requires more practice and good ſenſe than over-refined ſyſtems of thinking. He ſpent the beſt part of his life in reducing, uſeleſsly, the proportions of the human form, in all its various actions, to the muſical ſcale of concords, and produced fanciful analogies which no painter, whoſe mind is capable of graſping the true beauties of art, will ſtay, or ought to ſtay, to conſider. Thus he loſt the time which ſhould have been devoted to the practice of art, and when the hand and the imagination were required, both were found deficient. But he was an ingenious and highly reſpectable character.

HUSSINGABAD, in *Geography*, a town of Hindooſtan, in the circar of Hindia, on the S. bank of the Nerbuddah river; 120 miles N.E. of Burhanpour. N. lat. 22° 42′ 30″. E. long. 77° 54′.

HUSSITES, in *Eccleſiaſtical Hiſtory*, a party of reformers, the followers of John Huſs.

John Huſs, from whom the Huſſites take their name, was born in a little village, called "Huſſinez," in Bohemia, about the year 1376, and lived at Prague, in the univerſity of which he was educated, in the higheſt reputation, both on account of the ſanctity of his manners, and the purity of his doctrine. In the year 1396 he took the degree of M. A., and ſoon after that of B. D. In 1400 his abilities and piety had ſo far recommended him, that he was choſen confeſſor to the queen, and eight years after he was elected rector of the univerſity. He was diſtinguiſhed by his uncommon erudition and eloquence, and performed at the ſame time the functions of profeſſor of divinity in the univerſity, and of ordinary paſtor in the church of that city. During the courſe of theſe honours he obtained a benefice amply endowed by John Mulheym, a perſon of large fortune at Prague. By the marriage of Ann, ſiſter of the king of Bohemia, with Richard II. of England, in 1381, a communication and intercourſe were opened between England and Bohemia; and a young Bohemian nobleman, who had finiſhed his ſtudies in the univerſity of Prague, ſpent ſome time at Oxford; and on his return put into the hands of Huſs the writings of Wickliff. He adopted the ſentiments of Wickliff, and the Waldenſes; and in the year 1407 began openly to oppoſe and preach againſt divers errors in doctrine, as well as corruptions in point of diſcipline, then reigning in the church. Huſs likewiſe endeavoured to the utmoſt of his power to withdraw the univerſity of Prague from the juriſdiction of Gregory XII., whom the kingdom of Bohemia had hitherto acknowledged as the true and lawful head of the church. This occaſioned a violent quarrel between the incenſed archbiſhop of Prague, who was an illiterate man, to ſuch a degree that he was called "Alphabetarius," or the A B C doctor, and who, without ſufficient authority from the pope, had committed the works of Wickliff to the flames; and the zealous reformer, which the latter inflamed and augmented, from day to day, by his pathetic exclamations againſt the court of Rome, and the corruptions that prevailed among the ſacerdotal order. The archbiſhop, by his own authority, prohibited Huſs from preaching in his chapel of Bethelem, to which he had been appointed by Mulheym; upon which Huſs, as a member of the univerſity, which held immediately of the Roman ſee, appealed to the pope.

There were other circumſtances that contributed to inflame the reſentment of the clergy againſt him. He adopted the philoſophical opinions of the Realiſts, and vehemently oppoſed and even perſecuted the Nominaliſts, whoſe number and influence were conſiderable in the univerſity of Prague. He alſo multiplied the number of his enemies in the year 1408, by procuring, through his great credit, a ſentence in favour of the Bohemians, who diſputed with the Germans concerning the number of ſuffrages which their reſpective nations were entitled to in all matters that were carried by election in this univerſity. In conſequence of a decree, obtained in favour of the former, which reſtored them to their conſtitutional right of three ſuffrages, uſurped by the latter, the Germans withdrew from Prague, and in the year 1409, founded a new academy at Leipſick. This event no ſooner happened than Huſs began to inveigh with greater freedom than he had before done againſt the vices and corruptions of the clergy, and to recommend, in a public manner, the writings and opinions of Wickliff, as far as they related to the papal hierarchy, the deſpotiſm of the court of Rome, and the corruption of the clergy. Hence an accuſation was brought againſt him, in the year 1410, before the tribunal of John XXIII. by whom he was ſolemnly expelled from the communion of the church. Notwithſtanding this ſentence of excommunication, he proceeded to expoſe the Romiſh church with a fortitude and zeal that were almoſt univerſally applauded.

Some tumults having taken place among the followers of Huſs, in which he had no concern, and which, indeed, he lamented, and endeavoured to ſuppreſs, Winceſlaus, king of Bohemia, baniſhed him from Prague, upon which he retired to his native place, and lived there unmoleſted. During his retreat at Huſſinez he compoſed his celebrated treatiſe "Upon the Church;" and here he alſo dated a paper entitled "The Six Errors;" which he fixed on the gates of the chapel at Bethelem. It was levelled againſt indulgences, the abuſe of excommunication, believing in the pope, the unlimited obedience required by the ſee of Rome, ſimony, and making the body of Chriſt in the maſs.

This eminent man, whoſe piety was equally ſincere and fervent, though his zeal was perhaps too violent, and his prudence not always circumſpect, was ſummoned to appear before the general council of Conſtance, convened in the year 1414; whither princes and prelates, clergy and laity, regulars and ſeculars, flocked together from all parts of Europe. Secured, as he apprehended, from the rage of his enemies by the ſafe conduct granted him by the emperor Sigiſmund, for his journey to Conſtance, his reſidence in that place, and his return to his own country; John Huſs obeyed the order of the council, and appeared before it, to demonſtrate his innocence, and to prove that the charge of his having deſerted the church of Rome was entirely groundleſs. However, his enemies ſo far prevailed, that, by the moſt ſcandalous breach of public faith, he was caſt into priſon, declared a heretic becauſe he refuſed to plead guilty againſt the dictates of his conſcience, in obedience to the council, and burnt alive July 6th, 1415; a puniſhment which he endured with unparalleled magnanimity and reſignation.

We ſhall here ſubjoin ſome farther intereſting particulars relating to the cloſe of this eminent reformer's life. Whilſt his fate was in ſuſpence, his friends in Bohemia were ſufficiently active; and at length a petition was ſent through the kingdom, and ſubſcribed by almoſt the whole body of the Bohemian nobility and gentry. It was dated in May, 1415, and was addreſſed to the council of Conſtance. The firſt petition, complaining of the treatment which he had received, ſoliciting that a ſpeedy end might be put to his ſufferings by allowing him an audience, having been diſregarded, a ſecond and a third were preſented, urging his releaſe, and offering any ſecurity for his appearance. The laſt petition to the council was accompanied by another to the emperor, preſſing upon him a regard to his honour ſolemnly engaged for the ſecurity of Huſs, and imploring his protection and intereſt with the council. The emperor in this caſe was undoubtedly chargeable with a moſt notorious breach of faith; though the blame is generally laid, and with ſome reaſons, upon the council, who directed his conſcience. Huſs was at length, after repeated delays, ſummoned to appear before the council; but as ſoon as he began to reply to the firſt charge, a moſt indecent and tumultuous clamour began; and the diſorder and noiſe were ſo great that he could not proceed. "In this place," ſaid Huſs, who was the moſt diſpaſſionate of men, looking round him, "I hoped to have found a different treatment." His rebuke increaſed the clamour; and without attempting any further defence he held his peace. "He was now confounded," exclaimed the tumultuous aſſembly with ſeeming triumph, "ſilenced, by confeſſion guilty." On the next day the council reſumed its meeting, and the emperor Sigiſmund, diſguſted and offended at its preceding conduct, determined to maintain a more decent behaviour. The firſt charge exhibited againſt Huſs was his denying the real preſence. To which he had only to anſwer, that he had always held the true Catholic doctrine, which was a known fact among his friends, for he had ever believed tranſubſtantiation. He was next charged in general with maintaining the pernicious errors of Wickliff. To which he anſwered, that he had never held any error which he knew to be ſuch; and that he deſired nothing more than to be convinced of any errors into which he might have inadvertently fallen. Wickliff's doctrine of tythes was objected to him, which he owned he knew not how to refute. He had alſo expreſſed himſelf againſt burning the books of Wickliff, and he acknowledged that he had ſpoken againſt burning them in the manner practiſed by the archbiſhop of Prague, who condemned them to the flames without examining them. He was further charged with ſaying, that he wiſhed his ſoul in the ſame place where Wickliff's was. He owned having uſed this expreſſion, which afforded matter of great mirth to his hearers. He was afterwards charged with ſedition, in exciting the people to take arms againſt their ſovereign, from which charge he entirely exculpated himſelf. After the diſcuſſion of ſome other trifling particulars the council roſe, and Huſs was carried back to priſon. In his way thither the emperor turned to him and told him, that he had given him his ſafe conduct, which he found was more than was well in his power, that he might have an opportunity to vindicate his character. "But, depend upon it," ſaid he, "if you continue obſtinate, I will make a fire with my own hands to burn you rather than you ſhall eſcape." To which addreſs Huſs replied, that he could not charge himſelf with holding any opinions obſtinately, that he came thither with joy rather than with reluctance; that if any doctrine better than his own could be laid before him in that learned aſſembly, he might ſee his error and embrace the truth. Upon again appearing before the council, not fewer than 40 articles were brought againſt him. Of theſe the chief were extracted from his books, and ſome of them by very unfair deduction.

The following opinions, among many others, which gave offence, were eſteemed moſt criminal: "That there was no abſolute neceſſity for a viſible head of the church; that the church was better governed in apoſtolic times without one; that the title of holineſs was improperly given to man; that a wicked pope could not poſſibly be the vicar of Chriſt, that he denied the very authority on which he pretended to act; that liberty of conſcience was every one's natural right; that eccleſiaſtical cenſures, eſpecially ſuch as touched the life of man, had no foundation in ſcripture; that eccleſiaſtical obedience ſhould have its limits; that no excommunication ſhould deter the prieſt from his duty; that preaching was as much required from the miniſter of religion, as alms-giving from the man of ability; and that neither of them could hide his talent in the earth without incurring the divine diſpleaſure." Paletz and the cardinal of Cambray were the chief managers of this examination.

Beſides theſe opinions, moſt of which were proved and acknowledged, he threw out many things in the courſe of his examination which were eagerly laid hold on; particularly againſt the ſcandalous lives of the clergy of every denomination; the open ſimony practiſed among them, their luxury, lewdneſs, and ignorance.

Huſs having now been examined on all thoſe articles, which the niceſt ſcrutiny into his books, and the moſt exact remembrance of his words could furniſh, the cardinal of Cambray thus accoſted him: "Your guilt hath now been laid before this auguſt aſſembly with its full force of evidence: I am obliged, therefore, to take upon me the diſagreeable taſk of informing you, that only this alternative is offered to you: either to abjure theſe damnable errors, and ſubmit yourſelf to the council; in which caſe theſe reverend fathers will deal as gently with you as poſſible, or to abide the ſevere conſequence of an obſtinate adherence to them." To this Huſs anſwered, "that he had nothing to ſay, but what he had often ſaid before; that he came there not to defend any opinion obſtinately; but with an earneſt deſire to ſee his errors and to amend them; that many opinions had been laid to his charge, ſome of which he had never maintained, and others, which he had maintained, were not yet confuted; that as in the firſt caſe, he thought it abſurd to abjure opinions which were never his; ſo in the ſecond, he was determined to ſubſcribe nothing againſt his conſcience."

The emperor told him, he ſaw no difficulty in his renouncing errors which he had never held. "For myſelf," ſaid he, "I am, at this moment, ready to renounce every hereſy that hath ever exiſted in the Chriſtian church; does it therefore follow that I have been an heretic?"

Huſs reſpectfully made a diſtinction between abjuring errors in general, and abjuring errors which had been falſely imputed; and prayed the council to hear him upon thoſe points which to them appeared erroneous; were it only to convince them that he had ſomething to ſay for the opinions he maintained. To this requeſt, however, the council paid no attention.

Here Paletz and De Caſſis took an opportunity to exculpate themſelves of any appearance of malice in this diſagreeable proſecution. They both entered upon the taſk with great unwillingneſs, and had done nothing but what their duty required. To this the cardinal of Cambray added, that he could ſufficiently exculpate them on that head. They had behaved, he ſaid, with great humanity; and to his knowledge might have acted a much ſeverer part.

The emperor obſerving, that every thing, which the cauſe would bear, had now been offered, aroſe from his ſeat, and thus addreſſed himſelf to the council:

"You have now heard, reverend fathers, an ample detail of hereſies, not only proved, but confeſſed; each of which unqueſtionably, in my judgment, deſerveth death. If, therefore, the heretic continueth obſtinate in the maintenance of his opinions, he muſt certainly die. And if he ſhould even abjure them, I ſhould by no means think it proper to ſend him again into Bohemia; where new opportunities would give him new ſpirits, and raiſe a ſecond commotion worſe than the firſt. As to the fate, however, of this unhappy man, be that as it may hereafter be determined; at preſent, let me only add, that an authentic copy of the condemned articles ſhould be ſent into Bohemia, as a ground-work for the clergy there to proceed on; that hereſy may at length be rooted up, and peace reſtored to that diſtracted country."

The emperor having finiſhed his ſpeech, it was agreed in the council to allow Huſs a month longer to give in his final anſwer. With the utmoſt difficulty he had ſupported himſelf through this ſevere trial. Beſides the malice of his enemies, he had upon him the paroxyſm of a very violent diſorder. On this laſt day he was ſcarcely able to walk, when he was led from the council. His conſolation in theſe circumſtances was a cold and hungry dungeon, into which he was inhumanly thruſt.

His friend, the baron, attended him even hither, and with every inſtance of endearing tenderneſs, endeavoured to ſupport him. The ſuffering martyr wrung his hand; and looking round the horrid ſcene, earneſtly cried out, "Good God! this is friendſhip indeed!" His keepers ſoon after put him in irons; and none but ſuch as were licenſed by the council were allowed to ſee him.

The generous nature of Sigiſmund, though he was not unverſed in the artifices of the cabinet, abhorred a practiſed fraud. The affair of Huſs, amidſt all the caſuiſtry of the council, gave him keen diſtreſs; and he wiſhed for nothing more ardently than to rid his hands of it with honour. On the other ſide, his vanity and his intereſt engaged him to appear the defender of the Catholic cauſe in Germany. If he ſuffered Huſs to be put to death one part of the world would queſtion his honour; if he interfered with a high hand in preſerving him, the other part would queſtion his religion. The perplexity was great; from which he thought nothing could relieve him but the recantation of Huſs.

To obtain this he tried every means in his power. He had already endeavoured to intimidate him with high language which he had uſed, both in the council and in other places. But this was ineffectual. He had now recourſe to ſoothing arts. The form of a recantation was offered; in which Huſs was required only to renounce thoſe hereſies which had been fairly proved. But he continued ſtill inflexible. Several deputations were afterwards ſent to him in priſon; and biſhops, cardinals, and princes in vain tried their eloquence to perſuade him.

Sigiſmund, ſeeing the concluſion to which this fatal affair was approaching, might probably have intereſted himſelf thus far, as thinking he had been too condeſcending to the council. The flame alſo, which he ſaw kindling in Bohemia, where he had high expectations, and was willing to preſerve an intereſt, might alarm him greatly. He had gone too far, however, to recede, and knew not how to take Huſs out of the hands of the council, into which he had given him with ſo much zeal and devotion.

In the mean time Huſs remained maſter of his fate, and ſhewed a conſtancy which ſcarce any age hath excelled. He amuſed himſelf, while it was permitted, with writing letters to his friends, which were privately conveyed by the Bohemian lords who viſited him in priſon. Many of theſe letters are ſtill extant. The following, which is the ſubſtance of one of them, may be a teſt of that compoſed piety and rational frame of mind which ſupported him in all his ſufferings.

"My dear friends, let me take this laſt opportunity of exhorting you to truſt in nothing here, but to give yourſelves up entirely to the ſervice of God. Well am I authorized to warn you not to truſt in princes, nor in any child of man, for there is no help in them. God only remaineth ſtedfaſt. What *he* promiſeth, he will undoubtedly perform. For myſelf, on his gracious promiſe I reſt. Having endeavoured to be his faithful ſervant, I fear not being deſerted by him. Where I am, ſays the gracious Promiſer, there ſhall my ſervant be. May the God of heaven preſerve you!—This is probably the laſt letter I ſhall be enabled to write. I have reaſon to believe I ſhall be called upon to-morrow to anſwer with my life. Sigiſmund hath in all things acted deceitfully. I pray God forgive him! You have heard in what ſevere language he hath ſpoken of me."

The month, which had been allowed by the council, being now expired, a deputation of four biſhops came to receive his laſt anſwer, which was given in the ſame language as before.

The ſixth of July was appointed for his condemnation, the ſcene of which was opened with extraordinary pomp. In the morning of that day, the biſhops and temporal lords of the council, each in his robes, aſſembled in the great church at Conſtance. The emperor preſided in a chair of ſtate. When all were ſeated, Huſs was brought in by a guard. In the middle of the church a ſcaffold had been erected; near which a table was placed, covered with the veſtments of a Romiſh prieſt.

After a ſermon, in which the preacher earneſtly exhorted his hearers to *cut off the man of ſin*, the proceedings began. The articles alleged againſt him were read aloud; as well thoſe, which he had, as thoſe which he had not allowed. This treatment Huſs oppoſed greatly; and would gladly, for his character's ſake, have made a diſtinction; but finding all endeavours of this kind ineffectual, and being indeed plainly told by the cardinal of Cambray, that no farther opportunity of anſwering for himſelf ſhould be allowed, he deſiſted; and falling on his knees, in a pathetic ejaculation, commended his cauſe to Chriſt.

The articles againſt him, as form required, having been recited, the ſentence of his condemnation was read. The inſtrument is tedious: in ſubſtance it runs, "That John Huſs, being a diſciple of Wickliff, of damnable memory, whoſe life he had defended, and whoſe doctrines he had maintained, is adjudged by the council of Conſtance (his tenets having been firſt condemned) to be an obſtinate heretic; and as ſuch, to be degraded from the office of a prieſt; and cut off from the holy church."

His ſentence having being thus pronounced, he was ordered to put on the prieſt's veſtments, and aſcend the ſcaffold, according to form, where he might ſpeak to the people; and, it was hoped, might ſtill have the grace to retract his errors. But Huſs contented himſelf with ſaying once more, that he knew of no errors which he had to retract; that none had been proved upon him; and that he would not injure the doctrine he had taught, nor the conſciences of thoſe who had heard him, by aſcribing to himſelf errors, of which he had never been convinced.

When he came down from the ſcaffold, he was received by ſeven biſhops, who were commiſſioned to degrade him. The ceremonies of this buſineſs exhibited a very unchriſtian ſcene. The biſhops, forming a circle round him, each adding a curſe took off a part of his attire. When they had thus ſtripped him of his ſacerdotal veſtments, they proceeded to eraſe his tonſure, which they did by clipping it into the form of a croſs. Some writers ſay, that in doing this, they even tore and mangled his head; but ſuch ſtories are unqueſtionably the exaggeration of Proteſtant zeal. Their laſt act was to adorn him with a large paper cap; on which various and horrid forms of devils were painted. This cap one of the biſhops put upon his head, with this unchriſtian ſpeech, "Hereby we commit thy ſoul to the devil." Huſs ſmiling, obſerved, "It was leſs painful than a crown of thorns."

The ceremony of his degradation being thus over, the biſhops preſented him to the emperor. They had now done, they told him, all the church allowed. What remained was of civil authority. Sigiſmund ordered the duke of Bavaria to receive him, who immediately gave him into the hands of an officer. This perſon had orders to ſee him burned, with every thing he had about him.

At the gate of the church a guard of 800 men waited to conduct him to the place of execution. He was carried firſt to the gate of the epiſcopal palace, where a pile of wood being kindled, his books were burned before his face. Huſs ſmiled at the indignity.

When he came to the ſtake, he was allowed ſome time for devotion; which he performed in ſo animated a manner, that many of the ſpectators, who came there ſufficiently prejudiced againſt him, cried out, "What this man hath ſaid within doors we know not, but ſurely he prayeth like a Chriſtian."

As he was preparing for the ſtake, he was aſked whether he choſe a confeſſor? He anſwered in the affirmative; and a prieſt was called. The deſign was to draw from him a retractation, without which, the prieſt ſaid, he durſt not confeſs him. "If that be your reſolution, ſaid Huſs, I muſt die without confeſſion: I truſt in God, I have no mortal ſin to anſwer for."

He was then tied to the ſtake with wet cords, and faſtened by a chain round his body. As the executioners were beginning to pile the faggots around him, a voice from the croud was heard, "Turn him from the eaſt; turn him from the eaſt." It ſeemed like a voice from heaven. They who conducted the execution, ſtruck at once with the impropriety, or rather profaneneſs of what they had done, gave immediate orders to have him turned due weſt.

Before fire was brought, the duke of Bavaria rode up, and exhorted him once more to retract his errors. But he ſtill continued firm. "I have no errors," ſaid he, "to retract; I endeavoured to preach Chriſt with apoſtolic plainneſs; and I am now prepared to ſeal my doctrine with my blood."

The faggots being lighted, he recommended himſelf into the hands of God, and began a hymn, which he continued ſinging, till the wind drove the flame and ſmoke into his face. For ſome time he was inviſible. When the rage of the fire abated, his body, half conſumed, appeared hanging over the chain; which, together with the poſt, were thrown down, and a new pile heaped over them. The malice of his enemies purſued his very remains. His aſhes were gathered up and ſcattered in the Rhine, that the very earth might not feel the load of ſuch enormous guilt.

From this view of the life and ſufferings of Huſs, it is hard to ſay what were the real grounds of the animoſity he had raiſed. His creed unqueſtionably was far from being exactly orthodox; yet it is plain how very ill able his adverſaries were to gather from it offenſive matter enough for an accuſation. He believed tranſubſtantiation; he allowed the adoration of ſaints; he practiſed confeſſion; he ſpoke cautiouſly of tradition, and reverently of the ſeven ſacraments; and whatever latitude he might give himſelf on any of theſe articles, it was not more than had been often taken, inoffenſively taken, by Gerſon, Zabarelle, and other ſpirited divines of the Romiſh church.

Beſides, the great pains the council took to avoid a public queſtion, and the great confidence with which Huſs deſired one, are preſumptions very ſtrong in his favour.

It is the opinion of Lenfant, that the great cauſe of his condemnation was his introducing Wickliff's doctrine into Bohemia; and chiefly perhaps that offenſive part of it which ſtruck at the temporalities of the clergy. And, indeed, this is extremely probable from the whole conduct of the council; for though it is apparent, that he never adopted the entire ſyſtem of that reformer; yet his principles, it is certain, would have led him much farther than they had hitherto done; and the fathers of the council being aware of this, ſeem to have determined, though at the expence of juſtice, to cruſh an evil in its origin, which appeared teeming with ſo much miſchief.

Beſides this, there ſeems to have been another cauſe for that unabated prejudice which ran ſo high againſt him. The warmth with which he treated the corruptions of the clergy, and the uſurpations of the church of Rome, was a crime never to be forgiven by the eccleſiaſtics of thoſe times; and added the keeneſt edge to their reſentment. But as this was an unpopular cauſe to appear in, it is plain they wanted to have it believed their reſentment aroſe upon another account. This ſeems to have been the foundation of a ſpeech, attributed by Varillas to cardinal Perron; "My learned friends," (he would ſay) "you cannot employ your time worſe than in giving the world any account of the affairs of Huſs."

His life, however, was the ſevereſt ſatire upon the clergy. It was a mirror which reflected their diſtorted features. In him they ſaw the true eccleſiaſtic and the real Chriſtian, characters ſo different from their own. Gentle and condeſcending to the opinions of others, this amiable pattern of virtue was ſtrict only in his own principles. The opinions indeed of men were leſs his concern than their practice. His great conteſt was with vice; and he treated the miniſters of religion with freedom, only as he thought their example encouraged, rather than checked, that licence which prevailed. The great lines in his character were piety and fortitude. His piety was calm, rational, and manly; his fortitude nothing human could daunt. The former was free from enthuſiaſm; the latter from weakneſs. He was in every reſpect an apoſtolical man. "From his infancy," (ſays the univerſity of Prague in a voluntary teſtimonial,) he was of ſuch excellent morals, that during his ſtay here, we may venture to challenge any one to produce a ſingle fault againſt him.

As to his parts and acquirements, he ſeems to have been above mediocrity; and yet not in the higheſt form in reſpect of either. A vein of good ſenſe runs through all his writings, but their diſtinguiſhing characteriſtics are ſimplicity and piety.

To preſerve the memory of this excellent man, the ſixth of July was, for many years, held ſacred among the Bohemians. A ſervice, adapted to the day, was appointed to be read in all churches; and inſtead of a ſermon, an oration was ſpoken in commendation of their martyr, in which the noble ſtand he made againſt eccleſiaſtical tyranny was commemorated, and his example propoſed as a pattern to all Chriſtians.

In ſome places large fires were lighted in the evening upon the mountains, to preſerve the memory of his ſufferings; round which the country-people would aſſemble, and ſing hymns in his praiſe.

A very remarkable medal was ſtruck in honour of him, on which was repreſented his effigies, with this inſcription, CENTUM REVOLUTIS ANNIS DEO RESPONDEBITIS ET MIHI. Theſe words are ſaid to have been ſpoken by him to his adverſaries a little before his execution; and were afterwards applied by the zealots of his ſect as prophetic of Luther, who lived about an hundred years after him. The ſtory carries with it an air of irrational zeal, and ſeems calculated only for the credulous.

The ſame unhappy fate was borne by Jerome of Prague, his intimate companion, who attended the council, in order to ſupport his perſecuted friend. Jerome, indeed, was terrified into temporary ſubmiſſion; but he afterwards reſumed his fortitude, and maintained the opinions, which he had for a while deſerted through fear, in the flames, in which he expired the 30th of May, 1416. See JEROME.

The diſciples of Huſs adhered to their maſter's doctrine after his death with a zeal which broke out into an open war, that was carried on with the moſt ſavage and unparalleled barbarity. John Ziſka, a Bohemian knight, in 1420, put himſelf at the head of the Huſſites, who were now become a very conſiderable party, and threw off the deſpotic yoke of Sigiſmund, who had treated their brethren in the moſt barbarous manner. Ziſka was ſucceeded by Procopius, in the year 1424. The acts of barbarity that were committed on both ſides were ſhocking and horrible, beyond expreſſion; for notwithſtanding the irreconcileable oppoſition between the religious ſentiments of the contending parties, they both agreed in this one horrible principle, that it was innocent and lawful to perſecute and extirpate with fire and ſword the enemies of the true religion; and ſuch they reciprocally appeared to each other. Theſe commotions in a great meaſure ſubſided by the interference of the council of Baſil, in the year 1433.

The Huſſites, who were divided into two parties, *viz.* the Calixtines and Taborites, ſpread over all Bohemia and Hungary, and even Sileſia and Poland; and there are ſome remains of them ſtill ſubſiſting in all thoſe parts. Moſheim's Eccl. Hiſt. vol. iii. p. 406—412, 446—448, &c. Eng. ed. 8vo. 1790. Gilpin's Lives.—Life of John Huſs.

HUSSUNABAD, in *Geography*, a town of Bengal; 15 miles W. of Dacca.

HUSSUN-ABDAL, a town of Hindooſtan, in Lahore, 130 miles N.W. of Lahore. N. lat. 33°. E. long. 71° 45′.

HUSTINGS. See COURT *of Huſtings*.

HUSUM, in *Geography*, a ſea-port town of Denmark, on the W. coaſt of the duchy of Sleſwick, conſtituted a city in the year 1608, formerly famous for exporting great quantities of malt. It was alſo famous for the oyſter trade. The chief commerce at preſent conſiſts in beer, cattle, and horſes; 18 miles W. of Sleſwick. N. lat. 54° 32′. E. long. 9° 6′.

HUSWA, a town of Hindooſtan; 20 miles N.W. of Allahabad.

HUT, or HUTT, from the Saxon *hutte*, a ſmall cottage or hovel.

The word is alſo uſed for the ſoldiers' lodges in the field; otherwiſe called barracks or caſerns.

HUT, in *Rural Economy*, the common name of a low ſort of building of the cottage kind generally conſtructed of an earthy ſort of material, ſuch as ſtrong loamy clay, &c. A number of huts of this deſcription have within theſe few years been built on the borders of the South Eſk river in Scotland, which have a very neat and rural appearance, affording the idea, at a diſtance, of their being formed of a kind of brown brick-work.

In this caſe the compoſition of the materials which are employed is a ſort of muddy clay blended with the roots of plants of the aquatic kind, which are dug from out of the flood mark of the river, in ſuch ſizes and ſhapes as may be ſuitable for the purpoſe that is intended. The pieces or peats, as they are there called, are generally cut out in the form of bricks, but ſomewhat larger, being prepared in every reſpect in the manner of peat-fuel. It is uſual, in ſome caſes, to build theſe huts with lime-mortar, but more commonly with clay only.

Theſe huts are uſually preferred by the cottagers to thoſe which are built of ſtone, being warmer, and not much leſs durable.

It ſeems not improbable but that a ſimilar ſort of material for building this ſort of cottages may be met with in many ſituations where it has not yet been diſcovered, and be made uſe of in this way as well as for fences of the wall kind. See Cottage.

HUTA, a town of Lithuania, in the palatinate of Novogrodek; 40 miles E.N.E. of Novogrodek.

HUTCH, among *Farmers*, denotes a veſſel or particular place in which to lay corn; alſo, a kind of hollow trap for the taking of weaſels or other vermin alive; and it alſo ſignifies a ſort of caſe, formed of boards and ſlips of wood, opening in front, and divided within for keeping and breeding rabbits.

HUTCHESON, Francis, in *Biography*, an elegant writer and ingenious philoſopher, ſon of a diſſenting miniſter in the north of Ireland, was born on the eighth of Auguſt, 1694. After receiving a proper education at a grammar ſchool, he was ſent to an academy to begin his philoſophical courſe. In 1710 he was entered a ſtudent at the univerſity of Glaſgow, in Scotland, where he renewed his application to the ſtudy of the languages, but chiefly devoted himſelf to the divinity courſe. After ſpending ſix years in the univerſity of Glaſgow, he returned to his native country, and undertook the care of an academy at Dublin. Scarcely had he fixed himſelf in that city, when his accompliſhments and talents attracted the general notice of perſons of all ranks who had any taſte for literature. Lord viſcount Moleſworth took much delight in his converſation, and is ſaid to have aſſiſted him with his criticiſms and obſervations upon his "Enquiry into the Ideas of Beauty and Virtue," before it was committed to the preſs. He received a ſimilar favour from Dr. Synge, lord biſhop of Elphin, with whom he lived in habits of great friendſhip. The firſt edition of this work made its appearance anonymouſly, but its great merit did not ſuffer the author to remain long concealed. Lord Granville, the lord lieutenant, ſent his ſecretary to enquire at the bookſellers for the author, and when he could not learn his name, he left a letter to be conveyed to him, in conſequence of which he ſoon became acquainted with his excellency, and was ever after treated by him with diſtinguiſhed marks of familiarity and eſteem. From this time his acquaintance began to be ſtill more courted by men of diſtinction, either for ſtation or literature; among theſe was the celebrated archbiſhop King, who ſcreened him from two attempts made to proſecute him, for venturing to take upon himſelf the education of youth without having firſt ſubſcribed the eccleſiaſtical canons. In the year 1728, Mr. Hutcheſon publiſhed "A Treatiſe on the Paſſions." Having conducted his private academy in Dublin for ſeveral years with reputation and ſucceſs, he was invited into Scotland in 1729, to fill the chair of profeſſor of philoſophy in the univerſity of Glaſgow. Here he ſpent the remainder of his life, in a manner highly honourable to himſelf and uſeful to the univerſity of which he was a member. About this time the degree of doctor of laws was conferred upon him. At Glaſgow his time was divided between his ſtudies and the duties of his office. He was in every reſpect a valuable member of the univerſity, his abilities qualifying him, and his zeal prompting him, on all occaſions, to promote its civil and literary intereſts. His conſtitution ſeemed to promiſe his friends a long enjoyment of his valuable life, but a ſudden attack terminated it in 1747, in the 53d year of his age. His ſon publiſhed, from the original MS. of his father, a "Syſtem of Moral Philoſophy," in 2 vols. 4to. In this work the author endeavours to unfold the principles of the human mind, as united in a moral conſtitution, and from thence to point out the origin of our ideas of moral good and evil, and of our ſenſe of duty, or moral obligation; he next enquires what muſt be the ſupreme happineſs of a ſpecies conſtituted as mankind are, after which he deduces the particular laws of nature, or rules neceſſary to be obſerved for promoting the general good in our common intercourſe with one another as members of ſociety. Dr. Hutcheſon was of that claſs of philoſophers, who deduce all moral ideas from what they call a moral ſenſe, implanted in our natures, or an inſtinct like that of ſelf preſervation, which, independently of any arguments taken from the reaſonableneſs and advantages of any action, leads us to perform it ourſelves, or to approve it when performed by others. This moral ſenſe they maintain to be the very foundation of virtue. Dr. Hutcheſon was a man of conſiderable and various learning. He was not only acquainted with thoſe ſubjects moſt intimately acquainted with his profeſſion, but was a good mathematician and natural philoſopher; and was deſirous of applying all his knowledge to the grand purpoſe of eſtabliſhing the truths of the exiſtence, the perfections and government of God.

HUTCHINS, John, was born in 1698, at Bradford-Peverell, in Dorſetſhire, and educated at Baliol-college, Oxford, for the church. He took orders, and was preſented ſucceſſively to different livings, the laſt of which was the rectory of the church of the Holy Trinity, at Wareham. He died in June 1773. He was author of the Hiſtory and Antiquities of the County of Dorſet, which he was nearly forty years in compiling, and which, though he lived to ſee it put to preſs, was not publiſhed till 1774, when it was given to the world for the benefit of his widow and children. It was comprized in two volumes folio, and is adorned with many plates contributed by the patrons of the work.

HUTCHINSONIANS in *Eccleſiaſtical Hiſtory*, a kind of cabaliſtic ſect, that ſprung up in this country towards the beginning of the laſt century, and that derived its name from John Hutchinſon, who was born in Yorkſhire, A. D. 1674. Having been educated in his father's houſe, with a view to the office of ſteward to ſome gentleman or nobleman, he was advanced at an early period of life to this ſtation in the ſervice of the duke of Somerſet; and his buſineſs calling him to London about the year 1700, he became acquainted with Dr. Woodward, who employed him in making that large and noble collection of foſſils, &c. which the doctor bequeathed to the univerſity of Cambridge. Mr. Hutchinſon, being deſirous of proſecuting his literary ſtudies, begged leave to quit the ſervice of the duke, who appointed him his riding-purveyor, with a fixed ſalary of 200*l.* per annum; and this place he enjoyed till his death in 1737. In 1724 he publiſhed the firſt part of his Moſes's Principia, in which he ridiculed Dr. Woodward's Natural Hiſtory of the Earth, and his account of the ſettlement of the ſeveral ſtrata, ſhells, and nodules, by the law of gravity; attempting alſo, with no ſmall degree of preſumption, to refute and explode Newton's theory of gravitation; and from this time to his death he continued publiſhing a volume every year, or every other year; which, with the manuſcripts left behind, were publiſhed in 1748, in twelve volumes octavo, by the Rev. Julius Bate, a ſtrenuous advocate for his doctrine: an abſtract of his works was alſo publiſhed in 1752. In 1712, Mr. Hutchinſon completed a machine of the watch kind for the diſcovery of the longitude at ſea, which is ſaid to have been ſo contrived, that the ſpring, wheels, and pivots, &c. were not in any conſiderable degree influenced by heat, cold, moiſture, and drought, and to be capable of that degree of exactneſs which is requiſite for the purpoſe. Having obtained the teſtimonials of Newton, and ſome others to whom it was referred for examination, expreſſing their opinion of its excellence and utility, application was made for a parliamentary reward, but the author, exaſperated at his diſappointment, relinquiſhed his purſuits of this kind, and deſtroyed al his papers. In 1727 he publiſhed the ſecond part of Moſes's Principia, containing the principles, as he apprehends, of the ſcripture philoſophy; which are, a plenum, and the air. The air he ſuppoſes to exiſt in three conditions, *viz.* fire, light, and ſpirit; the two latter are the finer and groſſer parts of the air in motion; from the earth to the ſun, the air is finer and finer, till it becomes pure light near the confines of the ſun, and fire in the orb of the ſun, or ſolar focus. From the earth, towards the circumference of this ſyſtem, in which he includes the fixed ſtars, the air becomes groſſer and groſſer, till it becomes torpid and ſtagnant, in which condition it is at the utmoſt verge of this ſyſtem; from whence, he ſays, the expreſſion of "outer darkneſs, and blackneſs of darkneſs," uſed in the New Teſtament, ſeems to be taken. The ſun, which he places in the centre, is the active vivifying agent, which, by melting the ſpirit or groſſer parts of the air into atoms or finer parts, or æther, ſets the machine forward and keeps it a-going; for the light is preſſed out by the influx of ſpirit, and the ſpirit is preſſed in by the efflux of light; and thus the whole matter of the heavens or air is perpetually changing conditions and circulating. In the introduction to this work, Mr. Hutchinſon ſuggeſted, that the idea of the Trinity was to be taken from the three grand agents in the ſyſtem of nature, fire, light, and ſpirit; which are three conditions of one and the ſame ſubſtance, and wonderfully anſwer in a typical or ſymbolical manner to the three perſons of one and the ſame, eſſence. He alſo diſcovers the doctrine in the term *cherubim*, which is derived from כ, *ſicut*, denoting *ſimilitude* or *reſemblance*, and רבים, plural of רב, a *great* or *mighty one*; and ſo the cherubim, *i. e.* the ſimilitude of the great ones, were repreſented by a bull the chief of the tame animals, the lion the chief of the wild, and the eagle of the winged; and theſe were again figures of the celeſtial cherubim, or fire, light, and ſpirit. The bodies of theſe three animals were all joined in one, in order to ſignify the unity of the eſſence, and the diſtinction of the perſons, and man taken into the eſſence by his perſonal union with the ſecond perſon, whoſe conſtant emblem was the lion; and Mr. Hutchinſon contends, that the very name of the figure was an hieroglyphical repreſentation of the Trinity. The ſame doctrine is alſo taught by the word שמים, tranſlated *heavens*; but which the Hutchinſonians ſuppoſe to ſignify *names*, being, as they ſay, the plural of שם, a *name*; and the heavens, according to them, are called names; becauſe the material heaven, having in its one ſubſtance three conditions of fire, light, and ſpirit, is the proper name or repreſentation of the Deity in its unity of eſſence, and trinity of perſons; or of the אלהים, *Elohim*, or *Aleim*, which they derive from אלה, *alah*, an *oath*, or *conditional imprecation*, and therefore, muſt ſignify perſons that have bound themſelves by an indiſpenſible obligation; hereby intimating that the three perſons of the Godhead have abſolutely covenanted together to redeem man. On this account the ſingular Jehovah, *q. d.* the eſſence-exiſting, is ſo commonly found in conjunction with the plural *Aleim*, *i. e.* the *confederates* or *adjurators*. They derive אלוה, *Eloah*, alſo from the ſame root, and tranſlate it the *accurſed one*, referring to Chriſt, who was really made a curſe for us. The word ברית, which we tranſlate *covenant*, they derive from ברר, *to purify*, and render *purifier*; and thus ברת ברית, which is commonly rendered to *make a covenant*, they tranſlate *to cut off the purifier*. In this way Mr. Hutchinſon and his followers have founded their whole ſyſtem of theology and philoſophy on a forced and fanciful etymology of Hebrew words; indulging their minds in all the wildneſs of imagination and unbounded whim, making words ſignify what they pleaſe, turning the plaineſt hiſtory into ſublime prophecy, and conſtraining ſentences to be oracular in various ways, and meanings which they were never deſigned to bear, and which they are incapable of bearing. The ſcriptures, according to this author, written in Hebrew without points, which is the language framed in Paradiſe, and each root of which repreſents ſome obvious idea of action or condition, raiſed by the ſenſible object which it expreſſes, and farther deſigned to ſignify ſpiritual or mental things; the Hebrew ſcriptures, he ſays, rightly tranſlated and underſtood, compriſe a perfect ſyſtem of natural philoſophy, theology, and religion. Mr. Hutchinſon expreſsly ſays, that as God was primarily repreſented by the heavens, ſo emblems or draughts of theſe, or deſcriptions in Hebrew words, were no more than copies of the archetype; and thus the knowledge of the *Aleim* is derived from the light of nature, not as that phraſe is vulgarly underſtood, by any innate or inbred power in man, but by the immediate inſtruction of the Moſt High, the alone Interpreter as well the Lord of nature. The Greek, he ſays, that language of erring heathens, became of neceſſary uſe to the apoſtles, to ſpread the hiſtory of facts, which it behoved all men to be apprized of; but Chriſt and his diſciples knew too well its imperfection and unfitneſs to give juſt ideas of the divine economy to make uſe of it for that purpoſe. The original ſcriptures in Hebrew were diſtinct permanent evidence; to theſe references are always made, and there complete ſatisfaction is to be found. He alſo obſerves, that as the material machine is primarily ſuited to the ſervice of the body, ſo its ſecondary, but moſt important uſe, is to treaſure up ideas for the immortal ſoul, by affording types and evidences of the otherwiſe unutterable attributes of the Deity. Hence it muſt follow, that the language of ſcripture, which is admirably adapted to convey true and literal deſcriptions, will alſo in many places require an emblematical or ſpiritual interpretation, correſponding to the circumſtances of that creature who has a *ſoul* of *lives* to provide for. The Hutchinſonians not only erect their fanciful ſyſtem of theological and philoſophical opinions on the conſtruction of roots and ſymbols, to the ruin of natural religion and morality, but they loudly declaim againſt human learning and reaſon; and they expreſsly call abſtract reaſoning the very province of the devil.

The reader may find a diſtinct and comprehenſive account of the Hutchinſonian ſyſtem in a book, entitled "Thoughts concerning Religion, &c." printed at Edinburgh, 1743; and in a Letter to a Biſhop, annexed to it, firſt printed in 1732.

It is not improbable that Mr. Hutchinſon's death was haſtened by too intenſe an application to his ſtudies; for neglecting his uſual ſummer excurſion in 1737, in order to complete a work which he was preparing for the preſs, he became unable to reſiſt the attack of a bilious fever, to which he fell a ſacrifice, notwithſtanding the advice of ſir Edward Wilmot and Dr. Mead, in the 63d year of his age. His judgment ſeems to have been much inferior to his learning, and his temper appears from the tenor of ſome of his publications to have been irritable and dogmatical.

HUTKA, in *Geography*, a town of Hungary; 12 miles S.S.E. of Caſchau.

HUTOW, a town of Lithuania, in the palatinate of Brzeſc; 28 miles W.S.W. of Pinſk.

HUTTANY, a town of Hindooſtan, in the country of Viſiapour; 30 miles S.S.W. of Viſiapour. N. lat. 17° 5'. E. long. 75 6'.

HUTTEN, ULRIC DE, in *Biography*, one of the early reformers, was the ſon of a Franconian gentleman, and was born in 1488. He ſtudied at the univerſity of Frankfort on the Oder, where he took the degree of M. A. Being deſtitute of patrimony, he entered into the army of the emperor in Italy, and was at the ſiege of Parma. He afterwards maintained himſelf by teaching at Roſtock, and made himſelf known by ſome publications. At the command of his father he attempted to ſtudy the law, but finding the profeſſion ill accord with his temper, he enliſted in the army again and ſerved in Italy. He was a man of great courage, and in 1515, learning that his couſin John Hutten, marſhal to the court of the duke of Wirtemberg, had been killed by that prince, he drew his pen in his kinſman's cauſe, and publiſhed ſome very ſevere harangues againſt the duke, which have been compared for eloquence and bitterneſs to Cicero's Catilinarian orations. After attacking the duke with his pen, he employed his arms againſt him in a war which drove him from his dominions. Having become a proſelyte to the opinions of Luther, he publiſhed the bull of pope Leo X. againſt that reformer, with marginal remarks, in which he treated the holy pontiff with ſo little reſpect, that orders were tranſmitted from Rome to the elector of Mentz to ſend Hutten thither in fetters. He was on this occaſion obliged to quit Mentz, but ſuch was the vigour of his ſpirit, that he wrote a letter to the elector in which was the following paſſage: "If you burn my books, I will burn your towns." He afterwards wandered from place to place, and was at Baſil in 1523, where the ſenate made him a conſiderable preſent. He received, however, the mortification of having his viſit refuſed by Eraſmus, then reſiding in that city. Hutten was indignant at this treatment, and wrote a book againſt Eraſmus, which that learned man anſwered. Some farther quarrels drove him from Baſil, and he took refuge in the iſle of Uffnau, in the lake of Zurich, where he died in 1523, in the 36th year of his age. He was conſidered as a man of learning, and publiſhed various Latin works in proſe and verſe. He edited two new books of Livy, and diſcovered ſome MSS. of Pliny, Quintilian, and Marcellinus. Moreri.

HUTTER, Elias, was born at Ulric in 1553, and died at Nuremberg about the year 1603. He publiſhed an edition of the Hebrew Bible, entitled "Via Sancta, ſive Biblia ſacra Hebræa Veteris Teſtamenti." At the end is given the 119th Pſalm in thirty different languages. He alſo publiſhed two polyglots of the Bible; one at Hamburgh in 1596, in Hebrew, Greek, Latin, and German; and the other at Nuremberg in 1599; and in the following year he publiſhed a polyglot of the New Teſtament in twelve languages. Bayle.

HUTTING *of* Grain, the name of a practice employed in ſome places in the northern part of the kingdom, for preſerving the corn in wet bad harveſt-ſeaſons. See Harvesting.

HUTTWEIL, in *Geography*, a town of Switzerland, in the canton of Berne, on the frontiers of Lucerne; 22 miles N.W. of Lucerne.

HUTTYBARRY, a town of Bengal; 45 miles S. E. of Nattore.

HUXHAM, John, in *Biography*, a phyſician of conſiderable reputation, who practiſed his profeſſion at Plymouth, where he died in the year 1768. It is remarkable, that no biographical memoirs of this able and learned practitioner are extant. His writings diſplay a moſt intimate acquaintance with the writings of the ancients, and a great veneration for thoſe of Hippocrates in particular; and he quotes the ancient languages, and writes the Latin with great fluency and familiarity. He appears to have ſpent his life at Plymouth in the active exerciſe of his profeſſion; for he kept a regiſter of the ſtate of health and reigning diſeaſes at that place, together with an account of the variety of the ſeaſons, for nearly 30 years (namely, from the year 1724 to 1752 incluſive); which were publiſhed in Latin, under the title of "Obſervationes de Aëre et Morbis Epidemicis, &c." in 3 vols. 8vo. The firſt of theſe volumes commences with an account of the year 1728; but in the dedication to ſir Hans Sloane, he refers to an account of the conſtitution and diſeaſes of the ſeaſons, from 1724 to 1727 already publiſhed. The third volume was edited in 1770, after the death of the author, by his ſon, J. Cor. Huxham, A.M. F.R.S.; who, it is to be regretted, did not inſert any memoirs of his father's life.

Dr. Huxham was, at an early period, elected a member of the Royal Society, and communicated ſeveral papers on the ſubjects of pathology and morbid anatomy, which were publiſhed in the Philoſophical Tranſactions. But the work upon which his reputation principally reſts, is his "Eſſay on Fevers," publiſhed about the year 1739, of which a fifth edition appeared the year before his death, containing alſo "A Diſſertation on the Malignant, Ulcerous Sore Throat." His accuracy and acuteneſs, as an obſerver of the phenomena of diſeaſe, were particularly exemplified in his diſcriminative hiſtory of the "Slow Nervous Fever;" to which his name is often annexed, when this fever is mentioned by ſucceeding authors. His theory was the ancient humoral pathology, which much influenced his practice; but that was the general fault of the age. He was the author of ſome "Obſervations on Antimony," 4to. 1756; and was elected a fellow of the Royal College of Phyſicians at Edinburgh. He has given few preſcriptions in his works; for he obſerves, with Hippocrates, that the phyſician, who knows a diſeaſe, cannot be at a loſs in reſpect to the form of his remedy; but, having mentioned a favourite formula for the preparation of a tincture of the Peruvian bark, in his Eſſay on Fevers, in which the bitter is corrected by aromatics, his name has become attached to the tincture of bark, which is commonly prepared in the ſhops according to his preſcription, which is alſo adopted in the Pharmacopœia of the College of Phyſicians. See the works of Huxham.

HUXING *of* Pike, among *Fiſhermen*, a particular method of catching that fiſh.

For this purpoſe, they take thirty or forty as large bladders as can be got; blow them up, and tie them cloſe and ſtrong; and at the mouth of each tie a line, longer or ſhorter, according to the depth of the water. At the end of the line is faſtened an armed hook, artfully baited; and thus they are put into water with the advantage of the wind, that they may gently move up and down the pond. When a maſter pike has ſtruck himſelf, it affords great entertainment to ſee him bounce about in the water with a bladder faſtened to him; at laſt, when they perceive him almoſt ſpent, they take him up.

HUY, in *Geography*, a town of France, and principal place of a diſtrict in the department of the Ourte, ſituated on the Meuſe, which divides it into two parts; 12 miles S.S.W. of Liege. N. lat. 50° 31′. E. long. 5° 15′. The place contains 4871, and the canton 10,674 inhabitants, on a territory of 110 kiliometres, in 12 communes.

HUYGENS, Christian, in *Biography*, was born at the Hague in the year 162 . He was educated chiefly under his father, and exhibited very rare talents at an early age. At thirteen years of age he was a good mathematician, and began to ſtudy mechanics, having diſcovered a marked genius for this branch of ſcience by his great curioſity in examining different kinds of machines and pieces of mechaniſm. In the year 1645 he was ſent to the univerſity of Leyden to ſtudy law; but this purſuit did not prevent him from going on with his mathematical purſuits. At the end of one year he removed from Leyden to Breda, where an univerſity had been recently founded, the direction of which was given to his father. In 1651 he publiſhed the firſt fruits of his ſtudies, in a treatiſe entitled "Theoremata de Quadratura Hyperboles, Ellipſis, et Circuli, ex dato Portionum Gravitatis Centro, &c." and in 1654 he gave the world another work, "De circuli magnitudine inventa: accedunt Problematum quorundam illuſtrium Conſtructiones." In the following year he was admitted to the degree of doctor of laws at Angers. In 1657, Dr. Huygens publiſhed a ſhort piece, entitled "De Ratiociniis in Ludo Alæ," annexed to a mathematical work of profeſſor Schooten's, in order to ſhew the uſefulneſs of algebra. In the ſame year he printed his "Brevis Inſtitutio de Uſu Horologiorum ad inveniendas Longitudines." An attempt was made to deprive him of the honour of the diſcovery, which obliged him to publiſh another piece to ſhew that his pendulum was very different from that invented by Galileo. This philoſopher, in the courſe of his obſervations on the planet Saturn, had diſcovered what he imagined to be two ſatellites, almoſt in contact with his body, which ſome time after diſappeared. Huygens, being deſirous to account for theſe appearances and changes, applied himſelf to the improvement of the teleſcope, and he conſtructed one poſſeſſing a higher power than any which had been before invented. With this he diſcovered the ring, and he aſcertained that the appearances which Galileo had taken for ſatellites were only Anſæ, or the extreme parts of the ring. He alſo diſcovered a ſatellite belonging to that planet which had never been ſeen before. Theſe diſcoveries he communicated to the world in a work entitled "Syſtema Saturninum ſive de Cauſis mirandorum Saturni Phænomenon, et Comite ejus Planetâ novo." In the year 1660 he came to England, where he communicated his art of poliſhing glaſſes for teleſcopes, and was admitted a member of the Royal Society. Here he made conſiderable improvements in the air-pump, and diſcovered the laws of the colliſion of elaſtic bodies. In 1663 he was invited by the miniſter Colbert to ſettle at Paris; the offer of a handſome penſion in the king's name induced him to accede to the miniſter's propoſal, and he reſided at Paris from 1666 to 1681, where he was admitted a member of the Academy of Sciences. In 1673 he publiſhed "Horologium Oſcillatorium; ſive de motu Pendulorum ad horologia aptato, Demonſtrationes Geometricæ;" diſcovering a method of rendering clocks exact, by applying the pendulum, and of rendering all its vibrations equal by the cycloid. In conſequence of the revocation of the edict of Nantes he determined to leave France, though every effort was made to prevail upon him to remain there. Nothing he ſaid ſhould induce him to live in a country where his religion was proſcribed, and its profeſſors haraſſed by the moſt cruel perſecutions. He accordingly quitted Paris, and returned to Holland, where he ſpent the remainder of his life in ſcientific purſuits and employments. His laſt work, and which he did not live to ſee through the preſs, was a tract on the plurality of worlds, and the probability that the planets are inhabited. Huygens died in 1695, when he was in the 67th year of his age. He was, unqueſtionably, one of the ableſt mathematicians of the age. His temper was cheerful, his manners amiable, and he was in all reſpects a good man. Many of his works were publiſhed after his death. Moreri.

This great mathematician ſeems to have been as well acquainted with practical muſic, as the philoſophy of ſound. Dr. Smith, in his Harmonics, quotes his authority for an obſervation which could only be made by a very nice and practiſed ear.

M. Huygens obſerved long ago, "that no ſingle voice, or perfect inſtrument, can always proceed by perfect intervals, without erring from the pitch at firſt aſſumed; as in ſinging the ſounds in the baſe C, F, D, G, C, the voice would ſink inſenſibly ſo much, that the laſt C would be conſiderably lower than the firſt."

Becauſe of thoſe perfect intervals, which are as 4 to 3, 5 to 6, 4 to 3, 2 to 3, an account is made in ſuch a proportion, as 160 to 162, that is, as 80 to 81, which is what calculators call a comma. Corſnothcoros, lib. i. p. 77.

This, ſays Dr. Smith, is alſo confirmed by what we are told of a monk, who found by ſubtracting all the aſcents of the voice in a certain chant from all its deſcents, that the latter exceeded the former by two commas; ſo that if the aſcents and deſcents were conſtantly made by perfect intervals, and the chant were repeated but four or five times, the final ſound, which in that chant ſhould be the ſame as the initial, would fall about a whole tone below it.

We have always found ourſelves, that voices, ſinging without an organ or inſtrumental accompaniment, gradually ſink to a lower pitch than that in which they began. And in ſinging a ballad with many different ſtanzas to the ſame air, the depreſſion is proportionably conſiderable. But Huygens has aſſigned a ſcientific reaſon for the deſcent. Dr. Smith frequently refers in his Harmonics to the *Cyclus harmonicus* of Huygens at the end of his works, or in l'Hiſtoire des Ouvrages des Scavans, October, 1691.

HUYGENS, GOMARUS, was born at Liere, in the territory of Antwerp, in the year 1631. He was educated at the univerſity of Louvain, where he was ſo much diſtinguiſhed among his contemporaries, that he was appointed profeſſor of philoſophy when he was only twenty-one years of age. In 1668 he began to confine his ſtudies ſolely to divinity, and in the ſame year was admitted doctor, and deputed to proceed to Rome, to defend the privileges of the univerſity of Louvain before pope Clement X. Having ſucceeded in his object he returned to Louvain, where he was inceſſantly employed in his ſtudies till the year 1677, when he was appointed preſident of the college by pope Adrian VI. In the year 1682, his Catholic majeſty, without ſolicitation, beſtowed on him a canonry of St. Peter, at Louvain. Soon after this he was involved in diſputes with the Jeſuits, and his enemies procured an interdict againſt him, by which he was prohibited the exerciſe of his functions as preſident, preacher, and confeſſor. Both parties appealed to the pope, who decided in favour of Huygens. A temporary peace was produced among the ſeveral combatants, during which Mr. H. died in 1702, at the age of 71. He was author of many theological works, among which are his "Breves Obſervationes," which, notwithſtanding the title, are extended to fifteen volumes, 12mo. Moreri.

HUYGENS'S *Temperament of the Muſical Scale.* In his Cyclus Harmonicus, at the end of his works, and in Hiſt. des Ouvrages des Scavans, 1691, p. 78, M. Huygen's adopts a ſyſtem of temperament of the muſical ſcale, in which the octave is divided into 31 equal parts, whereof the mean tone is 5, and the major limma 3. Dr. Robert Smith, in his Harmonics, 2d edit. p. 158, calculates the temperaments of the Vth, IIId, and VIth in this ſyſtem, and Mr. Farey has done the ſame in ſcholium 12 to his Theorems, Phil. Mag. vol. xxxvi. p. 52. where it appears, that the fifths in this ſyſtem are each flattened 2.6518 Σ, each major third is ſharpened .4006 Σ, and each major ſixth is alſo ſharpened 3.0524 Σ. At page 224, Dr. Smith gives the lengths of a monochord ſtring for each of the 21 notes of this ſcale, for inſtruments with notes ſufficient, and which will equally ſerve for tuning the common douzeave inſtruments, by taking the ſeven natural notes C, D, E, &c. and C ※, E ♭, F ※, G ※ and B ♭ for the ſhort keys of the inſtrument. And at page 207 he ſhews, that by help of the firſt table of beats in plate 20, anſwering to the pitch 262, (that being nearly $\frac{1}{4}$th of a mean tone, or 24.71654Σ lower than our preſent CONCERT *pitch*, ſee that article); this ſyſtem may be tuned, on common, or on more perfect inſtruments. In 1725 Ambroſe Warren publiſhed a thin quarto, under the title of the "Tonometer," wherein he pretends to the diſcovery of this ſyſtem of 31 intervals in the octave, but which he more probably took from our author, as Mr. Farey has remarked in the page of the Phil. Mag. above referred to.

HUYSMAN, or HOUSEMAN, CORNELIUS, in *Biography*, a painter, born at Antwerp in 1648. He ſtudied the art under Gaſpar de Wit, but ſeeing ſome of the works of Artois, he was ſo ſtruck with them that he went to Bruſſels to place himſelf under him.

In ſome time he copied his manner, but afterwards adopted one of his own, yet retained ſomewhat of Artois, with a mixture of the taſte of the Italian ſchools, and he is conſidered as one of the beſt landſcape painters of the Flemiſh ſchool. He died in 1727, aged 79.

HUYSUM, JOHN VAN. This illuſtrious painter hath ſurpaſſed all who have ever painted in that ſtyle; and his works excite as much ſurpriſe by their finiſhing, as they excite admiration by their truth.

He was born at Amſterdam in 1682, and was a diſciple of Juſtus Van Huyſum, his father. He ſet out in his profeſſion with a moſt commendable principle, not ſo much to paint for the acquiſition of money, as of fame; and therefore he did not aim at expedition, but at delicacy, and if poſſible, to arrive at perfection in his art. Having attentively ſtudied the pictures of Mignon, and all other artiſts of diſtinction who had painted in his own ſtyle, he tried which manner would ſooneſt lead him to imitate the lightneſs and ſingular beauties of each flower, fruit, or plant; and then fixed on a manner peculiar to himſelf, which ſeems almoſt inimitable. He ſoon received the moſt deſerved applauſe from the ableſt judges of painting; even thoſe who furniſhed him with the lovelieſt flowers, confeſſing that there was ſomewhat in his colouring and pencilling that rendered every object more beautiful, if poſſible, than even nature itſelf. His pictures are finiſhed with inconceivable truth; for he painted every thing after nature, and was ſo ſingularly exact, as to watch even the hour of the day in which his model appeared in its greateſt perfection.

By the judicious he was accounted to paint with greater freedom than Mignon or Brueghel; with more tenderneſs and nature, than Mario da Fiori, Michael Angelo di Campidoglio, or Segers; with more mellowneſs than De Heem, and greater force of colouring than Baptiſt. His reputation roſe to ſuch a height at laſt, that he fixed immoderate prices on his works; ſo that none but princes, or thoſe of princely fortunes, could pretend to become purchaſers. Six of his paintings were ſold, at a public ſale in Holland, for prices that were almoſt incredible. One of them, a flower-piece, for fourteen hundred and fifty guilders; a fruit-piece, for a thouſand and five guilders; and the ſmaller pictures for nine hundred.

The vaſt ſums which Van Huyſum received for his works, cauſed him to redouble his endeavours to excel; no perſon was admitted into his room while he was painting, not even his brothers; and his method of mixing the tints, and preſerving the luſtre of his colours, was an impenetrable ſecret which he never would diſcloſe. Yet his conduct is certainly not to his honour; but rather an argument of a low mind, fearful of being equalled or ſurpaſſed. From the ſame principle he would never take any diſciples, except one lady, named Haverman, and he grew envious and jealous even of her merit.

By ſeveral domeſtic diſquiets his temper became changed; he grew moroſe, fretful, and apt to withdraw himſelf from ſociety. He had many enviers of his fame, which has ever been the ſevere lot of the moſt deſerving in all profeſſions; but he continued to work, and his reputation never diminiſhed. It is univerſally agreed, that he has excelled all who have painted fruit and flowers before him, by the confeſſed ſuperiority of his touch, by the delicacy of his pencil, and by an amazing manner of finiſhing; nor does it appear probable that any future artiſt will ever become his competitor. The care which he took to purify his oils, and prepare his colours, and the various experiments he made to diſcover the moſt luſtrous and durable, is another inſtance of his extraordinary care and capacity.

From having obſerved ſome of his works that were perfectly finiſhed, ſome only half finiſhed, and others only begun, the principles by which he conducted himſelf may perhaps be diſcoverable. His cloths were prepared with the greateſt care, and primed with white, with all poſſible purity, to prevent his colours from being obſcured, as he laid them on very lightly. He glazed all other colours, except the clear and tranſparent, not omitting even the white ones, till he found the exact tone of the colour; and over that he finiſhed the forms, the lights, the ſhadows, and the reflections; which are all executed with preciſion and warmth, without dryneſs or negligence. The greateſt truth, united with the greateſt brilliancy, and a velvet ſoftneſs on the ſurface of his objects, are viſible in every part of his compoſitions; and as to his touch, it looks like the pencil of nature.

Whenever he repreſented flowers placed in vaſes, he always painted thoſe vaſes after ſome elegant model, and the bas-relief is as exquiſitely finiſhed as any of the other parts. Through the whole he ſhews a delicate compoſition, a fine harmony, and a moſt happy effect of light and ſhadow. Thoſe pictures which he painted on a clear ground, are preferred to others of his hand, as having greater luſtre; and as they demanded more care and exactneſs in the finiſhing; yet there are ſome on a darkiſh ground, in which appears rather more force and harmony.

It is obſerved of him, that in the grouping of his flowers, he generally deſigned thoſe which were brighteſt in the centre, and gradually decreaſed the force of his colour from the centre to the extremities. The birds' neſts and their eggs, the feathers, inſects, and drops of dew, are expreſſed with the utmoſt truth, ſo as even to deceive the ſpectator. And yet, after all this merited and juſt praiſe, it cannot but be confeſſed, that ſometimes his fruits appear like wax or ivory, without that peculiar ſoftneſs and warmth which is conſtantly obſervable in nature.

Beſide his merit as a flower-painter, he alſo painted landſcapes with great applauſe. They are well compoſed; and although he had never ſeen Rome, he adorned his ſcenes with the noble remains of ancient magnificence which are in that city. His pictures in that ſtyle are well coloured, and every tree is diſtinguiſhed by a touch that is proper for the leafing. The grounds are well broken, and diſpoſed with taſte and judgment; the figures are deſigned in the manner of Laireſſe, highly finiſhed, and touched with a great deal of ſpirit; and through the whole compoſition, the ſcene repreſents Italy, in the trees, the clouds, and the ſkies. He died in 1749, aged 67. Pilkington's Dict.

HUZANKA,

Strahan and Preſton,
New-Street-Square, London.

HUZANKA, in *Geography*, a town of Lithuania, in the palatinate of Novogrodek; 36 miles S.E. of Novogrodek.

HUZZARD, in *Mining*, ſignifies ochry, foul, or bad; as huzzarded limeſtone in Derbyſhire, is the ochry and cherty mixtures of ſtone found in the rocks where they ſkirt the veins, and in the ſtony lenticular maſſes, found in the veins called *Riders*, which ſee. Sometimes this kind of ſtone, unfit for lime-burning, is called baſtard-limeſtone.

HWARF, in *Geography*, a town of Sweden, in Weſt Gothland; 63 miles E. of Uddevalla.

HWEN, Hven, or *Ween*, a fertile iſland of Sweden, to which country it was granted by the treaty of Roſchild, in 1658, ſituated in the Sound, about 8160 paces in circuit, and having at a diſtance the appearance of a high mountain. This iſland was granted by Frederick II. king of Denmark, to Tycho Brahe (ſee Brahe). The whole iſland contains but one pariſh, or village, with about 50 houſes; 15 miles N. of Copenhagen. N. lat. 55° 54′. E. long. 12° 42′.

HWITTIS, a town of Sweden, in the government of Abo; 15 miles N. of Biorneborg.

HYACINTH, in *Botany*. See Hyacinthus.

Hyacinth, *African blue umbellated*. See Crinum.

Hyacinth, *Grape*. See Hyacinthus.

Hyacinth, *Lily and Starry*. See Scilla.

Hyacinth, *Tuberoſe*. See Polyanthus.

Hyacinth, in *Natural Hiſtory*. See Gems and Zircon.

HYACINTHIA, in *Antiquity*, feaſts held at Sparta in honour of Apollo, and in commemoration of his favourite Hyacinth.

This Hyacinth was the ſon of Amyclas, king of Sparta, and was beloved both by Apollo and Zephyrus. The youth ſhewing moſt inclination to the former, his rival grew jealous; and to be revenged, one day, as Apollo was playing at the diſcus, *i. e.* quoits, with Hyacinth, Zephyrus turned the direction of a quoit which Apollo had pitched, full upon the head of the unhappy Hyacinth, who fell down dead. Apollo then transformed him into a flower of the ſame name; and, as a farther token of reſpect, they ſay, commanded this feaſt. The Hyacinthia laſted three days; the firſt and third whereof were employed in bewailing the death of Hyacinth, and the ſecond in feaſting and rejoicing.

The perſons who aſſiſted at the ceremony were crowned with ivy: becauſe, ſays Voſſius, De Idolol. lib. ii. cap. 14. Bacchus and Apollo were the ſame perſon.

HYACINTHUS, in *Botany*, ὑάκινθος, a name adopted from the ancient Greeks, who applied it to the flower ſuppoſed to have ſprung from the blood of Hyacinthus, the favourite of Apollo, when accidentally ſlain. Great differences have ariſen amongſt commentators concerning the plant of the ancients, which we cannot preſume to ſettle, but there ſeems no paramount authority for the preſent application of the name in queſtion.—Linn. Ord. *Coronariæ*, Linn. *Aſphodeli*, Juſſ.

Gen. Ch. *Cal.* none. *Cor.* of one petal, bell-ſhaped; its limb in ſix reflexed ſegments. Nectary three pores near the ſummit of the germen. *Stam.* Filaments ſix, awl-ſhaped, uniform, ſhorter than the corolla, inſerted into the tube; anthers approaching each other. *Piſt.* Germen ſuperior, roundiſh, with three angles and three furrows; ſtyle ſimple, ſhorter than the corolla; ſtigma obtuſe. *Peric.* Capſule roundiſh with three angles, of three cells and three valves. *Seeds* moſtly two in each cell, roundiſh.

Eſſ. Ch. Corolla inferior, of one petal; tube ſwelling; limb regular, in ſix ſegments. Germen with three honey-bearing pores.

Obſ. The tube of the corolla, and even its limb, varies ſo much in ſhape, that Tournefort, and recently Mr. Ker, in Curtis's Botanical Magazine, have divided this genus; their *Muſcari*, ſeparated from it, having a globular tube. In ſome ſpecies, as *H. romanus*, the limb is more deeply divided; but in *H. non ſcriptus* of Linnæus the corolla is actually of ſix petals, and we therefore preſume this ſpecies is properly removed, in the *Fl. Brit.* and Engliſh Botany, t. 377, to *Scilla.* Conſiderable doubts have, moreover, ariſen reſpecting the melliferous pores deſcribed by Linnæus upon the germen, which are certainly not diſcernible in every one of the ſpecies, but indeed they are to be ſeen at a particular period only in any.

Willdenow has thirteen ſpecies, of which *H. non ſcriptus* is a *Scilla*, as we have ſaid, and *cernuus* alſo; but the loſs of theſe may be ſupplied by two of the *Muſcari* tribe from Desfontaines, *maritimus* and *parviflorus.*

Fair examples of the genus are the common garden Hyacinth, *H. orientalis*, whoſe numerous and gorgeous varieties are the delight of floriſts; ſee Curt. Mag. t. 937; and *H. amethyſtinus*, prettily figured in Redoutés Liliacées. t. 14.

H. *Muſcari*, figured in Curt. Mag. t. 734, and Redouté Lil. t. 132, a native of the Levant, is hardy in our gardens, and valuable for its delicious muſky ſcent, though not conſpicuous for beauty, its flowers being of a duſky green.

H. racemoſus, Curt. Mag. t. 122. Engl. Bot. t. 1931, the Starch Hyacinth, ſo called from the peculiar ſmell of its dark blue flowers, is wild or naturalized on walls or in ſandy fields in England, flowering in May.

H. corymboſus, Linn. Mant. 223, is made a *Maſſonia* by Mr. Ker, in Curt. Mag. t. 991, but we are at a loſs to underſtand the reaſon of this meaſure, againſt which the habit ſtrongly revolts.

Hyacinthus, in *Gardening*, comprehends plants of the bulbous-rooted, flowering, perennial kind; of which the ſpecies principally cultivated are the eaſtern, or garden-hyacinth (H. orientalis); the common hyacinth or hare-bells (H. non-ſcriptus); the bending hyacinth (H. cernuus); the late-flowering hyacinth (H. ſerotinus); amethyſt-coloured hyacinth (H. amethyſtinus); the muſk hyacinth (H. muſcari); the feathered hyacinth (H. monſtroſus); the purple grape hyacinth (H. comoſus ; the blue grape hyacinth (H. botryoides); and the cluſtered grape hyacinth (H. racemoſus).

The firſt ſpecies and varieties are the ſorts that are the moſt uſually raiſed, and eſteemed by thoſe engaged in the culture of flowers.

The varieties of this ſpecies are numerous; as thoſe with ſingle white flowers; with double white flowers; with red ſingle and double flowers; with fleſh-coloured ſingle and double flowers; with blue ſingle and double flowers; with purple blue-coloured ſingle and double flowers; with yellow flowers; with double white flowers with red eyes or middles; with double white with purple eyes; with double white with fleſh-coloured eyes; with double white with yellow eyes; with double agate blue; with double and ſingle porcelain-blue; and with double and ſingle violet-coloured flowers.

And beſides, there are alſo a number of intermediate varieties which have been obtained from ſeed, and by which many new ones of the chief ſorts juſt noticed are yearly produced; each being diſtinguiſhed either by the name of the place where it was firſt raiſed, the perſon who raiſed it,

Strahan and Preſton,
New Street-Square, London.

or that of illuſtrious perſonages, ſuch as great kings, generals, poets and hiſtorians, as well as gods and goddeſſes, &c.

The principal circumſtances by which the properties of a good double hyacinth are known, are that the ſtem or ſtalk be tall, ſtrong, and upright; the flowers or bells ſufficiently numerous, each being ſuſpended by a ſhort ſtrong peduncle, having a horizontal poſition; the whole preſenting a compact pyramidal form, with the crown or uppermoſt flower perfectly erect: the flowers ſhould be large and well filled with broad bold petals, appearing to the eye rather convex than flat or hollow; they ſhould extend to about the middle of the ſcape or ſtalk. The plain colours ſhould be clear and bright, ſtrong ones being generally preferred to ſuch as are pale, and thoſe which are mixed ſhould blend together in an elegant manner.

In the fifth ſort moſt of the flowers have white ſtripes and edges; occaſionally varying to pure white, and a fine pale red colour, with deeper coloured veins running along the three outer ſegments. It was formerly known to gardeners under the title of Coventry blue hyacinth.

The ſixth ſpecies alſo affords varieties that have aſh-coloured purple flowers on the lower part of the ſpike, but which are larger and have more of the purple caſt than in that ſort; and thoſe on the upper yellow with a very grateful odour, and with very large yellow flowers.

The eighth ſort, which is termed the two-coloured or taſſel hyacinth by Mr. Curtis, has varieties with white and with blue flowers.

This is eſteemed more for its ſingularity than any beauty it diſplays.

The ninth ſpecies has likewiſe varieties with blue, with white, and with aſh-coloured flowers.

Method of Culture.—The firſt of theſe ſorts and varieties, are all increaſed by planting the off-ſets from the roots, in the manner of other bulbous-rooted perennial plants; and by ſowing the ſeed to produce new varieties of the flowers.

And they ſucceed beſt in a light ſoil, but will proſper in any common earth, particularly in moderate ſandy ground, in a dry, open, ſunny ſituation. Theſe bulbs, if planted in ſtrong or very moiſt land, are apt to rot in winter, or become diſeaſed. Where, therefore, the ſoil of the flower-borders or beds is of a ſtrong heavy quality, the part deſigned for hyacinths ſhould have light materials incorporated with it, ſuch as any light ſandy earth, from the ſurface of ſome common or other place; drift ſea-ſand, or any upper ſandy ſoil, or light earthy compoſt; and where the ſoil of the borders, &c. is of a very light, ſharp, ſandy nature, a portion of light, mellow, loamy earth and neat's dung, or well rotted dung of old hot-beds, ſhould be mixed with it, which make a fine compoſt ſurface mould for the hyacinth, when blended and laid on long enough before for the dung to be converted into mouldy earth.

The ground ſhould be well wrought over as a preparation for the plants, one ſpade deep at leaſt, raiſing the bed or border a little above the general level to avoid moiſture; and raking the ſurface as ſmooth and even as poſſible.

The floriſts moſtly prepare a compoſt for their rare kinds of hyacinths, with light ſandy loam, or any ſandy earth from a paſture field, taking only the top ſpit, ten or twelve inches deep, adding about one-third, from the ſurface, to one of drift or ſea-ſand, and the ſame quantity of rotten neat's dung; mixing the whole in a heap ridge-ways, in ſome dry ſunny expoſure, to lie ſeveral months, or if a year or more the better it will be.

To the above materials ſome alſo add a quantity of rotten leaves of trees, thoroughly decayed tanner's bark, or any perfectly rotten earthy wood, or rotten ſaw-duſt; all of which together greatly improve the compoſition; but as theſe are not always readily obtained, the other compoſt is frequently uſed with ſucceſs. With theſe compoſts a bed is prepared in the beginning of autumn, four feet wide and two deep, a cavity being dug out that width and depth, and filled up entirely with the compoſition, ſix inches above the common level, to allow for ſettling, leaving it a fortnight or a month to ſettle; when it is ready for the reception of the bulbs of the plants.

The cuſtom with the curious in theſe plants, is never to plant the fine ſorts two years together in the ſame bed or earth, without ſome previous renewal, as by planting them every year in a freſh bed, or freſh prepared compoſt, it greatly improves the ſize and beauty of the flowers.

The moſt proper ſeaſon for planting them is either in October or the beginning of November; as thoſe then planted ſhoot early in ſpring, and flower ſtrong at their uſual ſeaſon; but thoſe planted later in autumn, or continued out of the ground till January and February, for a late bloom, flower weaker and with inferior beauty; the principal part ſhould always be planted in the autumnal ſeaſon.

Where any of the common kinds are intended to be planted to adorn the open borders contiguous to the principal walks, or lawns near the habitation, to increaſe the variety in aſſemblage with other bulbous-rooted ſpring flowers, as early tulips, narciſſuſes, or anemones, ranunculuſes, &c., they ſhould be diſpoſed towards the front, more or leſs in a varied order, in patches of three roots in each, three or four inches deep; and the patches may be from about one yard to three or four diſtance, letting them ſtand to take their chance, without any further care in their culture.

And in planting the fine double ſorts, four or five rows may be planted on each bed lengthways, about nine inches diſtant in each row, and about four inches deep, either in drills the above depth, by dibble, or by bedding them in; and as ſoon as they are planted in either method, the ſurface of the bed ſhould be raked ſmooth and even on the upper ſide.

The bulbs being thus planted, the choiceſt ſorts ſhould be protected in the beds occaſionally, during winter, from ſevere froſt. They may be readily protected by a covering of ſtraw, or any kind of dry, ſtrawy litter, three or four inches thick; or by arching the beds with hoops or rods, or with moveable arched frames of open-work, covered with mats, the coverings being immediately removed when not wanted. The ſame caution ſhould be continued in the ſpring.

When the flower ſtems are advanced nearly to their full height, it is proper to ſupport them, by placing a ſmall ſtick, fifteen or eighteen inches long, cloſe to each plant, being careful not to thruſt it into the bulb, and to tie the ſtems neatly to each ſtick, by which the ſpikes of flowers will be preſerved in an upright poſition.

When in bloom, the curious ſorts may be preſerved much longer in beauty, by being ſcreened occaſionally from the ſun and rain, by an awning or umbrella of mats or canvas: they ſhould, however, be ſhaded only from the mid-day ſun, from about ten to three or four o'clock, and only from exceſſive rains and boiſterous winds.

But when the flowers begin to fade, all coverings ſhould be entirely removed, that the bulbs and increaſing off-ſets may derive all poſſible benefit from the free air, dews, &c. When the ſeaſon for flowering is over, the bulbs ſhould be taken up, which, in the floriſt's language, is called lifting the roots. The fine ſorts ſhould be taken up at this period to ſeparate the off-ſets for increaſe, as well as to benefit the main bulbs, which will always flower ſtronger than ſuch as are ſuffered to remain two or more years unremoved.

The proper time for this work is in ſummer, ſoon after they have done flowering, when their leaves begin to turn yellow, as then the bulbs have had their full growth for that ſeaſon, and ſhould by no means remain longer in the ground, as they will rot.

Dry weather ſhould be choſen, and a trowel or ſmall ſpade is proper for lifting them, taking them up one by one, and breaking off the ſtem within an inch or two of its origin; then laying them in an airy room, out of the midday ſun, to dry off the graſs moiſture very gradually, and to ripen the bulbs to a due hardneſs, when they appear of a purpliſh tinge, otherwiſe they are apt to rot and be deſtroyed.

When the bulbs are properly hardened and ripened, they ſhould be taken up and ſeparated from any off-ſets, well cleared from earth, looſe ſkins, and fibres at bottom; then, after expoſing them a few hours to the ſun, put up in boxes ſingly or upon dry ſhelves out of the ſun, to remain till the ſeaſon for planting them again arrives.

All the off-ſets appearing about the main bulbs at the lifting ſeaſon, are to be carefully ſeparated from them, either as ſoon as they are taken up, or after the bulbs have lain to ripen, being kept ſeparate, and planted in the early autumn, in beds by themſelves, in rows ſix inches aſunder, and two or three deep, where they ſhould remain a year or two; then be taken up at the proper lifting ſeaſon in ſummer, and managed as the large blowing roots.

In raiſing theſe bulbs from ſeed, which is practiſed by the curious, to obtain new varieties, to increaſe their ſtock; from the time of ſowing, it will be four or five years before the bulbs produce flowers: the ſeed ripens in the ſummer, which may eaſily be ſaved, by ſuffering ſome of the fineſt ſingles and half doubles to ſtand to ripen it in perfection. The proper ſeaſon of ſowing it is about the beginning of autumn, in which caſe the plants will appear in the following ſpring. It grows perfectly well in a bed or border of light earth in the open ground; but where only a ſmall quantity is to be ſown, it may be done in pots or boxes, and be thereby much more convenient to remove into different ſituations at different ſeaſons, as there may be occaſion. Whichever mode is adopted, light rich mould ſhould conſtantly be choſen for the purpoſe, the ſurface being rendered perfectly even and ſmooth, and the ſeeds ſown with regularity over it, and covered in to the depth of from an inch to an inch and a half. Where ſown in pots or boxes, they ſhould be plunged up to their brims in the mould, in ſome dry ſituation, and as the winter begins to ſet in, be removed either under the occaſional protection of a hot-bed frame, or be covered with ſome light dry litter in froſty weather, but letting them be fully expoſed whenever it is mild.

As ſoon as they firſt appear in the ſpring, with very ſmall leaves, they ſhould be kept perfectly free from weeds, and have a little fine mould ſifted over them in the autumn in the beds, being protected in the winter ſeaſon as before directed. When their leaves begin to decay in the ſecond ſummer, the young bulbs ſhould be taken up, and replanted in nurſery beds, about the end of Auguſt or beginning of the following month, in ſmall drills, two inches in depth, letting them be three or four inches apart. They may remain in this ſituation two years, only ſifting over the ſurfaces of the beds about half an inch thickneſs of fine mould in the autumn, and giving them occaſional protection by coverings or other means, during the winters. After this they are to be managed in the uſual manner, being taken up at the general lifting ſeaſon, and planted out where they are to flower in the autumnal months.

All the other ſpecies are capable of being readily increaſed by planting out the off-ſets in the method that has been already directed, as they each of them afford them in great plenty. They may be taken up every ſecond or third year, at the time the leaves decay, and the off-ſets be ſeparated and managed in the ſame mode as has been directed for thoſe of the firſt ſpecies.

Method of blowing the Bulbs in Water-Glaſſes, &c.—Bulbs of this ſort may be brought to flower in the winter and early ſpring, by having them put in root-glaſſes filled with water, or in pots, or ſmall light boxes filled with ſand, or light dry ſandy mould, in the beginning of the autumn, and depoſiting them in a warm room, green or hot-houſe. In all theſe ſituations they blow in a highly agreeable manner, and earlier or later in theſe different ſeaſons, according to the periods at which the bulbs have been introduced and planted.

The ſorts of bulbs commonly employed for glaſſes and pots, &c. are principally the varieties of the oriental kind, eſpecially where they are to be blown in water. In providing theſe, care ſhould be taken to ſelect ſuch bulbs as are perfectly ſound and firm, having the root part at the bottom full, plump, and ſolid.

The glaſſes for this purpoſe are of the bottle kind, having ſtraight upright bodies gradually narrowing towards the tops, where they terminate in wide concave mouths, capable of containing one root or bulb in each. They are uſually ſold at the glaſs-ſhops, ſeed-ſhops, and nurſeries, at from about five to nine ſhillings the dozen. In uſing them they ſhould be filled with ſoft clear water up to the necks, and a little way into the cavity of the mouths, one bulb being then placed in each glaſs, with the bottom or root part a little in the water, and the top upright, ſetting them in the window of a room which faces the ſun, or upon a chimney-piece, or the ſhelves of a light room where there is a fire, as the growth of the bulbs is thus greatly promoted. And they ſoon put forth ſtrong root-fibres into the water, and at the ſame time puſh out leaves and flower-buds at the tops, which advance in a regular manner to flowering, in their peculiar habits. It is neceſſary to renew the water occaſionally, as it becomes foul, or affords a fœtid ſmell, by diſcharging the old, and immediately filling up the glaſſes with ſuch as is freſh, which is the whole of the trouble that is requiſite in their management. As ſoon as the ſtalks and flower-ſpikes are advanced to a tolerable height, a neat ſmall ſtick ſhould be placed to each as a ſupport to keep it in an upright direction.

But in order to have the bulbs in blow at the moſt early ſeaſon, the glaſſes that contain them ſhould be placed in a hot-houſe, or other forcing-houſe.

And by planting ſome bulbs in pots or neat boxes of light ſandy earth, or pure ſand, in the autumn, and putting them in a warm ſitting room, green-houſe, &c. they will flower at an early period.

The bulbs in the glaſſes uſually flower in about ſix, eight, or ten weeks, acccording to the warmth of the ſituation in which they are placed. And they generally continue in blow for three or four weeks.

Where bulbs of this ſort are to be forced by fire or bark heat, ſome middling ſmall pots ſhould be provided, or ſmall, neat, oblong boxes, ſix inches in depth, filling them half way, or a little more, with light dry earth, or that of a ſandy nature, or with ſand, planting one, two, three, or more bulbs in each pot or box, according to the ſize of them, preſſing the bottoms gently into the earth, and filling up with more earth or ſand over the crown of the bulbs. After they have been thus planted, the pots or boxes ſhould be placed in the houſes, &c. watering the bulbs moderately with ſoft water, when the earth appears dry. They ſoon come into blow in this way, and, when the flowering is over, and the ſtems and leaves are decayed, the old bulbs ſhould be taken up, cleaned and dried; being afterwards planted out in the open ground to recover ſtrength, and produce good effects in the future year.

Theſe are all highly beautiful plants, that afford much ornament and variety in gardens and pleaſure-grounds. The more hardy common ſorts are proper in the borders, clumps, and other parts towards the fronts; and thoſe of the double finer kinds, in beds, pots, glaſſes and boxes, to be ſet out for variety.

HYADES, Ὑάδες, from ὕειν, *to rain*, in *Aſtronomy*, are ſeven ſtars on the bull's head, famous among the poets for the bringing of rain.

The principal of them is in the bull's left eye, by the Arabs called Aldebaran. See TAURUS.

The poets feign them to have been the daughters of Atlas and Pleione; and we have the names of ſix of them, *viz.* Eudora, Ambroſia, Prodice, Coronis, Philito, and Poliſo, others add a ſeventh, *viz.* Thione. Their brother Hyas being torn in pieces by a lioneſs, they wept his death with ſuch vehemence, that the gods, in compaſſion to them, tranſlated them into heaven, and placed them in the Bull's forehead; where, as they ſay, they continue to weep: this conſtellation being ſuppoſed to preſage rain.

Others repreſent the Hyades as Bacchus's nurſes, and the ſame with the Dodonides, who fearing the reſentment of Juno, and flying from the cruelty of king Lycurgus, were tranſlated by Jupiter into heaven.

It is probable that theſe pretended Hyades, a Greek term ſignifying rainy, were merely poetical perſonages, whoſe names were given to certain ſtars diſcovered by Atlas.

HYÆNA, or HIÆNA, in *Natural Hiſtory*, a ſpecies of the canis, with a ſtraight annulated tail, and the hairs of the neck long and erect; naked ears, and four toes on each foot. It has ſix cutting teeth, and two canine in each jaw; and between the tail, which is ſhort, and the anus, a tranſverſe orifice. The animal which is known to us by this name is a quadruped almoſt as large as a wolf, excepting that its legs are not ſo long; the hair of it is rough, and its ſkin ſpotted with divers colours. Hyænas were formerly produced at Rome in the public games, and they have been repreſented on ſome medals on account of their rarity. Spanheim, who had copies of it engraved from medals, deſcribes it with the head of a maſtiff, with ſhort triangular ears, a lion's tail and feet, and hair ſpotted all over like a tyger's. It inhabits Aſiatic Turkey, Syria, Perſia, and Barbary.

Pliny's account of this animal is very fabulous. He ſays, that it changes its ſex every year; and that from its eyes are taken precious ſtones, called *hyænia.* Ariſtotle and Ælian ſay, that it makes dogs dumb with its ſhadow; and that it imitates the ſpeech of mankind in order to deceive them, and thus draw them out of their houſes and devour them. The ſuperſtitious Arabs carefully bury the head when they kill a hyæna, leſt it ſhould be applied to magical purpoſes, as the neck was of old, by the Theſſalian ſorcereſs. Lucan. lib. vi. 672.

Buſbequius, in his travels to Amaſia, relates ſeveral particulars of this animal. He ſays, it is almoſt of the ſhape of a wolf, but not ſo tall; that its hair is like that of a wolf, except its being more briſtly, and marked at certain diſtances with great black ſpots; it has no neck, but its head is faſtened to the vertebræ of the back, ſo that it is forced to turn itſelf quite round, whenever it would look behind. It is very cruel and voracious; it drags dead bodies out of graves, and carries them to its den. It alſo preys on the herds and flocks. It is ſaid to imitate the voice of a man, and that by this means it often deceives travellers. It is a ſolitary unſociable animal, and inhabits the chaſms of rocks. Theſe animals have a moſt malevolent aſpect; and they are in their nature cruel, fierce, and untameable.

HYÆNA, *foſſil remains of.* M. Cuvier, in his Report to the National Inſtitute of France, of the Tranſactions of the Phyſical and Mathematical Claſs in 1806, mentions, that the bones of hyænas have been found in a great number of caverns in the mountains of Hungary and Germany, in company with the ſkeletons of tigers, bears, and other animals of unknown ſpecies: they are alſo found in looſe recent alluvial ſoils, in ſome vallies, he ſays, in the Report for 1809. Phil. Mag. vol. 35. p. 388.

HYÆNIUS LAPIS, the name of a ſtone ſaid to be found in the eyes of the hyæna. Pliny tells us, that theſe creatures were anciently hunted and deſtroyed for the ſake of theſe ſtones, and that it was ſuppoſed they communicated the gift of prophecy, on being put under the tongue.

HYAGNIS, in *Greek Mythology*, the Oxford marbles tell us, was of Celene, and according to Alexander, cited by Plutarch in his Dialogues, he was the moſt ancient performer on the flute in Greece.

He was contemporary with Ericthon, 1506 years B. C., who inſtituted the Panathenæan games at Athens. He was ſaid to be the author of the nomes conſecrated to Cybele, to Bacchus, to Pan, and to many other divinities.

He added a ſixth ſtring to the lyre of Mercury. Some make him the inventor of the Phrygian mode, and double flute. He was the father of Marſyas, according to Plutarch and Nonnus. Apuleius ſays, that he brought the flute to its higheſt perfection.

HYALE, in *Mythology*, one of the nymphs of Diana.

HYALINÆ, in *Natural Hiſtory*, derived from ὕαλος, *glaſs*, the name of a genus of foſſils, of the claſs of the talcs, the characters of which are, that they are compoſed of ſeparate plates, of conſiderable thickneſs, and thoſe not fiſſile into any thinner.

There is but one ſpecies known of this genus, which is found lodged in the clay, in the ſteep banks of the river Aube in Champaigne, near the town of Bar, and in ſome other places along that river; but ſo far as is yet known, in no other part of the world.

HYALINGE, in *Geography*, a town of Sweden, in the province of Bleckingen; 20 miles S. S. E. of Konſbeck.

HYALITE, in *Mineralogy*, occurs in wacke, in reniform maſſes, and is chiefly found at Frankfort on the Mayne. It has a conſiderable reſemblance to gum, and is nearly allied to opal. The maſſes are uſually much cracked. Its colour is yellowiſh and greyiſh-white, and it occurs in thin cruſts on other minerals. Externally and internally it is ſhining, and its luſtre is vitreous. The fracture is ſmall and flat conchoidal. The fragments are indeterminately angular, and ſharp edged. It is tranſlucent, paſſing to ſemi-tranſparent. It is intermediate between the hard and ſemi-hard: is brittle and frangible. The ſpecific gravity is 2.11. It is infuſible at 150° of Wedgwood, but yields to ſoda. Jameſon's Min. Thomſon's Chemiſtry.

HYALOIDES, in the *Natural Hiſtory of the Ancients*, the name of a tranſparent ſtone fit to engrave ſeals on, which was the great uſe they made of the gems, and very bright and readily reflecting the images of things. We have this ſtone to this day in many parts of America, particularly about the river of the Amazons, from whence many fair ſtones of it have at times been brought, and have been by ſome miſtaken for diamonds; they are a ſort of pebble cryſtal, approaching to what the jewellers call the white ſapphire. Hill's Theophraſt. p. 80.

HYALOIDES, from ὑαλη, *glaſs*, in *Anatomy*, is ſometimes applied to the vitreous humour of the eye, contained betwixt the tunica retina, and the uvea.

HYANCHE, a word uſed by the old medicinal writers to ſignify a quinſy, attended with a ſwelling on each ſide of the throat.

HYARON, in *Geography*, a ſmall iſland in the Grecian Archipelago, near the coaſt of the Morea, between the gulf of Napoli and the gulf of Engia.

HYAT, a town of Hindooſtan, in the circar of Sollapour; 12 miles E. N. E. of Sollapour.

HYATNAGUR, a town of Hindooſtan, in Bengal; 18 miles N.W. of Mauldah.

HYBERNICUS LAPIS. See *Iriſh* SLATE.

HYBLA, in *Ancient Geography*, a town of Sicily; of which Stephanus gives an account, diſtinguiſhing three places of this name under the appellations of *major*, *minor*, and *parva*. The firſt, or *Hybla major*, was ſituated near and ſouth of mount Ætna. Pauſanias, in his "Eliac," l. i. c. 25, ſays, that it was ſituated in the territory of Catana, and entirely depopulated. Avola, 16 miles from Syracuſe, which formerly ſtood on a hill, boaſts of having been the Hybla major, ſo celebrated for its honey: but to this title ſo many places lay claim, that it is not eaſy to decide on the ſubject. See AVOLA, MELILLI, and PATERNO. *Hybla minor*, or *minima*, called alſo *Heræa*, was ſituated in the ſouthern part of Sicily; and is placed in the Itinerary of Antonine on the route from Agrigentum to Syracuſe. This is now "Calata-Girone." *Hybla parva* was a maritime town of Sicily, on the eaſtern coaſt. It was alſo denominated *Galaotis*, and more frequently *Megara*, from which the gulf, to the ſouth of which it was ſituated, was called "Megarenſis ſinus."

HYBLA, *Mount*. See MELILLI.

HYBLÆANUM BITUMEN. See BITUMEN.

HYBOMA, a word uſed by the old ſurgical writers for a gibboſity of the ſpine.

HYBRISTICA, of ὑβρις, *injury*, in *Antiquity*, a ſolemn feaſt held among the Greeks, with ſacrifices, and other ceremonies; at which the men attended in the apparel of women, and the women in that of men, to do honour to Venus in quality either of a god, or a goddeſs, or both. Or, according to the account given by others, the hybriſtica was a feaſt celebrated at Argos, wherein the women, being dreſſed like men, inſulted their huſbands, and treated them with all marks of ſuperiority, in memory of the Argian dames having anciently defended their country with ſingular courage againſt Cleomenes and Demaratus.

Plutarch ſpeaks of this feaſt in his treatiſe of the great actions of women. The name, he obſerves, ſignifies *infamy*; which is well accommodated to the occaſion, wherein the women ſtrutted about in men's clothes, while the men were obliged to dangle in petticoats.

HYDAGE. See HIDAGE.

HYDARTHRUS, in *Surgery*, ſignifies the diſeaſe of the joints, better known by the name of white-ſwelling. The term is derived from ὑδωρ, *water*, and αρθρον, *a joint*.

HYDASPES. See BEHUT.

HYDATID, ὑδατὶς, in *Medicine*, from ὑδωρ, *water*, in the genitive caſe, ὑδατος, literally a *veſicle* containing a watery or tranſparent fluid, denotes certain ſpherical bodies, which are found occaſionally in man, as well as in other animals, lodged in, or adhering to, the different viſcera.

The term *hydatid* has been applied to *two ſpecies* of veſicular bodies, which appear to differ very materially in their nature: one of theſe, which, in the human ſubject, is commonly found adhering to the liver, ſpleen, or meſentery, and appears to have no farther connection with the body, than as it furniſhes a nidus, is commonly ſuppoſed to be of an animal nature, and to poſſeſs an independent vitality: the other ſpecies, which is found attached to the kidnies, uterus, ovaries, or placenta, is conſidered as dependent on a mere morbid alteration of the ſtructure of theſe parts. The firſt of theſe may be called the *true*, the ſecond the *ſpurious* hydatid, for the ſake of diſtinction; although at preſent we cannot conſider the nature of either variety as ſatisfactorily aſcertained, or the appellations as ſtrictly correct.

1. *Of the true Hydatid.* The firſt authors, who deſcribed the hydatids accurately, and obſerved that they poſſeſſed the power of motion, were Phil. Jac. Hartmannus, who publiſhed his diſcovery in the year 1685 (ſee Miſcell. Natur. Curioſ. Dec. 2, Ann. 4.); and Dr. Tyſon, whoſe account was printed in the Philoſophical Tranſactions for the year 1692, and who appears to have been unacquainted with Hartmann's obſervations. Tyſon, who deſcribed and figured the hydatid, as found in ſheep, obſerved the neck and mouth of the animal, and ſaw them in motion; Hartmann farther ſaw the whole body in motion, by putting them into warm water. Profeſſor Pallas afterwards examined them very minutely, and finding their heads of the ſame ſtructure as that of the *tænia*, or tape-worm, he gave them the name of *tænia hydatigena*. (See his Miſcellanea Zoologica.) The abbé Fontana alſo obſerved them in ſheep, ſaw the young ones adhering to the ſides of the parent bag, and alſo with a microſcope examined the heads of them, and found them reſembling thoſe of tæniæ. (Opuſcoli Scelti, tom. 6.) Dr. Baillie ſays, "there is no doubt at all, that the hydatids in the livers of ſheep are animalcules: they have been ſeen to move when taken out of the liver, and put into warm water; and they retain this power of motion for a good many hours after a ſheep has been killed." (Morbid Anatomy, p. 224, ed. 2d.) The late Dr. John Hunter gave the following account of ſome hydatids, that were found in the abdomen of a ſheep, adhering to the fat about the kidnies, and to the liver, in conſiderable number.

"The hydatids in the ſheep were exactly the ſame with thoſe deſcribed by Tyſon. They conſiſt of a mouth, neck, and oblong ſpherical body. The mouth had nothing of the cruciform appearance, if I may be allowed the expreſſion, that late writers have made the characteriſtic mark of *tænia*, and which they ſay is to be found in all hydatids. The mouth, examined with ſome care with the microſcope, appeared to be a ſimple longitudinal aperture. The neck was compoſed of rings, and there appeared very fine circles ſurrounding the body. They varied in ſize, from that of a cheſnut to the dimenſions of a turkey's egg. When put in warm water, though it muſt have been twelve or fourteen hours after the ſheep had been killed, they moved briſkly, with a kind of periſtaltic motion all over the body. Each hydatid was lodged in a ſeparate ſac, which was little more than ſufficient to hold it, for the neck was reflected upon the body. The ſides of the ſac were lubricated with a mucous fluid." See Tranſactions of a Society for the Improvement of Med. and Chirurg. Knowledge, vol. i. p. 50.

Hydatids are alſo found in the *brain* of ſheep, in which caſe they produce the diſeaſe, called, in ſome parts of the country "*the ſtaggers*." The hydatid is lodged in the ſubſtance of the brain; in one ſheep there were two hydatids, one in each hemiſphere of the brain; they were of an irregular oval ſhape, they had no mouth; their coats had the ſame appearance as in the hydatids found in the abdomen;

and, when put in warm water, they had a ſtrong periſtaltic motion. In ſome there were cluſters of young ones adhering to their inner coats. Theſe were ſomewhat oval in their ſhape, and adhered by one end; but on detaching them carefully, and examining them with good magnifiers, I could never find the cruciform mouth deſcribed by ſome writers." Dr. Hunter, loc. cit.

The hydatids, found in, or attached to, the liver, in the human ſubject, bear a ſtrong analogy to thoſe of ſheep above deſcribed; whence it is concluded, that they are moſt probably alſo animalcules. They have never been ſeen to move, indeed, when taken out of the body, and put into warm water; a circumſtance which may be explained by the length of time which elapſes after death, before the human body is examined; during which the hydatids muſt have loſt their living principle. There is undoubtedly ſome difference between the hydatids in the liver of ſheep, and in that of the human ſubject, in ſimplicity of organization, the hydatid in the human liver being a ſimple uniform bag, and the hydatid in that of the ſheep having a neck and mouth appended to the bag. But "this difference," Dr. Baillie remarks, "need be no conſiderable objection to the opinion above ſtated: life may be conceived to be attached to the moſt ſimple form of organization. In proof of this, hydatids have been found in the brains of ſheep, reſembling almoſt exactly thoſe in the human liver, and which have been ſeen to move, and therefore are certainly known to be animalcules." (Morbid Anat. p. 225.) In other reſpects, too, they bear a conſiderable analogy to each other.

The hydatids of the liver in man are commonly found incloſed in a cyſt, which is frequently of conſiderable ſize, and is formed of very firm materials, ſo as to give to the touch almoſt the feeling of cartilage: it is endowed with a ſtrong contractile power, ſo as forcibly to protrude its contents, through any opening made into it. It conſiſts of two coats, the outer one of which is thick and laminated, the inner a ſoft and pulpy lining, like coagulable lymph. A cyſt may contain one hydatid, or a greater number of them: they lie looſe in the cavity, ſwimming in a fluid; or ſome of them are attached to the ſide of the cyſt.

As to the ſtructure of the hydatids themſelves, they conſiſt of a tranſparent, or ſemi-tranſparent bag, uniformly round and ſmooth, and contain a clear fluid capable of coagulation. The common colour of them is white, but they are occaſionally ſeen of a light amber colour. The bag of the hydatid conſiſts of two laminæ, and poſſeſſes a good deal of contractile power. They are commonly unconnected with each other, or with the cyſt which contains them; but ſometimes they have been ſaid to incloſe each other in a ſeries, like pill-boxes. On the inſide of an hydatid ſmaller ones are ſometimes found, which are commonly not larger than the heads of pins, but ſometimes they are even larger in their ſize than a gooſeberry. Theſe are attached to the larger hydatid, either at ſcattered irregular diſtances, or ſo as to form ſmall cluſters; and they are alſo found floating looſe in the liquor of the larger hydatids. Dr. Hunter obſerves, that when the young ones, growing in the coats of the larger ones, were examined with the microſcope, they were found not to be ſet in the coats like pearls, but to be covered by a thin tranſparent membrane, ſo as to lie between two layers. The moſt common ſituation of hydatids of the liver is in its ſubſtance, and incloſed in a cyſt; but they are occaſionally attached to the outer ſurface of the liver, hanging from it, and occupying more or leſs of the general cavity of the abdomen.

There are many inſtances of hydatids, occurring in the ſituation laſt mentioned, and terminating life, in conſequence of the derangement produced by the prodigious preſſure on the viſcera, which they occaſioned. In theſe caſes, a large ſwelling of the abdomen takes place, yielding a diſtinct ſenſation of fluctuation, as in aſcites, or abdominal dropſy, attended with emaciation of the limbs, difficulty of breathing, œdema of the legs, and other ſymptoms of impeded functions. In one caſe, related by Dr. Simmons, a cyſt was found after death, of immenſe ſize, filled with hydatids of various ſizes, and attached to the liver, omentum, meſentery, and peritoneum. It alſo penetrated the diaphragm, and then, expanding again, filled almoſt the whole of the left cavity of the thorax, adhering to the pleura and mediaſtinum. The upper part of this ſac communicated in ſeveral places with the lungs, which were ulcerated; ſo that if the patient had lived long enough, ſhe would probably have coughed up hydatids, as one of the openings from the cyſt into the lungs was large enough to admit a gooſe-quill. In the ſubſtance of the liver, which weighed ſixteen pounds and a half, another large cyſt was found. This contained ten pints of hydatids, and ſixteen pints had been taken out of the abdominal cyſt before the part in the thorax was examined. (See Medical Communications, vol. 1. art. 5.) A ſimilar caſe is related in the Edinburgh Medical and Surgical Journal, vol. 2. p. 170. in which "an immenſe cyſt, occupying the whole cavity of the abdomen," was found after death, connected to the meſentery. It was diſtended to the utmoſt, and contained thirty-five pints of hydatids, many of them exceeding the largeſt oranges in ſize. In both theſe caſes, the diſeaſe was ſuppoſed to be common aſcites during life; and in both a fruitleſs attempt was made to draw off the fluid by tapping.

In the firſt of theſe hiſtories, we have ſeen that a ſmall communication actually exiſted between the ſac of hydatids, and the cells of the lungs, although none of the hydatids had paſſed that way. But there are inſtances on record, in which the true hydatids were *coughed up* from the lungs. A lady of Lancaſter, during an illneſs which continued more or leſs for three years, "coughed up ſeveral hundreds of hydatids, moſt of which were burſt, and of theſe many muſt have been as large as a pullet's egg: thoſe which were not burſt, were only about the ſize of a nutmeg." (London Med. Journal, vol. 6. p. 293, for the year 1785.) This lady recovered her health; ſhe had been conſidered as dropſical, and having diſeaſe in the liver. Another lady, who had a tumour in the right hypochondrium, in which fluctuation was diſtinctly perceived, expectorated 135 hydatids in the courſe of four months, after which ſhe began to amend. Med. Tranſactions of the Coll. of Phyſicians, vol. 2. art. 22.

In ſome caſes theſe abdominal cyſts form adheſions to, and communications with, the alimentary canal, through which the hydatids are diſcharged. A lady at Windſor was treated with mercurials, under the ſuppoſition that hepatitis, and conſequent ſuppuration in the liver, had taken place. "In about ten days the mercury began to affect her mouth, and at the ſame time ſhe voided an incredible quantity of the *tæniæ hydatigenæ*, or hydatides, by ſtool and by vomiting. Her attendants reckoned ſhe paſſed to the number of a thouſand; there being as many as filled two large chamber-pots. They were from the ſize of a ſmall pea, to an inch and a half in diameter, &c." An hepatic abſceſs afterwards opened externally, a gall-ſtone was diſcharged from it, and ſhe ultimately recovered. (Lond. Med. Journal, vol. 10. for 1789, p. 76.) An example of fatality occaſioned by a ſac of hydatids, ſituated in the *porta* of the liver, which, by its preſſure on the veſſels, produced complete obſtruction and jaundice, is related by Dr. Duncan, ſen. in the Ed. Med. and Surg. Journal, vol. 4. p. 187.

In a few inſtances, ſmall hydatids, formed in the kidnies, have been diſcharged by urine; as in a caſe related by Dr. Baillie, who obſerves, that "ſometimes the true hydatid is formed in the kidnies, having exactly the ſame nature with that which grows in the liver." (Morbid Anat. p. 279.) The hydatids, in this inſtance, differed much in ſize, from that of a ſmall orange, to that of a pin's head: the ſmaller ones only were of courſe paſſed with the urine; but in conſequence of the increaſed exertion, neceſſary to drive theſe through the urethra, the bladder had acquired a conſiderable thickneſs in its muſcular coat, as in other caſes of obſtruction to the free paſſage of the urine. In a caſe related by Dr. John Hunter, death was occaſioned by a collection of theſe hydatids, lodged between the bladder and *rectum*, filling the pelvis, and producing a fatal ſuppreſſion of urine. Dr. Hunter puts the following query reſpecting the manner in which the hydatids came to be lodged in that ſituation. "It has been obſerved," he ſays, "that they are moſt commonly found in the liver and ſpleen, and in the preſent caſe their original ſeat would appear to have been in the laſt of theſe viſcera: may not, however, one of the ſacs or bags in the ſpleen have burſt, by which the contents would be ſpread all over the abdomen, and from their own gravity would naturally fall into the pelvis; and may they not have adhered to the neighbouring parts, and ſo multiplied there?" See Tranſ. of a Society, &c. before quoted, vol. 1. p. 48.

Laſtly, theſe hydatids are ſaid to have been diſcharged from tumours in different parts of the body. See Philoſ. Trans. vol. 25.

Such are the ſituations in which the true hydatids have been obſerved to occur, and the modes in which they have eventually been diſcharged or have deſtroyed the patient. Dr. Hunter remarks, that of the various caſes related by writers ſcarcely any proved fatal, when the hydatids found an outlet. But, however deſirable it might, therefore, be to procure ſuch an outlet, where the preſence of hydatids is ſuſpected, it is obvious that, as they are generally ſeated in the abdomen, art can ſeldom if ever interfere, and the buſineſs muſt be left entirely to nature.

2. The *ſpurious hydatids*, if that term be allowable, which are found connected with the kidnies, the placenta, the ovaries, and uterus, appear to differ greatly in their nature from the hydatids above deſcribed. They are not incloſed in firm cyſts, nor exiſt without any attachment to each other, or the ſurrounding parts, nor do the larger ones contain others attached to their internal coats, or ſwimming in the fluid, as in the true hydatids. "Their coats are alſo thinner, and leſs pulpy, and not uncommonly they are almoſt as thin as any membrane of the body." It is, therefore, probable that they depend on a diſeaſed alteration of the parts in which they are ſeated, and are not diſtinct organized ſimple animals. (Baillie Morb. Anat. p. 278.) The hydatid ſtructure of the placenta is a diſeaſe not very uncommon, and uſually occaſions miſcarriage; for when it takes place, Mr. Home has remarked, "the natural healthy actions for the ſupport of the fœtus are ſo much impeded, that its growth is arreſted. This evidently happened in a caſe publiſhed, with an engraving of the placenta and fœtus, by Dr. Denman: and when the patient does not early miſcarry, the fœtus diſappears; and in all the inſtances where miſcarriage has taken place in a more advanced ſtage of the diſeaſe, I believe no fœtus has been found." (Mr. Home, in Tranſ. of a Soc. for the Improvement of Med. and Chir. Knowledge, vol. 2. p. 300.) The hydatids, in theſe caſes, are commonly ſmall, from the ſize of a pin's head, to that of a large pea or common grape, are cluſtered together, and individually connected with the placenta, or with each other, by a narrow ſtalk or pedicle. Lieutaud has mentioned the circumſtance of large maſſes of hydatids being found in the uterus. (Hiſt. Anat. Med. tom. 1. p. 335.) But it is probable, as Dr. Baillie ſuggeſts, that theſe were only hydatids of the placenta which had been retained there. Loc. cit. p. 379.

Hydatids are, perhaps, ſometimes found connected with the ovaria; but it is not improbable, as the ſame author remarks, that the cyſts, in ovarial dropſy, have been occaſionally confounded with the true hydatids, to which they bear ſome reſembance. They are, however, really very different. They have much firmer and leſs pulpy coats than hydatids; they contain a different kind of fluid; and they are differently connected among themſelves: for they adhere to each other laterally by pretty broad ſurfaces; do not incloſe each other; and appear to have no power analogous to generation, like hydatids, by which ſmaller cyſts are formed, that are attached to others of a larger ſize. It appears not improbable, that theſe ovarial cyſts are formed by a gradual enlargement of the ſmall veſicles, which make a part of the natural ſtructure of the ovaria. (Baillie, p. 392.) See *Encyſted* DROPSY.

HYDATIDES, Ὑδατίδες, of ὕδας, for ὕδωρ, *water*, in *Natural Hiſtory*, a name given by ſome writers to a ſpecies of aſtroites, the lineations of which reſemble waves. It is by others uſed as a name of the enhydros.

HYDATIS, in *Medicine*. See HYDATID.

HYDATIS, in *Zoology*. See TÆNIA.

HYDATISM, in *Surgery*, a word uſed by ſome writers to expreſs the noiſe or ſound made by the fluctuating humours contained in abſceſſes.

HYDATOCHOLOS, of ὕδωρ, *water*, and χολὴ, *bile*, an epithet uſed by the old writers on medicine for ſtools more than ordinarily liquid or bilious.

HYDATOIDES, Ὑδατοειδής, formed of ὕδωρ, ὕδατος, *water*, and εἶδος, *form*, *reſemblance*, a name ſome authors give to the aqueous humour of the eye, incloſed between the cornea and uvea.

HYDATOSCOPIA, compounded of ὕδατος, the genitive of ὕδωρ, *water*, and σκοπέω, *I view*, *I conſider*, called alſo *hydromancy*, a kind of divination, or method of foretelling future events, by means of water.

There is a natural or allowable kind of hydatoſcopia: it conſiſts in foretelling ſtorms, tempeſts, hurricanes, &c. from natural ſigns or indications in the ſea, air, clouds, &c.

HYDE, EDWARD, earl of Clarendon, in *Biography*, was born at Dinton, in Wiltſhire, in February 1608. He was educated in the elements of learning, under his father's roof, by the vicar of the pariſh, and his progreſs was ſo great that he was deemed fit for the univerſity at the age of thirteen. He was intended for the profeſſion of the law, and was entered very early of the Middle Temple. Here he was under the protection of his uncle Nicholas Hyde, afterwards chief juſtice of the King's-bench. He had the happineſs of being introduced early to a very reſpectable ſet of acquaintance, among whom were perſons of the firſt rank for talents and learning in the kingdom, ſuch as lord Falkland, Selden, Kenelm Digby, Carew, Waller, Sheldon, Hales of Eton, Chillingworth, &c. of whom he has, in his memoirs, given very characteriſtic and entertaining ſketches. To their converſation and example he has aſcribed much of his own greatneſs, and he has ſtrongly expreſſed his ſenſe of the benefit of ſuch ſociety, by ſaying that "he never was ſo proud, or thought himſelf ſo good a man, as when he was the worſt man in company." He engaged in a caſe on the part of the merchants of London, which was the means of introducing him to the notice of archbiſhop Laud, then a commiſſioner of the treaſury, who became very ſerviceable to him in his future profeſſional advancement. His connections were the means of throwing a deal of buſineſs into his hands as a barriſter, but he did not ſo immerſe himſelf in legal purſuits as wholly to neglect polite literature, and by his manner of living, and the company which he kept, he ſeemed to affect the gentleman rather than the man of buſineſs. In the year 1640, on occaſion of the Scotch rebellion, he was choſen burgeſs, and ſat in parliament for Wootton-Baſſet. Almoſt as ſoon as he had taken his place in the houſe of commons, he brought forward a complaint of the illegal practices and oppreſſions of the earl marſhal's court, but the ſpeedy diſſolution of the parliament prevented any proceedings upon it at that time. In the new houſe he ſat for the borough of Saltaſh, and renewed, with ſo much effect, his attack upon the marſhal's court, that he procured its ſuppreſſion. He now laid aſide his buſineſs at bar, and gave himſelf up entirely to the public concerns of the country, and being an independent gentleman, enliſted under the banners of no party, he was frequently appointed chairman of committees in matters of great importance. One of theſe, was that which drew up the charges againſt the judges for their deciſion in the caſe of ſhip-money. In this caſe he oppoſed the court, but at the ſame time ſhewed ſuch an attachment to regal government, and to the eſtabliſhed church, that he was regarded with ſuſpicion by the heads of that party. The king was ſenſible of the obligations he was under to him, and took an opportunity of expreſſing his ſenſe of gratitude for the ſervices towards himſelf, and his regard for the national religion. Flattered, perhaps, by his ſovereign's condeſcenſion, he was from this time looked upon as one of the royal party: he avows that "he had a very particular paſſion and devotion for the perſon of the king; and a moſt zealous eſteem and reverence for the conſtitution of government, which he believed ſo equally poiſed, that if the leaſt branch of the prerogative were torn off, the ſubject ſuffered by it, and he was as much troubled when the crown exceeded its juſt limits." When the commons' remonſtrance on the ſtate of the nation came out, Mr. Hyde, as he ſays, only to give vent to his own indignation, and without the leaſt purpoſe of communicating it, drew up a reply, which, however, he ſhewed to lord Digby, and at length ſuffered it to appear as the king's anſwer with the advice of his council. Soon after this he was offered the place of ſolicitor-general, which he declined, but agreed to be one of a private conſultation on the king's affairs and their management in parliament, with lord Falkland, and ſir John Colepepper. In this office he ſtood apart from the others, by oppoſing the king's aſſent to the bill for depriving the biſhops of their ſeat in the houſe of lords, which, however, his majeſty was prevailed on to give. In April 1642, Mr. Hyde was ſent for by the king to York; and repairing thither he aſſiſted in drawing up many papers in the royal cauſe, and in private conſultations. The parliament recalled him, but refuſing to comply with their order he was exempted from pardon by a ſpecial vote. After the commencement of the civil war, Hyde was nominated to the chancellorſhip of the exchequer, ſworn of the privy-council, and knighted. He remained with his majeſty till March 1644, when he accompanied prince Charles into the Weſt, and afterwards attended him to the iſland of Jerſey. After the prince left the kingdom, ſir Edward Hyde remained in the iſland two years longer, purſuing his ſtudies in great tranquillity, and attending to the compoſition of a hiſtory of the tranſactions in which he had borne a conſpicuous part. In 1648 he was ordered to attend the prince at Paris. Upon his arrival he found great differences prevailing between the queen-mother, and the duke of York. The king's court at the Hague was not in a better ſtate of union, and he found ſo little good to be done by a perſonal attendance, that he obtained leave to retire to Antwerp, where his wife and children were, with whom he lived in a ſtudious and domeſtic retreat, and in a ſtyle ſuited to his reduced circumſtances. After this he removed to Breda, at the deſire of the princeſs of Orange, the late king's eldeſt daughter, who propoſed to take his daughter as one of her maids of honour, to which, with much heſitation, he agreed In 1657 he was appointed to the poſt of lord chancellor of England, which he very unwillingly accepted, properly judging that it was ridiculous, as the office proceeded from a king without a kingdom, but it appeared that Charles, not able of himſelf to reject the importunities of thoſe who were continually applying to him for contingents, grants, and reverſions, wiſhed to throw the burden upon one who had firmneſs enough to refuſe improper requeſts. At the Reſtoration, the chancellor might be conſidered as the king's firſt and moſt confidential miniſter; and it is agreed, that he diſplayed great wiſdom and integrity in ſettling the many difficult affairs which this event brought for deciſion. He is particularly praiſed for rejecting the propoſal of raiſing a great ſtanding revenue, which would have made the king independent of future parliaments; and for the earneſtneſs with which he proceeded to diſband the army. He alſo moderated the forward zeal of the royaliſts, and checked their appetite for revenge. His honours naturally roſe with his power, and in 1660 he was created a peer, and elected chancellor of the univerſity of Oxford, and in the following year he was advanced to the titles of viſcount Cornbury and earl of Clarendon. He alſo received various grants from the crown, which rendered his eſtate adequate to his dignity. A ſhort time after the king's return, it was diſcovered that his daughter, at the princeſs of Orange's court, had attracted the notice of the duke of York, who, failing of ſucceſs in an attempt to obtain her favours upon eaſy terms, had entered into a private contract of marriage with her. Lord Clarendon was exceſſively indignant at this tranſaction, and adviſed the king to ſend his daughter to the Tower, and bring her to condign puniſhment. The king, however, felt leſs keenly on the ſubject, and behaved with great juſtice and propriety in the buſineſs, though the duke baſely denied his marriage, and even encouraged ſcandalous reports againſt his wife. The queen-mother alſo expreſſed the utmoſt rage at the connection, but ſhe was nevertheleſs at length acknowledged as ducheſs of York, and eventually gave two queens to England. This marriage was made a ſtep for alienating the king from his chancellor, and in 1663 the earl of Briſtol exhibited various charges againſt him in the houſe of lords, which he was unable to ſubſtantiate, and which terminated greatly to the honour of the chancellor. Many other charges were brought againſt him; his oppoſition to a bill for liberty of conſcience, and many of his public meaſures rendered him very unpopular: his admonitions of a corrupt prince alienated from him his ſovereign's affection, ſo that, notwithſtanding all his faithful ſervices to the crown, he was, without reluctance, given up as a ſacrifice to the national odium. In Auguſt 1667, he was required to reſign the great ſeal, and was at the ſame time removed from all offices of public truſt. He was afterwards impeached of high treaſon by the houſe of commons, but the lords refuſed to commit him upon their charge, and during the debates upon this head he received the king's commands to withdraw from the kingdom. Before his departure he ſent an apology to the houſe of peers, which was voted to be a libel, and burnt by the hands of the common hangman. A bill was now paſſed againſt him as a fugitive from juſtice. He landed at Calais, but received an order from the court of France to quit their territory inſtantly. A fit of illneſs rendered this impoſſible, and he finally obtained permiſſion to reſide in that country. He had nearly loſt his life by an attack of ſome Engliſh ſeamen, with whom he was very unpopular; after this he proceeded to Montpellier, where he employed himſelf in writing a vindication of his conduct. He died at Rouen, in the month of December 1674. His body was brought to England and interred in Weſtminſter-abbey. He left ſeveral children, of whom his eldeſt ſon ſucceeded him. Lord Clarendon was author of "Contemplations and Reflections on the Book of Pſalms:" "A brief View of the Errors in Hobbes' Leviathan:" "The Hiſtory of the grand Rebellion," in three volumes folio, to which was added his life, and a continuation of his hiſtory publiſhed in 1759, by the univerſity of Oxford. This, his great work, is regarded as a valuable ſource of information on the events of that unhappy period. According to Mr. Hume, it is, excepting Whitelock's memorials, the moſt candid account of thoſe times compoſed by any contemporary author. Clarendon, ſays the ſame hiſtorian, was always a friend to the liberty and conſtitution of his country. It is ſaid that when he firſt engaged in the ſtudy of the law, his father exhorted him with great earneſtneſs to ſhun the practice, too common in that profeſſion, of ſtraining every point in favour of prerogative, and perverting ſo uſeful a ſcience to the oppreſſion of liberty, and in the midſt of theſe rational and virtuous counſels, which he reiterated, he was ſuddenly ſeized with an apoplexy, and expired in a few hours in his ſon's preſence. As an hiſtorian, Clarendon will ever be eſteemed as an entertaining writer, even independently of our curioſity to know the facts which he relates. He is more partial in appearance than in reality. He is leſs partial in his relation of facts than in his account of characters: he was too honeſt a man to falſify the former; his affections were eaſily capable, unknown to himſelf, of diſguiſing the latter. "An air of probity and goodneſs," ſays Hume, "runs through the whole work, as theſe qualities did in reality embelliſh the whole life of the author." See Hume's Hiſt. vol. vii. octavo. Biog. Brit.

HYDE, THOMAS, a moſt profound Oriental ſcholar, who flouriſhed in the ſeventeenth century, was born at Billingſley, near Bridgenorth, in Shropſhire, in the year 1636. He received the elements of a learned education under his father's inſtructions, and at the age of ſixteen he was entered of King's college, Cambridge. In the courſe of two years he was ſent to London to the learned Walton, afterwards biſhop of Cheſter, as a perſon very capable of aſſiſting him in preparing for publication the grand polyglot bible, on which he was then engaged. Mr. Hyde rendered this undertaking the moſt eſſential ſervices: he tranſcribed the Perſian Pentateuch out of the Hebrew characters, in which it was firſt printed, at Conſtantinople, into the proper Perſian characters. Of this Pentateuch, Mr. Hyde added a Latin tranſlation; and he further aſſiſted in correcting different parts of Walton's work, in the Arabic, Syriac, and Samaritan languages. In 1658 Mr. Hyde went to Oxford, and was admitted of the Queen's college, and ſoon afterwards appointed Hebrew reader in that ſociety. Soon after the reſtoration of king Charles II. Mr. Hyde was made under-keeper of the Bodleian library; which furniſhed him with ample opportunities of proſecuting his favourite ſtudies with ſingular advantage, and in 1665 he was elected to the office of head-keeper. In the ſame year he publiſhed "Verſio Latina e Lingua Perſica, et Commentarii in Obſervationes Ulug. Beigi, de Tabulis Longitudinis, et Latitudinis Stellarum fixarum." About the time when this verſion was publiſhed, Mr. Hyde became acquainted with the great Mr. Boyle, to whom he communicated ſeveral remarkable paſſages relating to chemiſtry, phyſics, and natural hiſtory, which he had collected from Oriental writers. In 1666 he was promoted to a prebend in the cathedral church of Saliſbury, and in the following year he publiſhed "Quatuor Evangelia, et Acta Apoſtolorum, Lingua Malaicâ, Characteribus Europæis," printed at the expence of Mr. Boyle. In 1674 he gave the world "Catalogus impreſſorum Librorum Bibliothecæ Bodleianæ in Academia Oxon:" and in 1678 he was made archdeacon of Glouceſter. Two years after this he was admitted to the degree of doctor of divinity, and from this period he was frequently giving additional proofs of his unremitting ſtudy, and ſingular ſkill in all kinds of Oriental learning. An account of his ſeveral learned works will be found in the Biographia Britannica, and alſo in a more abbreviated form in the General Biography. In 1697, Dr. Hyde was appointed regius profeſſor of Hebrew, and canon of Chriſt-church. Shortly after this he publiſhed "the Religion of the ancient Perſians." Dr. Hyde's profound ſkill in Oriental literature, and deſire to promote it, would have led him to publiſh many more learned works than he did, could he have obtained encouragement from the public. The want of this obliged him to decline running the riſk of printing any thing more, and on a ſimilar account the writings which he left behind him were ſuffered to lie neglected, till it was too late to recover them, though the loſs has ever ſince been regretted by the learned, and thoſe who knew how to eſtimate their value. In 1701 Dr. Hyde reſigned the office of head-keeper of the Bodleian library, on account of his great age and infirmities. During the reigns of Charles II, James II., and William III. he had occupied the poſt of interpreter and ſecretary in the Oriental languages; and in the courſe of his employment, had made himſelf moſt intimately acquainted with the policy, ceremonies, and cuſtoms of the Oriental nations. Dr. Hyde died in the year 1702, at his apartments in Chriſt-church, in the ſixty-ſeventh year of his age. We ſhall tranſcribe the character of this great man as given by Granger: "Dr. Thomas Hyde," ſays he, "is a great character, but is much leſs known than he deſerves to be, becauſe the ſtudies in which he was occupied are but little cultivated. Thoſe that are acquainted with the Oriental languages, are aſtoniſhed at the progreſs which was made in them by one man, though aided by the power of genius, ſupported and ſtrengthened by inceſſant induſtry. There never was an Engliſhman, in his ſituation of life, who made ſo great a progreſs in the Chineſe. Bochart, Pococke, and Hyde, are allowed to been the greateſt Orientaliſts that any age or nation have produced. I am informed that Dr. Hyde's mind had been ſo much engroſſed by his beloved ſtudies, that he was but ill qualified to appear to any advantage in common converſation." Dr. Gregory Sharpe, maſter of the Temple, collected and republiſhed ſome of his pieces which were formerly printed. Theſe made their appearance in two volumes quarto, under the title of "Syntagma Diſſertationum et Opuſcula." Anthony Wood has preſerved a catalogue of MSS. which Dr. Hyde had either completed, or in part prepared for the preſs. Biog. Brit.

HYDE, in *Geography*, a maritime county of America, in Newbern diſtrict, North Carolina, bounded E. by the ocean, W. by Beaufort county, N. by Tyrrel, and S. by Carteret, it contains 4783 inhabitants, of whom 1386 are ſlaves.

HYDE *of Land*. See HIDE.

HYDE-*gild*. See HIDE-*gild*.

HYDEPARK, in *Geography*, a townſhip of America, in Orleans county, in Vermont; containing 110 inhabitants.

HYDER Ally, in *Biography*, was a ſoldier of fortune in the Eaſt, and the ſon of a perſon who ſerved in quality of a "killatar," or governor of a ſmall fortreſs, to one of the kings of Myſore. He is ſaid to have acquired the rudiments of war in the French camps; and in the year 1753, diſtinguiſhed himſelf as their auxiliary, in the plains of Tritchinopoly. About 10 years afterwards, being then at the head of the Myſore army, he dethroned his ſovereign, and governed under the title of regent. Soon after, he extended his dominions on every ſide, the Carnatic excepted: the fine province of Bednore (or Biddanore) and the Patan nabobſhips of Cuddapah, Canoul, &c. beſides ſome Mahratta provinces towards the river Kiſtnah, and the country of the Nairs, and other ſmall ſtates on the Malabar coaſt, were added to his original poſſeſſions; until at laſt he was at the head of a ſtate, in extent equal to Great Britain, and producing a groſs revenue of four millions ſterling. The civil broils and revolutions in the weſtern Mahratta ſtate, particularly in latter times, allowed Hyder to aggrandize himſelf at its expence, but not without receiving ſome ſevere checks from that quarter. Before he had arrived at the height of his power, the war between him and the Engliſh broke out in 1767; neverthelefs his power alarmed his neighbours, and a reſolution was formed for attacking him. The Mahrattas under Maderow entered Hyder's country on the ſide towards Viſiapour; and the Nizam, joined by a detachment of Britiſh troops, moved from Hydrabad towards the frontier of Myſore, ſoon after. Hyder firſt contrived to buy off the Mahrattas with a large ſum of money, and the reſtitution of ſome of the places which he had taken from them. He next negotiated with the Nizam, and ſucceeded not only in detaching him from the Engliſh, but in drawing him over to his party: ſo that the Engliſh detachment was compelled by neceſſity to retire to the Carnatic; on the frontiers of which their great army was now aſſembling. The ſuperiority of the Nizam in the Carnatic had been always nominal; however, Hyder who now meditated the conqueſt of it, was glad to obtain from the Nizam a grant, or "ſunnud," for the nabobſhip of it; and from this time, at leaſt, he conſidered Mahomed Ally as his rival. In the days of this laſt mentioned prince's diſtreſs, when he poſſeſſed only a ſmall part of the Carnatic, he had engaged to cede the fortreſs of Tritchinopoly, a moſt important poſt in the ſouthern diviſion of it, to the king of Myſore, for the aſſiſtance then afforded him; but this engagement never being performed, Hyder adopted the claims and reſentments of the prince, of whoſe throne he had taken poſſeſſion; and never loſt ſight of his title to Tritchinopoly. In the war that immediately enſued, a ſtrong detachment of the Britiſh army ſeized on Hyder's province of Coimbettore, a fertile diſtrict on the ſouth of Myſore, and commanding a ready paſs to Hyder's capital, Seringapatam. During the years 1767, 1768, and part of 1769, the war was continued with various ſucceſs. (See Hindoostan.) In 1771 Hyder ſuffered a total defeat from the Mahratta army within a few miles of his capital, into which he eſcaped with great difficulty, and after having ſuſtained a great loſs. Here, as his enemies had neither ſkill nor the ordinary requiſites for a ſiege, he remained unmoleſted, and patiently waiting the retreat of his enemies after they had deſolated the country. Some ſubſequent years of peace very much improved both his army and revenues; and the diſtractions that ſubſiſted among the Mahrattas afforded him an opportunity of extending his territories at their expence. Hyder's projects of ambition were counteracted by two unſucceſsful campaigns, in which he combatted with the Britiſh troops under ſir Eyre Coote; ſo that in October 1782, he was reduced to the neceſſity of earneſtly wiſhing for peace. Soon after Hyder died, and was ſucceeded by his ſon Tippoo. (See Hindoostan.) Major Rennell, at the cloſe of the ſhort abſtract which he has given in the introduction to his "Memoir" of the hiſtory of Hyder, ſubjoins the following outline of his character, which, as he conceives, has been little underſtood. "His military ſucceſs, founded on the improvement of diſcipline; attention to merit of every kind; conciliation of the different tribes that ſerved under his banners; contempt of ſtate and ceremony, except what naturally aroſe from the dignity of his character, and his conſequent economy in perſonal expences (the different habits of which form the chief diſtinction of what is called character among ordinary princes) together with his minute attention to matters of finance, and the regular payment of his army:—all theſe together raiſed Hyder as far above the princes of Hindooſtan, as the great qualities of the late Pruſſian monarch raiſed him above the generality of European princes; and hence I have ever conſidered Hyder as the Frederic of the Eaſt. Cruelty was the vice of Hyder; but we are to conſider that Hyder's ideas of mercy were regulated by an Aſiatic ſtandard; and it is not improbable that he might rate his own character for moderation and clemency, as far above thoſe of Tamerlane, Nadir Shah, and Abdallah, as he rated his diſcipline above theirs."

HYDERGUNGE, in *Geography*, a town of Hindooſtan, in Oude; 21 miles W.N.W. of Fyzabad.

HYDERGUR, a town of Hindooſtan, in Bednore; nine miles S.W. of Bednore.

HYDNOPHYLLUM, or Hydnophyllon, in *Botany*, a name given by the ancient Greeks to a plant which they tell us grew on thoſe places where the tubera or truffles lay underneath.

HYDNORA. See Aphyteia.

HYDNUM, an ancient name adopted by Linnæus, but miſapplied, as the ὕδνον of Dioſcorides, οἴδνον of Theophraſtus, ſo called from οἰδέω, *to ſwell*, is the Truffle or *Tuber*.—Perſoon Syn. Fung. 554. Linn. Gen. 568. Syſt. Veg. ed. 14. 978. Schreb. 769. Mart. Mill. Dict. v. 2. (Erinaceus; Dill. Giſſ. 188. Mich. t. 72.) Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eſſ. Ch. Cap turbinate; ſmooth above; echinated beneath with awl-ſhaped fibres.

Obſ. Theſe awl-ſhaped bodies which Linnæus compares to the prickles of a hedge-hog, are ſoft, ſolid, conical, or cylindrical ſubſtances, emitting ſeeds from every part of their ſurface. *Bulliard*.

This is a very extenſive genus of *Fungi*, Perſoon in his Synopſis having deſcribed 26 ſpecies, moſt of which have been figured either by Sowerby, Bulliard, Jacquin, or Schrader.—Linnæus was acquainted with only ſix ſpecies of *Hydnum*. Theſe plants are chiefly found in moiſt ſituations upon the decayed trunks of trees. It will be ſufficient to enumerate a few of the moſt ſtriking ſpecies.—*H. imbricatum*, Sowerb. Fung. t. 73, was communicated from lord Ongley's plantations in Bedfordſhire. Its colour is a duſky yellow, having a reddiſh brown border.—*H. repandum*, t. 176, is found plentifully in Peckham and Hornſey woods, during autumn. This is of a fine reddiſh buff colour, and very brittle in ſubſtance.—*H. Daviſii*, t. 15, is a ſmall yellow or brown fungus; when freſh of a pure white, more rare than beautiful, very ſimilar in texture to *Boletus verſicolor*, and was firſt diſcovered in Angleſea by the Rev. H. Davies.—*H. ſublamelloſum*, t. 112. of a delicate white colour, was ſent from Bedfordſhire by the Rev. Dr. Abbot.—*H. auriſcalpium*, *Barba Jovis*, *coralloides*, *membranaceum*, and *ramoſum*, leſs conſpicuous ſpecies are alſo figured by the ſame author. *H. auriſcalpium*, beautifully diſplayed in Curt. Lond. faſc. 3. t. 68, is of a browniſh colour and grows upon the cones of fir-trees. Curtis mentions it as an excellent example of this genus for the inſtruction of a young botaniſt.

Moſt *Hydna* are furniſhed with ſtems, but not all. *H. paraſiticum* is the only Linnæan ſpecies that is ſtemleſs.

HYDRA, in *Aſtronomy*, a ſouthern conſtellation, conſiſting of a number of ſtars, imagined to repreſent a water ſerpent. The ſtars in Hydra, in Ptolemy's Catalogue, are twenty-ſeven; in Tycho's, nineteen; in Hevelius's, thirty-one; and in the Britannic Catalogue, ſixty. See Constellation.

Hydra, in *Geography*, a ſmall iſland in the Grecian Archipelago, about 10 miles long, and two broad. N. lat. 37° 20′. E. long. 23° 30′.—Alſo, a town of Africa, in the kingdom of Tunis, on the frontiers of Algiers, ſituated in a narrow valley, near a running ſtream and the ſcite of extenſive ruins; 90 miles E.S.E. of Conſtantina.

Hydra *of Lerna*, in *Mythology*, a terrible monſter, born of Typhon and Echidne, according to Heſiod; which was deſtroyed by Hercules. The poets repreſent it ſometimes as a ſerpent, branched out into ſeveral other ſerpents, and ſometimes with a human head, bearing ſerpents inſtead of hair; and they add, that when one of the ſerpents heads were cut off, a double head ſprouted in its place.

This hydra with many heads is ſaid to have been only a multitude of ſerpents, which infeſted the marſhes of Lerna, near Mycenæ, and which ſeemed to multiply as they were deſtroyed. Hercules, with the aſſiſtance of his companions, cleared the country of them, by burning the reeds in which they lodged. See Hercules.

Hydra, in *Zoology*, a generic name of the polypes. See Polype.

Hydra is alſo a ſynonymous name given by different authors to various animals, as, for inſtance, by Linnæus to Tænia globoſa, by Bohadſch to Holothuria tubuloſa, and again by Linnæus with the ſpecific term of glomerata to Corallina pencillus.

HYDRABAD, or Bagnagar, in *Geography*, a city of Hindooſtan, and capital of a province, to which it gives name, now called *Golconda*, (which ſee,) is the preſent capital of the Nizams of the Deccan; who, ſince the diſmemberment of their empire, have left Aurungabad, the ancient capital; which is not only in a corner of their dominions, but in that corner which lies near their hereditary enemy, the Poonah Mahrattas, and which is alſo the leaſt defenſible. Hydrabad was formerly only a palace of pleaſure, and celebrated for the beauty of its gardens and delightfulneſs of its ſituation; but in the 16th century, the king of that period was induced, by the perſuaſion of one of his wives, to build a city, after whom he called it Bagnagar, or the gardens of Nagar. It is of large extent, ſurrounded with walls, and defended with towers; and is ſuppoſed to contain upwards of 100,000 inhabitants. The ſuburbs are extenſive, and inhabited by merchants and tradeſmen; 352 miles N.N.W. of Madras. N. lat. 17° 12′. E. long. 78° 51′.

Hydrabad is alſo the name of a fortreſs of Hindooſtan, ſituated on the Indus, not far above the head of the Delta, and in the vicinity of Naſſarpour; the uſual place of reſidence of the prince of Sindy.

HYDRACHNA, in *Entomology*, a genus of the apterous order, eſtabliſhed by Müller, the character of which, as reduced by Gmelin to the arrangement of the "Syſtema Naturæ," conſiſts in the head, thorax, and abdomen being united; the feelers jointed and two in number; the eyes either two, four, or ſix, and the legs eight.

Till within the ſpace of the laſt few years, almoſt every author, not excepting Linnæus and Geoffroy, have confounded the hydrachna with the acarus tribe; while, from their ſimilarity of aſpect, the globular form of the body, and the length of their feet, theſe inſects were conſidered by general obſervers as no other than a race of ſpiders, to which the ſignificant appellation of aquatic was moſt commonly annexed, becauſe they inhabit watery places, and thus appear from their habits, though not in form, to conſtitute a diſtinct family from the true or terreſtrial ſpiders. Both Roeſel and Degeer have entered with a peculiar ſhare of minuteneſs into the hiſtory of theſe animals; and it is more than probable the obſervations of theſe naturaliſts might furniſh many very uſeful ſuggeſtions to the ingenious Müller, whoſe monagraphia on this curious race appeared in 1781. This conjecture is doubtleſs correct, but neverthelefs the tract, or rather hiſtory, publiſhed under the title laſt mentioned, contains a fund of new and valuable information; it elucidates in a very comprehenſive manner their internal as well as external conformation, and beſides, condenſes into one point of view a ſeries of no leſs than fifty diſtinct ſpecies, the far greater part of which was totally unknown to any of his predeceſſors. Theſe ſpecies are divided into three families, according to the number of eyes in each, which are either two, four, or ſix; thoſe of the firſt diviſion have the body of the male terminated in a kind of tail or elongated proceſs.

After the publication of this uſeful work the genus hydrachna, as propoſed by that author with ſome ſlight amendments or deviations, was embraced by the generality of naturaliſts, and ſtill continues to be approved by the beſt authorities. Fabricius is indeed an exception; that excellent entomologiſt perhaps, without mature conſideration, and certainly without affording us any reaſonable grounds for believing he was ſo well acquainted with this tribe of creatures as Müller, rejects the genus altogether, and refers the few ſpecies he deſcribes, which really belong to that tribe, to his genus Trombidium. Gmelin, on the contrary, differs from Fabricius in this reſpect, and adopts the genus together with its numerous ſpecies as deſcribed by Müller. The moſt material, and in our opinion the moſt able deviation from Müller, hitherto propoſed, is that ſubmitted by Latreille; this very aſſiduous and intelligent naturaliſt agrees with Müller in conſidering the hydrachna as a diſtinct natural family, but inſtead of allowing them to remain with the inſect tribe in conformity with preceding writers, he referred them in the firſt inſtance to the cruſtacea, and ſince that time to the Arachnides, in which latter they conſtitute his family Hydrachnelles. The Hydrachnellæ of this writer are divided into three different genera, eylais, hydrachna, and limnochare; the firſt of which is furniſhed with mandibles, as we find exemplified in the Fabrician Trombidium extendens. That to which the name of hydrachna is retained has no mandibles, and is furniſhed with a projecting ſiphon in the form of a beak, the feelers are advanced, and have a moveable appendice, and the body is of a globular figure: Trombidium geographicum of Fabricius is an illuſtrative example of this genus. The limnochare genus has no mandible; a ſiphon not at all, or very little projecting; feelers curved, without appendices, and the body depreſſed; the Linnæan Acarus aquaticus is of this genus.

The hydrachnæ, as we have before ſaid, are vulgarly called water ſpiders; they are all of the aquatic kind, reſiding among plants that grow in the water, or in the banks of ditches, and other ſituations contiguous to their favourite element. When in the water they ſwim with great facility by means of their feet, which in moſt ſpecies, when attentively examined, appear ciliated, and admirably adapted for that purpoſe;

their ſkin is thick, and their body covered more or leſs with down, hair, or ſpines. The females are larger than the males, and often different in colour. In general their colours are remarkably bright, and poſſeſs a peculiar degree of brilliancy when ſeen in the water; the prevailing hues red or green, and ſilvery. They are exceſſively abundant in ſpring, and ſome of the ſpecies are almoſt conſtantly ſeen at that ſeaſon of the year, on the ſurface of ſtagnant pools of water: they couple in the midſt of ſummer, and depoſit their eggs in cluſters, chiefly among the weeds; theſe eggs are of a red colour, and at firſt ſpherical, but afterwards change to a ſemilunar form; the larvæ are furniſhed with ſix feet, and have a proboſcis of very ſingular ſtructure. The hydrachnæ prey upon the larvæ of the tipulæ and monoculi, and the juices of decayed vegetables, and are themſelves the food of fiſhes, of many inſects that reſide in the water while in the ſtate of larva, of polypes, and many of the larger kinds of aquatic worms.

Species.

* *Section. Eyes two; Body tailed.*

GLOBATOR. Globular; eyes red. Müll.

Abundant in ditches, and other ſtagnant waters; the male greeniſh ſpotted; female blueiſh, without ſpots, and twice the ſize of the male.

TABULATOR. Globular, yellowiſh, with ſpotted diſk; tail cylindrical and equal. Müll.

Inhabits ſtagnant waters, and in ſome reſpects reſembles the former.

BUCCINATOR. Obovate, red, behind black; tail cylindrical, yellow and narrow at the baſe. Müll. *Trombidium caudatum*, Fabr. *Acarus caudatus*, Degeer.

Lives in banks, the body beneath black; eyes reddiſh; legs black.

CUSPIDATOR. Brown, truncated before, and mucronated behind; tail depreſſed and bidentated. Müll.

Body depreſſed, and broader on the anterior part; behind narrow, and armed with an erect triangular ſpine; eyes black; legs pale. Lives in fiſh-ponds.

PUSTULATOR. Gibbous, red; tail depreſſed, with obtuſe angles. Müll.

Body ſmooth, and generally covered with animalcules of the vorticella tribe. In graſſy ſtreams.

ALBATOR. Rounded, grey, with a white diſk; tail depreſſed, and armed with three teeth. Müll. *Acarus globoſus*, &c. Schranck. *Acarus fluviatilis*, Ströem.

Found in fiſh-ponds.

MACULATOR. Rounded, cinereous, ſpotted, and mucronate behind; tail depreſſed, and armed with three teeth. Müll.

In ditches; breaſt whitiſh; legs green.

TRICUSPIDATOR. Red, with a triple gibboſity on the back; tail depreſſed, and three-toothed. Müll.

The body is ſomewhat reticulated; breaſt blackiſh; feelers and legs whitiſh. Found in pools.

EMARGINATOR. Red, with the back gibbous; tail depreſſed and emarginate. Müll.

Feelers and legs greeniſh. Occurs in boggy ſituations.

SINUATOR. Grey; the back yellowiſh on the fore part, and tripunctated behind; tail depreſſed and ſinuated. Müll.

Body reticulated; feelers and legs white. Found in ſtagnant waters.

INTEGRATOR. Green and without ſpots; tail depreſſed and entire. Müll.

Found in ditches; the body roundiſh oval, depreſſed, and contracted behind; breaſt yellowiſh; legs hyaline.

PAPILLATOR. Rounded, purple with an excreſcence each ſide the tail; legs black.

Inhabits wet meadows.

* * *Section. Eyes two, Body marked with a Fork.*

GROSSIPES. Nearly ſquare, white, with three ſpots and a rufous fork; anterior legs thick.

Body pellucid and glabrous; legs twice as long as the body. Inhabits ditches.

CRASSIPES. Obovate; black, the diſk black with a reddiſh fork; tail papillous; anterior legs thick. Müll.

Found in fiſh ponds and dykes; legs three or four times the length of the body; pellucid; breaſt whitiſh; eyes black.

GROSSIPES. Nearly ſquare, white, with three ſpots and a rufous fork; anterior legs thick. Müll. Geoffr.

Inhabits fiſh-ponds; body glabrous; legs twice the length of the body.

CLAVICORNIS. Obovate, rufous with a yellow fork; feelers clavated; legs pale. Müll.

Found in ponds; the eyes black; legs and feelers white.

SPINIPES. Oval, greeniſh yellow, with eight dots and a rufous fork; legs ſpinous. Müll.

Inhabits pools. The body poliſhed, with the eyes, breaſt, legs, and dots on the back black.

LONGICORNIS. Nearly ſquare, white with five brown ſpots and a rufous fork; feelers long. Müll.

Frequents rivulets; pellucid; eyes black; breaſt pale yellow.

VERNALIS. Oval, greeniſh with a deeper diſk, and rufous fork. Müll.

Inhabits overflown meadows; and has the appearance of a grey dot; the legs white.

LUNIPES. Oval, white, ſpotted, with a clear white fork; fourth joint of the poſterior legs lunated. Müll.

Found in ditches, the body pellucid, with large eyes, and the legs and feelers pale.

TRIFURCALIS. Oval, whitiſh, with a brown back and triple ſilvery fork. Müll.

Frequents wet meadows; the feelers ending in a claw, and with the legs pale greeniſh white; eyes black; abdomen beneath, ſometimes brown with a white line.

ORBICULARIS. Depreſſed, orbicular, pale yellow with black ſpots on the diſk and a rufous fork. Müll.

Eyes black; legs white. This ſpecies occurs in rivers.

STELLARIS. Globular, blue, with a cinereous back and ſtellated fork. Müll. Subzer, &c.

In the banks of rivulets; the body of this kind is reticulated; and the legs ſomewhat longer than the body.

OVALIS. Ovate, compreſſed, greeniſh and flattiſh above, carinated and yellow brown beneath; feelers placed beneath. Müll.

Found in overflown meadows. Eyes and legs black.

ELLIPTICA. Rounded, blue with fulvous ſpots and dots. Müll. *Acarus maculatus aquaticus*, Degeer.

A ſcarce ſpecies found in rivers; eyes black; legs white, breaſt, tail, and poſterior margin yellowiſh.

ORBICULATA. Depreſſed, orbicular, violet, with a white ſpot and circle. Müll.

Breaſt fulvous with the tip green; feelers and thighs whitiſh; eyes black. Inhabits muddy ditches.

LUGUBRIS. Globular, browniſh, with black ſtreaks; legs green. Müll.

In boggy places; eyes black; feelers green.

TRUNCATELLA. Grey, oblong, truncated behind, with duſky dots and lines. Müll.

Inhabits marſhes; eyes black, feelers white.

* * * *Section. Eyes two; Body glabrous.*

Despiciens. Rounded, red, with numerous ſpots; eyes placed beneath. Müll. *Aranea aquatica*, Friſch.

Found in ditches; body ſlightly depreſſed, thick and wrinkled; eyes blackiſh; legs pale yellow.

Geographica. Spherical, black with four ſcarlet ſpots and dots. Müll. Roeſ., &c.

The largeſt and moſt beautiful of its genus; eyes, feelers, and laſt joint of its legs red. Inhabits ditches.

Abstergens. Globular, red without ſpots; legs black. Müll. Roeſ., &c.

Inhabits ſtagnant waters; lines on the body beneath, with the eyes and legs black.

Extendens. Rounded, red; hind legs contracted. Müll.

In ditches; body convex, and ſhining.

Cruenta. Diſtended, red; legs equal. Müll. *Trombidium globoſum*, Fabr. *Acarus aquaticus globoſus*, Degeer.

Found in overflown meadows; eyes red; feelers downy.

Impressa. Diſtended, red, with impreſſed dots; feelers ſhort. Müll. *Acarus aquaticus ruber*, Degeer. *Acarus holoſericeus ſubgloboſus aquaticus*, Schranck.

Found in marſhes; a ſuppoſed variety has the feelers longer.

Ovata. Obovate, grey-brown, with a triangular fulvous ſpot; legs pale black. Müll.

Another analogous kind, an apparent variety of ovata, has the body marked with a fulvous croſs, and the legs with the eyes and feelers black. Both are found in ditches.

Lunaris. Oval, rufous, with a black lunate ſpot on the back. Müll.

Inhabits fiſh-ponds; the eyes are black, and the legs grey.

Liliacea. Obovate and whitiſh, the diſk lily-white, with a black ſpot each ſide. Müll.

The feelers, legs, and breaſt are pale, the latter ſpotted with black. This kind inhabits fens.

Torris. Oval, yellowiſh, with lateral black ſpots, and red in the middle; hind ſhanks lamellated. Müll.

Found in ditches, the eyes black, and legs white.

Strigata. Oblong, yellowiſh-green, the fore part depreſſed, with two blackiſh ſtreaks united behind. Müll.

Near the banks of rivers; the eyes are black; feelers and legs white.

Obsoleta. Rounded, reddiſh-brown, with a double obſolete ſtreak behind the eyes. Müll.

Frequents the waters of woody ſituation; the eyes are black; feelers pellucid; and the legs pale-browniſh.

Nodata. Red, truncated before, and ſpotted each ſide; poſterior legs knotty. Müll.

Occurs in ditches; the eyes are black; feelers annulated; legs yellowiſh and longer than the body.

Complanata. Green, depreſſed, and emarginate before, with a white band in the middle. Müll.

The body elliptic; eyes black; legs and feelers pellucid.

Musculus. Green, oval, compreſſed, grooved above, beneath carinated. Müll.

Varies in colour; the eyes are black, feelers white, and pellucid. Found in marſhes.

Latipes. Oval, yellowiſh, and ſpotted each ſide; fourth joint of the poſterior legs dilated. Müll.

In marſhes; the legs pale-blueiſh, with the tip brown.

Versicolor. Nearly ſquare, with whitiſh, blue, and brown ſpots. Müll.

Found in wet meadows; the body white, beneath brown, with a yellow margin; feelers and legs pellucid, white.

* * * * *Section. Eyes four.*

Calcarea. Rounded, brown, with a clear white diſk.

Inhabits marſhy woods; the eyes are black; feelers pointed, and the legs pale and pellucid.

Fuscata. Ovate, reddiſh-brown, with a darker diſk, and pale rufous fork. Müll.

The body is convex, and ſpotted on the back; eyes black; legs and feelers white and pellucid. Found in muddy ditches.

Undulata. Oval, pale-yellow, with flexuous black ſtreaks. Müll.

In marſhes. The body ſub-globular, pellucid, with black eyes.

Maculata. Oval, red, with black ſpots on the back. Müll.

Eyes black; legs and feelers pale-yellow, and pellucid.

* * * * * *Section. Eyes ſix.*

Umbrata. Rounded, red, with numerous darker ſpots Müll.

Inhabits marſhy woods; the body glabrous, ſub-depreſſed with ten darker ſpots above, beneath blackiſh; eyes black; feelers yellowiſh at the tip; legs yellow.

HYDRAGOGUES, Hydragoga, ὑδραγωγα, from ὑδωρ, *water*, and αγειν, *to draw*, in *Medicine*, an appellation given to thoſe purgatives which produce copious watery ſtools.

The moſt acrid and draſtic purgative drugs are thoſe to which the epithet of *hydragogue* is particularly applicable; not as the ancients conceived, becauſe they have a particular attraction for the *watery* part of the circulating fluids; but becauſe, by their powerfully ſtimulant operation on the mouths of the exhalent arteries, which open every where along the inner ſurface of the inteſtinal canal, they occaſion thoſe veſſels to pour out their fluids in great abundance, and thus render the ſtools thin and watery. Of the more active hydragogues in modern uſe are the elaterium, ſcammony, camboge, &c.: jalap, calomel, colocynth, and ſome other ſubſtances of a leſs acrid quality, when adminiſtered in large doſes, likewiſe excite a copious excretion of watery fluids from the inteſtines. Some caution is requiſite in the adminiſtration of theſe active cathartics, eſpecially in habits originally delicate or weakened by diſeaſe, or in thoſe whoſe bowels are peculiarly irritable. Fainting, convulſions, and even death have been the conſequence of exceſſive purging: theſe reſults appear to have been not very rare among the ancients, who were obliged to have recourſe to ſuch medicines as white hellebore, when a conſiderable catharſis was neceſſary. "Convulſio poſt helleborum lethale," is an aphoriſm more than once expreſſed by Hippocrates. A *hypercatharſis*, with bloody ſtools, is a more common conſequence of hydragogue purging in modern times. See Hypercatharsis.

Draſtic hydragogues are ſeldom indicated, except in dropſy eſpecially of the belly, in which a copious watery diſcharge from the inteſtines occaſionally effects a cure of the diſeaſe;—or in caſes of paralytic torpor extending to the bowels, in hemiplegia;—or in the painter's cholic, after the ſpaſm has been relaxed by opiates. In enteritis, or inflammation of the bowels, hydragogues ſhould be cautiouſly ſhunned, notwithſtanding the conſtipated ſtate of the canal; for ſince the conſtipation ariſes from the inflammatory condition of the inteſtines, every acrid ſtimulant applied to them muſt inevitably augment, rather than alleviate the diſeaſe. See Cathartic.

HYDRANGEA, in *Botany*, from ὑδωρ, *water*, and αγγος, *a veſſel*, ſo named by Gronovius, in alluſion to the pitcher-like ſhape of the ſeed-veſſel. Linn. Gen. 222. Schreb.

299. Willd. Sp. Pl. v. 2. 633. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 76. Juſſ. 310. Lamarck. Dict. v. 3. 150. Illuſtr t. 370. Gærtn. t. 30. (Hortenſia; Juſſ. 214. Primula; Loureir. Cochinch. v. 1. 104.) Claſs and order, *Decandria Digynia*. Nat. Ord. *Succulentæ*, Linn. *Caprifolia*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, ſuperior, five-toothed, permanent, ſmall. *Cor.* Petals five, equal, roundiſh, larger than the calyx. *Stam.* Filaments 10, longer than the corolla, but ſometimes alternately longer and ſhorter themſelves; anthers roundiſh, twin. *Piſt.* Germen roundiſh, inferior; ſtyles two, ſhort, diſtant; ſtigmas obtuſe, permanent. *Peric.* Capſule roundiſh, twin, the double ſtyle forming two beaks to it, angulated with many nerves, crowned by the calyx, two-celled by a tranverſe partition, opening by a hole between the horns. *Seeds* numerous, angulated, pointed, very ſmall.

Eſſ. Ch. Calyx ſuperior, five-toothed. Corolla of five petals. Capſule of two cells and two beaks, containing many ſeeds.

1. H. *hortenſis*. Chineſe Guilder-roſe. Willd. Sp. Pl. No. 2. Sm. Ic. Pict. t. 12.—"Leaves elliptical, ſerrated, very ſmooth. Stamens all of an equal length."—This ſhrub is a native of the Eaſt, and is uſually cultivated in the gardens of China and Japan, from whence it was introduced into Kew gardens by ſir Joſeph Banks in 1790.—*Root* fibrous, much branched, whitiſh. *Stems* erect, ſhrubby, having a ſmooth brown bark. *Branches* oppoſite, leafy, green, ſpeckled with dark purple ſpots, flowering at the top. *Leaves* oppoſite, ſpreading and curved backwards, bright green, veiny. *Cluſters* of flowers terminal, of a beautiful roſe-colour, inodorous, green when young as well as in decay. *Calyx* only ſeen by us in a luxuriant ſtate of deformity, very large, compoſed of four (rarely three or five) ſpreading unequal, obovate leaves, which are entire, ſmooth, roſe-coloured, ſlightly ribbed and permanent. *Petals* generally four, nearly equal, ſmall, obovate, concave, of the colour of the calyx, fading. *Filaments* awl-ſhaped, red; anthers greyiſh, with yellow pollen. *Styles* purple.

This plant, which is nearly allied to *Viburnum* and *Sambucus*, is much eſteemed for its very elegant flowers and eaſy culture. We have ſelected *H. hortenſis* for a ſpecimen of the genus, as it is the moſt beautiful ſpecies, out of the four deſcribed by Willdenow. The others, *H. arboreſcens*, *radiata*, and *quercifolia*, are of American origin, tolerably hardy in the gardens of Europe.

HYDRANGEA, in *Gardening*, comprehends plants of the ſhrubby and flowering perennial kinds; of which the ſpecies cultivated here are; the ſhrubby hydrangea (H. arboreſcens); and the garden hydrangea, or Chineſe guilder roſe (H. hortenſis.)

The latter of theſe ſorts is held in high eſtimation on account of the number of elegant flowers which it diſplays.

Method of Culture.—The firſt of theſe plants is increaſed by ſlipping off or parting the roots in the early autumn, and planting them out where the plants are to grow. It ſucceeds beſt on a moiſt ſoil, and requires no trouble but being kept free from weeds, by digging the ground about it in the winter. When the ſtems are deſtroyed in ſevere froſts, new ones are put forth in the enſuing ſpring ſeaſon.

And the ſecond ſort is eaſily increaſed by planting cuttings of the young ſhoots, in pots of rich loamy earth in the ſpring, plunging them in a moderate hot-bed. When they have ſtricken good root, they ſhould be removed, with balls of earth about their roots, into ſeparate pots, and be placed in the green-houſe or under other ſimilar protection.

But though this plant is capable of ſtanding the open air in mild winters, in warm dry ſituations, it does not flower ſo well as in the green-houſe. Superfluous plants ſhould therefore only be employed in this way as they may frequently be deſtroyed.

Theſe are ornamental plants; the former in fronts of clumps and borders, and the latter among green-houſe collections and other potted plants, where it produces a fine appearance during the flowering ſeaſon.

HYDRAOTES, in *Ancient Geography*. See RAUVEE.

HYDRARGYROSIS, a term uſed by the chirurgical writers to expreſs the anointing of the body with a mercurial unction, in order to the raiſing a ſalivation.

HYDRARGYRUM, Ὑδραργυρον, a name given to mercury, or quickſilver.

The word is formed of ὑδωρ, *aqua*, *water*, and αργυρος, *argentum*, *ſilver*; *q. d. water of ſilver*, on account of its reſembling liquid or melted ſilver. For an account of mercury and its different preparations, ſee MERCURY.

HYDRASPIS, *water-ſhield*, or *water buckler*, a machine of wood, invented by John Chriſtopher Wagenſeil, a German, by the help of which a perſon may walk on the water, without fear of ſinking. It encompaſſes the breaſt, ſerving the office of the cheſt in water-fowl, and is furniſhed with apertures for receiving a quantity of food, or for preſerving money, writings, or other valuable things, in caſe of an inundation. The perſon who uſes it is provided with paddles for the feet, conſiſting of moveable flaps of very thick leather, which open and ſhut, and are faſtened to a wooden ſole, on which the foot reſts, by an iron pin paſſing through their hinges. They are faſtened to the feet by ſtraps or thongs. The inventor of this machine made trial of it in a whirlpool of the Danube, where he moved about in the current without danger. He propoſes, that this machine ſhould be uſed in a ſhipwreck, in eſcaping the danger of ſudden inundation in paſſing a river, for the ſervice of war, and hunting and taking water-fowl, &c. Act. Erud. ann. 1691, p. 40.

HYDRASTIS, in *Botany*, ſo named by Mr. John Ellis, who probably, as profeſſor Martyn conjectures, received it from Miſs Colden, daughter of governor Colden. From ſome confuſion, perhaps, in the hiſtory of the diſcovery, or of the communication, Linnæus was led to underſtand the appellation given by his friend as intended to commemorate "a young lady of noble birth;" whereas it appears rather to have a reference to the native ſituation of the plant, from ὑδωρ, *water*, or ὑδρεια, *an imbibing of water*.—Linn. Gen. 283. Schreb. 379. Willd. Sp. Pl. v. 2. 1339. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 273. Juſſ. 232. Lamarck Dict. v. 3. 151. Illuſtr. t. 500—Claſs and order, *Polyandria Polygynia*. Nat. Ord. *Multiſiliquæ?* Linn. *Ranunculaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth none. *Cor.* Petals three, ovate, regular. *Stam.* Filaments numerous, linear, compreſſed, a little ſhorter than the corolla; anthers compreſſed, obtuſe. *Piſt.* Germens numerous, ovate, forming themſelves into an ovate head; ſtyles very ſhort; ſtigmas broadiſh, compreſſed. *Peric.* Berry compoſed of oblong grains. *Seeds* ſolitary, oblong.

Eſſ. Ch. Calyx none. Petals three. Nectary none. Berry compoſed of ſingle-ſeeded grains.

1. *H. canadenſis*. Canadian Yellow-root. Linn. Sp. Pl. 784. (Warneria canadenſis; Mill. Dict. 190. t. 285. Hydrophyllum verum canadenſium; Linn. Sp. Pl. ed. 1. 146.)—This bog plant is a native of Canada, and flowers in May or June. It was firſt cultivated by Mr. P. Miller in 1759.—*Root* of a deep yellow colour within, whence its Engliſh name, throwing out fibres in the ſpring. *Stems* about nine inches high, at firſt light green, but afterwards tinged

with purple, hairy towards the top. *Leaves* two on each ſtem, petioled, emarginate at the baſe, palmate, ſerrate, three, four, or five-lobed, the lobes having a ſmaller lobe on each ſide, changing from light to dark green, or a purpliſh colour. *Flower* ſolitary, white, of ſhort duration. *Fruit* red, and ſucculent. *Berry* reſembling the raſpberry or mulberry more than the ſtrawberry.—Juſſieu ſays it has the fruit and habit of a *Rubus*, and is allied to *Podophyllum*.—It is remarked by Linnæus, in his herbarium, that the flowers of this plant were unknown to his pupil Kalm. We are not aware that it has been figured by any author except Miller, as quoted above.

HYDRATE, in *Chemiſtry*, a term that has been applied by ſome modern chemiſts to expreſs the chemical union of water with any ſubſtance, and more particularly with certain metallic oxyds; thus from the ſalts of copper precipitates are thrown down by the alkalies, and ſome of the earths, which are either of a green or blue colour, and which were formerly regarded as mere oxyds. According to Prouſt, the *green* is a ſub-ſalt, or an oxyd with a ſmall portion of acid, and a quantity of water; the *blue* a compound of black oxyd with water alone, in the proportion of 24 parts of water to 76 of oxyd, and is denominated a *hydrate* of copper. The water is thought to be in a ſtate of chemical combination, and to be the cauſe of the blue colour. This hydrate, by the ſame chemiſt, is ſuppoſed to be the baſe of a number of ſalts. The water may be expelled with a low red heat.

HYDRAULICON, in the *Ancient Muſic*, an organ blown by the fall of water. From the deſcription of this inſtrument by Vitruvius, cap. xiii. it ſeems as if the water which forced the air into the pipes was pumped by men. Indeed, it has been much diſputed whether it was played with *fingers*, by means of levers or *keys*; and yet the deſcription of it by Claudian ſeems ſuch a one as would ſuit a modern organ, only blown by water inſtead of bellows.

> "Vel qui magna levi detrudens murmura tactu
> Innumeras voces ſegetis moderator aënæ
> Intonet *erranti digito*, penituſque trabali
> Vecte laborantes in carmina concitet undas."

In Athenæus, lib. iv. p. 174, there is a hiſtory and deſcription of this inſtrument. He tells us that it was invented in the time of the ſecond Ptolemy Euergetes, by Cteſibius, a native of Alexandria, and by profeſſion a barber: or rather, that it was improved by him, for Plato furniſhed the firſt idea of the hydraulic organ, by inventing a night-clock, which was a *clepſydra*, or water-clock, that played upon flutes the hours of the night at a time when they could not be ſeen on the index.

The anecdote in Athenæus concerning the mechanical amuſements of the great ideal philoſopher, is curious. What a condeſcenſion in the *divine* Plato to ſtoop to the invention of any thing uſeful! This muſical clock muſt have been wholly played by mechaniſm. But neither the deſcription of the hydraulic organ in Vitruvius, nor the conjectures of his innumerable commentators, have put it in the power of the moderns either to imitate, or perfectly to conceive the manner of its conſtruction; and it ſtill remains a doubt whether it was ever worthy of the praiſes which poets have beſtowed upon it, or ſuperior to the wretched remains of the invention ſtill to be ſeen in the grottos of the vineyards, near the city of Rome.

The pneumatic organ, or inſtrument blown by bellows, and furniſhed with keys, ſuch as are in preſent uſe, though perhaps a deſcendant from the hydraulicon, will have a diſtinct article, where its invention will be diſcuſſed, and its improvements traced, among thoſe of modern inſtruments.

HYDRAULICS, that part of ſtatics which conſiders the motion of fluids, and particularly water; with the application of it in artificial water-works. Hydraulics, as diſtinguiſhed from hydrodynamics, is that ſcience which treats of certain machines or engines, in which fluids are principally concerned.

The word is derived from the Greek, ὑδραυλος, *ſounding water*, formed of ὑδωρ, *aqua*, *water*; and αυλος, *tibia*, *pipe*, or *flute*: the reaſon of which is this, that at the time of the firſt invention of organs, being unacquainted with the method of applying bellows to blow them, they made uſe of a cataract or fall of water to make a wind, and ſound them.

To hydraulics belong not only the conducting and raiſing of water, with the conſtruction of engines for thoſe purpoſes, but alſo the laws of the motion of fluid bodies, the nature of ſprings, the courſe of rivers, the agitation of waves, the theory of the tides, &c.

Hydroſtatics explain the equilibrium of fluids, or the gravitation of fluids at reſt: upon removing that equilibrium, motion enſues; and here hydraulics commence.

Hydraulics, therefore, ſuppoſe hydroſtatics; and the generality of writers, from the immediate relation between the two, join them together, and call them both either hydraulics or hydroſtatics.

The laws of hydraulics the reader will find under FLUID. The art of raiſing waters; with the ſeveral machines employed for that purpoſe, as ſiphons, pumps, ſyringes, fountains, jets d'eau, fire engines, &c. are deſcribed under theſe, and other articles of a ſimilar kind, reſpectively.

The ſcience of hydraulics muſt be allowed to be of as great importance to civil life, and eſpecially to a maritime nation, as any department of practical mechanics. Let us only reflect for a moment to what ſtate the metropolis of England would be reduced, if deprived of pipes for the conveyance of water, of pumps, and fire engines; and how much the commerce of the whole kingdom has been facilitated and increaſed by the formation of navigable canals, and we ſhall be convinced of the importance and utility of the art of modifying the motion of water, and of the principles of hydraulics, on which that art depends.

The principal writers who have cultivated and improved hydraulics, are Archimedes in his Liber de Inſidentibus Humido; Hero in his Liber Spiritualium, who is the firſt who has written on hydraulic machines; Marinus Ghetaldus in his Archimedes prometus; Jo. Ceva, in his Geometria Motus; Jo. Bap. Balianus, De Motu Naturali Gravium, Solidorum et Liquidorum; Mariotte, in his Mouvement des Eaux et autres Fluides; Boyle, in his Hydroſtatical Paradoxes; Fr. Tertius de Lanis, in his Magiſterium Naturæ et Artis; Lamy in his Traité de l'Equilibre des Liqueurs; Rohault; Dr. Wallis in his Mechanics; D. Guglielmini, in his Menſura Aquarum Fluentium, where the higher laws of hydraulics are reduced to practice; ſir Iſaac Newton, in his Phil. Nat. Prin. Mathemat.; Varignon, in the Memoirs of the Royal Academy of Sciences; Jurin, Belidor, Bernouilli, Solomon de Caux, in a French treatiſe of Machines, and chiefly hydraulic ones; Caſp. Scottus in his Mechanica Hydraulico-pneumatica; De Chales, in his Mundus Mathematicus; Boecler, in his Architectura Curioſa; Luc. Antonius Portius; Herman; Wolfius; S'Graveſande; Muſchenbroeck; Leopold; Sturmius, in his Treatiſe on the Conſtruction of Mills; Switzer's Hydroſtatics; Euler; Emerſon; Deſaguliers; Clare; Ferguſon; Berda; D'Alembert; Lagrange; Boſſut; Buat; Ximenes; Lametherie; M. Young; Bernhard; Prony; Lorgna; Vince; Venturi; &c. &c. &c.

HYDRAULO-PNEUMATICAL, a compound term, applied by ſome authors to ſuch engines as raiſe water by means of the ſpring of the air. See AIR, WATER, and ENGINE.

Mr. Boyle mentions a very pretty fountain, which he calls hydraulo-pneumatical; made by the ſpring of the air preſſing up water in a pipe upon the air's being exhauſted out of a receiver, and thus the weight of the atmoſphere taken off. See FOUNTAIN.

HYDREA, in *Ancient Geography*, an iſland of the Hermionic gulf, ſituated S.E. of the Argolide peninſula. See HERMIONE.

HYDRELÆON, Ὑδρελαιον, compounded of ὕδωρ, *water*; and ελαιον, *oil*, in *Pharmacy*, a mixture of common oil and water.

The hydrelæon was taken internally to excite vomiting; externally it is anodyne, and promotes ſuppuration.

HYDRE'NTEROCE'LE, a term in *Surgery*, denoting a hydrocele complicated with an inteſtinal hernia. Hydrenterocele is compounded of three Greek words, *viz.* ὕδωρ, *water*, εντερον, *an inteſtine*, and κηλη, *a tumour*. See HYDROCELE.

HYDRIA, in *Ancient Geography*, an iſland of the Adriatic ſea, placed by P. Mela before the Electrides.

HYDRIA, or *Idria*, in *Geography*, a town of Germany, in the duchy of Carniola. N. lat. 46° 14'. E. long. 14'.

HYDRIA, in *Mythology*, the name given by the Egyptians to the god of the water, which they repreſented by a vaſe, perforated on all ſides. According to Vitruvius (lib. viii.) the prieſts upon certain days filled this vaſe with water, adorned it with great magnificence, and then placed it upon a kind of public theatre, where all proſtrated themſelves before the vaſe, with hands lifted up to heaven, and gave thanks to the gods for the benefits they received from this element. The intention of this ceremony was to teach the Egyptians that water was the principle of all things, and had communicated life and motion to every thing that breathes.

HYDRIAPHORÆ, compounded of ὕδωρ, *water*, and φερω, *I carry*, among the *Athenians*, a deſignation given to wives of ſtrangers reſiding at Athens.

They were thus called, as being obliged during the proceſſion of the feſtival Panathenæa, to carry veſſels of water. Potter, tom. i. p. 56 and 401.

HYDRIAS, in *Ancient Geography*, a country of Aſia Minor, in the vicinity of the river Marſyas. Herodotus.

HYDRINUS, a name given by ſome authors to the *ophites*, or ſerpent-ſtone.

HYDROCANISTERIUM, a fire engine; or a machine which ſpouts water plentifully, and with force; uſed to be applied to the extinguiſhing of fires, and conflagrations of houſes, &c. We have various contrivances to this effect: the firſt, and which is, as it were, the baſis of all the reſt, is a pump incloſed in a ciſtula, or wooden vehicle filled with water, and mounted on wheels; the pump being wrought with long levers which come out of the ciſtula: and the water it raiſes directed to the place by means of a jointed tube.

The Dutch and others uſe a long flexible tube of leather, ſail-cloth, or the like, which they carry or conduct in the hand from one room to another as occaſion requires; ſo that the engine may be applied where the fire is only within-ſide, and does not burſt out to expoſe it to its external action. To improve on this original fire-engine, they have ſince contrived to make it yield a continued ſtream; by ſubſtituting a forcing or preſſing pump in lieu of the ſucking pump. See FIRE-*Engine*, and *Forcing* PUMP.

HYDROCANTHARUS, in *Entomology*. See DYTISCUS *Marginalis*.

HYDROCARBONATE GAS, in *Agriculture*, an ærial fluid formed during the decompoſition of water, which is ſaid to be uſeful in promoting the proceſs of vegetation. It is ſuppoſed by the author of the work entitled "Phytologia," that during the proceſs of putrefaction "carbon is not only converted into carbonate acid, but there appears to be a decompoſition of water, as is known by the ſmell of hydrogen; and it is probable that this inflammable body may unite with carbon, as in hydrocarbonate gas, and thus render them both ſoluble in water, and abſorbable by the veſſels of vegetable roots, without their paſſing into an acid or gaſeous form, and may contribute much to the nutriment of vegetables." This hint requires the further attention of the philoſophical agriculturiſt.

HYDROCARDIA, a term invented by Hildanus to expreſs a ſerous, ſanious, or purulent tumour of the pericardium.

HYDROCELE ſignifies, in *Surgery*, any preternatural collection of water in the ſcrotum. The term is derived from ὕδωρ, *water*, and κηλη, *a tumour*. In this diſeaſe the fluid may occupy various parts of the ſcrotum. In ſome caſes it is ſituated in the cellular membrane, which affection receives the appellation of *hydrops ſcroti*. In moſt inſtances it is contained in the tunica vaginalis teſtis. In ſome examples it is lodged within the ſheath of the ſpermatic cord; in others it is included in a preternatural cyſt; occaſionally the water is contained in a true hernial ſac; therefore we have five different kinds of hydrocele diſtinguiſhed by the particular ſituation of the fluid.

Hydrops Scroti.—The firſt ſpecies, namely, the hydrops ſcroti, is nothing more than an œdematous ſwelling of the ſcrotum. The water is diffuſed throughout all the cellular membrane of this part of the body, cauſing every where an equal diſtenſion, ſo that the raphe is not puſhed out of the central ſituation which it naturally holds. The ſwelling has all the character of œdema; the preſſure of the end of the finger makes an impreſſion upon it; the ſurface of the ſcrotum is ſmooth and ſhining, without any veſtige of the corrugations; the part retains its natural colour, is generally very ſoft, and has a cold feel. In moſt caſes the prepuce is alſo affected with a ſimilar ſort of ſwelling, ſo that the patient is actually troubled with a phymoſis. In certain inſtances veſicles make their appearance on the integuments of the penis. We may add, that the tumour is quite free from pain. In ſome caſes one ſide of the ſcrotum is more diſtended than the other, and, conſequently, the raphe is not ſituated in the middle. It is deſerving of notice, that women are ſometimes affected with a ſimilar ſwelling of the labia.

The hydrops ſcroti is generally a ſymptom of another conſtitutional diſeaſe, eſpecially of aſcites and anaſarca, in which event it is commonly attended with an œdematous ſwelling of the feet. However, it is occaſionally quite a local diſeaſe; and in this caſe it is uſually a conſequence of preſſure upon the returning veſſels, produced by a diſlocated thigh-bone, a badly made truſs, an indurated omental hernia, &c. Sometimes the diſeaſe is noticed in new-born children, and it has been obſerved to follow contuſions of the ſcrotum, and expoſure either of this part, or of the whole body, to certain degrees of cold.

An analogous diſeaſe may proceed from an extravaſation of urine in the cellular membrane of the ſcrotum. This particular caſe is ſometimes the conſequence of a retention of urine. When the laſt affliction has attained a high degree, gangrenous ſpecks are apt to be formed on the poſterior and inferior parts of the bladder, ſo as to let the urine eſcape into the cellular ſubſtance of the perineum and ſcrotum. In this inſtance the ſwelling of the latter part originates ſuddenly; and in proportion as it increaſes, all the ſymptoms of a preternatural diſtention of the bladder undergo a diminution. The urine ſometimes paſſes through an ulcerated aperture in the urethra into the cellular membrane of the ſcrotum. Hence fiſtulæ in perineo may be attended with this ſort of extravaſation. When, alſo, by external violence the tunica vaginalis has been burſt, while diſtended with water, the fluid has been known to eſcape from the cavity of that membrane into the cellular ſubſtance of the ſcrotum, the caſe changing at once from a common hydrocele into an hydrops ſcroti. Laſtly, we have to remark, that a ſimilar extravaſation of fluid ſometimes happens in the palliative operation for the ordinary hydrocele, when the puncture is executed with a lancet, and the opening in the ſkin happens to ſlip away from that in the tunica vaginalis, while the water is flowing out.

In the treatment of the hydrops ſcroti, it is always an indication to remove the cauſes of the diſeaſe, whether they are of a local or general nature. When a dropſy of the abdomen is fortunately cured by medical means, the hydrops ſcroti ſpontaneouſly diſappears. The ſwelling of the ſcrotum, likewiſe, proceeding from the preſſure of an ill made truſs, a diſlocated thigh-bone, &c. will ſubſide as ſoon as ſuch preſſure is removed. But ſurgical writers appear to coincide in opinion, that caſes may preſent themſelves in practice where local treatment is indiſpenſably proper. An inſtance of this kind may be where the general or local cauſe does not admit of a removal in a complete or ſufficiently ſpeedy manner, and where the tumour of the ſcrotum is attended with ſerious inconvenience, or any degree of danger. Thus, when urine is effuſed into the ſcrotum an immediate operation is proper, in order to avert inflammation, ſuppuration, ſloughing, and fiſtulæ, effects which would otherwiſe quickly follow. In caſes of the common hydrocele of the tunica vaginalis, eryſipelatous inflammation, ulcerations, and gangrenous complaints may occur when the ſwelling is exceedingly large. The prepuce is ſometimes ſo ſwollen that the urine cannot eſcape from the orifice of the urethra. Yielding as the integuments of the ſcrotum are, they may yet be burſt by being exceſſively diſtended with fluid, as the obſervations of Mr. Warner confirm. Local means are alſo obviouſly requiſite whenever the hydrops ſcroti ariſes from a local cauſe.

The moſt common and effectual means of relieving the hydrops ſcroti is letting the fluid out of the cellular membrane by ſuitable punctures. In a few inſtances, indeed, a milder plan will anſwer the purpoſe. The complaint in new-born infants may uſually be cured by bathing the ſcrotum with warm wine. The hydrops ſcroti, conſequent to a bruiſe, or expoſure to cold, may in general be very ſoon diſperſed by the uſe of a ſuſpenſory bandage, and repeatedly waſhing the tumour with brandy, lime-water, wine, vinegar, or any decoction of aſtringent and aromatic herbs. The ſame remedies will alſo be found to avail when the ſwelling remains after its cauſe has been removed. When the tumour is exceedingly large, and the ſymptoms preſſing, the ſurgeon is not to conſume time in the trial of theſe applications, but immediately make the neceſſary punctures. If urine ſhould happen to be the fluid in the cellular membrane of the part, proper inciſions ſhould be directly made for its eſcape, leſt inflammation, abſceſſes, and gangrenous miſchief enſue.

The fluid of hydrops ſcroti may be diſcharged either by an inciſion or a puncture. Five or ſix ſuperficial ſcarifications with a lancet will in general be found to anſwer the purpoſe. If ſuch openings ſhould be cloſed the day after making them, before all the fluid has been diſcharged, the practitioner is called upon to uſe the lancet in the ſame manner again. When inciſions are preferred, it is cuſtomary to make one about an inch long on each ſide of the raphe, and deep enough to extend through the ſkin into the cellular membrane. Scarifications are commonly deemed the moſt adviſable. It is true that they do not let out the fluid ſo quickly as inciſions, but they are ſafer, as every material wound in dropſical parts is very apt to fall into a gangrenous ſtate. It is remarked, that frequently the inciſion ſoon begins to be painful, its edges to be affected with hardneſs and inflammation, while an eryſipelas ſeizes the whole circumference of the wound, and rapidly induces gangrenous diſorder.

Such evils are moſt liable to occur when the operation has been performed at a period when the ſcrotum is exceſſively diſtended, and already ſomewhat affected with an eryſipelatous redneſs, and when care has not been taken to keep the parts quite dry, during the iſſue of the fluid. Hence it is an important rule to keep the ſcrotum from being wet, by laying over and under it dry compreſſes. When pain and inflammation follow the operation, the moſt eligible applications are the ſaturnine lotion, lime-water, the decoction of bark, a ſolution of alum, &c. Should mortification actually take place, the patient is always in conſiderable danger, and the event is too frequently fatal. Sometimes the whole ſcrotum ſloughs and is caſt off, both the teſtes being left entirely denuded. Notwithſtanding all this miſchief, the teſtes uſually become furniſhed with a new ſort of covering.

We know of only one example in which inciſions are decidedly better than ſcarifications, and this is where urine is lodged in the cellular membrane of the ſcrotum, and where a ſpeedy diſcharge of this irritating fluid is urgently required.

Of the Hydrocele of the Tunica Vaginalis Teſtis.—This is the chief and moſt intereſting form of the diſeaſe. It is ſituated in the cavity of the tunica vaginalis teſtis. It makes its firſt appearance as an oval ſwelling at the lower end of the ſpermatic cord, ſeeming, indeed, to ariſe from the teſtis itſelf. In proportion as it increaſes in ſize it approaches more and more towards the abdominal ring; but between this opening and the upper part of the tumour, the ſpermatic cord may always be felt quite free. The ſwelling continuing to grow larger, it arrives at length as high as the ring, ſo that the ſpermatic cord cannot be at all diſtinguiſhed; yet it is worthy of notice that the upper roundiſh end of the tumour may ſtill be plainly felt, particularly on laying the hand under the ſcrotum, and preſſing the ſwelling upwards; for when this is done the upper margin of the tumour projects ſo much forwards that it may always be diſtinctly perceived. The finger can even be put between the upper part of the ſwelling and the abdominal ring, by which means the ſurgeon can conſtantly aſcertain that the tumour does not come out of the latter aperture. Beſides, the diſeaſe cannot be eaſily miſtaken for a hernia, eſpecially as the ſwelling is ſubject to no variation of ſize, whether the patient is in an erect or recumbent poſture, whether he coughs, holds his breath, or the tumour itſelf is compreſſed. We may alſo obſerve that all the other general ſymptoms of a hernia are abſent.

The ſwelling is commonly of an oval ſhape, the greateſt diameter extending downwards. Sometimes the poſition of the tumour is oblique, or even completely tranſverſe. In this laſt circumſtance it may be neceſſary to make the puncture on the right ſide of the ſcrotum in performing the palliative operation, notwithſtanding the collection of fluid may be ſituated in the cavity of the left tunica vaginalis, and *vice verſâ*. Probably this unuſual ſhape of a hydrocele may be cauſed by tight breeches or the preſſure of the ſuſpenſory bandage. The larger the tumour is the rounder does its figure become; but in ſome caſes the ſhape is very different from what it is in others. Hydroceles have been obſerved to have occaſionally quite a cylindrical appearance. The tumour is occaſionally divided by a ſort of contraction. When a hydrocele is the conſequence of inflammation, the tunica vaginalis is ſometimes adherent in different places to the tunica albuginea, and of courſe the ſwelling has an irregular knobby ſhape.

The tumour feels like a bladder diſtended with water. In its commencement it is ſoft and yielding; but the tenſion and hardneſs increaſe in proportion to the quantity of fluid, and the quickneſs with which it has accumulated. It deſerves attention, however, that there are ſome hydroceles of conſiderable magnitude, which are ſo remarkably ſoft that they may be made quite flat by preſſure, and allow the teſtes to be plainly felt. The freer the ſwelling is from tenſion the more evident is the fluctuation; but even in caſes which are exceedingly tenſe a certain degree of fluctuation can be diſtinguiſhed on applying the palms of the hands on oppoſite ſides of the tumour. Schmucker has ſeen hydroceles which felt as hard as a ſarcocele, and Saviard mentions their being occaſionally attended with the hardneſs of horn. In ſuch inſtances the tunica vaginalis is in general thickened and indurated in an extraordinary degree, and, in certain caſes, that membrane, inſtead of containing merely an aqueous ſecretion, has been found to include cyſts or veſicles filled with a yellow fluid.

When either the patient himſelf or the ſurgeon handles the tumour, the ſame kind of ſenſation is communicated to the fingers, whatever part of the ſwelling is touched. The ſurgeon perceives every where the ſame kind of feel as he would be ſenſible of in handling an elaſtic diſtended bladder, and the patient ſuffers no pain from any manual examination of the diſeaſe. The whole circumference of the ſwelling is ſmooth and even, except juſt at one place, which is where the teſtis is ſituated, and is uſually at the hinder and middle part, though not unfrequently at the upper portion of the tumour. In ſuch ſituation the ſurgeon may feel an inequality and an inelaſtic hardneſs, and when the part is compreſſed the patient is afflicted with the peculiar pain which is always produced by ſqueezing the teſtis. This gland may almoſt always be felt at the back part of the ſwelling, at various heights, according as the tunica vaginalis happens to have been dilated upwards or downwards by the increaſing quantity of the fluid. B. Bell twice ſaw the teſtis in front of the tumour. The ſame gland, though at the back part of the ſwelling, has been found adhering to the fore part of the tunica vaginalis, in conſequence of inflammation, which was prior to the hydrocele. Mr. Elſe had an opportunity of ſeeing a caſe, where the oval ſwelling of a hydrocele was in an horizontal poſition from before backwards, while the teſtis could be plainly felt at the bottom of the ſcrotum.

When the end of the finger is preſſed upon the hydrocele of the tunica vaginalis, it does not leave after it any impreſſion or dent. How large ſoever the ſwelling may be, the ſkin of the ſcrotum always retains ſome veſtiges of the corrugations, or, at leaſt, is never ſo ſmooth and ſhining as it is in the caſe of hydrops ſcroti. Frequently, when the tumour has acquired a conſiderable ſize, the penis becomes retracted in ſuch a manner, that the prepuce has ſomewhat the appearance of a navel at the upper and forepart of the ſcrotum. The diſeaſe is entirely free from pain, except when it increaſes very quickly, in which circumſtance a degree of uneaſineſs is experienced in the ſwelling, at the ſame time that painful ſenſations are felt in the loins, probably excited by the weight of the tumour, when the patient has been a long while in a ſtanding poſture. We find, therefore, that ſuch pain may be relieved by the patient's lying down. As this ſpecies of hydrocele commonly affects only one ſide, or ſince, when in a few inſtances, it happens at the ſame time on both ſides of the ſcrotum, it is not equally large on each ſide, the raphe is never ſeen exactly in the middle. The integuments of the ſcrotum have their natural colour. Moſt hydroceles of the tunica vaginalis are attended with a certain degree of tranſparency, and the knowledge of this circumſtance is of infinite importance to the practitioner, ſince it will often enable him to form an accurate judgment reſpecting ambiguous caſes. In order to learn whether the ſwelling is tranſparent, the chamber ſhould be darkened, while a lighted taper is held juſt on one ſide of the ſcrotum, while the ſurgeon looks at the other, which ought to be in the ſhade. It is neceſſary, however, for every ſurgeon to be aware that tranſparency is by no means a conſtant ſymptom of a hydrocele, and is never preſent, either when the tunica vaginalis is preternaturally thick and indurated, or when it is filled with a dark turbid fluid, or cyſts reſembling hydatids.

By paying attention to the foregoing ſymptoms, the ſurgeon will be able, in all ordinary caſes, to diſcriminate the hydrocele of the tunica vaginalis from every other kind of tumour to which the ſcrotum is liable. But yet it muſt be allowed that there are caſes where the diagnoſis is attended with conſiderable difficulty, certain diſeaſes having ſo much ſimilitude to the hydrocele of the tunica vaginalis, that they may deceive the moſt attentive and experienced ſurgeon. One of ſuch caſes is the ſarcocele, which has the ſame ſhape as the hydrocele, and, like it, is ſituated at the lower end of the ſpermatic cord. The chief difference, therefore, between the two diſeaſes, ſeems to be, that the ſarcocele is hard, while the hydrocele has a ſoft, yielding, elaſtic feel, accompanied with a fluctuation. The ſarcocele itſelf, however, is not always remarkably hard, and the hydrocele is now and then very indurated. The ſarcocele, indeed, is not tranſparent; neither is the hydrocele in certain inſtances; and theſe are caſes where a miſtake may eaſily be made. Still, with due attention, both diſeaſes may be diſcriminated with tolerable preciſion. The ſarcocele, when held in the ſurgeon's hand, ſeems heavier than the hydrocele. The teſtis is ſeldom equally indurated every where, and the ſarcocele is uſually much ſofter in ſome places than others. The hydrocele preſents the ſame kind of feel at every point, except behind, where the teſtis is felt. When, in the caſe of hydrocele, preſſure is made in this latter ſituation, the patient experiences a much more acute ſenſation than when the preſſure is made upon any other part of the tumour; but in the example of ſarcocele, the patient commonly has the ſame kind of feel, let the preſſure be applied to any part of the ſwelling whatſoever. The hydrocele may be compared with a bladder full of water, the ſurface of the tumour being every where ſmooth and even, except in the ſituation of the teſtis. This gland itſelf, when hardened, ſeldom undergoes a regular, uniform enlargement; but generally has a ſurface more or leſs uneven. When the upper portion of the ſpermatic cord can be felt, and it ſeems quite hard and thickened, the ſurgeon has reaſon to ſuſpect that the caſe is a ſarcocele. Laſtly, though a hydrocele, when gently handled, may ſeem to be conſiderably hard; yet, on being more ſtrongly compreſſed, it will generally betray a ſoft elaſtic feel, which is never the caſe with an indurated ſarcocele.

A hydrocele is ſometimes conjoined with a fleſhy enlargement of the teſtis, which caſe is well known among ſurgeons under the appellation of *hydro-ſarcocele*. As the diſeaſed teſtis is here ſurrounded with water, it cannot be felt nor examined by the fingers. However, when an unuſual degree of hardneſs is perceptible at the back part of the tumour, where the teſtis is ſituated, or when the upper portion of the ſpermatic cord is found to be quite indurated, the ſurgeon has reaſon to ſuppoſe that the teſtis is affected with ſarcocele. The latter is commonly the original and principal diſeaſe, the hydrocele firſt coming on ſubſequently to the enlargement of the teſtis. To the experienced practitioner this circumſtance often affords uſeful light. We learn from the obſervations of that very excellent ſurgeon, Mr. Warner, that omental herniæ in young children are ſometimes ſo tranſparent, that they may be miſtaken for hydroceles. But all the other ordinary characters of theſe fluid ſwellings are abſent. A cyſtocele, or hernia of the urinary bladder, has ſome reſemblance to a hydrocele, though the two affections may eaſily be diſtinguiſhed from one another by paying attention to the particular ſymptoms of each, as deſcribed in a foregoing part of this work, (ſee HERNIA,) and in the preſent article.

The diagnoſis is always apt to be attended with a degree of obſcurity, when the hydrocele is complicated with other diſeaſes of the ſcrotum. Sometimes it is conjoined with a hernia. On other occaſions, the hydrocele of the tunica vaginalis exiſts in conjunction with one of the ſpermatic cord. The ſurgeon can only acquire a perfect knowledge of ſuch caſes by paying cloſe attention to the peculiar ſymptoms of each of the diſeaſes. When the requiſite information cannot be thus obtained, it may often be procured by adverting to circumſtances which preſented themſelves in an early ſtage of the caſe; for frequently the hydrocele is at firſt ſimple, and does not become complicated till an advanced period. The nature of the caſe is often elucidated on the palliative operation for the hydrocele being performed, as the other diſeaſe of the ſcrotum becomes quite obvious immediately the fluid is diſcharged from the tunica vaginalis.

The ſpecies of hydrocele, now engaging our attention, continues for a long while unattended with any ſerious inconvenience, or preſſing ſymptoms: it only annoys the patient by its ſize and weight. When it is exceedingly large, the penis is drawn completely back, ſo that the urine dribbles over the forepart of the ſcrotum, and, unleſs particular care be taken to maintain cleanlineſs, is liable to excite inflammation and painful excoriations. When a hydrocele is the conſequence of an inflammation of the teſtis, the fluid generally accumulates with great quickneſs. But the progreſs of the diſeaſe is occaſionally ſo ſlow, that the palliative operation has not been required till twenty years after the commencement of the diſorder. In general, the water only collects in one tunica vaginalis; ſometimes in both. In the latter kind of caſe, a preternatural communication has been noticed between the oppoſite ſides of the ſcrotum, though we believe ſuch a circumſtance is very uncommon. See Richter's Anfangſgrunde der Wundarzneykunſt, Band 6. Kapitel 5.

The hydrocele appears to be one of thoſe diſeaſes, the cauſes of which are far from being well underſtood. In a natural, healthy ſtate, the cavity of the tunica vaginalis always contains a ſmall quantity of a fine fluid, exhaled from capillary arteries, and conſtantly abſorbed by veſſels for that purpoſe. This fluid, in the natural ſmall quantity, ſerves to keep the tunica albuginea moiſt, and to prevent a coheſion between it and the vaginalis; a conſequence which almoſt neceſſarily follows any ſuch diſeaſed ſtate of theſe parts as prevents the due ſecretion of it. On the contrary, if the quantity depoſited be too large, or if the regular abſorption of it be by any means prevented, it will be gradually accumulated, and, by diſtending the containing bag, will form the diſeaſe in queſtion.

It is a diſeaſe from which no time of life is exempt; not only adults are ſubject to it, but young children are frequently afflicted with it, and infants ſometimes born with it. The great Mr. Pott profeſſed himſelf incapable of determining the immediately producing cauſe. Ruyſch thought that the complaint might proceed from a varicoſe ſtate of the ſpermatic veſſels. What real foundation there may be for ſuch conjecture, Pott could not ſay, and, at the ſame time that he acknowledges the frequently varicoſe affection of the ſpermatic veſſels in caſes of hydrocele, he ſeems to conſider it as unproved whether ſuch ſtate be a cauſe or an effect of the diſeaſe. It is alſo remarked by Mr. Ramſden, that though we often find the hydrocele preſent with the varicocele, we much more frequently meet with this laſt diſeaſe, even in its moſt advanced ſtates, unaccompanied by any accumulation of fluid within the ſacculus. (Practical Obſervations on the Sclerocele, &c. p. 195.) The hydrocele of the tunica vaginalis may frequently, perhaps commonly, be regarded as a diſeaſe altogether local, and dependent upon local cauſes. According to ſurgical writers, contuſions of the ſcrotum often give riſe to the complaint, and hence it is ſaid to occur with particular frequency in perſons who are in the habit of riding a great deal on horſeback. In ſuch caſes the tumour is ſometimes formed with ſurpriſing quickneſs. Preſſure made upon the upper part of the ſpermatic cord by an ill conſtructed truſs, or by an indurated omental hernia, may alſo be a cauſe of an hydrocele. Sometimes the latter malady is joined with a ſarcocele, when it may be conſidered only as an effect of the diſeaſe of the teſtis. A hydrocele may likewiſe originate from an inflammation of this laſt gland. In ſome inſtances the diſeaſe appears to depend upon general and leſs manifeſt cauſes. We are informed of its having ariſen in the ſpace of four days, after expoſure to cold. (See Richter's Anfangſgrunde, &c. Band 6. p. 67.) Warner and other authors have taken particular notice how prevalent the diſeaſe is in warm climates, and they make mention of patients who got well on removing from a hot into a cold country, but ſuffered relapſes on their return into a warm part of the world. We deem the opinion, that hydroceles are ever connected with a venereal cauſe, entirely deſtitute of foundation.

Mr. Ramſden has recently advanced a new doctrine reſpecting the cauſe of hydroceles. This experienced ſurgeon has eſtabliſhed three forms of the diſeaſe, as occurring within the tunica vaginalis; namely, the acute, the ſpurious, (hydro-ſarcocele), and the true, or chronic hydrocele. He endeavours to prove that all theſe caſes may be dependent upon excitement within the urethra. He remarks, "that the teſticle will become hardened and enlarged, and that the ſacculus of the tunica vaginalis will be diſtended with watery fluid, in conſequence of various degrees of excitement within the urethra, from the irritable and acutely painful ſtricture, down to that concealed, ſubtle, and local derangement of the membrane, which is totally free from pain, until it is preſſed upon by the bougie, and which may exiſt for years without the patient being conſcious of its preſence.

"It cannot therefore be unreaſonable to ſuppoſe that an habitual ſuſceptibility of the whole membrane of the urethra may, in ſome inſtances, be induced by general or local cauſes, and although it create no conſcious ſenſation to the patient, may have the power of gently provoking the excretory veſſels of the teſticle ſomewhat beyond their natural action, and thus, by deſtroying the balance of fluid, in courſe of time eſtabliſh that undue accumulation which characterizes the chronic, or true hydrocele.

"I am induced," ſays Mr. Ramſden, "to offer this opinion from a variety of facts which have preſented themſelves to my obſervation, and which lead me to ſuſpect, that in almoſt every caſe of true hydrocele the urethra will be found either to have been expoſed at ſome previous time to excitement or inflammation, or to be in a preſent ſtate of increaſed ſenſation, from conſtitutional irritability, from the membranous fence, or from ſome other of the ſeveral general or local cauſes, to which I have in the preceding pages referred the derangement of this membrane.

"The prevalence of hydrocele in the Eaſt and Weſt Indies, inſtead of being attributable to the relaxation of the climate, may more reaſonably be referred to the conſtant excitement to which the urethra is expoſed from the habits of the table; ſince it is well known that, in thoſe hot countries, every individual indulges in high-ſeaſoned diſhes, and in the moſt ſtimulating deſcription of diet.

"The frequency of the hydrocele being preſent with the varicocele may alſo be ſatisfactorily explained, by referring to that ſtate of continual excitement, which is kept up by the diſtention and weight of the loaded veſſels. In the more advanced ſtates of varicocele, nothing is more common than an habitual gleet or weeping from the urethra, which is occaſioned by the dragging of the varicoſe veſſels; and it certainly appears not difficult to ſuppoſe, that ſuch excitement in the urethra, when once eſtabliſhed, may in its turn re-act upon the teſticle, and produce a caſe of hydro-varicocele." P. 193—201.

For the cure of the hydrocele of the tunica vaginalis, a ſurgical operation is generally neceſſary, as it is only in a few inſtances that the complaint yields to internal or external remedies. The obſervations of writers prove, however, that in young children the diſeaſe may ſometimes be diſperſed by emetics. A boy, twelve years old, was cured of a hydrocele by means of the ſteam of vinegar, the ſaturnine lotion, and repeated purgative doſes. (See Richter's Chir. Bibliothek, 5. b. p. 120, 9. b. p. 593.) Morand ſucceeded in curing ſeveral hydroceles by making an iſſue on the ſcrotum; and Douglas found ſimilar ſucceſs from placing an iſſue near the groin. Schmucker diſperſed a hydrocele by fumigating the ſcrotum with vinegar every morning and evening, and in the intervening time compreſſes wet with the ſame fluid. In the courſe of a few days the tumour ſubſided, the ſcrotum emitting a large quantity of perſpiration. Warner frequently cured hydroceles in young ſubjects by means of purgatives, and ſtimulating aſtringent applications. Mohrenheim ſucceeded in diſperſing a hydrocele, which aroſe from expoſure to cold. (Richter's Anfangſgr. &c. Band 6. p. 68.) Mr. Keate has recommended the following lotion, as an efficacious remedy: ℞ Sal. Ammon. Pulver. ℥j Acet. Spir. Vin. Rectif. āā ℥iv Miſce. Compreſſes, wet with this mixture, are to be laid upon the ſcrotum, and kept there with a bag-truſs. They ſhould be dipped in the liquid three times a day. Mr. Keate aſſures us, that when this plan is properly followed up, the water of the hydrocele not only gradually diſappears, but that it does not accumulate again, and the cure is radical and permanent, if the application be continued about a month. This method may be tried, either while the tumour is filled with water, or after the fluid has been let out. In the firſt inſtance it excites the abſorption of the water; in the ſecond it prevents a new collection. When the application happens to make the integuments red or painful, it muſt be left off a few days. The obſervations of ſir James Earle, however, tend to evince, that the preceding practice does not always anſwer, and is not to be depended upon. From the account which Mr. Ramſden has lately publiſhed, of the hydrocele being connected with a morbid ſtate of the urethra, one might ſuppoſe that the diſeaſe would yield to the proper treatment of this laſt canal. This gentleman remarks, however, that in caſes of chronic hydrocele, the uſe of the bougie is not attended with the ſame degree of ſucceſs as in the examples of the acute and ſpurious forms of the complaint. We may again ſtate, that by a ſpurious hydrocele is meant a collection of fluid in the tunica vaginalis, accompanied by an enlargement of the teſticle. The ſimple indurated enlargement of this gland, unattended with any ſubverſion of its organization, we conceive to be the caſe, which Mr. Ramſden has lately ſignified by the appellation of ſclerocele, and which, being ſometimes joined with an accumulation of fluid in the tunica vaginalis, conſtitutes an inſtance of ſpurious hydrocele, or what this eminent ſurgeon has named hydro-ſclerocele, in order to diſtinguiſh the diſeaſe from the hydro-ſarcocele where the organization of the teſticle is actually more or leſs ſubverted. Now Mr. Ramſden has endeavoured to prove, that the acute hydrocele, as well as the hydro-ſclerocele, may be cured by treating the urethra with bougies, ſo as to deſtroy the morbid irritation in that canal. "The ſclerocele of the teſticle, whether with or without fluid in its ſacculus, yields moſt readily to the uſe of the bougie, when the progreſs of induration in the gland has been moſt rapid, and the point of irritation within the urethra, on which it depends, is moſt ſuſceptible; but the chronic hydrocele being ſlow in its progreſs, and dependant on a much more modified ſtate of derangement in the urethra, is, on ſuch account, very little under the influence of the treatment of that membrane, and muſt be referred to ſome other operation for its permanent cure." (P. 202—203.) From a note, it appears to be Mr. Ramſden's opinion, that when a tumour of the ſcrotum preſents itſelf under the external appearances of true chronic hydrocele, and is co-exiſtent with an acutely deranged urethra, and eſpecially if the patient has any diſlike to the hydrocele being tapped, the treatment of the urethra by the bougie will always be a fair experiment previous to the letting out of the water. Mr. Ramſden can aſſert, from his own experience, that it will, in ſome few inſtances, prove ſucceſsful in curing the hydrocele. He thinks it probable, that in the caſes in which this treatment ſucceeded, there might be concealed ſclerocele; but he conſiders that ſuch a fact would not leſſen the propriety of the experiment. When the true hydrocele is not attended with an urethra ſo obviouſly deranged, Mr. Ramſden believes, that an attempt to cure the complaint by the uſe of the bougie will only be waſte of time. See Practical Obſervations on the Sclerocele, &c. by T. Ramſden, ſurgeon to Chriſt's Hoſpital, &c. &c.

For relieving the preſent diſeaſe, two operations are practiſed; one called palliative, the other radical. In the firſt, the deſign of the ſurgeon is merely to diſcharge the water, which uſually accumulates again, and the malady returns. By the ſecond he permanently frees the patient from the complaint, and hinders any relapſe, this object being accompliſhed by exciting an inflammation of the whole ſurface of the tunica vaginalis, and a conſequent univerſal adheſion of this membrane to the teſtis. In ſhort, the cavity of the tunica vaginalis, which is the ſeat of the diſeaſe, is thus obliterated. This is the commonly received opinion; but at the ſame time we are not unaware of a different ſentiment upon this ſame point having been lately advanced by Mr. Ramſden, who has adduced caſes in which, from the tranſparency manifeſted in the ſcrotum, a conſiderable time after the radical operation had

had been performed, the doctrine of the diſeaſe being always cured, by the obliteration of the cavity of the tunica vaginalis, is called in queſtion. The ſurgeon cannot invariably and indiſcriminately undertake either of the preceding operations, at his own pleaſure, with equal prudence and propriety. The palliative operation is entirely exempt from danger, and when a ſufficient quantity of fluid is collected in the tunica vaginalis may be ſafely undertaken, even though the teſtis may not be altogether undiſeaſed, nor the patient in good health. On the other hand, the radical operation, executed in any way whatſoever, demands more caution, and if done in improper caſes, may be followed by dangerous and unpleaſant conſequences. In determining which method is to be adopted, the ſurgeon ſhould attend to the following directions.

When the hydrocele is exceedingly large, it is not adviſable to perform the radical operation, the great diſtention which the parts have juſt ſuffered placing them in not the moſt advantageous ſtate for bearing inflammation. It is much better, in a caſe of this ſort, to be at firſt content with merely letting out the water, and to undertake the radical operation afterwards, when a moderate quantity of fluid has accumulated.

When any ſuſpicions are entertained of the teſticle being diſeaſed, the ſurgeon muſt reſtrict himſelf to diſcharging the water, a plan which can always be ſecurely undertaken, though the teſticle may not be found, and has the advantage of enabling the practitioner to feel and examine diſtinctly this latter part.

Should any radical operation be done, unpreceded by tapping the tumour, and the teſticle prove to be affected with ſarcocele, caſtration ought to be immediately performed, ſince the irritation excited would, in all probability, bring on a malignant change in the diſeaſe of the teſticle. If an attempt at the radical cure ſhould have been made, and the teſticle be found thus diſeaſed, yet, without the caſe admitting of the performance of caſtration, the patient is put into a very unpleaſant and precarious condition.

When the patient's health is very bad, the radical operation ought not to be undertaken, for fear of inducing alarming ſymptoms. This obſervation, however, muſt not be extended to a claſs of ſubjects, who, though not in health, are neither affected with extreme weakneſs, nor any preſſing indiſpoſition. The palliative cure, being free from danger, may be undertaken in almoſt any ſtates and circumſtances.

When the hydrocele is complicated with other diſeaſes of the ſcrotum, it is a wiſe maxim to reſt ſatisfied in the firſt inſtance with ſimply diſcharging the fluid. The ſurgeon can then examine more accurately the nature of the other diſorder, and, at a future period, attempt the radical cure of the hydrocele, if judged prudent, with greater ſafety.

Of the Palliative Operation.—The intention of this proceeding is to relieve the diſeaſe for the preſent, by diſcharging the accumulated fluid. The operation by which the water is let out is a very ſimple one. The only circumſtances requiring our attention in it, are the inſtrument wherewith we would perform it, and the place or part of the tumour into which ſuch inſtrument ſhould be paſſed.

The two inſtruments in uſe are the common bleeding lancet, and the trocar.

"The former having the finer point (ſays Mr. Pott), may poſſibly paſs in rather the eaſier, though the difference is hardly perceptible, but is liable to inconveniences, to which the latter is not. The trocar, by means of its cannula, ſecures the exit of the whole fluid, without a poſſibility of prevention, the lancet cannot. And, therefore, it frequently happens, when this inſtrument is uſed, either that ſome of the water is left behind; or that ſome degree of handling and ſqueezing is required for its expulſion; or that the introduction of a probe, or a director, or ſome ſuch inſtrument, becomes neceſſary for the ſame purpoſe. The former of theſe may in ſome habits be productive of inflammation: the latter prolongs what would otherwiſe be a ſhort operation, and multiplies the neceſſary inſtruments; which, in every operation in ſurgery, is wrong. To which it may be added, that if any of the fluid be left in the vaginal coat, or inſinuates itſelf into the cells of the ſcrotum, the patient will have reaſon to think the operation imperfect, and to fear that he ſhall not reap even the temporary advantage which he expected. The place where this puncture ought to be made is a circumſtance of much more real conſequence; the ſucceſs of the attempt, the eaſe, and even ſometimes the ſafety of the patient, depending upon it.

"All the anterior and lateral parts of the vaginal coat are looſe and detached from the albuginea; in its poſterior and ſuperior parts, theſe two tunics make one; conſequently the teſticle is, as it were, affixed to the poſterior and ſuperior part of the cavity of the ſac of an hydrocele, and conſequently, the water or fluid can never get quite round it. This being the ſtate of the caſe, the operation ought always to be performed on that part of the tumour where the two coats are at the greateſt diſtance from one another, and therefore, where the fluid muſt be accumulated in the largeſt quantity, and never on that part of it where the fluid cannot poſſibly be. The conſequence of acting otherwiſe, muſt not only produce a diſappointment, by not reaching the ſaid fluid; but may prove, and has proved highly, and even fatally miſchievous to the patient." (Pott on the Hydrocele.) In ſhort, it muſt be plain to every perſon, who has any knowledge of the preſent diſeaſe, that in all common caſes, the proper place for making the puncture is at the lower and fore-part of the ſcrotum. It ought, however, to be underſtood, that ſurgical writers make mention of examples, in which the hydrocele has an unuſual ſhape, in conſequence of the preſſure of a bag-truſs, &c. Inſtances have been obſerved, in which the hydrocele was of an horizontal oval form, with the teſticle plainly perceptible underneath at the bottom of the ſcrotum. In all ſuch caſes, the ſurgeon ſhould firſt examine the ſituation of the teſticle, and chooſe a place for making the puncture, where there will be no riſk of injuring the latter part. The oval ſac of an hydrocele of the left tunica vaginalis, has been known to have ſo oblique a poſition, that its bottom could be felt on the right ſide of the raphe at the inferior part of the ſcrotum, while its upper end lay on the left ſide of the ſcrotum, near the abdominal ring. This hydrocele of the left tunica vaginalis was tapped on the right ſide of the raphe at the bottom of the ſcrotum, and as ſoon as half the fluid had been diſcharged, the ſac became ſituated quite on the left ſide of the raphe, the exit of the water ceaſed, and the cannula fell out. Even in caſes where the ſwelling has had the ordinary ſhape, the teſticle has occaſionally been ſeen at the fore-part of the tumour. Hence practitioners ſhould remember, that making the puncture at the lower and anterior part of the hydrocele is not a matter of courſe; and that it is their duty, in every inſtance, to endeavour to aſcertain the preciſe ſituation of the teſticle, in order that it may be more certainly avoided. Richter's Anfangſgrunde, &c. Band. 6, p. 73.

After letting out the water of an hydrocele by the palliative operation, it is prudent to cover the puncture with a bit of lint and a plaſter, to keep up the ſcrotum with a bag-truſs, and direct the patient to keep himſelf quite ſtill for the firſt twenty-four hours afterwards. The bag-truſs gently ſupports the ſuddenly relaxed parts, and thus tends to prevent any painful ſwelling of the teſticle, as well as hemorrhage in the tunica vaginalis, and too rapid an accumulation of the water again. Although no painful and inflammatory ſymptoms uſually follow the operation, and the orifice heals in a few hours, like that made in blood-letting, and this notwithſtanding the patient neither pays attention to regimen, nor abſtains from his ordinary purſuits; yet the contrary ſometimes happens. We learn, on the authority of Mr. Pott, that in ſome habits and circumſtances, the puncture inflames and feſters. Such feſtering is generally ſuperficial only, and is ſoon quieted by any ſimple dreſſing; but it is ſometimes ſo conſiderable, and extends ſo deeply as to affect the vaginal coat, and by accident produce a radical cure. Mr. Pott has likewiſe ſeen it prove more troubleſome, and even fatal, when the circumſtances of the patient, and the caſe have been particular. The accounts delivered to us by ſurgical authors confirm, that in perſons of bad conſtitutions, pain, inflammation, and fever are apt to ſucceed, if the ſcrotum be too much rubbed or agitated. A patient, immediately after the operation, went ſeveral miles, and brought on by this means ſo high a degree of inflammation, ſwelling, and fever, that the conſequence was a radical cure of the hydrocele. (Deſault, Journal de Chirurgie, tom. i.) Theden has recorded a caſe where ſimilar ſymptoms were produced, only in a more ſevere form. Upon the whole, however, the palliative operation is not very liable to any diſagreeable conſequences. If pain, inflammation, and fever occaſionally ariſe, it almoſt always will be found, that the patient has been guilty of imprudent exertion, or that the habit is exceedingly bad. In ſome inſtances, theſe ſymptoms are to be aſcribed to the circumſtance of the end of the cannula having been rubbed againſt the teſticle during the eſcape of the fluid. An hæmatocele, which is occaſionally produced after the operation, proceeds either from the great determination of blood to the relaxed parts, or from an actual injury of one of the blood-veſſels of the tunica vaginalis with the lancet or trocar. When, from the colour of the water, there is reaſon to apprehend that a veſſel has been wounded, the ſurgeon may often ſucceed in preventing any ſerious collection of blood, by taking care to cover the ſcrotum with cold applications, and ſupport it well with a bag-truſs. Should he however be unable to hinder ſuch collection from taking place, both the hæmatocele and hydrocele may be radically cured by laying open the cavity of the tunica vaginalis. See HÆMATOCELE.

It is ſaid, that when the tunica albuginea is unfortunately wounded with the point of the trocar, the ſubſtance of the teſtis is protruded through the puncture of that membrane, and forms a ſwelling which may create a neceſſity for caſtration. When the trocar happens to injure any varicoſe blood-veſſels of the integuments of the ſcrotum, an extravaſation of blood in the cellular ſubſtance may enſue, and end in ulceration, unleſs ſpeedily diſperſed. But while we are noticing theſe occaſional evils, let us not forget to ſtate, that the palliative operation ſometimes proves beneficial beyond expectation, no water collecting again, and the patient remaining for ever afterwards free from the diſeaſe.

Wiſeman and others have adviſed deferring the puncture till a pint of fluid has collected. On the contrary, Mr. Pott expreſſes his decided opinion, that when the water is in ſufficient quantity to keep the teſticle from the inſtrument, there can be no reaſon for deferring the diſcharge; and he contends, that the ſingle point on which this argument ought to reſt is this: whether the abſorbent veſſels, by which the extravaſation ſhould be prevented, are more likely to re-aſſume their office, while the vaginal coat is thin, and has ſuffered but little violence from diſtention; or after it has been ſtretched and diſtended to ten, or perhaps twenty times its natural capacity; and by ſuch diſtention is, like all other membranes, become thick, hard, and tough? Mr. Pott believes the probability ſo much more on the ſide of the former, that he ſhould never heſitate a moment about letting out the water, as ſoon as he found that the puncture could be made ſecurely. And, from what has happened within the ſmall circle of his own experience, he is inclined to think, that if it was performed more early than it generally is, it might ſometimes prevent the return of the diſeaſe.

Although we have given a general preference to the trocar, as the beſt inſtrument for tapping hydroceles; we can conceive a few inſtances in which the employment of a lancet for the purpoſe might be attended with advantages. Suppoſing the ſurgeon has to operate upon a very ſmall hydrocele, which contains only a little quantity of fluid, it is better to uſe the lancet. The trocar muſt always be introduced more deeply than the latter inſtrument, and is therefore more apt to injure the teſticle. In ſuch a caſe, alſo, there is no danger of the lancet occaſioning an hæmatocele, ſince the veſſels of the tunica vaginalis have ſuffered no dilatation. On the ſame principle, the lancet ought to be preferred in all caſes where the hydrocele is complicated with either a hernia, or an exceedingly large ſarcocele, and it is impoſſible to aſcertain the exact poſition, ſize, and quantity of parts in the ſcrotum.

Sir James Earle thinks, that the palliative operation ought to be performed at leaſt once on thoſe who determine to ſubmit to the radical method of cure, as it enables the ſurgeon to examine the ſtate of the teſticle, and affords an opportunity of operating in the other way afterwards, when the tunica vaginalis is not more diſtended than is proper. On the Hydrocele, p. 13, edit. 2.

We ſhall conclude the obſervations which we have to offer on the palliative operation, with noticing the circumſtance of the fluid ſometimes not flowing through the cannula of the trocar, or of eſcaping only juſt at firſt, and then ſtopping, notwithſtanding the introduction of a probe. This occurrence may depend on various cauſes. The fluid in the tunica vaginalis is occaſionally as thick and viſcid as white-of-egg. (Warner.) Sometimes the cavity of the tunica vaginalis is divided by ſeveral partitions formed of a looſe ſort of cellular ſubſtance. In certain inſtances, the cavity has appeared to be filled with hydatids, or tranſparent cyſts. Should the patient be in a fit ſtate for the radical operation, it would undoubtedly be right, in a caſe of the foregoing deſcription, to perform it at once. The plan by injection being here quite inapplicable, the ſurgeon ſhould introduce a director through the cannula of the trocar, withdraw the tube, and, with the aid of the director and a curved biſtoury, lay open the cavity of the tunica vaginalis.

Of the Radical Method of Treatment.—The great object in the radical operation is to produce an entire obliteration of the cavity of the tunica vaginalis, which is the ſeat of the diſeaſe, and thus render a recurrence of the complaint impoſſible. This purpoſe has been fulfilled in two manners, *viz.* by cutting the whole of the tunica vaginalis away, or by exciting ſuch an inflammation of this membrane as makes it univerſally adherent to the teſticle. In the latter method, it is a principal indication to have an effectual, yet not too violent a degree of inflammation. When it is too ſlight, or does not extend to the whole of the membrane, it is ineffectual. In the firſt of theſe circumſtances no coheſion follows, and the operation completely fails; in the ſecond, the tunica vaginalis only becomes adherent to the teſticle at thoſe places where the inflammation exiſts, while elſewhere a cavity remains, in which the fluid re-accumulates. When there are ſeveral ſuch parts, to which the inflammation does not extend, the hydrocele recurs in the form of ſeveral diſtinct ſwellings, and the water is contained in ſeparate cyſts. On the other hand, the inflammation is too violent, when it is ſuch as brings on ſevere febrile ſymptoms, and affects the teſticle even more than the vaginal coat. The means employed to raiſe the neceſſary inflammation ought always to be calculated to affect the latter membrane chiefly, and the teſticle as little as poſſible; a conſiderable inflammation of this gland not being eſſential to the radical cure of a hydrocele, and being invariably attended with more ſevere ſymptoms, than thoſe which reſult from an inflammation of the vaginal coat. With the preceding intentions, various methods of operating have been practiſed, the chief of which we ſhall now proceed to deſcribe.

Inciſion.—In this plan, an inciſion of ſome length is made through the integuments of the ſcrotum and the tunica vaginalis, by which means, not only the fluid is diſcharged, but ſuch inflammation excited as ends in a coheſion of the whole of the vaginal coat with the teſticle, and, of courſe, the recurrence of the hydrocele is effectually prevented. This mode of effecting the radical cure of the hydrocele is the moſt ancient of all, having been deſcribed by Celſus. The operation is performed as follows: the point of a ſtraight biſtoury is to be placed on the fore-part of the ſwelling, while the back of the inſtrument is to reſt againſt the index-finger of the ſurgeon's left hand. The knife is to be puſhed into the tumour, and an opening of ſuch ſize immediately made as will let the operator introduce completely into the tunica vaginalis his finger, on which the further courſe of the biſtoury is to be directed. Directly the firſt puncture is made, the fluid is apt to guſh out all on a ſudden, leaving the tumour collapſed, and the operator incapable of eaſily introducing the inſtrument, with which he purpoſes to enlarge the firſt wound. In order to prevent any inconvenience of this kind, ſurgical authors direct us to place the end of the left index finger cloſe behind the point of the knife, and to take care to make it paſs into the wound immediately behind the latter inſtrument. This being done, the ſurgeon, with the aid of his left thumb, can take hold of the inveſtments of the hydrocele, and hinder a cloſure of the opening juſt made. A blunt-pointed crooked biſtoury is then to be introduced, and, guided by the fore-finger, will ſerve for enlarging the inciſion downwards and outwards, in ſuch manner, that the wound may extend down the middle of the front of the tumour to its lower part. When the hydrocele is ſmall, or complicated with a ſarcocele, or hernia, or when any doubts exiſt concerning the real nature of the caſe, writers adviſe us to let the firſt inciſion only divide the integuments of the ſcrotum, and then to open the tunica vaginalis ſeparately.

Should any modern practitioner chooſe to perform this operation, he would find it very advantageous to make the firſt opening into the hydrocele at the upper part of the ſwelling, as all the fluid would then not make a ſudden eſcape, ſo as to occaſion a collapſe of the tumour, and difficulty in effecting the neceſſary dilatation of the wound.

The inciſion muſt be carried to the bottom of the tunica vaginalis, or elſe blood and matter will be very likely to lodge there, and create trouble.

The cavity of the hydrocele having been thus laid open, is to be dreſſed with ſoft pieces of lint; theſe are to be covered with a pledget; and a ſuſpenſory, or T bandage. The dreſſings are to be changed at proper intervals, until the part is completely healed.

Much more might be ſaid concerning this method of effecting the radical cure of the hydrocele; but we ſuppreſs many particulars, conceiving them to be ſuperfluous in the preſent almoſt exploded ſtate of the operation. Whoever will take the trouble to read the accounts of this plan, as delivered to us by ſurgical writers, will find that, according to Monro and Acrell, its conſequences are ſometimes dangerous, and even fatal, while, in other inſtances, the inflammation of the teſticle has been ſo violent, as to end in ſuppuration. (See Richter's Anfangſgr, &c. Band 6. p. 92.) Hence it has been commonly found proper to employ a ſtrict antiphlogiſtic treatment, which is acknowledged to have occaſionally defeated the very object of the operation, by preventing the kind of inflammation neceſſary for the completion of the radical cure. Thus, ſevere as the method is, it is uncertain, and its failures are confirmed by the teſtimony of Bertrandi, Sabatier, and ſir James Earle. We will not dwell upon the objections which might be urged againſt the practice, from the diſagreeable and dangerous bleedings which ſometimes follow the operation, or the painful excoriations which frequently ariſe. The method has no advantage over a milder operation, which we have to recommend, and it is altogether ſevere, as well in its performance as in its conſequences. We ſhould, however, have deemed it our duty to enter into a more particular detail of the reaſons againſt the plan, had not the diſrepute into which it has now ſunk rendered this taſk unneceſſary.

Extirpation.—It ſometimes happens, after performing the foregoing operation, that the tunica vaginalis is found in a thickened and indurated ſtate. Certain writers and practitioners have fancied, that when this is the caſe, ſuch an inflammation as is eſſential to the radical cure will not take place. Under this impreſſion, they recommend ſcarifying the inner ſurface of the tunica vaginalis, or even cutting this membrane entirely away. Many eminent ſurgeons of paſt times have adopted the latter proceeding with ſucceſs, as for inſtance, Douglas, Saviard, White, Gooch, and Louis. Indeed, it was remarked by Bertrandi, that the ſymptoms are generally milder after the exciſion of the tunica vaginalis, than after a mere diviſion of it. The method conſiſts in diſſecting away portions of the membrane, after laying open its cavity, care being taken not to cut too cloſely to the teſticle, for fear of exciting a violent degree of hernia humoralis.

Certainly we can conceive a caſe in which the tunica vaginalis may be ſo diſeaſed, as to juſtify the tedious and painful plan of removing a part of it by diſſection. But an inſtance of this kind muſt be very uncommon; and the obſervations of ſir James Earle confirm, that the radical cure, by means of an injection, can be accompliſhed without any exciſion, notwithſtanding the tunica vaginalis is thickened. The method of extirpation, however, is not only objectionable, as being productive of avoidable pain; it is liable to bring on troubleſome hemorrhages both during and after the operation, and to be followed by ſores and fiſtulous abſceſſes, which are a very long time in healing.

Tent.—Experience having ſhewn that, in many inſtances, moderately ſtimulating the tunica vaginalis will bring on a ſufficient inflammation of this membrane to effect a radical cure; and likewiſe, that the common palliative operation, done with a trocar, is ſometimes followed by the ſame beneficial conſequence; attempts have been made to free the patient permanently from the diſeaſe by milder methods than thoſe which we have juſt now been deſcribing. After the palliative operation with a trocar, Monro ſuggeſted leaving the cannula in the wound until the neceſſary inflammation had been excited, and he aſſures us, that in this manner he often accompliſhed a radical cure with the utmoſt ſucceſs.

Warner uſed to puncture the ſwelling with a lancet, and, after letting out the fluid, introduce into the opening a tent, which was left there until an adequate degree of inflammation had come on.

The laſt mode of operating has been the moſt extenſively adopted. It is executed as follows: a puncture is made with an abſceſs-lancet in the anterior and inferior part of the tumour, and the fluid diſcharged. A tent is then introduced into the aperture, ſo as to lie betwixt the tunica vaginalis and the teſticle. The opening is next covered with a pledget. The wound in the integuments and vaginal coat ought to be about an inch and a half in length. We are alſo adviſed by ſome authors to introduce the tent while the water is making its eſcape; as, in conſequence of the way in which the ſac occaſionally collapſes, the operator may afterwards have trouble in getting the tent into the tunica vaginalis, and, perhaps, force it into the cellular ſubſtance of the ſcrotum, inſtead of the proper ſituation, in which circumſtance the attempt at a radical cure would fail. The tent ought to be at leaſt an inch long, have a ligature attached to it, and be made either of ſponge, or a ſoft doſſil of lint. The latter can be beſt introduced by means of a probe. A freſh tent ſhould be put in every day, and the length and thickneſs of it may be gradually diminiſhed. This mode is to be followed up, until an effectual inflammation is excited, which commonly happens on the ſecond or third day, though ſometimes later. The tent is afterwards to be diſcontinued, and an emollient poultice applied. In general, ſuppuration very ſoon commences. Occaſionally abſceſſes form, and require to be opened. Frequently the ſymptoms are ſo mild that the patient ſcarcely finds it neceſſary to keep his bed; but ſometimes they are ſo ſevere, that a rigorous employment of antiphlogiſtic treatment is indiſpenſable.

Franco is ſaid to have made the firſt mention of the cure by the tent. The method has been practiſed by a long liſt of eminent ſurgeons of later date; but it has now been abandoned by all practitioners in this country. Mr. Pott objected to the cannula, that it was very inconvenient, as, by reaſon of its inflexibility, it hurt the teſticle whenever the patient moved; conſequently he preferred a tent or bougie; but, according to his account, the method is attended with a conſiderable degree of uncertainty.

Cauſtic.—The ancients employed cauſtic for the purpoſe of forming in the tunica vaginalis ſuch an opening as would extend the whole length of this membrance. The common conſequence of the method was a train of ſevere and violent ſymptoms, and, on this account, the practice was for a long while entirely given up. It was afterwards revived, by reaſon of the favourable reports made of it by Elſe, Acrell, &c.; but theſe later ſurgeons did not uſe the cauſtic exactly in the ſame way as the old ſurgeons, as their object was not to make an opening through the vaginal coat with it, but only to irritate the membrane, and make it inflame. Cauſtic has this effect, when employed according to the following directions.

The cauſtic muſt be applied to the inferior and anterior part of the ſcrotum, and, in order that it may not act too extenſively, the part ſhould be covered with a piece of plaſter, in which a hole has been cut. When the hole is about as large as a half guinea, the eſchar produced by the cauſtic will generally equal a guinea in ſize, which, according to Mr. Elſe, in all common inſtances, will be quite large enough. Other writers have adviſed making a more extenſive ſlough, and to proportion its ſize, in ſome meaſure, to that of the ſwelling, and to the degree of hardneſs and thickneſs with which there may be reaſon to ſuppoſe the tunica vaginalis affected. The cauſtic which has been moſtly uſed is the kali purum blended with quicklime, and made into a paſte. Acrell made the ſuggeſtion of mixing opium with the cauſtic, with a view of leſſening the pain of the application.

In attempting the radical cure of the hydrocele by this method, it was the deſign of the ſurgeon to make the action of the cauſtic extend through the integuments and cellular ſubſtance, and affect the ſurface of the tunica vaginalis ſufficiently to make this membrane inflame. The cauſtic-paſte was generally left on about ſix or ſeven hours, and after its removal a pledget was applied, the patient enjoined to keep quiet in bed, and an antiphlogiſtic regimen directed. The denuded tunica vaginalis did not often burſt of itſelf, or at leaſt not till a conſiderable time after the detachment of the ſlough, ſo that it was generally neceſſary to make a puncture with a lancet. It was accounted a matter of much importance that the fluid ſhould not be diſcharged too ſoon after the application of the cauſtic, leſt the very purpoſe of the operation ſhould be defeated. About the eighth or tenth day was uſually reckoned the beſt time for making the opening; but the criterion of the proper period was when the patient began to experience a ſenſe of heavineſs and heat about the ſcrotum, and the ſwelling was every where painful and inflamed.

When the inflammatory ſymptoms prevailed, it was cuſtomary to apply emollient poultices. Theſe complaints were often exceedingly ſevere, and attended with pain in the back and abdomen. Bleeding was ſometimes required for their alleviation. Surgeons, indeed, found it prudent to prepare their patients for this mode of treatment by diet and medicines, and, after the cauſtic had been applied, a ſtrict obſervance of an antiphlogiſtic plan was deemed generally adviſable.

The method, however, was apt to fail when the cauſtic did not act deeply enough, and the requiſite inflammation could not then be excited, without repeating the painful application again.

The treatment of the hydrocele with cauſtic has now quite fallen into diſuſe, as being attended with an avoidable deſtruction of parts, a degree of efficacy not equal to that of an injection, and often creating a painful and ill-conditioned ſore, beſides being ſubject to other inconveniences obvious in the foregoing account.

The deſire of Mr. Elſe to regulate the cauſtic with ſuch preciſion as juſt to burn down to the tunica vaginalis, or juſt through it, could not, in general, be realized; and the opening could only be completed by employing a lancet, or uſing the cauſtic again.

Seton.—The ſeton was preferred by the celebrated Mr. Pott, as the means of effecting the radical cure of the hydrocele; and, next to the injection, this, perhaps, is to be conſidered as the moſt eligible method. The ſwelling is to be firſt punctured with a trocar in the ordinary place; an eye probe is next to be introduced through the cannula into the cavity of the hydrocele, and its end puſhed to the upper and anterior part of the tunica vaginalis. Juſt where this extremity of the probe is felt, the ſurgeon is to make an inciſion for the paſſage of the inſtrument, which will convey with it the ſeton through the cavity of the tunica vaginalis. But, as the probe is apt to ſlip away at the moment of cutting upon it, and the ſkein of ſilk is liable to rub againſt the teſticle, when drawn through the cavity of the diſeaſe, the method adopted by Pott is undoubtedly that which deſerves imitation. The inſtruments uſed by this conſummate practitioner, conſiſted of a trocar, the cannula of which was about a quarter of an inch wide; a ſeton cannula, which was made of ſilver, was about five inches long, and was juſt ſmall enough to paſs with eaſe through the cannula of the trocar; and, laſtly, a probe ſix inches and a half in length, furniſhed at one end with a fine ſteel trocar-point, and, at the other, with an eye which ſerved to carry the ſeton. The ſeton was compoſed of as much white ſewing thread as would fill the cannula, and yet paſs through it with facility. The operation was performed in the following way. The tumour was punctured in the common manner with a trocar, and the fluid diſcharged. The end of the ſeton cannula was then introduced, through the cannula of the trocar, to the upper and fore-part of the cavity of the tunica vaginalis, and there preſſed againſt the integuments, ſo as to be externally perceptible. The needle, provided with the ſeton, was next conveyed through the ſeton cannula, and puſhed from within outwards through that part of the ſcrotum, with which the end of the tube was in contact. The ſkein of thread was thus drawn through the cavity of the hydrocele, and both the cannulæ, having fulfilled their office, were taken away.

The operation occupied but a ſhort time, and was productive of no ſevere pain. The patient was generally put to bed immediately afterwards, and took about twenty, or five and twenty drops of the tinctura thebaica. On the third day the ſcrotum was uſually affected with ſwelling and inflammation, ſymptoms which were ſoon appeaſed by means of a bag-truſs, emollient poultices, clyſters, and a low regimen. The inflammation commonly ſubſided about the tenth day. From this time, the ſeton was leſſened every day by withdrawing ſome of the threads, and the diſcharge of matter from the openings was generally inconſiderable. Pott believed, that, in this method, the tunica vaginalis did not ſuppurate, but was only made to inflame and become adherent to the teſticle. Other ſurgeons, however, have ſometimes found the plan tedious, the ſeton not becoming looſe for more than a fortnight, and large abſceſſes being occaſionally produced, which ſtood in need of being opened. Upon the whole, however, the ſeton may be conſidered as one of the mildeſt and ſureſt modes of cure, and, perhaps, ought to be preferred to all the other plans, excepting one, of which we ſhall now ſpeak.

Injection.—The method of injecting into the cavity of the tunica vaginalis a ſtimulating fluid, for the purpoſe of bringing on an inflammation of this membrane, and thereby a radical cure of the hydrocele, is by no means one of modern invention. Of late years, however, it has been more particularly practiſed, and the manner in which it has been recommended, and perfected by ſir James Earle, together with its confirmed mildneſs and ſucceſs, has almoſt entirely ſet aſide all the other modes of cure. According to the ſtatement of the preceding author, even the celebrated Mr. Pott lived to expreſs his approbation of the method, notwithſtanding the great partiality which he has evinced in his writings to the ſeton.

Many different kinds of injection have been employed for the radical cure of the hydrocele. The principal are wine mixed with water; a ſolution either of two grains of kali purum, or of two grains of cuprum vitriolatum, in an ounce of water; lime-water, either alone, or containing hydrargyrus muriatus; a ſtrong ſolution of alum, or acetite of lead; brandy diluted with water; an infuſion of red roſes, or of oak-bark, &c. However, at preſent, the injection univerſally employed in this country is compoſed of port wine and water, in the proportion of two parts of the former to one of the latter ingredient. On the continent, it is not uncommon to uſe five parts of claret, or Burgundy-wine, to one of water.

We learn from ſir James Earle's treatiſe, that he commonly uſes about two-thirds of port wine to one of water. When the parts appear inſenſible, and no pain at all is produced on introducing the firſt quantity of the injection, he withdraws the ſyringe, and increaſes the proportion of wine. On the other hand, when the complaint is recent, and the parts irritable, he increaſes the proportion of water, the ſtrength of the injection, in fact, being principally regulated by the degree of pain experienced by the patient. The ſyringe preferred for this operation is made of elaſtic gum. The pipe formerly employed by ſir James Earle was furniſhed with a ſtop-cock, in order to hinder the injection from making its eſcape, whenever it was neceſſary to remove the ſyringe. Of late years he has uſed a pipe, one end of which fits the cannula of the trocar, while the other is adapted to receive the neck of the elaſtic bottle; and inſtead of a ſtop-cock, which required a hand to turn it, and was therefore found inconvenient, the pipe is furniſhed with a valve, which allows the injection to paſs into the tunica vaginalis, but not back again. The operation is generally performed as follows: the hydrocele is firſt tapped with a trocar at its anterior and inferior part, and after all the fluid has been diſcharged, the cavity of the tunica vaginalis is to be diſtended to its former dimenſions with the vinous injection, which, upon an average, is to be kept in the part about five minutes, after which it may be let out through the cannula. The patient commonly feels pain in the groin, and about the kidnies, on the injection being introduced; a circumſtance which is rather deſirable, as it ſhews that the ſtimulus of the fluid is likely to have the wiſhed-for effect of exciting the neceſſary degree of inflammation.

When the hydrocele is exceedingly large, ſir James Earle recommends practitioners to be at firſt content with merely diſcharging the fluid, and to take a future opportunity, when the tumour is ſmaller, for putting into practice the attempt at a radical cure.

The experience of the ſame gentleman has proved, that the injection is adequate to the accompliſhment of a permanent cure, even though the tunica vaginalis may be indurated and thickened.

The treatment of hydroceles with the vinous injection is now generally acknowledged to be the mildeſt and moſt certain method, and hence it is univerſally practiſed by all the moſt eminent ſurgeons of this country, in preference to the other plans. One great advantage attending it muſt be immediately obvious,—it does not commonly occaſion any ſuppuration or ſore; and it is ſo efficacious, that many very experienced ſurgeons have never known an inſtance of its failing.

It remains for us to give one caution; let every operator be ſure that the end of the cannula is in the tunica vaginalis before he ventures to introduce the injection. It has ſometimes happened that the cannula has ſlipped out of the puncture in that membrane, juſt after the fluid has been diſcharged, ſo that its extremity became ſituated in the cellular ſubſtance of the ſcrotum. Now when the ſurgeon injected the wine and water, this liquid, inſtead of paſſing into the cavity of the hydrocele, was forced into the cellular membrane. Miſtakes of this kind have brought on violent attacks of inflammation, abſceſſes, and ſloughing, without there being any chance of a radical cure of the hydrocele. Whenever ſuch an accident happens, it is conſidered beſt to defer the operation till the fluid of the hydrocele is accumulated again in ſufficient quantity.

No objection can be reaſonably urged againſt the method, on account of the preceding accident, which is eaſily avoidable, and is always imputable either to awkwardneſs or negligence.

After the operation, the puncture is to be covered with a piece of lint and ſoap-plaſter, and the ſcrotum is to be ſupported in a bag-truſs. As ſoon as the parts begin to inflame and become tenſe and painful, then an emollient poultice is to be applied to them, care being taken to employ the ſuſpenſory, keep the patient on an antiphlogiſtic regimen, and quiet in bed. If the inflammation ſhould appear to exceed the requiſite degree, leeches may be put on the ſcrotum, the patient gently purged, and even bled in the arm.

Congenital Hydrocele of the Tunica Vaginalis.—The diſeaſe is ſo named when the tunica vaginalis, beſides containing a preternatural quantity of fluid, is uncloſed above, ſo as to have an open communication with the cavity of the abdomen. In moſt caſes the fluid, in all probability, is ſecreted by the peritoneum, and then deſcends by its weight into the ſcrotum. This form of the hydrocele has eſcaped the notice of the generality of ſurgical writers. The French ſurgeon, Deſault, however, has given a deſcription of it, and we find that he was in the habit of effecting a radical cure by means of a vinous injection. The nature of the diſeaſe cannot be difficult of diſcrimination, when the ſurgeon adverts to the tranſparency and fluctuation of the tumour, the abſence of pain, and the diſappearance of the ſwelling in the recumbent poſture, or on preſſure being made.

Deſault uſed to cure the complaint in the following manner. After letting out the fluid with a trocar, he took care to reduce any viſcera which happened to be protruded, and directed a confidential aſſiſtant to cloſe the communication between the abdomen and tunica vaginalis by preſſure. The injection was then introduced through the cannula into the cavity of the hydrocele. In this way, Deſault not only cured a boy of a hydrocele, but alſo of a hernia, with which he was afflicted. Œuvres Chirurgicales de Deſault, par Bichat, tom. ii.

Hydrocele of the Spermatic Cord.—In this caſe the fluid is contained in the cellular ſubſtance which ſurrounds the ſpermatic veſſels, and forms what is ſometimes named the common ſheath of the cord. The water is not diffuſed in all the cellular membrane of the ſcrotum. Some writers think that the complaint might, with greater propriety, be called an œdema of the ſpermatic cord. However this may be, it is certain that this ſpecies of hydrocele is the leaſt frequent. In external appearance it is ſubject to conſiderable variety, according to the ſtage in which the diſeaſe preſents itſelf. In the early ſtate, the ſwelling merely ſurrounds the lower part of the ſpermatic cord, and has no connection with the abdominal ring, the upper portion of the cord remaining quite free. The ſhape of the tumour is generally pyramidical, having a kind of apex above, and a broad baſe below. The teſticle can be quite plainly felt juſt below the ſwelling. The tumour is unattended with pain, has a doughy feel, and allows its ſhape to be altered by preſſure. The ſcrotum retains its natural corrugated appearance, being only ſomewhat more full and diſtended on the affected ſide than the other. In a more advanced ſtate, the ſwelling undergoes two alterations; it aſcends up to the abdominal ring, ſo that the upper portion of the cord can no longer be felt; and it deſcends ſo far down by the ſide of the teſticle, that this gland is likewiſe completely concealed. In the extreme ſtage of the diſeaſe, not only the cellular ſubſtance which ſurrounds the ſpermatic cord in the ſcrotum is diſtended with water, but even that which forms the inveſtment of the ſpermatic veſſels in their courſe from the inner to the outer opening of the abdominal ring.

The firſt ſtage of the hydrocele of the ſpermatic cord may eaſily be diſtinguiſhed from all other tumours of the ſcrotum, for there are none which bear ſo much reſemblance to it as to be readily miſtaken. But in the very advanced period of the diſeaſe, the ſwelling has much of the appearance of an omental hernia. It has the ſame ſoft flabby feel; it paſſes up into the abdominal ring; and the latter opening is wide and dilated. When the patient has been long in a ſtanding poſture, the water deſcends from the cellular ſubſtance which ſurrounds the ſpermatic veſſels within the ring, and paſſes into the cellular membrane, with which they are inveſted below this aperture; conſequently, the external ſwelling undergoes an increaſe of ſize. On the other hand, when the patient lies down for a time, the tumour diminiſhes. It may alſo be leſſened by external preſſure, and even nearly puſhed within the ring. Likewiſe, when the patient coughs, or holds his breath, the tumour ſwells and becomes larger. Such ſymptoms correſpond with thoſe of an omental hernia. The two diſeaſes, however, may, with a little attention, be eaſily diſcriminated from one another. By adverting to the early ſtage of the diſeaſe, and recollecting that the ſwelling firſt made its appearance at the lower part of the ſpermatic cord, had then no connection with the ring, and afterwards gradually aſcended into this opening, the ſurgeon may know with certainty that the caſe cannot poſſibly be an omental rupture. A careful examination of the ſwelling will alſo diſcover the difference. An epiplocele communicates the feel of ſeveral lumps or maſſes, and is ſofter in ſome places than others. On the contrary, the hydrocele of the ſpermatic cord has every where a ſmooth uniform feel. Its ſhape alſo undergoes alterations according to poſture. When the patient obſerves an horizontal poſition, and the ſcrotum does not hang down, the hydrocele becomes oblong, equally thick, and cylindrical. But when the patient continues in a ſtanding poſture, and the ſcrotum is unſupported, the ſwelling becomes pyramidical, that is to ſay, broad below and thin above. Its ſhape may be altered by making preſſure on it for a little while. When the lower part is thus preſſed it becomes thin, while the upper portion increaſes in thickneſs; and *vice verſâ*. Although an omental hernia alters in ſize, it undergoes no change of ſhape, at leaſt none that is ſo plain and durable. When the horizontal poſture or external preſſure is long continued, the hydrocele of the ſpermatic cord, like the epiplocele, becomes ſmaller, or even appears to paſs entirely within the abdominal ring. Like this hernia, alſo, it ſeems to deſcend again, when the patient continues erect, or the preſſure is removed; but ſtill a difference is obſervable in the modes in which the two diſeaſes return. For on applying two fingers to the abdominal ring, at the period when the hydrocele is aſcending or deſcending, nothing can be felt to paſs up or down; but if the caſe be an epiplocele, the viſcera can be diſtinctly felt to paſs into, or out of, the abdominal ring. The deſcent and reduction of an omental rupture are moreover obſerved to happen more quickly than the aſcent and falling down of the fluid of the hydrocele. When the latter tumour is large, the patient ſuffers ſhooting pains in the loins, at the period of urging the fluid upwards by preſſure.

If the diſeaſe has made conſiderable progreſs, a fluctuation may be diſtinguiſhed in the ſwelling, upon laying one hand upon its upper part and the other below, and making preſſure with the firſt downwards, and with the ſecond upwards, in an alternate manner. The abdomen, in the vicinity of the ring, is alleged to appear ſometimes preternaturally prominent, on preſſing the fluid upwards.

Laſtly, it deſerves attention, that, in the hydrocele of the cord, no complaints of the ſtomach and bowels prevail, as they uſually do in caſes of epiplocele.

The hydrocele of the ſpermatic cord is generally a local diſeaſe, which proceeds from cauſes altogether local. Sometimes it ariſes from wearing an ill made truſs. Children are occaſionally born with it. (Delattre Journal de Medécine, t. 32.) In certain inſtances it appears to originate from coſtiveneſs. Frequently it is the conſequence of a general dropſical affection of the ſyſtem.

Should the diſeaſe depend upon internal cauſes, it is the buſineſs of the ſurgeon to endeavour to remove them. When it ariſes from local cauſes, a ſurgical operation is commonly neceſſary for its cure, diſcutients very ſeldom being found effectual. It is to be obſerved, however, that when this kind of hydrocele is ſmall, it is hardly an object of ſurgery; the pain or inconvenience which it produces being ſo little, that few people would chooſe to ſubmit to an operation to get rid of it; and (as Pott ſays) it is very ſeldom radically curable without one. But when the hydrocele is large, or affects the membrane within the abdominal ring as well as without, it becomes an apparent deformity, is very inconvenient both from ſize and weight, and the only method of cure which it admits is far from being void of hazard.

Authors deſcribe two operations for the relief of this diſeaſe, one is called palliative, and conſiſts in making a few punctures with a lancet in the tumour; the other is named radical, and is executed by making an extenſive inciſion into the ſwelling.

The generality of patients are content with the relief derived from the employment of a ſuſpenſory; and, except in bad caſes, an operation ſeems ſcarcely adviſable.

Encyſted Hydrocele of the Spermatic Cord.—The fluid is ſometimes obſerved to be contained in a preternatural cyſt formed in the cellular membrane, and reſembling ſuch as commonly compoſe the inveſtment of encyſted tumours. This ſpecies of hydrocele is moſtly met with in children and young ſubjects; and not often in adults and old perſons. The ſwelling is moſt frequently ſituated about the middle of the ſpermatic cord, and is more or leſs of an oval ſhape. In ſome caſes it lies cloſe to the cord; in others it is ſo diſtant from this part, that the finger may be put between them. Below the tumour is the inferior portion of the ſpermatic cord, together with the teſticle; while above, the upper part of the cord can be plainly felt to be quite free, ſo that the ſwelling manifeſtly has no connection with the abdominal ring. But there are examples in which the diſeaſe acquires ſuch magnitude, that it mounts upwards as far as the ring, and deſcends down to the bottom of the ſcrotum. In this circumſtance the caſe may ſomewhat reſemble the hydrocele of the tunica vaginalis. The teſticle, however, can always be diſtinctly felt on the outſide of the ſwelling, a fact which immediately makes an experienced ſurgeon acquainted with the nature of the diſeaſe. A miſtake would be attended, indeed, with no ſerious ill conſequences, the treatment of both tumours being ſimilar. It may be remarked, likewiſe, that the ſwelling is completely circumſcribed, has a very even ſurface, and is entirely free from pain. A diſtinct fluctuation cannot often be felt.

In young ſubjects, the tumour may frequently be diſperſed by external means; but in ordinary caſes a ſurgical operation is indiſpenſable for the cure of the diſeaſe, and is of two kinds; one palliative, the other radical. The firſt conſiſts in merely diſcharging the fluid with a lancet or trocar. Care muſt be taken to avoid injuring the ſpermatic cord. Here a lancet is moſtly preferred to a trocar. In children, tapping the tumour is often productive of a radical cure. The cyſt is frequently found filled with a fluid of ſo viſcid a quality, that it will not paſs through the cannula of a trocar.

The radical operation, formerly practiſed, was to lay open the ſwelling its whole length, and cut away as much of the cyſt as could be accompliſhed, without riſk of wounding the ſpermatic veſſels. The wound was afterwards dreſſed with digeſtive applications. Modern experience proves, however, that this caſe can be radically cured with the port wine injection, juſt like the hydrocele of the tunica vaginalis, and as the method is free from all ſeverity and danger, it certainly deſerves to be recommended. Sir James Earle aſſures us, that he has ſucceſsfully treated the diſeaſe in this way.

In certain examples, two or three ſeparate cyſts, filled with fluid, are met with in the cellular membrane of the ſpermatic cord or ſcrotum. While ſmall, they can eaſily be diſtinguiſhed from each other; but when they have acquired a conſiderable ſize they lie ſo cloſe together, that they ſeem like one ſingle uniform ſwelling. Furrows, however, may frequently be felt between them, and ſome information may be obtained from a recollection of the early ſtage of the diſeaſe. But in operating, the nature of the caſe cannot fail to ſhew itſelf, it being impoſſible to diſcharge all the fluid, unleſs an opening be made into each of the cyſts. Every operator ſhould uſe the utmoſt care not to injure the teſticle and ſpermatic cord, as theſe parts have no fixed ſituation with reſpect to the tumours. The place of the teſticle may, indeed, be often aſcertained beforehand, by the peculiar pain which is occaſioned by preſſing it.

Encyſted hydroceles have occaſionally been remarked in women. They are moſtly ſituated in the vicinity of the groin (Journal de Medécine, t. 82.) or elſe in one of the labia. Authors adviſe us to treat them juſt like other encyſted hydroceles. We ſee no reaſon why they ſhould not be extirpated in the manner of common encyſted tumours.

Hydrocele of Hernial Sacs.—Hernial ſacs occaſionally contain, beſides the protruded viſcera, a quantity of fluid, which is frequently ſo copious, that the bowels cannot be felt, the water alone being perceptible, and the caſe apt to be miſtaken for a common hydrocele of the tunica vaginalis. But the diagnoſis can be attended with no difficulty, when the viſcera admit of being reduced. However, in ſome caſes, the protruded parts are adherent to the neck of the ſac in ſuch a way, that, beſides being incapable of reduction, they prevent the fluid from paſſing up into the cavity of the abdomen. In this circumſtance, the ſurgeon may fall into error, though a correct judgment can always be formed by paying a little attention. In the early ſtate the diſeaſe has commonly been nothing more than an ordinary inteſtinal or omental hernia. The recollection of this fact throws much light on the nature of the caſe. The ſwelling at its commencement is always connected with the abdominal ring. The teſticle can be plainly felt at the under and lower part of the tumour. The patient is likewiſe afflicted with the uſual ſymptoms of an enterocele or epiplocele. Were any of the operations, employed for the cure of common hydroceles, erroneouſly practiſed in the preceding caſe, excepting that of merely letting out the fluid, the conſequences would be highly perilous, and, in all probability, fatal.

When a hernia has been reduced, and the deſcent of the bowels again effectually hindered by the gradual cloſure of the neck of the ſac, a collection of fluid ſometimes takes place in the cavity of the latter part. We have already deſcribed the congenital hydrocele, where water collects in the tunica vaginalis, and the ſac has an open communication with the abdomen. We have further recorded the ſucceſs with which Deſault freed a lad not only of ſuch a hydrocele, but alſo of a hernia, by the employment of an injection. Certainly, the hydrocele of a hernial ſac, when the neck of the latter part is cloſed, may be ſafely treated juſt like an ordinary hydrocele. But ſhould the ſac communicate with the abdomen, or contain any protruded parts, ſuch treatment would be raſh and almoſt certainly fatal.

HYDROCELODES Ischuria, in *Surgery*, a retention of urine, produced by a rupture of the urethra. The term is derived from ὕδωρ, *water*, and κηλωδης, attended with ſwelling.

HYDROCEPHALUS, in *Medicine*, from ὕδωρ, *water*, and κεφαλον, *cephalon*, the *head*, ſignifies ſtrictly *dropſy*, or *water, in the head.*

For the knowledge that we poſſeſs, relative to the nature and characteriſtic ſymptoms of effuſion of water within the cranium, we are indebted almoſt entirely to modern obſervation. Hippocrates, Aëtius, Celſus, and ſome other ancient phyſicians, ſpeak of the preſence of water between the cranium and the ſurface of the brain, and of an external hydrocephalus, or dropſy of the teguments of the head; but the writers of the 16th century firſt mention the occurrence of water in the ventricles of the brain itſelf. (See Mercurialis, Opuſcula Aurea, lib. de Morb. puerorum.) After this occurrence had been obſerved by a number of writers, and had even been mentioned by the celebrated Boerhaave, the ſymptoms, by which it might be diſtinguiſhed from other diſeaſes of the brain, remained ſtill unknown. The diſorder was briefly and inaccurately deſcribed in the Memoirs of the Academy of Sciences at Paris, for the year 1718, by M. Petit; but it was not until the publication of a poſthumous eſſay of Dr. Whytt, profeſſor of medicine at Edinburgh, in 1768, that a well-connected hiſtory of the ſymptoms accompanying the effuſion of water into the ventricles of the brain was clearly made out, or that hydrocephalus was known as a diſtinct diſeaſe. Immediately after this publication, Dr. Fothergill, whoſe ſagacity had already detected moſt of the peculiarities belonging to the diſeaſe, read a paper on the ſubject to a medical ſociety in London, which was publiſhed in 1772 (ſee Med. Obſerv. and Inquiries, vol. iv. art. 3.), ſince which period the diſeaſe has been well known to medical practitioners.

Before the appearance of Dr. Whytt's Eſſay, the term *hydrocephalus* had been almoſt entirely confined to a chronic affection, analogous in its cauſes and progreſs to other forms of dropſy in the human body. This diſorder, commencing ſoon after birth, before the ſutures of the ſkull are united, proceeds very ſlowly, continuing even for years, until the head becomes enormouſly large, without producing any very extraordinary ſymptoms. After death, which is uſually preceded by convulſions, the brain is found ſo exceedingly diſtended by water within the ventricles, as to be rendered extremely thin; or, on the other hand, ſo much oppreſſed by the water, collected between it and the ſkull, as to aſſume rather the appearance of a ſmall gland than that of a brain. This form of the diſeaſe, or the *chronic hydrocephalus*, we have deſcribed under the article, Dropsy *in the head.* The variety of the diſeaſe, to which our attention is at preſent directed, differs altogether from the one juſt mentioned; and, being accompanied by febrile ſymptoms, and generally of ſhort duration, has been diſtinguiſhed by the appellation of *acute* hydrocephalus, or

Hydrocephalus *acutus*. This name was firſt appropriated to the diſeaſe in queſtion by Dr. Charles William Quin, of Dublin, in his inaugural diſſertation, publiſhed at Edinburgh in the year 1779. He pointed out the febrile, or rather inflammatory nature of the affection of the brain, in the commencement of the complaint, of which the effuſion of water appeared to be a conſequence, and by which the diſeaſe was diſtinguiſhed from the ordinary dropſical effuſions. Dr. Cullen, being convinced of the accuracy of this ſtatement when he republiſhed his "Noſologia Methodica," in 1780, removed the *acute hydrocephalus*, from the dropſies to the apoplexies, with the new appellation of *apoplexia hydrocephalica*, and retained only the *chronic* form as one of the genera of dropſies, with the old name of hydrocephalus. Dr. Ruſh, of Philadelphia, having taken the ſame view of the diſeaſe with Dr. Quin, and deeming it inflammatory in the commencement, called it *phrenicula*, from its being a diminutive ſpecies or ſtate of *phrenitis*, or inflammation of the brain. See his Med. Inquiries and Obſervations, vol. ii. p. 215. Philad. 1793.

Phyſicians have acknowledged the extreme difficulty of detailing a diſtinct hiſtory of the ſymptoms of hydrocephalus, which ſhall be exemplified in every caſe; and they have, eſpecially, differed in deſcribing the appearance which the diſeaſe aſſumes in its commencement, and the length of time which it uſually occupies in its progreſs. The truth is, we believe, that each writer has ſeen what he has deſcribed; for that the malady actually puts on a conſiderable variety of character, both in reſpect to its phenomena and duration. The lateſt writer on the ſubject, Dr. Cheyne, now of Dublin, has deſcribed three different modes in which it has made its attack in different inſtances which have fallen under his obſervation (ſee his Eſſays on the Diſeaſes of Children, Eſſay III. Edinburgh, 1808.); and a ſimilar diviſion of the varieties of the diſeaſe has alſo been made by profeſſor Kuhn of Leipſic. (See Edinburgh Med. and Surg. Journal, vol. iii. p. 13.) Theſe are, 1ſt, when the ſymptoms come on ſlowly and gradually; 2d, when the attack is ſudden and the progreſs more rapid; and 3d, when the diſeaſe enſues upon ſome previous indiſpoſition. The firſt of theſe Dr. Kuhn terms the *nervous*, and the ſecond, *inflammatory* hydrocephalus; the third he mentions only as a ſequela of ſcarlet fever. Theſe varieties of the ſymptoms, however, only mark the attack of the diſeaſe; for in the latter ſtages there is little diverſity in the appearances.

In the firſt, or gradual mode of attack, before any characteriſtic ſigns of the diſeaſe appear, the child for ſome days, or even weeks, has complained of pains in his head or belly; while at the ſame time he has been ſlightly feveriſh, dull, ill-complexioned, without appetite, or perhaps with an increaſed appetite, and with ſome diſorder in the functions of the abdominal viſcera. Theſe complaints riſe gradually, but are ſeldom alarming; and the child's friends are not awakened to a ſenſe of his danger, until, advancing a ſtep farther, the diſorder begins to ſhew itſelf more diſtinctly. The dulneſs is accompanied with pains in the head, which is alſo connected, upon getting up in the morning perhaps, or after he has begun to ſtir about, with vomiting. Yet even this ſymptom is often diſregarded, until the ſecond or third day of its recurrence, and the diſeaſe has made conſiderable progreſs, before the illneſs of the patient is ſuſpected to ariſe from a diſordered condition of the brain. When the attention is more particularly excited by theſe ſymptoms, the head-ache, which is chiefly in the forehead, or ſometimes in the crown, will be found to return at ſhorter intervals. The child often affectingly complains of his head. He ſighs frequently, is dull, his head requires to be ſupported; he complains of wearineſs in his eyes; the pupils are ſometimes unuſually contracted, and he has an averſion to light ; his tongue is white, and his belly generally coſtive : the ſtools are firſt clayey ; as the diſeaſe advances they become of a gelatinous conſiſtence, of a dark green colour, ſometimes as dark as tar, and of a ſickly ſmell. The pulſe becomes quick ; and at particular times of the day theſe ſymptoms are attended with febrile heat and irritability, and the child complains not only of head-ache, but of pains in different parts of the body, ſometimes extremely acute. At one time he complains of pains in his limbs, at another of pains in his breaſt, or in the nape of the neck, very often in his bowels; and before the anxiety of his friends can make any preparations to relieve him, the pain is gone, or fled to ſome other part ; at another time he lies on his mother's knee, reſtleſs and whining, as from dull rheumatic pain. Theſe diſorders neceſſarily impair the child's ſtrength, and in the courſe of ten days or a fortnight his appearance is conſiderably altered ; he is peeviſh and feeble.

In the ſecond form of the attack, Dr. Cheyne obſerves, the diſeaſe runs a more rapid courſe. After the child has been drooping for a ſhort time, which, although it ſometimes eſcapes obſervation, is generally recollected, there is a ſudden change to a fever, attended even from the firſt with a great degree of heat and irritation, with frequent but ſhort and irregular remiſſions, fluſhing, ſevere head-ache, tenderneſs all over the abdomen, and increaſed ſenſibility, with ſometimes brilliancy of the eyes. It is ſaid to be often difficult immediately to diſtinguiſh hydrocephalus from fever, and this is the form of the complaint in which there is the greateſt reſemblance between the two diſeaſes ; but we are led to ſuſpect ſome deeply ſeated evil, from the frantic ſcreams, and complaints of the head and belly, alternating with ſtupor, or rather lowneſs ; and we are ſtruck with the irritability of the ſtomach, in a degree beyond what we find in fevers of this country, retching and vomiting being often brought on by a change of poſture, certainly by every attempt to ſit up in bed, and with the diſordered ſtate of the bowels which attends this irritability of the ſtomach ; and when at any time the child has a little reſpite from the violence of theſe ſymptoms, we find our ſuſpicions confirmed by his look ; for, in this diſeaſe, when the features do not expreſs pain or terror, there is not unfrequently an expreſſion, which it has in common with ſome other diſeaſes of the brain, of dejection, bordering upon inſenſibility, which is quite inſupportable to thoſe who are intereſted in the patient's recovery.

In the third mode of attack, when hydrocephalus ariſes after an imperfect ſtate of health, as where there had been a ſcrofulous action which has abated, or where the child has had ſome epidemic diſeaſe formerly (perhaps many months before), from which he has not perfectly recovered, or regained ſound health, the attack is ſometimes made with all the violence diſtinguiſhing the ſecond form juſt deſcribed. When again the attack comes on as the ſequel of an acute diſeaſe, as fever, hooping-cough, perhaps dentition, or during ſome actually exiſting ſcrofulous diſeaſe, the child almoſt imperceptibly ſlips into hydrocephalus ; there are ſcarcely any of the acute ſymptoms ; and the palſies or convulſions are the firſt indications of the new diſorder.

In whatever mode the diſorder commences, it is marked in what has been called, by Dr. Whytt, the *firſt ſtage* by a febrile condition, varying much in degree and regularity ; the ſleep becomes imperfect and apparently uneaſy, the little patient often grinding his teeth, picking his noſe, and ſtarting with a ſcream, as if he were terrified. There is great fluctuation in the feveriſhneſs : at one time the pulſe is quick and throbbing ; the heat of the body is increaſed ; the ſkin parched ; there is a deep bluſh on the face, more eſpecially on one cheek ; and the breathing is ſighing, laborious, and quick : at another time the blood circulates more equally ; the ſkin is of a natural warmth, or moiſt with temporary perſpiration ; the countenance is pale ; and the breathing ſo ſoft that it cannot be heard. There is alſo great fluctuation in the ſtate of the other functions. Sometimes the ſtate of the ſtomach appears to be nearly natural ; at other times the heavy ſmelling breath, that has been ſuppoſed by Dr. Whytt to be peculiar to this diſeaſe, the total abſence of appetite, and conſtant vomiting, even for days, ſhew the ſtomach to be in the greateſt diſorder. The bowels are never regular ; they are generally ſlow, requiring cathartic medicines, and now and then a conſtant and ſevere bilious purging attends the vomiting. The urine is ſometimes withheld for 24 or 36 hours ; occaſionally a frequent deſire to paſs it has been obſerved. And not only are the vital and natural functions irregular ; we find the ſame extremes in the animal functions ; to this, indeed, the diſeaſes of the brain owe much of their intereſting character. The ſenſes and judgment are often perfect and entire, ſometimes morbidly acute ; in general the retina is painfully ſenſible to light, and the child is ſometimes unpleaſantly affected by ſlight ſounds : on the contrary, ſometimes, even in the early days of the diſeaſe, the mind is ſubdued, and there is the greateſt dulneſs of apprehenſion.

It generally happens, but by no means with the certainty which the deſcription of Dr. Whytt would lead the ſtudent to expect, that after the firſt or febrile ſymptoms have continued an indefinite time, from a few days to a fortnight or more, a remarkable change takes place in the diſeaſe, eſpecially in the condition of the pulſe, by which the commencement of the *ſecond ſtage*, according to Dr. Whytt and others, is marked. The pulſations become ſlow, even ſlower than in health, and at the ſame time unequal and irregular, both as to ſtrength and the intervals between the ſtrokes ; but, as Dr. Cheyne remarks, they are eaſily doubled by the leaſt exertion. With the ſlowneſs of the pulſe, a greater degree of dulneſs and torpor comes on ; the pain of the head ſeems to abate, or at leaſt the patient becomes apparently leſs ſenſible of it ; and as this ſtage advances, he grows drowſy and lethargic, yet moans heavily, without being able to tell what diſtreſſes him; and often ſtarts and cries in a wild manner, as if from momentary attacks of acute pain. The pupils are obſerved to be dilated, and a want of conſent between the two eyes, attended with imperfect, and not unfrequently double viſion, takes place. As the diſeaſe proceeds, the ſquinting and dilatation of the pupil increaſe ; the patient lies with one or both eyes half cloſed, which, when minutely examined, are often found to be completely inſenſible to light ; and they now loſe their vivacity in conſequence of a filmy covering of the cornea. The ſickneſs ceaſes, and whatever food or medicine is offered, is uſually ſwallowed with apparent voracity ; the bowels generally remaining obſtinately coſtive.

Theſe ſymptoms are ſoon ſucceeded by others, which mark the *third ſtage*, and announce the approach of death within five or ſix days, or ſometimes within a much ſhorter period. The pulſe now becomes equal and regular, and riſes to a rapidity greater than ever ; which continues to increaſe while life remains. There is no diſeaſe, we believe, in which the pulſations become ſo frequent, and yet continue diſtinctly numerable, as in the cloſing ſcene of hydrocephalus. Dr. Whytt ſays, that no patient dies of this diſeaſe, while his pulſe remains under 130 beats in the minute ; in one caſe he counted it 210 in the minute on the day of death. We have diſtinctly enumerated 190 beats under the ſame circumſtances.

A comatoſe ſtate now comes on. The patient lies with a frequent hectic fluſh on his cheek, alternating with a deadly paleneſs; drawing a long ſigh at intervals; often grinding his teeth; incoherent, or in a ſtate of complete inſenſibility; perhaps picking about or ſawing the air with one hand, while the oppoſite ſide is palſied; with a burning fever on his ſkin, or ſweat forced from every pore; and all theſe ſymptoms alternating with, and at laſt finiſhed by, apoplectic breathing, and convulſions.

The whole concourſe of the ſymptoms, as well as the changes in the ſtate of the pulſe, which occur in each of the three ſtages, conſtitutes a very remarkable peculiarity in this diſeaſe, and gives a character to each ſtage. The *firſt* has been called the ſtage of increaſed ſenſibility, or inflammatory irritation: the *ſecond*, that of decreaſed ſenſibility, or torpor: and the *third*, the paralytic or convulſed ſtage. In the *firſt*, every ſtimulus produces an inordinate effect: there is great averſion to light and to ſounds; watching, ſickneſs, pain, and quickened pulſe. In the *ſecond* ſtage, the child is not eaſily rouſed, his pupil is dilated, and does not contract on the approach of light, his pulſe is ſlow, he is lethargic, with often an obſtinately coſtive belly. In the *third* ſtage, which may, perhaps, be conſidered as a continuation of the ſecond, there is ſquinting, rolling of the head, delirium, ſtupor, convulſions, with a rapid thready pulſe.

Phyſicians have repreſented the duration of the diſeaſe differently: Dr. Whytt ſuppoſed it to extend to four, five, or ſix weeks, from the date of the firſt ſymptom; while Dr. Fothergill commonly found it to terminate in three weeks. On the whole, experience ſeems to have corroborated the obſervation of Dr. Fothergill. But, like every other diſeaſe, of the brain, hydrocephalus is uncertain in its duration, eſpecially when the pulſe has become ſlow, or the ſtage of torpor has arrived. Sometimes, in the courſe of two or three days from this change, the child ſhall be carried off; while, in other caſes, even the laſt ſtage continues day after day, for upwards of a week, when, at every viſit, the obſerver would conceive that the patient had only a few hours to live. In caſes of the ſecond, or acute mode of attack, and alſo in the third, the whole diſeaſe ſometimes runs its courſe in a few days; while, in the firſt mode, from the great length of the firſt ſtage, it has been obſerved to laſt many weeks. Dr. Quin ſtates, apparently on conjecture, that the diſeaſe may be expected to be more rapid in its courſe, in adult perſons, than in young children. But our obſervation accords with that of Dr. Cheyne and others, in ſtating the contrary. In a boy of twelve years old, we once ſaw the diſeaſe run on, in a very gradual courſe, to the length of eight weeks, and then terminate fatally.

Nor is there leſs variety in the ſymptoms and progreſs of the diſeaſe, than in its duration; inſomuch that Dr. Quin has called it a "truly Proteiform diſtemper," and Dr. Ruſh accords in the juſtneſs of the appellation. Caſes have terminated fatally, in which ſome one or more of the characteriſtic ſymptoms have not appeared, and ſometimes when "no one ſymptom afforded any ſuſpicion of the real cauſe of death," which was aſcertained by diſſection. (See Dr. Quin's Eſſay, p. 43.) The ſame author mentions another caſe, which terminated fatally in ſeven days, and diſſection determined the nature of it; "yet the uſual variations of the pulſe in the ſeveral ſtages did not take place; the pupils were not dilated until the laſt day of the child's life; he never once vomited, never expreſſed a diſlike to light, and the head-ache, though conſtant, was not violent." Dr. Ruſh obſerves, "I have not found the dilated and inſenſible pupil, the puking, the delirium, or the ſtrabiſmus, to attend univerſally in this diſeaſe. I ſaw one caſe in which the appetite was unimpaired from the firſt to the laſt ſtage of the diſorder." (Med. Inq. and Obſ. vol. ii. p. 209.) On the contrary, we lately ſaw a caſe, in which the chief ſymptom of indiſpoſition, for the firſt four or five days, was a conſtant ſickneſs in the ſtomach, which rejected almoſt every thing as ſoon as ſwallowed while the head remained apparently free from uneaſineſs. Other caſes are mentioned by Dr. Ruſh, in which no head-ache occurred during the courſe of the diſorder; in which no preternatural ſlowneſs or intermiſſion was ever perceived in the pulſe; and in which no dilatation of the pupil, ſquinting, ſickneſs, or loſs of appetite had attended: and others, in which an uncommon acuteneſs of hearing, palſy of one ſide, and the ſymptom of hydrophobia, had reſpectively occurred. Dr. Whytt alſo mentions an irregularity in the ſtate of the pupil. "Three or four days before the death of a boy of five years old," he ſays, "I was ſurpriſed to find the pupils, which had been much dilated before, no larger than natural. At firſt I flattered myſelf that the diſeaſe had taken ſome favourable turn; but was ſoon undeceived: for, upon giving the child a ſpoonful of weak cinnamon water, with ſome drops of *ſpiritus volatilis oleoſus*, the pupils became as wide as they had been the day before. In leſs than half an hour after they contracted again; but immediately dilated upon holding ſome ſpirit of *ſal ammoniacus* to his noſe. I have ſince obſerved the ſame interchanges in the pupils of a boy of four years old, on the third day before he died. In this caſe the pupils not only were enlarged, by giving him a ſpoonful of wine, or holding volatile ſpirits to his noſe, but alſo by ſo ſmall a ſtimulus as my lifting up his eyelids, which had loſt all their motion, and had fallen ſo far down as to cover near the half of the eye." Obſervations on Dropſy in the Brain, Whytt's Works, p. 735.

Diſſection.—The circumſtance which was firſt noticed, on examining the head by diſſection, in patients who had died of this diſeaſe, was the conſtant occurrence of a limpid watery fluid, diſtending the ventricles of the brain, and amounting in different inſtances to the quantity of from two to ſix ounces. In ſome caſes, only one of the lateral ventricles has been found thus diſtended. A ſmall quantity of fluid is alſo commonly found between the membranes ſurrounding the brain, eſpecially under the *tunica arachnoides*, both above and at the baſe of the brain. The water, collected from the ventricles in hydrocephalus, does not coagulate by heat; in which reſpect it differs from the *ſerum* of the blood, from the water that is found in the *pericardium*, and from that which is taken from the abdomen, by tapping, in dropſy.

But in addition to this effuſion of water, later authors have obſerved, in many inſtances, the marks of congeſtion in the blood-veſſels of the brain, and of different degrees of inflammatory action. Dr. Cheyne remarks, "upon diſſection, we generally find within the cranium, the veins, particularly thoſe of the membranes on the ſurface of the brain, and lining of the ventricles, gorged with blood; ſometimes conſiderable adheſion between and thickening of the membranes, and minute and florid veſſels upon the *pia mater*." (Loc. cit. p. 31.) And Dr. Quin has related ſeveral caſes, "wherein the quantity of fluid found in the ventricles was very conſiderable; but at the ſame time, there were ſigns ſo viſible of an increaſed flow of blood to the brain, that in all of them the veſſels were remarkably turgid; in moſt of them a degree of inflammation had taken place, as appeared at the time of diſſection, either by preternatural adheſions of the membranes, or by a partial opacity and increaſed thickneſs of them, together with patches of inflammatory cruſt, very ſimilar to thoſe which are found on the abdominal viſcera of perſons whoſe death has been the conſequence of *enteritis;* or on the lungs and *pleura* of thoſe who have ſunk under pulmonic inflammation." P. 51.

In inveſtigating the ſeats of diſeaſes by diſſection, phyſicians are too apt to confine their examinations to that part of the body, in which the moſt prominent ſymptoms of derangement had occurred during life; by which practice a very imperfect knowledge of the morbid changes is often acquired. This error is too frequently committed in reſpect to hydrocephalus, when the contents of the *cranium* alone are examined: for it appears that the viſcera of the abdomen often ſuffer in this diſeaſe. "In the abdomen," ſays Dr. Cheyne, "I have found the inteſtines inflamed, and conſtricted from ſpaſm, and the ſurface of the liver of a bright red colour, abounding in minute veſſels; and ſometimes extenſively adhering to the peritoneum. In ſeveral diſſections, I have found the ſurface of the liver ſtudded with ſmall white tubercles, not larger than a grain of muſtard. The glands of the meſentery are often diſeaſed, &c." (P. 31.) And, in another place, the ſame writer remarks, "upon diſſection of hydrocephalic children, I have found in the liver the remains of great inflammatory action, and alſo proofs that undue irritation had exiſted in the alimentary canal." P. 46.

Cauſes of Hydrocephalus.—This ſubject remains in ſome degree of obſcurity, more eſpecially in what regards the exciting cauſes. A *prediſpoſition* to the diſeaſe is pretty obviouſly found in that peculiarity of conſtitution which is allied to ſcrofula, and which is characterized by a frame of body that is rather delicate and irritable, and often beautiful—and by acuteneſs of intellect and liveline ſs of diſpoſition—the ſkin being fair and well coloured, the eyes blue, and the hair light. This prediſpoſition is often *hereditary*, and attached to particular families. Dr. Cheyne attended two families, in one of which four children, in the other three, died of this diſeaſe; and he had "heard of an unfortunate family who loſt ſeven children of hydrocephalus." We are acquainted with one, in which ſeven children periſhed from this malady, when they arrived at a certain age, apparently of ſtrumous conſtitutions. Sauvages has a ſimilar obſervation. "Novi familiam," he ſays "cujus infantes circa ſextum ætatis annum omnes periere ex hoc morbo, ſcrofula huic effuſioni anſam præbente." (See his Noſol. Method. claſs. iv. gen. xii. 5. Convulſio ab Hydrocephalo:—alſo, gen. xviii, 14. Ecclampſia ab Hydrocephalo.) Dr. Percival ſtates, that of twenty-two caſes of which he kept notes, eleven were certainly ſtrumous children, and four were probably ſo. (Med. Facts and Obſ. vol. i. p. 129.) Hydrocephalus is more particularly a diſeaſe of *childhood*, occurring moſt frequently in the middle years, between weaning and puberty. Occaſionally, however, it is ſeen at every period of life, with the exception, perhaps, of old age. A ſtate of *imperfect convaleſcence* from ſcarlet fever, meaſles, ſmall-pox, whooping cough, and other acute diſeaſes, appears to generate a prediſpoſition to hydrocephalus. Many caſes of hydrocephalus occur, of which no *exciting cauſe* can be traced, ſometimes, indeed, little accidents, as falls and blows, are recollected, when the diſeaſe has made its appearance, which had occurred ſeveral weeks or months before, and had excited little attention at the time. Whether theſe accidents were actually the cauſes of the diſeaſe, which thus enſued, after a long interval of health, is certainly a matter of doubt. Dr. Cheyne obſerves, that, in upwards of a hundred caſes which he had attended, he had only met with one, in which external violence could be conſidered as the origin of the diſeaſe, and that in an indirect manner. This child had, at the ſame time, a ſevere and obſtinate catarrh; which he deemed more likely to impair the general health, and thus to prediſpoſe to hydrocephalus. He adds, that he has repeatedly ſeen ſymptoms of ſcrofula following a ſevere accident, which may thus intermediately induce hydrocephalus, by deranging the general health, and calling into action what, from a good and fortunate management, had hitherto been latent.

It would ſeem, however, that any circumſtance which can produce a ſtate of general debility, but eſpecially any cauſe exciting an active feveriſh ſtate, of the inflammatory kind, in children prediſpoſed to the diſeaſe, will call it into action. Hence the irritation of teething, and of worms in the alimentary canal, eſpecially if attended with convulſions; ſudden expoſure to cold; fevers; rheumatiſm; pulmonary conſumption; colic, and other diſeaſes, have been mentioned among the cauſes of hydrocephalus. (See Ruſh, Med. Inquiries, vol. ii. p. 211, et ſeq .and the references there given.) Some other cauſes have been alleged; ſuch as a ſuppreſſion, or ſpontaneous metaſtaſis, of eruptions, eſpecially of the ſcald head; the healing of old ulcers; the ceſſation of cuſtomary diſcharges; a ſerous colluvies of the blood; ruptured lymphatics, &c.; but theſe are apparently hypothetical ſuppoſitions, and their operation is not very obvious.

The *proximate cauſe*, as in many other diſeaſes, has been the ſubject of conſiderable difference of opinion. Dr. Whytt, Dr. Fothergill, and other authors, viewed the malady in the light of a mere dropſical effuſion into the cavities of the brain, partaking of the nature of ordinary dropſy in other parts of the body, and originating from the ſame cauſes. Dr. Quin, however, pointed out the error of this opinion, and the proper diſtinction between the chronic and the acute hydrocephalus, of which we now treat. There are many reaſons for adopting the opinion of Dr. Quin, and attributing the peculiar ſymptoms of the diſeaſe, not ſo much to an effuſion of water in the ventricles, as to a morbid circulation or accumulation of blood in the veſſels of the brain, which ſometimes proceeds to a degree of inflammation, which is generally followed by ſuch an effuſion. Dr. Cheyne adopts a notion very ſimilar to this. "I would venture to ſubmit the following," he ſays, "as a more conſiſtent view of the pathology of hydrocephalus. That in this diſeaſe there is produced a venous congeſtion, in addition to, and probably ariſing from, the increaſed arterial action: that the effuſion of ſerous fluid ariſes from this venous congeſtion: that this effuſion has a tendency to counteract the baleful effects of the increaſed action, and to retard the fatal termination of the diſeaſe: of courſe, that the effuſion into the ventricles is not the cauſe of the violent ſymptoms; and that the increaſed arterial action, though perhaps varied, does not ceaſe when the congeſtion and effuſion have taken place." P. 59.

There are many facts and obſervations which tend to corroborate this opinion. Dr. Quin mentions two caſes, in which the ſymptoms preceding death were, to all appearance, ſo unequivocal, that the phyſicians not only pronounced the diſeaſe to be water in the head, but likewiſe foretold the ſymptoms that were to be expected a few days before diſſolution: the looked for changes did accordingly take place, and the patients died. "In both caſes, to the aſtoniſhment of thoſe who were preſent, and prepared to find on diſſection a great redundancy of water within the cranium, *none could be diſcovered* in any part of the brain; but the *blood-veſſels were ſo unuſually diſtended*, that the whole of the cerebrum and cerebellum reſembled an anatomical preparation, in which the utmoſt force of injection had been employed." (P. 50.) Dr. Cheyne mentions two caſes of a ſimilar nature; in one of which the progreſs of the diſeaſe, although rapid, was regular, the three ſtages of Dr. Whytt being well marked. Scarcely a ſpoonful of water was found in the ventricles; "but the brain was ſo turgid, that when the bones were ſawed fairly round, the ſection was thruſt up half an inch by the ſudden and forcible protruſion of the cerebrum: not only the veins of the pia mater were loaded with blood in a very remarkable degree; the medullary ſubſtance of the brain was finely dotted with numerous red points, and the cortical ſubſtance ſtreaked with pencils of red parallel lines." In the other inſtance, "no effuſion was diſcovered in the ventricles" after death. It was an extreme caſe of the *acute* hydrocephalus, where the excitability was ſuddenly exhauſted by the violence of the attack. "When, as in this caſe, Dr. Cheyne adds, "the child dies early in the diſeaſe, with every ſymptom of accelerated arterial action, but before the ſubſequent congeſtion has exiſted for any length of time, the diſſection will never afford much effuſion. When, on the contrary, the patient long ſurvives the ſlow pulſe; and when, from the continuance of the diſeaſe, we have reaſon to think that the congeſtion has exiſted for a conſiderable time; then we find a large effuſion. In ſuch caſes I have diſcovered, within the head, little appearance of arterial action, as marked by the tiſſue of minute and florid veſſels: this ſtage of the diſeaſe was over; yet the effects of inflammation abundantly appeared in the thickened and greater adheſion of the membranes; in the great congeſtion; and indeed, from the pain, ſuffuſion of the eye, &c. we cannot doubt that it exiſts to the laſt." (Cheyne, p. 63.) Dr. Quin details ſeveral caſes, in which, together with conſiderable effuſion of water, the veſſels were found extremely turgid, and the previous exiſtence of a degree of inflammation was demonſtrated "by preternatural adheſions of the meninges, or by a partial opacity and increaſed thickneſs of them, with patches of inflammatory cruſt," &c.

On the other hand, numerous caſes are on record, in which quantities of effuſed fluid have been found, on diſſection, in the ventricles, when no complaint of pain in the head, or ſymptom denoting an oppreſſed brain, had exiſted before death. Maniacal patients, in whoſe ventricles many ounces of fluid have been found, have died without evincing any hydrocephalic ſymptoms. And, in fact, there is ſcarcely any organic diſeaſe of the brain which is not accompanied by effuſion.

Theſe facts being admitted, we think it were unneceſſary to argue the point taken up by Dr. Cheyne, againſt Dr. Quin and Dr. Ruſh, *viz.* whether "the morbid arterial action" in the brain amounts to ſuch a degree of inflammation as entitles it to be compared with *phrenitis*, or to be called *phrenicula*; or whether we muſt be content to ſay, with Dr. Cheyne, that it appears "to conſiſt of a diſeaſed action of a *peculiar* kind." P. 82.

This view of the diſeaſe, however, although doubtleſs correct as far as it goes, does not embrace the whole phenomena. It has often been obſerved that a train of ſymptoms, ſimilar to thoſe of hydrocephalus, has ariſen from the ſympathy which ſubſiſts between the brain and other organs, eſpecially the alimentary canal, the liver, and the urinary organs. (For inſtances of ſympathy with the laſt mentioned organs, ſee Sauvages, claſs vi. gen. xxix. 4. *Carus iſchurioſus*, and the references there given: alſo Med. Facts and Obſ. vol. i. art. 1.) It is chiefly, however, as Dr. Cheyne obſerves, from a morbid ſtate of the liver and alimentary canal, that we find the hydrocephalic ſymptoms by aſſociation to ariſe. Every practitioner of obſervation has probably been occaſionally ſurpriſed by the recovery of children under many of the ſymptoms of hydrocephalus, while purgative medicines, eſpecially of the mercurial claſs, were adminiſtered. Dr. Willan ſtates, that the hydrocephalus of Dr. Quin, marked by the preſence of inflammatory irritation in the head, as above deſcribed, "ſhould be diſtinguiſhed from the ſymptomatic hydrocephalus, which often takes place, with very ſimilar ſymptoms, after the criſis of malignant fevers; during the *hectica infantilis*; and in ſome other acute diſeaſes of children, particularly the febrile ſtate produced by dentition, worms, and diſorders of the bowels and meſentery. Caſes of this kind are uſually removed, within a week or two, by the uſe of calomel or other active purgatives, and bliſters." Reports on the Diſeaſes in London, p. 270.

Now we think this ſtatement much too general. It is certain that theſe irritations and morbid conditions of the bowels are common concomitants of the ordinary and fatal form of hydrocephalus. In his deſcription of the ſecond ſtage of the diſeaſe, Dr. Whytt mentions the diſcharge of worms, or of ſome ſubſtance like worms in a diſſolved ſtate, as a "frequent" occurrence (Works, p. 732.); and we have more than once ſeen a *lumbricus* voided under the ſame circumſtances. The condition of the ſtools, when hydrocephalus is eſtabliſhed, is ſo peculiarly morbid, that ſeveral practitioners ſpeak of "hydrocephalic ſtools," as ſufficiently intelligible to thoſe who have made any obſervation on the ſubject. The evacuations appear to conſiſt ſolely of a dark glazy bile, mixed with the mucus of the inteſtines. There are many other conſiderations, too, which tend to prove the connection of the proper hydrocephalus with this morbid condition of the abdominal viſcera, and to ſupport the opinion of Dr. Cheyne, Dr. James Curry, and others, that this diſeaſe "is often fairly and incurably eſtabliſhed by the ſympathy which the brain has with theſe organs." Cheyne, loc. cit. p. 38.

In the firſt place it would appear that hydrocephalic ſymptoms, ariſing from ſympathy with diſordered digeſtive organs, have ſometimes proved fatal, without producing any obvious change of ſtructure in the brain. Mr. Abernethy examined the body of a child, who had unequivocal ſymptoms of hydrocephalus, in which the brain was found perfectly healthy, the only diſeaſed appearance being in the bowels. (See his Surgical Obſervations, part ii. p. 193.) Again, Dr. Hamilton has obſerved, that "hydrocephalus often ſteals ſlowly on the devoted victim, with ſymptoms reſembling thoſe of maraſmus;" whence he thinks it not unreaſonable to ſuppoſe that the maraſmus, which is clearly the reſult of a morbid ſtate of the liver and bowels, may occaſionally give riſe to hydrocephalus. (See his Obſervations on Purgative Medicines.) Dr. Cheyne advances ſimilar obſervations. "In many caſes," he ſays, "previouſly to the hydrocephalic ſymptoms, the chylopoetic viſcera have been diſordered for many weeks. The appetite has been bad; the bowels coſtive, the ſtools betraying diſorder in the hepatic ſyſtem; there has been all that want of alacrity, both of body and mind, ſo invariably the conſequence of the derangement of the biliary ſecretion; and in ſeveral children, previous to the exiſtence of any morbid ſenſation, the firſt ſymptom of ill health was the loſs of the healthy colour of the ſkin. In children prediſpoſed to the diſeaſe, I have, while removing, by a courſe of purgative medicines, a vitiated biliary ſecretion and diſordered ſtate of the bowels, removed alſo the very ſymptoms which had preſented themſelves in other children of the ſame family, when the attacks of a hydrocephalus, which actually proved fatal, were ſuppoſed to have been eſtabliſhed. In children, where I did not know of any family prediſpoſition, I have, by the ſame means, in many inſtances, removed the ſymptoms which are always found in the beginning of hydrocephalus."—"The increaſed arterial action on the ſurface of the liver, the remains of which I have obſerved in my diſſections, to every appearance had been of ſome ſtanding, and in two or three inſtances, from the extent of the adheſions, it evidently had been of great intenſity. While the diſeaſe is forming, there is generally a defect in the function of the liver: it ſeems to admit of only a ſcanty and imperfect formation of the bile, inſufficient to ſtimulate the inteſtinal canal, which becomes torpid, and is ſometimes loaded with fœtid clay-coloured excrement." Pp. 45.—47.

We omit many other circumſtances, occurring in other diſeaſes, which might illuſtrate the influence of a morbid condition of the chylopoetic viſcera in producing coma, lethargy, apoplectic ſymptoms, affections of viſion, &c., as well as ſeveral ſtriking caſes mentioned by Dr. Cheyne. It appears, from what has been ſtated, in the higheſt degree probable, that hydrocephalus, when it makes its attack eſpecially in the firſt mode above related, frequently originates from the ſympathy of the brain with ſuch a morbid condition in the viſcera of the abdomen: and that the inſtances which Dr. Willan would ſeparate, as diſtinct from the moſt acute form, differ principally in the degree of mildneſs, or in being treated properly before the diſeaſe was too firmly eſtabliſhed. It may not be eaſy, indeed, to frame rules, to uſe the words of Dr. Cheyne, "by which we may decide, when the ſymptoms ariſe from the morbid ſympathy between the brain and a deranged ſtate of the liver or the inteſtines, or when they originate from the diſordered ſtate of the brain, unconnected with any diſtant organ. This inveſtigation is important, but not eaſily proſecuted: perhaps future obſervation may prove that we ſhall not be wrong to trace the diſeaſe to the organ *which firſt has its functions ſenſibly impaired;* in a great many caſes it has appeared to me that a ſeries of diſeaſed actions has commenced with the diſordered ſtate of the abdominal viſcera." Loc. cit. p. 50.

An *explanation of the ſymptoms,* then, may be thus given. The firſt ſtage of the diſeaſe is principally referable to increaſed arterial action in the brain, not yet, however, ſo great as to have produced any material change in its condition, which could be detected by diſſection, until near the approach of the ſecond ſtage. The patient is then feveriſh, averſe to light, ſick, diſturbed in his ſleep, fretful, and complaining of head-ache. When the pulſe is becoming irregularly ſlow, the inflammatory congeſtion is conſiderably increaſed, and the effuſion of water into the ventricles is probably beginning: and as the preſſure augments, the effects of it upon the root of the optic nerves, (or the *thalami nervorum opticorum,*) become obvious in the ſquinting and dilatation of the pupil, which laſt ariſes from the beginning inſenſibility of the retina, and the ſquint from the irregular influence of the nerves connected with the muſcles of the eye-balls. At the ſame time the lethargic diſpoſition, the cruel pains darting through the head, exciting ſcreams and ſtarting from ſleep, the ſlowneſs and irregularity of the pulſations of the heart and arteries, all denote the impeded functions of the brain from the increaſing congeſtion and preſſure within it. Then ſucceed complete blindneſs, often accompanied by convulſions or paralytic ſymptoms, as the diſeaſe approaches to its termination; after which we diſcover all the remains of great arterial action, adheſions of the membranes, great congeſtion, effuſion, and even obvious change of ſtructure; more particularly when the laſt-mentioned ſymptoms have been ſevere and of ſome duration. It is not very eaſy, as Dr. Whytt admits, to explain the origin of the extraordinary rapidity of pulſe which enſues towards the cloſe of the diſeaſe, ſince the third ſtage appears to be but a continuation and increaſe of the ſecond. Whether the ſickneſs, in the beginning, ariſes from the ſympathy of the ſtomach with the diſordered ſtate of the brain, or from the ſtate of the bilious ſecretion and of the bowels, is not clear, and probably it originates from one or the other in different circumſtances; but the vomiting in the more advanced ſtages of the diſorder is more naturally explained (according to Dr. Whytt) by the ſympathy of the ſtomach with the oppreſſed brain. The great torpor of the bowels, which ariſes in the firſt inſtance, probably from the ſcanty and imperfect formation of the bile, may be afterwards augmented by the diſordered condition of the brain and nerves.

The Diagnoſis.—Having ſtated the phenomena of hydrocephalus at conſiderable length, it will be unneceſſary to dwell minutely upon the peculiar diagnoſtic ſymptoms. It is of the utmoſt importance, however, that the nature of the diſeaſe ſhould be detected as early as poſſible; and it is not too much to ſay, with Dr. Cheyne, that the phyſician ſhould be ever on the watch for it, in attending to the diſorders of children, and ſhould never hear a little patient complain of head-ache, without inveſtigating the hiſtory of his health preceding this complaint, and comparing it with every ambiguous ſymptom. Loc. cit. p. 89. See alſo Dr. Quin's Treatiſe, p. 44.

The principal difficulty is to diſtinguiſh incipient hydrocephalus from the fevers, occaſioned by the irritation of dentition, or of worms in the inteſtines; or "the infantile remittent fever" of Dr. Butter. Theſe fevers have ſeveral ſymptoms in common with hydrocephalus: but the commencement of hydrocephalus is generally more gradual; the diſorder of the ſtomach is more conſtant, eſpecially the frequent recurrence of vomiting; there is an averſion to light; the ſtools are dark, of a dirty green colour, and glairy; the pain of the head, when fixed, is oftener dull than acute, but ſo overpowering that it does not admit of the head being raiſed from the pillow; ſometimes it is a very acute pain; at intervals, and theſe ſometimes regular, it darts through the centre of the brain, and the child is rouſed with an expreſſion of helpleſs anguiſh from the dozing which precedes this acute pain, and into which he inſtantly relapſes when it is gone: the intermiſſions of the diſeaſe are very irregular. In children of ſome growth, a peculiar expreſſion occurs in hydrocephalus; the countenance has a ſort of ſtare of vacancy, with much appearance of anxiety, and great caution evinced in moving the head. In the remittent fever the affection of the head is commonly much leſs obvious; the remiſſions are generally regular and complete, there being one in the morning or early in the forenoon, followed by an exacerbation in the afternoon, which continues through the night; the ſtools are uſually dark-brown, or mud-like; a glairy dark-green diſcharge, however, has been ſometimes obſerved in this fever. All organic diſeaſes of the brain have a general reſemblance to hydrocephalus, and to each other, ſuch as ſcrofulous tumours, abſceſſes, caries of the bones, &c.; but the diſorder, in theſe caſes, is much more tedious than hydrocephalus. Cheyne.

The Prognoſis in hydrocephalus is always doubtful, and, on the whole, unfavourable, even in the firſt ſtage of the diſeaſe; in the ſecond ſtage it is extremely unfavourable; and in the third it is almoſt uniformly hopeleſs. Dr. Whytt conſidered it, indeed, as hopeleſs under all circumſtances, and acknowledged that he never ſaw a patient recover. But ſubſequent experience has taught us, that it ought not to be held an incurable diſeaſe: ſeveral inſtances of recovery are on record. Dr. Percival of Mancheſter, and Dr. Dobſon of Bath, both effected a cure in their own family, by timely attention to the diſeaſe; ſeveral examples are related in the periodical publications, (Lond. Med Journ. vol. iv. p. 82. vi. 113. i. 424.—See alſo Med. Obſ. and Inq. vol. iv. and vi. Edin. Med. Com. vol. vi. p. 220 and 224. viii. 325 and 332. ix. p. 240. x. 299, &c. and other journals,) and in the appendix to Dr. Cheyne's treatiſe. Dr. Willan mentions three caſes out of eight which terminated favourably, "two recovered about the eighteenth day of the diſorder, the third, an infant, at the end of the fifth week, after having been long abandoned to its fate." (Reports on the Diſ. in London, p. 269.) The chance of cure in general, however, is nearly in the inverſe proportion to the duration of the ſymptoms.

It has been obſerved by Dr. Cheyne, that a great increaſe of urine has often occurred when the diſeaſe has terminated in recovery; and that when the urine flows freely after giving mercury, it may be deemed a favourable prognoſtic. Occaſionally a copious diaphoreſis, eſpecially from the head, has alſo preceded recovery. In one caſe, after a child had been condemned as in a hopeleſs ſtate, and the phyſicians had diſcontinued their viſits, "a profuſe ſweat broke out on the head and neck, and flowed ſo copiouſly that the pillows had to be ſhifted one after another. From that moment the child is ſaid ſenſibly to have recovered, and yet lives. Seven years have elapſed ſince his recovery." P. 87, *note*. See alſo a caſe in the Edin. Med. Comment. vol. x. p. 299, and Dr. Quin's Treatiſe, p. 73.

Of the Cure.—In a diſeaſe which, from its very commencement, is of a moſt dangerous tendency, and when completely eſtabliſhed is commonly fatal, it is obvious that, in order to have any tolerable chance of ſucceſs, the treatment ſhould be entered upon early, in a deciſive manner, and purſued with ſteadineſs and vigour. The principal indications of cure appear to be, 1ſt, to diminiſh the inflammatory activity of the circulation in the brain; and, 2dly, to remove all irritations, eſpecially in the alimentary canal, and to correct the hepatic ſecretion or congeſtion, which, by morbid ſympathy, may have given riſe to, or may have aſſiſted in prolonging the diſeaſed action in the brain.

In the very early periods of the diſeaſe, indeed, our firſt attention ſhould be directed to the ſtate of the alimentary canal, and an active cathartic ſhould be given, and repeated according to circumſtances. Should we aſcertain that the canal is torpid, and imperfectly performing its functions, admitting an accumulation of feculent matter; or that the ſecretions flowing into it are vitiated or diminiſhed in quantity, (which we diſcover by the peculiarity in the appearance, or the pungent fætor of the ſtools,) we muſt endeavour, by ſteadily purſuing the purgative plan, to effect a change: for while this is produced in the appearance of the ſtools, by the ſtimulating quality of the medicines, a moſt important change is effected in the hepatic ſyſtem, inteſtinal canal, and all the parts including every organ eſſential to life, which is by ſympathy connected with them. The purgative plan may be purſued without inducing debility; on the contrary, with evident acceſſion of ſtrength, ſo long as there is foulneſs of the bowels, either while the ſtools are fœtid and clay-coloured, or while they are dark and ſlimy. In the advanced ſtages, however, when the oily-looking, or glazed dark-green ſtools, almoſt peculiar to this diſeaſe, are evacuated, we cannot hope to effect a cure by purgatives. But in the earlier periods, ſhould little diſorder in the alimentary canal and biliary ſecretion be obſerved, if the ſtrength of the patient be unimpaired, and his conſtitution originally ſound, the exhibition of purgative medicines, perhaps every ſecond or third day, may be advantageous.

For theſe purpoſes preparations of mercury, and eſpecially calomel, appear to be the moſt ſuitable, as the firſt doſes of them ſeldom fail to ſtimulate the bowels. When this does not happen, and the purgative effect is not produced, ſome other medicine, as jalap, aloes, ſcammony, muſt be given in addition. Dr. Cheyne ſays, "purges have generally been given in this diſeaſe; but, when called early, what I recommend is, the exhibition of the largeſt doſe, which can with ſafety be preſcribed, of ſome powerfully cathartic medicine, two, three, or four times a day, and this continued for ſeveral days, or until natural ſtools are procured. The advantage of keeping the inteſtinal canal under the continued influence of a ſtimulus, I have, in various inſtances, found to be ſo great, that I am induced to repeat the declaration of my belief, that the happieſt reſult may be expected from this meaſure." P. 95.

It may be added, that ſhould the ſymptoms indicative of commencing hydrocephalus, prove to be in fact the ſymptoms of remitting fever, or to ariſe from worms in the inteſtines, this practice fortunately proves the moſt efficacious means of removing theſe diſeaſes. On the whole, therefore, the free adminiſtration of cathartics may be recommended, under all circumſtances, in the commencement of the diſeaſe.

In regard to the means of fulfilling the indication of reducing inflammatory action within the head, eſpecially by *blood-letting*, there has been ſome difference of opinion. Dr. Ruſh recommends general bleeding indiſcriminately, in the firſt ſtage of the phrenicula (as he denominates the diſeaſe), even to an extent greater than is requiſite in the more acute phrenitis, except in very young children. It has not appeared, however, that this practice is entitled to more credit, even in his hands, than other modes of treatment. Where the conſtitution is robuſt, and the attack is of the moſt acute form, general blood-letting may, doubtleſs, be reſorted to with great benefit, and is eſpecially ſerviceable, as Dr. Ruſh intimates, in preparing the way for the operation of mercury. In leſs active forms of the diſeaſe, however, and in delicate habits, and more particularly when it ariſes after the conſtitution has been exhauſted by preceding diſorders, local evacuations of blood by means of leeches, or cupping, ſhould be preferred; and the operation may be repeated, according to the urgency of the ſymptoms, the ſtate of the pulſe, and the general ſtrength of the patient. We agree with Dr. Cheyne in looking upon the inflammatory action in the brain as going on during the whole progreſs of the diſeaſe, and not ceaſing with the firſt ſtage of increaſed ſenſibility, or before the ſtage of torpor has begun; and, therefore, in conſidering local bleeding, as a proper expedient, when otherwiſe indicated, even to a late period of the diſeaſe. At the ſame time, the proſpect of deriving benefit from the practice is trifling, when much organic change has already occurred. Dr. Whytt mentions, as the only benefit he had ever obſerved from medicine, a temporary relief, in the *ſecond* ſtage of the diſeaſe, from the uſe of local evacuations; and probably almoſt every practitioner has witneſſed the ſame effect of them, even in this ſtage.

Bliſters applied over the whole ſcalp, or to the forehead, occiput, and ſides of the head, in ſucceſſion, may be conſidered as important *juvantia* in relieving the internal inflammatory action of the brain; eſpecially ſome evacuation of blood has been procured. They often afford obvious relief to the pain, and therefore ſhould not be omitted at any ſtage of the diſorder. Several inſtances of recovery from hydrocephalus are on record, in which the agency of bliſters appears to have conſtituted a very important part in the cure. (See Dr. Quin, loc. cit.) This intelligent phyſician generally applied a large bliſter over the whole head, and dreſſed it with an ointment of cantharides: Dr. Cheyne uſes the ſtrong mercurial ointment for that purpoſe.

With a view to leſſen the activity of the circulation, the uſe of *digitalis* has likewiſe been reſorted to, as well as for the purpoſe of increaſing the urinary diſcharge, and exciting abſorption of the effuſed fluids. Its qualities of diminiſhing the irritability, retarding the pulſe, and quickening the action of the abſorbents, ſeem to render it a medicine of great promiſe in fulfilling the indication now under conſideration, without endangering the conſtitution of a delicate child, in the ſame degree as blood-letting. In a few caſes it has been employed with apparent advantage. It is a medicine, however, of extreme uncertainty in its operation, and has not anſwered the expectations at firſt entertained of it in the cure of ſome other diſeaſes; it can only be uſed, with any probability of ſucceſs, when adminiſtered with activity, and it can only be given with ſafety in adequate doſes, when its operation is cautiouſly and unremittingly watched. Dr. Cheyne, who has well deſcribed the peculiarities of its operation, adds, "The method which I have for ſome time followed in uſing digitalis is the moſt obvious: it accords with the view which I have given of its powers, and does not appear ill adapted to the attainment of a ſafe and quick effect. I begin with a moderate doſe, eight or ten drops of the ſaturated tincture; and to every ſucceeding doſe, which is generally given at an interval of ſix hours, I add two or three drops; ſo that, in a day or two, generally ſome part of the ſyſtem is affected. I proceed with great caution, aſcertaining, while augmenting it, the effect of the medicine after each increaſed doſe." P. 103.

In aid of the means of diminiſhing inflammatory action in the brain, already mentioned, the *application of cold*, or, more correctly ſpeaking, the abſtraction of heat from the head, particularly in the more acute forms of hydrocephalus, may be reſorted to with advantage. Frequent waſhing of the face and neck with cold water, the application of linen cloths to the forehead wetted with cold vinegar or water, or with æther (which produces cold by its rapid evaporation), contribute much to relieve the pain in the head. In a caſe mentioned by Dr. Ruſh, a ſolution of ice in vinegar appeared to afford the moſt obvious relief of this diſtreſſing ſymptom. Med. Inq. vol. ii. p. 227.

Of thoſe individuals who have been known to recover from hydrocephalus, the greater number have taken mercury in one form or other; ſeveral of them to a very great extent, ſometimes with the effect of inducing ſalivation, often without that reſult. Drs. Dobſon and Percival firſt recommended and ſucceſsfully employed that practice, (ſee Edinburgh Med. Comment. vol. vi. pp. 220 and 224.) and it has been ſince employed by other practitioners, with a happy effect, in a number of inſtances. (See many of the references to cures above given.) It has, indeed, frequently diſappointed the hopes of the practitioner, even after ſalivation was induced; although, from the general difficulty of producing this diſcharge in patients labouring under hydrocephalus, it was at one time thought that the failure of mercury to accompliſh a cure, aroſe from its failure to excite ſalivation. The ſuperior ſucceſs of the practice has been ſuch, however, on the whole, that it will be admitted, with Dr. Cheyne, that "when the exiſtence of the diſeaſe becomes probable, there ought to be no other delay than that occaſioned by our endeavours to ſubdue the diſorder in the bowels, in commencing a *mercurial courſe*, which, it muſt be allowed, has cured hydrocephalus, even when far advanced." That intelligent phyſician adds, that "it ſhould give us more confidence in this remedy, that I have ſeveral times obſerved, when the mercurial ſtimulus was fully eſtabliſhed, that the ſymptoms were interrupted, and the termination of the diſeaſe, although fatal, unlike what we find in caſes where mercury has not been uſed. The convulſions were ſuſpended; the ſenſes, both external and internal, reſtored; the diſeaſe appeared to be checked; but the debility was ſuch, that the vital functions languiſhed; and the conſtitution had ſuſtained ſo great a ſhock, that every effort to invigorate them was unavailing." Cheyne, loc. cit. p. 99.

The plan purſued by Dr. Percival, and ſubſequently followed by others, conſiſted in giving repeated doſes of calomel internally, (ſuch as the quantity of two grains at intervals of a few hours,) and at the ſame time uſing the ſtrong mercurial ointment by friction upon the ſkin. It was ſuggeſted, that the ſalutary influence of the mercury was chiefly the operation of the calomel upon the alimentary canal and hepatic ſyſtem; but Dr. Percival and other practitioners conceived that the effects of the remedy were decidedly more obvious and ſalutary, when it was thus adminiſtered in a two-fold manner. We have been occaſionally ſurprized, indeed, by the prodigious quantity of calomel which has been taken by children, in this diſeaſe, within a ſhort ſpace of time, without producing any obvious effect whatever, either on the bowels, the ſalivary glands, or the ſyſtem at large. It is not eaſy to induce ſalivation in children under ordinary circumſtances; but in this diſeaſe there is a peculiar degree of torpor in the advanced ſtages, which renders the conſtitution much leſs ſuſceptible of the influence of medicine in the common doſes.

Much has been written reſpecting the beſt method of reſtoring the ſtrength of the patient after the decline of the diſeaſe. But in this, as in other inſtances of acute diſeaſe, when the great cauſe of irritation is removed, if there be any ſtrength left, the ſyſtem never fails to act with vigour, and requires little aſſiſtance from art. With the exception of a moderately nouriſhing diet, ſcarcely any thing is required to further the progreſs of convaleſcence.

In regard to the *prevention* of hydrocephalus, perhaps the moſt important precept relates to a conſtant attention to the ſtate of the bowels. "The mother muſt be taught," to adopt again the words of Dr. Cheyne, "to attend to and to underſtand every irregularity in the ſtate of her child's bowels. It is not merely coſtiveneſs which is to indicate the propriety of a purgative courſe: coſtiveneſs is not to be neglected; but conſtitutional coſtiveneſs may perhaps exiſt without danger. Attention muſt be paid to every deviation (not abſolutely temporary) from a natural appearance of the inteſtinal evacuation;" p. 108. (See DEJECTION.) The propriety of inſtituting a drain, by means of an iſſue or ſeton, in the neck, in the ſurviving children of families where the diſeaſe has already occurred, and in whom the marks of prediſpoſition are viſible, has been ſuggeſted and carried into execution, in ſome caſes, with apparent ſucceſs. In the family to which we formerly alluded, the laſt ſurviving child was ſuppoſed to be preſerved from the diſeaſe by the uſe of a ſeton in the neck: it may be remarked, however, that he has now, after attaining the adult age, become the ſubject of inſanity.

All the general means of ſupporting the general health in children prediſpoſed by conſtitution to hydrocephalus, ſuch as regular moderate exerciſe, the occaſional uſe of the cold bath, regularity in diet, &c. muſt be combined with the attention to the ſtate of the inteſtinal canal.

HYDROCERATOPHYLLON, in *Botany*. See CERATOPHYLLUM.

HYDROCHARIDES, a natural order of plants named from HYDROCHARIS, which is one of the genera; ſee the next article. This order is the 22d in Juſſieu's ſyſtem, or the 4th of his 4th claſs, *monocotyledones, ſtaminibus epigynis.* The character he gives is,

"Calyx of one leaf, ſuperior, undivided, or divided, the ſegments diſpoſed either in a ſimple or double row, the inner ones often petal-like. Stamens either definite or indefinite, ſituated upon the piſtil. Germen ſimple, inferior;

ſtyle either ſimple, or definitely manifold, or none; ſtigma ſimple or divided. Fruit inferior, of one or many cells. The plants are herbaceous aquatics."

As Juſſieu included the *Cyamus*, or *Nelumbo*, in this order, he was obliged to make an exception, on account of its ſuperior germen, but there having been ſcarcely any other reaſon for ſuch an arrangement than its being a water plant, the cotyledons being two, and the other characters as different from the *Hydrocharides* as can well be, this difficulty is removed, and *Cyamus* goes to the *Papaveraceæ*, with *Nymphæa*, and *Nuphar* of Smith in Prodr. Fl. Græc. Sibth. —The other genera in Juſſieu are *Valiſneria*, *Stratiotes*, *Hydrocharis*, *Trapa*, *Proſerpinaca*, and *Piſtia*, the three laſt very dubious at beſt as to their claim to a place here.

Mr. R. Brown, in his Prodromus Nov. Holl. v. 1. 345, reckons *Najas*, *Lemna*, and *Chara*, as akin to the natural order in queſtion.

HYDROCHÆRIS, in the Linnæan ſyſtem of *Zoology*, a ſpecies of hog found at Surinam. See Cavia *Capybara.*

HYDROCHARIS, in *Botany*, from ὑδωρ, *water*, and χαιρω, *to rejoice*, becauſe this genus, from its beauty, may be conſidered as the glory or pride of the water.—Linn. Gen. 527. Schreb. 695. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. v. 3. 1084. Ait. Hort. Kew. v. 3. 409. Juſſ. 67. Lamarck Illuſtr. t. 820. (Stratiotes; Dill. Gen. 9.)—Claſs and order, *Diœcia Enneandria*. Nat. Ord. *Palmæ*, Linn. *Hydrocharides*, Juſſ.

Gen. Ch. Male, *Cal.* Spathe three-flowered, of two leaves, oblong; perianth of three ovate-oblong, concave leaves, membranaceous at the margin. *Cor.* Petals three, roundiſh, flat, large. *Stam.* Filaments nine, awl-ſhaped, erect, arranged in three rows, of which the middle row puts forth an awl-ſhaped ſtem, from its inner baſe, like a ſtyle, which is placed in the centre; the two other rows are ſo connected at the baſe, that each inner filament coheres with the outer; anthers ſimple. *Piſt.* none, except the above rudiment of a germen. Female, *Cal.* Spathe none; flowers ſolitary; perianth as in the male, ſuperior. *Cor.* as in the male flowers. *Piſt.* Germen roundiſh, inferior; ſtyles ſix, as long as the calyx, compreſſed, bifid, channelled; ſtigmas bifid, pointed. *Peric.* Capſule leathery, roundiſh, ſix-celled. *Seeds* numerous, very ſmall, roundiſh.

Eſſ. Ch. Male, Calyx three-cleft. Petals three. The three interior filaments beaked. Female, Calyx three-cleft. Petals three. Styles ſix. Capſule inferior, with ſix cells, and many ſeeds.

Obſ. This genus is very nearly allied to *Stratiotes*.

1. H. *Morſus Ranæ*. Common Frog-bit.—Linn. Sp. Pl. 1466. Engl. Bot. t. 808. Curt. Lond. faſc. 3. t. 64. (Morſus Ranæ; Ger. Em. 818.)—Found on the ſurface of ditches and ſlow ſtreams, plentifully in the neighbourhood of London, flowering in July and Auguſt. This perennial aquatic, every part of which is ſmooth, floats on the ſurface, throwing out from its joints cluſters of leaves and flowers. *Roots* ſtraight and ſimple, deſcending into the mud. *Leaves* on footſtalks, kidney-ſhaped, entire, generally purple beneath. The female ſtalks are quite ſimple, ſingle-flowered, having a ſpathe at the baſe; males umbellated, three or four-flowered, with a pair of bracteas at the baſe of the partial flower-ſtalks. *Flowers* white, elegant, and ſhowy, with large, roundiſh, corrugate petals, yellow at the baſe.—"Ray mentions a variety with fragrant double flowers, which Mr. Relham informs us is not now to be found in the place he indicates. Flowers with ſix petals now and then occur. Engl. Bot.

HYDROCHOOS, in *Aſtronomy*, derived from ὑδωρ, *water*, and χεω, *I pour*. See Aquarius.

HYDROCORAX, in *Ornithology*. See Horn-*bill*.

HYDROCOTYLE, in *Botany*, from ὑδωρ, *water*, and κοτυλη, *a cavity* which forms a ſort of cup, becauſe the leaves of the original ſpecies are round and concave, and it grows in watery places. This name was beſtowed by Tournefort. Its Engliſh appellation is Pennywort, or White-Rot.—Linn. Gen. 127. Schreb. 178. Willd. Sp. Pl. 1360. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. v. 1. 290. Ait. Hort. v. 1. 327. Juſſ. 226. Tournef. t. 173. Lamarck Dict. v. 3. 151. Illuſtr. t. 188. Gærtn. t. 22.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Umbellatæ*, Linn. *Umbelliferæ*, Juſſ.

Gen. Ch. *Cal.* Umbel generally ſimple; involucrum moſt commonly of four leaves, ſmall; perianth ſcarcely any. *Cor. Univerſal*, uniform in figure, not in ſituation; all the flowers fertile; *partial*, of five ovate, acute, ſpreading, entire petals. *Stam.* Filaments five, awl-ſhaped, ſhorter than the corolla; anthers very minute. *Piſt.* Germen erect, compreſſed, circular, inferior, peltate; ſtyles two, awl-ſhaped, very ſhort; ſtigmas ſimple. *Peric.* none; fruit orbiculate, compreſſed, tranſverſely diviſible into two parts. *Seeds* two, ſemi-circular, compreſſed.

Eſſ. Ch. Umbel ſimple. Involucrum of about four leaves. Petals undivided. Fruit orbiculate, compreſſed.

Linnæus originally reckoned only five ſpecies of *Hydrocotyle*; profeſſor Martyn enumerates fifteen, and Willdenow eighteen, from the Supplementum and other books. The author of Engliſh Botany obſerves that "the name of White-rot was given to *H. vulgaris*, from a ſuppoſition that this plant cauſed the diſeaſe in ſheep called the rot; but it is doubtful if they will ever taſte it, and moſt people now attribute that diſeaſe to the animals inhabiting wet paſtures, where indeed the *Hydrocotyle* grows, but which are in ſome other way noxious to their conſtitution."

1. *H. vulgaris*. Marſh Pennywort. White-rot. Linn. Sp. Pl. 338. Engl. Bot. t. 751. Curt. Lond. faſc. 6. t. 19.—"Leaves peltate. Umbels of five flowers."—Found on marſhes, and in moiſt places that are ſubject to be inundated, flowering throughout the months of May and June. —*Root* perennial. *Stems* creeping, thread-ſhaped. *Leaves* oppoſite, on foot-ſtalks, peltate, horizontal, roundiſh, crenate, pale green, ſmooth, clear. *Flower-ſtalks* axillary, ſolitary, or twin, having a pair of bracteas at their baſe. *Umbel* ſmall, denſe, generally five-flowered, often producing another umbel from its centre. *Flowers* white or bluſh-coloured, with acute petals.

The leaf of this plant is uſually referred to as a perfect ſpecimen of what Linnæus intended for a *peltate* leaf. The common Naſturtium of our gardens, *Tropæolum majus*, is however a more familiar and an equally correct inſtance.

2. *H. inundatum*. Floating White-rot. Sm. Fl. Brit. v. 1. 290. (Siſon inundatum; Linn. Sp. Pl. 363. Engl. Bot. t. 227.)—"Leaves pinnate, jagged; thoſe which are immerſed, in capillary ſegments. Umbels in pairs, each conſiſting of five flowers."—Not very unfrequent in ditches and pools among other aquatics, flowering in May.—*Root* moſt probably biennial. *Stems* creeping, floating, round. *Leaves* alternate, on dilated ſtalks which embrace the ſtem, unequally pinnate; leaflets oblong, trifid, often pinnatifid. *Flower-ſtalks* oppoſite to the leaves, bifid, divaricated. *Umbels* ſolitary, five-flowered. *Flowers* white, having acute, equal petals. *Fruit* elliptical, ſtriated.

This ſpecies of *Hydrocotyle* is referred hither from *Siſon* ſolely on the authority of the *Flora Britannica*. This and the preceding are the only ſpecies indigenous to Great Britain.

3. *H. umbellata*. Linn. Sp. Pl. 338. Swartz Obſ. 111.

—Leaves peltate, umbels many-flowered.—Native of damp places in America, and particularly in Jamaica.—This ſpecies is very nearly allied to *H. vulgaris*, but differs in having the flower-ſtalk twice as long as the leaves, and inſtead of five flowers, more than twenty crowded together ſo as to form a ſimple umbel.

4. *H. bonarienſis.* Willd. n. 3. Lamarck Dict. v. 3. 153.—"Leaves ſomewhat peltate, kidney-ſhaped or roundiſh, crenate. Umbel compound; rays branched, flowering at the top and ſides."—Found by Commerſon on the ſea-ſhore of Buenos Ayres near Monte Video.—The *whole plant* is ſmooth. *Branches* trailing on the ground, a foot or more in length. *Leaves* on foot-ſtalks, crenulated, or obſcurely lobed, having a ſort of arch-work from the baſe to the centre. *Foot-ſtalk* inſerted cloſe to the ſummit of this arch, ſo as to make the leaves umbilical or imperfectly peltate. *Flowers* yellowiſh.

5. *H. americana.* Linn. Sp. Pl. 338. Lœfl. it. 281.—"Leaves kidney-ſhaped, ſomewhat lobed, crenate."—A native both of North and South America.—Similar in appearance and magnitude to *H. vulgaris*, but it differs in having its *leaves* ſeparated half way down by a narrow ſinus, their margin divided into nine obſolete lobes, each of which is marked by three ſmaller crenulations. *Umbel* five-flowered.—A variety of this, much ſmaller in all its parts, appears in the Linnæan herbarium communicated by M. Cuſſon.

6. *H. hirſuta.* Willd. n. 5. Swartz. Ind. Occ. v. 1. 560. Hairy.—Leaves kidney-ſhaped, lobed, crenate. Whorls four-flowered.—Native of St. Domingo, flowering in June and July.—*Stem* herbaceous, creeping. *Leaves* on foot-ſtalks, obtuſely five or ſeven-lobed, nervoſe, veined. *Stipulas* ſmall, at the baſe of the footſtalks. *Flowers* whorled, greeniſh, each one furniſhed with a linear, obtuſe, hairy leaflet not longer than the germen. The whole plant is thickly covered with whitiſh hairs.

7. *H. moſchata.* Willd. n. 6. Forſt. Prod. n. 135.—Leaves kidney-ſhaped, ſeven-lobed, ſerrated, villoſe. Umbels many-flowered.—This is a native of New Zealand. We know nothing of it but from the authorities above quoted.

8. *H. aſiatica.* Linn. Sp. Pl. 338. (Ranunculo affinis; Pluk. Alm. 314. t. 106. f. 5.)—"Leaves kidney-ſhaped, equally toothed or crenate."—Native of the Eaſt Indies and Cape of Good Hope, flowering in July. It was introduced into this country by Mr. F. Maſſon in 1774.—This ſpecies is nearly allied to *H. americana*, but differs in having the denticulations of its leaves equal or regular; the *leaves* are twice as thick, and almoſt hoary, with many footſtalks from the joints of the ſtem, whilſt in *H. americana* the leaves are ſolitary.

9. *H. chinenſis.* Linn. Sp. Pl. 339.—"Leaves linear, umbels many-flowered."—Native of North America, not of China.—*Stem* creeping. *Leaves* linear, ſmooth, obtuſe, flat, often in pairs at the joints of the ſtem. *Scapus* the length of the leaf. *Umbel* many-flowered.—We are not acquainted with any figure of this ſpecies.

10. *H. erecta.* Willd. n. 8. Linn. Suppl. 177.—"Leaves heart-ſhaped, crenate. Stalk with few flowers, the length of the leaf-ſtalks."—Native of Jamaica.—*Leaves* obtuſe, acutely dentated, an inch long; footſtalks radical, a ſpan long, hairy at the top. *Scapi* radical, with a few flowers at their ſummit, erect, as is the whole plant, not creeping.

11. *H. villoſa.* Willd. Sp. Pl. n. 9. Linn. Suppl. 175.—"Leaves heart-ſhaped, entire, downy or villoſe."—A native of the Cape of Good Hope.—*Root* fibrous. *Stems* proſtrate, bearing leaves and flowers at their ſummits. *Leaves* on foot-ſtalks, undivided, reſembling *Viola odorata*. *Flower-ſtalks* many, from the top of the ſtems, filiform, ſhorter than the leaves, ſingle-flowered. *Flowers* ſmall.

12. *H. glabrata.* Willd. Sp. Pl. n. 10. Linn. Suppl. 176.—Leaves obovate or lanceolate, acute, three-nerved, very ſmooth."—Found at the Cape of Good Hope.—*Whole plant* extremely ſmooth. *Stem* angulated, rigid, geniculated; *leaves* growing at the joints, and both leaves and flowers towards the ſummit of the ſtem.

13. *H. Spananthe.* Willd. Sp. Pl. n. 11. (Spananthe paniculata; Jacq. Ic. Rar. v. 2. t. 350.)—Stem erect. Leaves triangular, pointed, ſerrated, bearded at their baſe.—Native of South America.—Referred to this genus by Willdenow, of which we doubt the propriety. It has a tall branching *ſtem*, and proliferous *umbels*.

14. *H. ranunculoides.* Willd. n. 12. Linn. Suppl. 177. Leaves cut into five deep ſegments. Umbels ſimple.—Sent by Mutis from Mexico.—*Stem* creeping, jointed, fibrous. *Leaves* ſolitary, or in pairs, very ſimilar to thoſe of a *ranunculus*; the ſegments three-lobed, obtuſe; foot-ſtalks about three inches long. *Flower-ſtalk* an inch in length. *Umbel* ſimple. *Petals* white.

15. *H. ſaniculæfolia.* Willd. n. 13. Lamarck Dict. v. 3. 154. Illuſtr. t. 188. f. 1.—Leaves three or five-lobed, toothed. Umbel compound.—Gathered by Commerſon at Buenos Ayres, and on his authority referred by Willdenow to this genus.

16. *H. ſolandra.* Willd. n. 14. Linn. Suppl. 176. Lamarck Illuſtr. t. 188. f. 5. (Solandra capenſis; excluſis ſynonymis; Linn. Sp. Pl. 1407.)—Leaves wedge-ſhaped, ovate, retuſe.—Sent from the Cape of Good Hope.—*Root* branching on the ſurface of the ground. *Whole plant* covered with whitiſh downyneſs. *Leaves* alternate, wedge-ſhaped or obovate, ſeven-toothed. *Flower-ſtalks* amongſt the lower leaves, lateral. *Receptacle* of the flowers dark purple. *Petals* white.

17. *H. tridentata.* Willd. n. 15. Linn. Suppl. 176.—Leaves linear-wedge-ſhaped, three-toothed at the top.—Found by Sparrmann at the Cape of Good Hope.—Very ſimilar in habit to the preceding ſpecies, but differs in having the *ſtems* ſhorter, woolly, and not proſtrate. *Leaves* with three equal teeth at their top. *Flower-ſtalks* much ſhorter than the leaf.

18. *H. linifolia.* Willd. n. 17. Linn. Suppl. 176.—Leaves linear-lanceolate, hirſute, entire.—A native alſo of the Cape of Good Hope, and very nearly akin to the following ſpecies.

19. *H. virgata.* Willd. n. 18. Linn. Suppl. 176. Thunb. Prod. 49. Lamarck Illuſtr. t. 188. f. 3.—Leaves linear, ſmooth.—Communicated to Linnæus by Thunberg, from the Cape of Good Hope.—*Stem* upright, jointed, nearly ſmooth. *Leaves* channelled withinſide, dilated at their baſe. *Umbels* lateral, ſimple.

HYDRODES FEBRIS, in *Medicine*, a fever in which the patient is, from the beginning, afflicted with very copious and weakening ſweats, and great weakneſs.

HYDRODYNAMICS, of ὕδωρ, *water*, and δύναμις, *force*, is uſed for the ſcience of the laws of the motion of fluids, and denotes much the ſame with hydraulics. See FLUID and HYDRAULICS.

HYDROENTEROCE'LE See HYDRÉNTEROCÉLE.

HYDROGEN, HYDROGENOUS GAS, or *Inflammable Air*, is an elaſtic fluid of extreme ſubtilty and levity. It is aſcertained to be nearly $\frac{1}{12}$th of the weight of an equal bulk of common air, or only $\frac{1}{10000}$dth of the weight of an equal bulk of water, being by much the lighteſt ponderable ſubſtance with which we are acquainted. It is, on this account, that balloons are filled with it. The weight of a cubic foot of hydrogen gas, at the common temperature and preſſure, is not more than 2½ grains; whereas the ſame volume of common air weighs 31 grains. It is not only in the elaſtic ſtate that hydrogenous gas exhibits extreme levity, but alſo the ultimate particle of it, according to the inveſtigations of Mr. Dalton, is lighter than that of any other body, on which account he makes it the unit or ſtandard of compariſon in weight. See Gas.

Hydrogenous gas may be procured by various proceſſes; the moſt ſimple and eaſy one is to take ſome turnings or filings of zinc or iron, and put them into a gas bottle, to which add their weight of water, and about ⅕th of its volume of concentrated ſulphuric acid. A violent efferveſcence enſues, and the gas is generated in great abundance, and may be received over water in the uſual way. The rationale of the proceſs ſeems this; the metals have a ſtrong affinity for oxygen, but not equally ſo for hydrogen; they are not of themſelves ſufficiently powerful to effect an union with the oxygen and a detachment of the hydrogen, but by the aid of the acid they can accompliſh it, and the acid afterwards unites with the new compound or oxyd, forming a ſalt, called a *ſulphate*. Hence the hydrogen is derived from the water. Another method of obtaining hydrogen is to ſend ſteam over red-hot iron ſhavings in a gun-barrel; in this caſe, the iron unites with the oxygen, and the hydrogen is liberated in the gaſeous form.

The properties of hydrogen gas are, 1ſt. *It is the lighteſt of all gaſes*, as has been obſerved, and may be proved, by actually weighing it in an air-bottle fitted up for ſuch purpoſes, which has previouſly been exhauſted and weighed. But there are ſeveral ſimple experiments by which it may be ſhewn to be much lighter than common air; namely, if a jar be filled with hydrogen, and then uncovered for a moment, the hydrogen will eſcape, but not if the jar be placed with its mouth downwards, as will be proved by putting a lighted taper into the jar, which will not be affected in the former caſe, but extinguiſhed with a ſlight exploſion in the latter. If, inſtead of a jar, a tube of 12 inches long and ¼ inch diameter be filled with hydrogen, it will be five minutes in loſing one-half of its gas, and that the ſame whether held up or down. (See Nicholſon's Journal, vol. viii. p. 148.) This ſerves to ſhew that the effect of a difference in ſpecific gravity is not perceived unleſs a ſufficiently large volume or body of air can move together. If bubbles of ſoap and water be raiſed with hydrogen they aſcend in the air like balloons. If a volume of hydrogen be gently placed *over* a volume of common air, they do not mix immediately, but in due time they are found mixed completely, whatever caution may be uſed to prevent agitation, and they remain mixed ever afterwards. (See Mancheſter Mem. vol. i. ſecond Series, p. 262, and Memoires d'Arcueil, tom. ii. p. 466. This curious fact, which is of a general nature, and by no means peculiar to hydrogen and common air, was firſt obſerved by Prieſtley, and is aſcribed by Dalton to the mechaniſm of elaſtic fluids; but moſt others have thought it an effect of chemical affinity. 2d. *Hydrogen gas is fatal to animals*, as is proved by confining a mouſe or other ſmall animal in it for a few moments. 3d. *It is inflammable.* This quality is ſhewn by applying a taper to a phial of the gas with its mouth downwards; a ſlight exploſion will be obſerved ſucceeded by a lambent flame. If a bladder be filled with the gas, and then the gas be gently driven out through a ſmall tube, ſuch as a tobacco-pipe, it will take fire with a candle and burn with a reddiſh flame. A mixture of one part hydrogen and two common air, or two hydrogen and one oxygen, in a ſmall phial, explodes violently by being preſented to a flame. The ſame effect may be produced by an electric ſpark in a glaſs veſſel, called an inflammable air-piſtol; or a ſtrong braſs tube, called Volta's eudiometer, may be partly filled with a mixture of hydrogen and oxygen, and the mixture exploded over water or mercury by electricity. In this way the quantity of hydrogen or oxygen in mixtures of gaſes may be aſcertained. (See Eudiometry.) If a bladder, filled with hydrogen and common air, or oxygen, in the proportions above-mentioned, have its contents infuſed into bubbles of ſoap and water, they will explode with a loud report by a taper, and the bladder itſelf will burſt with a tremendous report if the flame be applied to it or to the bubbles before they quit the pipe of the bladder. 4th. *Hydrogen gas, though inflammable itſelf, yet extinguiſhes flame.* If a jar of hydrogen be put over the flame of a candle, ſo as to ſurround it, the flame is inſtantly extinguiſhed. 5th. A mixture of oxygen and hydrogen has been made to explode by mechanical condenſation, by M. Biot. 6th. In the ſlow combuſtion of hydrogen, when the flame is confined in a long tube, under certain circumſtances, a muſical ſound is produced. 7th. Hydrogen, when united to oxygen, produces water; when it is united to azote the product is ammonia; when united to carbon it forms olefiant gas, carburetted hydrogen, oil, &c. 8th. It contains half as many atoms in the ſame volume as oxygen gas.

Hydrogen, *Sulphuretted*, in *Chemiſtry*, a compound of ſulphur and hydrogen, which uſually owes its origin to the decompoſition of water in the proceſſes by which it is formed, and is generated in various proceſſes, in which its elements are preſented to each other in a naſcent or condenſed ſtate. It was firſt procured from ſolutions in water of the compounds of ſulphur with the fixed alkalies. When ſulphur is combined with potaſh, ſoda, or lime, on diſſolving the compound in water, a partial decompoſition takes place; one part of the ſulphur combines with part of the oxygen of the water, forming ſulphuric acid, which unites with the potaſh; another part of the ſulphur unites with the hydrogen of the water, forming ſulphuretted hydrogen. This gas is produced likewiſe by expoſing to a ſtrong heat mixtures of ſulphur with vegetable matter, as ſugar, oil, or powdered charcoal; the hydrogen exiſting in vegetable ſubſtances combining with the ſulphur; in theſe proceſſes the gas is, very rarely, quite pure, or of an uniform compoſition. The ſpecific gravity of ſulphuretted hydrogen is to that of atmoſpheric air, as about 1.14 to 1.00, a hundred cubical inches weighing 33 grains. Its ſmell is extremely fœtid; the effluvia diſengaged in putrefaction conſiſt chiefly of this gas. Its properties are, that it extinguiſhes combuſtion, and is wholly incapable of ſupporting animal life. It is abſorbed by water, the water taking up more than its volume, or 100 cubical inches of water will abſorb 108 inches of this gas. It has a peculiar action on the metals, and tarniſhes them very quickly, communicating ſhades of yellow, brown, or purple, with a diminution of metallic luſtre. This curious gas is poſſeſſed of the properties of an acid, enters into combination with the alkalies, and forms compounds, ſome of which are cryſtallizable. It is capable of changing vegetable colours to a red. It decompoſes ſoap, combines with the metallic oxyds, and precipitates ſulphur from its combinations. The compounds of ſulphuretted hydrogen with the fixed alkalies, are readily formed by paſſing a current of it in its elaſtic ſtate through the alkaline ſolution. Theſe compounds are called Hydrosulphurets, which ſee. Sulphuretted hydrogen is capable of combining with an additional proportion of ſulphur, and in this ſtate the compound is denominated ſuper-ſulphuretted hydrogen. "The knowledge," ſays Mr. Murray, "which we have acquired of ſulphuretted hydrogen, and of its combinations, has thrown light on the compoſition of mineral ſulphureous waters, and of the changes which they ſuffer. As ſulphur is itſelf inſoluble in water, and as frequently no traces of an alkali, by which it might be rendered ſoluble, could be diſcovered in theſe waters, chemiſts found it difficult to conjecture by what means its ſolution was effected. The diſcovery of ſulphuretted hydrogen, and of its ſolubility in water, ſolved this difficulty, and the mutual action exerted between it and oxygen, elucidates the changes theſe waters ſuffer from expoſure to the air." Murray's Chemiſtry, vol. 2. See MINERAL *waters*.

HYDROGEN, *Super-ſulphuretted.* See HYDRO-SULPHURETS.

HYDROGEN *Gas*, in *Agriculture*, the modern name of an elaſtic fluid, formerly denominated inflammable air. Its effects on vegetation have not yet been aſcertained.

HYDROGETON, in *Botany*, from ὕδωρ, *water*, and γείτων, *a neighbour*, from the circumſtance of its being an aquatic plant. Such is the name given by Loureiro, which is of a rather extenſive application, but juſtifiable by the analogy of *Potamogeton*, which it evidently imitates.—Loureir. Cochinch. v. 1. 244.—Claſs and order, *Octandria Tetragynia.* Nat. Ord. *Inundatæ*, Linn. *Naiades*, Juſſ.

Gen. Ch. *Cal.* Perianth none. *Cor.* inferior, petals four, roundiſh, inflexed, furniſhed with a ſlender, ſhort, incurved claw. *Stam.* Filaments none; anthers eight, ovate, affixed to the receptacle. *Piſt.* Germens four, ovate, ſtyle none; ſtigmas four, oblong, erect. *Peric.* Capſules four, ovate, ſingle-ſeeded. *Seeds* of a ſimilar ſhape.

Eſſ. Ch. Calyx none. Corolla of four roundiſh petals, each furniſhed with a claw. Capſules four. Seeds ſolitary.

1. *H. heterophyllum.* Loureir. Cochinch.—"Lower leaves awl-ſhaped, or linear, upper ones ovate, pointed."—Native of rivers and marſhes in Cochinchina. *Stem* procumbent, long, branching, immerſed in the water. *Leaves* entire, ſmooth. *Flowers* green, ſmall, in oblong, arched, terminal, naked ſpikes.

Loureiro obſerves that he ſeparated the preſent genus from *Potamogeton* chiefly on account of the number of its ſtamens. Whether this diſtinction be ſufficient to eſtabliſh his genus, we greatly doubt, or rather, we think it quite inadequate. The Cochinchineſe name of the plant is *Raong hai thú lá.*

HYDROGRAPHICAL MAPS, more uſually called *ſea charts*, are projections of ſome part of the ſea, in plano, for the uſe of navigation.

In theſe are laid down all the rhumbs, or points, of the compaſs, the meridians, parallels, &c. with the coaſts, capes, iſlands, rocks, ſhoals, ſhallows, &c. in their proper places, proportions, &c.

Chriſtopher Columbus, the firſt great diſcoverer of America, was a man that earned his living by making and ſelling hydrographical maps. He happened to be heir to the memoirs or journals of a noted pilot, one Alonzo Sanchez de Huelva, captain of a ſhip, who, by chance, had been driven by a ſtorm to the iſland of St. Domingo, and died at Columbus's houſe ſoon after his return. This gave Columbus the firſt hint to attempt a diſcovery of the Weſt Indies, in which he ſucceeded.

For the conſtruction of the ſeveral kinds of hydrographical maps, ſee CHART.

For their uſes, ſee SAILING.

HYDROGRAPHY, compounded of ὕδωρ, *aqua, water*, and γράφω, *I deſcribe*, that part of geography which conſiders the ſea; principally, as it is navigable.

Hydrography teaches how to deſcribe and meaſure the ſea; it gives an account of its tides, counter tides, currents, ſoundings, bays, gulfs, &c. as alſo of its rocks, ſhelves, ſands, ſhallows, promontories, harbours, diſtances, &c. from port to port; with all that is remarkable, either out at ſea, or on the coaſt.

Some of the beſt authors uſe the term in a more extenſive ſenſe; ſo as to denote the ſame with *navigation.*

In this ſenſe hydrography includes the doctrine of ſailing; the art of making ſea charts, with the uſes thereof; and every thing neceſſary to be known, in order to the ſafeſt and moſt expeditious performance of a voyage. See SAILING.

Hydrography is the moſt perfect of all the mathematical ſciences; there being ſcarcely any thing wanting to its perfection, but the accurate diſcovery of the longitude.

The Jeſuits Ricciolus, Fournier, and De Chales, have written on the ſubject of hydrography.

In France they have profeſſors of hydrography eſtabliſhed in all their ſea-ports, who are to inſtruct the youth intended for the ſea in all the parts of navigation, ſailing, ſteering, &c. with the ſeveral branches of mathematics neceſſary thereto; as arithmetic, and the doctrine of the ſphere, and trigonometry.

They are royal profeſſors, and teach gratis; having ſalaries allowed them. They are alſo charged with the examination of pilots, &c.

HYDROLEA, in *Botany*, was ſo named by Lœfling, though we are unable to trace its derivation.—Lœfl. It. 310. Linn. Gen. 124. Schreb. 173. Willd. Sp. Pl. v. 1. 1327. Mart. Mill. Dict. v. 2. Juſſ. 134. Lamarck. Illuſtr. t. 184. Gærtn. t. 55.—(Coutarde; Lamarck. Dict. v. 2. 161.)—Claſs and order, *Pentandria Digynia.* Nat. Ord. *Convolvuli*, Juſſ.

Gen. Ch. *Cal.* Perianth of five, awl-ſhaped, erect, unequal, permanent leaves. *Cor.* of one petal, wheel-ſhaped or campanulate; tube ſhorter than the calyx; limb ſpreading, divided into five, ovate, incumbent, obtuſe ſegments. *Stam.* Filaments five, awl-ſhaped, incurved, heart-ſhaped at the baſe; anthers oblong, curved, incumbent. *Piſt.* Germen ſuperior, ovate: ſtyles two or three, thread-ſhaped, ſpreading; ſtigmas truncated. *Peric.* Capſule ovate, two-valved, two-celled, with a parallel partition. *Seeds* numerous, very ſmall, imbricated; receptacle ovate, large.

Eſſ. Ch. Calyx of five leaves. Corolla wheel-ſhaped. Filaments heart-ſhaped at the baſe. Capſule of two cells and two valves.

Obſ. Aublet has remarked that in ſome flowers the calyx and corolla are ſix-cleft, with ſix ſtamens.

1. *H. ſpinoſa.* Linn. Sp. Pl. 328. Aubl. Guian. 281. t. 110.—Leaves lanceolate, hairy. Flowers cluſtered, terminal.—Native of South America, particularly in moiſt ſituations at Guiana and Cayenne, flowering at various times of the year.—The whole *ſhrub* is extremely bitter, having a fibrous *root*, from which ariſe one or more *ſtems* about three feet high, ſtraight, branched, woody, overſpread with a viſcous downyneſs. *Leaves* alternate, nearly ſeſſile, lanceolate, entire, downy, clammy. *Spines* axillary, awl-ſhaped, ſtraight, ſpreading. *Flowers* corymboſe, of a blue colour, each one furniſhed with a ſort of leafy ſcale at the baſe.

2. *H. inermis.* Loureir. Cochinch. 172. Mart. Mill. Dict. v. 2.—Stem ſpineleſs. Flowers ſolitary, lateral.—Found in moiſt places about Canton. *Stem* herbaceous, annual. *Leaves* lanceolate-linear, ſmooth, ſeſſile, ſcattered. *Flowers* blue. Loureiro obſerves that he could not diſtinguiſh whether or not the filaments were cordate at their baſe.

3. *H. trigyna.* Willd. n. 2. Swartz. Ind. Occ. v. 1. 558.—

Leaves oblong, hairy. Flowers with three ſtyles, axillary. Found by Dr. Houſton near Vera Cruz. *Shrub* armed with ſpines, hairy. *Leaves* alternate, ſometimes approaching to nearly oppoſite, oblong, rather acute, entire. *Spines* ſolitary, half an inch long, ſpreading. *Flowers* blue, axillary, generally ſolitary, on ſtalks.

4. *H. zeylanica.* Willd. n. 3. Vahl. Symb. p. 2. 46. (Nama; Linn. Fl. Zeylan. 117. t. 2. N. zeylanica; Sp. Pl. 327. Steris javana; Mant. 54.)—Leaves lanceolate, ſmooth. Flowers with two ſtyles, ſomewhat cluſtered.—Native of the Eaſt Indies.—*Stem* herbaceous, about ſix inches high, erect, branched. *Leaves* alternate, on footſtalks, ſmooth, entire, ſpreading. *Cluſters* ſimple, erect, the length of the leaves. *Flowers* alternate, as long as the partial ſtalks.

HYDROLOGY, compounded of ὑδωρ, *water*, and λογος, *ſcience*, denotes that part of natural hiſtory which examines and explains the nature and properties of water in general. See WATER.

HYDROMANCY, Ὑδρομαντεια, compoſed of ὑδωρ, *water*, and μαντεια, *divination*, the act, or art, of divining, or foretelling future events, by means of water.

Hydromancy is one of the four general kinds of divination (ſee DIVINATION): the other three reſpecting the other elements, *viz.* fire, air, and earth, are denominated pyromancy, aeromancy, and geomancy.

Varro mentions the Perſians as the firſt inventors of hydromancy, adding, that Numa Pompilius, and Pythagoras, made uſe of it.

This ſpecies of divination was performed in various ways: ſometimes they uſed invocations and magic ceremonies, in conſequence of which they diſcovered the names of certain perſons, or events, which they wiſhed to know upon the water: ſometimes they ſuſpended a ring by a thread over a veſſel full of water, and ſtruck the ſides of the veſſel with it a certain number of times; they alſo formed preſages by caſting ſmall ſtones into ſtill water, and obſerving the circles hereby formed on the ſurface of the water; by examining the various agitations of the waves of the ſea; by obſerving the colour of the water, and the figures repreſented in it, &c. &c. See an account in Delrio Diſquiſ. Magic. lib. iv. queſt. 6. ſect. 3.

The writers in optics furniſh us with divers hydromantic machines, veſſels, &c.

To conſtruct an hydromantic machine, by means whereof an image, or object, ſhall be removed out of the ſight of the ſpectator, and reſtored again, at pleaſure, without altering the poſition, either of the one or the other. Provide two veſſels, A B F, C G L K (*Plate* VIII. *Hydraulics*, *fig.* 4.); the uppermoſt filled with water, and ſuſtained by three little pillars, one whereof, B C, is hollow, and furniſhed with a cock B. Let the lower veſſel C L be divided by a partition H I into two parts; the lower of which may be opened, or cloſed, by means of a cock at P.

Upon the partition place an image, which the ſpectator in O cannot ſee, by a direct ray G L.

If now the cock B be opened, the water deſcending into the cavity C I, the ray G L will be refracted from the perpendicular G R to O; ſo that the ſpectator will now ſee the object by the refracted ray O G. And again ſhutting the cock B, and opening the other P, the water will deſcend into the lower cavity H L; whence the refraction ceaſing, no rays will now come from the object to the eye: but ſhutting the cock P again, and opening the other B, the water will fill the cavity again, and bring the object in ſight of O afreſh.

To make an hydromantic veſſel, which ſhall exhibit the images of external objects, as if ſwimming in water. Provide a cylindrical veſſel A B C D (*Plate* VIII. *Hydraulics*, *fig.* 5.) divided into two cavities by a glaſs E F, not perfectly poliſhed: in G apply a lens convex on both ſides; and in H incline a plain mirror, of an elliptic figure, under an angle of 45°; and let I H and H G be ſomething leſs than the diſtance of the focus of the lens G: ſo that the place of the images of an object radiating through the ſame may fall within the cavity of the upper veſſel: let the inner cavity be blackened, and the upper filled with clear water.

If, now, the veſſel be diſpoſed in a dark place, ſo that the lens be turned towards an object illuminated by the ſun, its image will be ſeen as ſwimming in the water.

HYDROMEL, Ὑδρόμελι, compoſed of ὑδωρ, *water*, and μελι, *honey*, a drink made of water and honey, nearly in equal quantities; called alſo by the Greeks, μελικρατον.

When this liquor has not fermented, it is called *ſimple* hydromel; and *compound* when other ingredients are added to the water and honey, in order to improve and exalt the flavour and virtues.

When it has undergone the ſpirituous fermentation, it is called the *vinous* hydromel, or mead and metheglin. To induce this fermentation, nothing is neceſſary but to dilute the honey ſufficiently in water, and to expoſe the liquor to a convenient degree of heat.

Hydromel is the common drink of the Poles and Ruſſians. Diodorus Siculus, lib. v. and Ariſtotle, relate, that the Celtiberi, and Taulantii, ancient people of Illyria, drank hydromel inſtead of wine.

HYDROMELON, a name given by the ancients to a liquor prepared with one part of honey, impregnated with the juice of quinces, and two parts of boiled water, ſet in the ſun during the dog-days.

HYDROMETER, compound of ὑδωρ, *water*, and μετρον, *meaſure*, an inſtrument wherewith to meaſure the gravity, denſity, velocity, force, or other properties of water.

The extenſive uſe of the knowledge of the ſpecific gravities of bodies has produced a variety of contrivances, under the name of *Eſſay Inſtrument*, *Hydrometer*, *Areometer*, *Gravimeter*, *Peſe-liqueur* or *Water-poiſe*, for the purpoſe of aſcertaining the ſpecific gravities of different bodies, both ſolid and fluid, in an expeditious manner.

From Lowthorp's abridgment of the Philoſophical Tranſactions, vol. i. p. 516, &c. or Boyle's Works, 4to. London ed. 1772. vol. iv. p. 204, &c., it appears, that the hydrometer was firſt invented by Boyle, and deſcribed under the name of a New Eſſay Inſtrument. It conſiſted of a ball, ſomewhat leſs than an hen's egg, with a graduated ſtem, four or five inches in length, ſoldered to the upper part, and by means of a ſtirrup or ſlit piece of braſs underneath, it was applied, as perfectly as a graduated inſtrument could be, to aſcertain the ſpecific gravities of ſolids as well as fluids. To extend the uſe of the inſtrument, Boyle propoſes that the ball ſhould be made large, and provided with an appendage for occaſionally changing the quantity of ballaſt applied beneath the ball. (See ARÆOMETER.) Boyle's inſtrument was intended to be uſed in water, and, conſequently, the graduations of its ſtem denoted certain invariable weights. But when the hydrometer is to be uſed in various fluids, it diminiſhes the accuracy of the reſults, if thoſe ſpaces be taken for abſolute weights; or, at all events, it brings forward a rather intricate conſideration of the relation which the bulks of the ſpaces, or parts of the ſtem, have to the whole immerſed part. Hence Fahrenheit firſt applied a diſh, or ſcale, for weights at the top, in order to aſcertain the ſpecific gravities of fluids truly, and his inſtrument had only a ſingle mark, that, in all caſes, was to be brought to the ſurface of the fluid, by means of weights added in the above-mentioned ſcale; as may be ſeen in Reid and Grey's abridgment of the Phil. Tranſ. vol. vi. pt. 1. p. 294.

The general principle on which the conſtruction and uſe of the hydrometer depends, has been illuſtrated under the article *ſpecific* GRAVITY: for it has there been ſhewn, that a body ſpecifically lighter than ſeveral fluids will ſerve to find out their ſpecific gravities; becauſe it will ſink deepeſt in the fluid whoſe ſpecific gravity is the leaſt, or, that a greater addition of weight is required to keep the ſame part of the floating body below the ſurface of a heavier than of a lighter fluid.

Thus, let A B, (*Plate* IX. *Hydraulics, fig.* 1.) be a ſmall even glaſs tube, hermetically ſealed, having a ſcale of equal diviſions marked upon it, with a hollow ball of about an inch in diameter at bottom, and a ſmaller ball C under it, communicating with the firſt. Into the little ball put mercury or ſmall ſhot, before the tube be ſealed, ſo that it may ſink in water below the ball, and ſtand upright, the diviſions on the ſtem ſhewing how far it ſinks. If this inſtrument be dipped in common water and ſink to D, it will ſink only to E in ſalt water; but in port wine it will ſink to F, and in brandy under proof, it will perhaps ſink to B. It is evident that an hydrometer of this kind will only ſhew that one liquid is ſpecifically heavier than another; but the true ſpecific weight of any liquid cannot be determined without a calculation for this particular inſtrument, the tube of which ſhould be truly cylindric, and not tapering as they commonly are. Beſides, theſe inſtruments will not ſerve for fluids, whoſe denſities are conſiderably different. With a view of remedying theſe and ſome other inconveniences, Mr. Clark, in the year 1730, ſeemingly unapprized of what had been done before by Boyle and Fahrenheit, conſtructed a new hydrometer, for the uſe of dealers in brandy and ſpirits, that they might be able to determine, by inſpection, whether any ſpirituous liquor be proof, above proof, or under proof, and exactly in what degrees. This inſtrument is made of copper, becauſe ivory imbibes ſpirituous liquors, and glaſs is apt to break. It conſiſts of a braſs wire about one-fourth of an inch thick, paſſing through and ſoldered into the copper ball B *b*, (ſee *fig.* 2.) The upper part of the wire is filed flat on one ſide of the ſtem of the hydrometer, and marked at *m*, to which diviſion it exactly ſinks in proof-ſpirits. There are two other marks A and B; the one ſhewing that the liquor is one-tenth above proof, when this inſtrument ſinks to A, and the other indicating one-tenth under proof when it emerges to B; a braſs weight, as C, having been previouſly ſcrewed on to the bottom at *c*. There is a great variety of weights of different ſizes, as K, &c. adapted to liquors that differ more than one-tenth from proof, and for determining the ſpecific gravities of all ſuch liquors as occur in trade, as well as for ſhewing the ſpecific gravities of all fluids quite to common water. The round part of the wire above the ball may be marked acroſs, as in *fig.* 3, ſo that with the weight as C, which fits the inſtrument for the trial of river water, in which it ſinks to R W, it may ſerve for wines or other waters: thus in ſpring water it will ſink to S P; in mineral water to M I; in ſea-water to S E; and in the water of ſalt ſprings to S A: and the marks *br, ra, po, me,* denote the diviſions to which the inſtrument deſcends in Briſtol water, rain water, Port wine, and Mountain wine, reſpectively. Phil. Tranſ. abr. vol. vi. p. 326, &c.

This hydrometer, ſays Mr. W. Nicholſon, (ubi infra), is inferior to Fahrenheit's in two reſpects. In the firſt place, either a bubble of air, or a portion of the fluid, will be hid in that part of the cavity of the ballaſt weight, which is not filled by the ſcrew; and it is of very different conſequence, which of the two is there. And ſecondly, the weights acting on the inſtrument, by their reſidual gravity, will not be conſtant; or, in other words, an additional weight will be accompanied by an addition to the bulk of the immerſed part of the inſtrument; and in the caſe where the ſpecific gravity of the liquid is not given, but required, it will not be eaſy to determine how much the operation of the one is counteracted by that of the other. However, though this laſt conſideration evinces that the inſtrument is not fit for general uſe, yet it is accurate for the trial of ardent ſpirit, or any other particular liquid, when the weights are adjuſted by experiment to the intended uſe.

Dr. Deſaguliers contrived an hydrometer, for determining the ſpecific gravities of different waters to ſuch a degree of nicety, that it would ſhew when one kind of water was but one forty thouſandth part heavier than another. This inſtrument (ſee *fig.* 4.) conſiſts of C B *b*, a hollow glaſs ball of about three inches in diameter, with a ſmall ball under it of about an inch in diameter. To a ſhort neck at C there is fixed a braſs head, with a fine ſcrew, into which the piece C *c* is to be ſcrewed; and this piece is joined to a wire C A, about one-fortieth part of an inch in diameter, and ten inches long, which is divided into inches, and tenths of inches. Having put a certain quantity of ſmall ſhot into the ball *b*, ſo that when the head C *c* with its wire C A is ſcrewed on, it ſhall ſink as far as D, *e. g.* five inches, in river or ſoft ſpring water, we may know by obſerving how far this hydrometer ſinks lower in one kind of water than another, their different ſpecific gravity to a forty thouſandth part, which correſponds with one-tenth of an inch marked on the ſtem A C. For let the hydrometer float in water in the jar I K L M, and the ſurface of the water cut the ſtem at D, a grain weight laid on the ſtem at A will cauſe the inſtrument to ſink, till the mark D of the ſtem ſettles one inch under the ſurface; and, therefore, a grain depreſſes it an inch. The hydrometer weighs four thouſand grains, and every inch of the graduated wire weighs ten grains; and, therefore, the part of it D C B *b c* D muſt weigh three thouſand nine hundred and fifty grains. But it is known, from the principles of ſpecific gravity, that a bulk of water equal to D C B *b c* D the immerſed part, weighs juſt as much as the whole hydrometer, or four thouſand grains: and, therefore, this inſtrument ſerves to compare together the different bulks of four thouſand grains of water, according to their different ſpecific gravities: and ſince the whole inſtrument is ſunk an inch by the weight of one grain, and the inſtrument will ſtand at one-tenth of an inch, the difference indicated by it in waters in which it floats, it is evident that it will diſtinguiſh the tenth of a grain in four thouſand, or the forty thouſandth part of the whole bulk of water. By altering the quantity of ſhot in the ball *b*, the inſtrument may be prepared for the compariſon of any other two liquors that are nearly of the ſame ſpecific gravity. Deſaguliers, &c. vol. ii. p. 234.

This inſtrument is capable of ſtill greater exactneſs, by making the ſtem of a flat thin ſlip of braſs or of ſteel, by which means we increaſe the ſurface without diminiſhing the ſolidity: on one ſide of this ſtem may be ſeveral marks denoting the depths to which the inſtrument would ſink in various ſorts of water, as rain water, river water, &c. and on the other ſide may be the diviſions to which it would ſink in lighter fluids, as hot Bath water, Briſtol water, Port wine, &c. but in determining the ſtrength of ſpirituous liquors, a cylindric ſtem is beſt.

Dr. G. Fordyce conſtructed an inſtrument, which is the moſt perfect we poſſeſs, its weights being adjuſted to the different ſpecific gravities of ſpirits by experiments made at numerous varieties of ſtrength and temperature.

Mr. Quin's hydrometer has been recommended by many diſtillers, &c. on account of its accuracy, which requires only eighteen weights uſed on the top of the inſtrument, to ſhew all the under and over proofs to the certainty of one pint in a hundred gallons, from proof to ſeventy gallons to one hundred over proof, and to fifty gallons in a hundred under proof, which would require nine hundred and ſixty-eight weights, beſides forty-five air weights, according to the old conſtruction of Clark's hydrometers. The weights are numbered 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 30, 40, 50, 100, 200, 300, 600, grains. He has alſo formed a table ſhewing the degrees of the thermometer, and the number of grains correſponding with each degree; the number of grains required for each ſtrength; the over proofs, or the quantity of water neceſſary to reduce one hundred gallons of ſpirit to proof, with the former manner of expreſſing the ſeveral preparations, as one to two, one to three, &c. and likewiſe the under proofs.

There is one circumſtance, which deſerves particular attention in the conſtruction and graduation of hydrometers for determining the preciſe ſtrength of different brandies, and other ſpirituous liquors. M. Reaumur, in making his ſpirit thermometers, diſcovered, that when rectified ſpirit and water, or phlegm, the other conſtituent part of brandy, are mixed together, there appears to be a mutual penetration of the two liquors, and not merely juxtapoſition of parts; ſo that a part of the one fluid ſeems to be received into the pores of the other; thus, *e. g.* if a pint of rectified ſpirit be added to a pint of water, the mixture will be ſenſibly leſs than a quart. The variations hereby produced in the bulk of the mixed fluid render the hydrometer, when graduated in the uſual way, by equal diviſions, an erroneous meaſure of its ſtrength; becauſe the ſpecific gravity of the compound is found not to correſpond to the mean gravity of the two ingredients. M. Montigny conſtructed a ſcale for this inſtrument in the manner before ſuggeſted by Dr. Lewis, on actual obſervation of the ſinking or riſing of the hydrometer in various mixtures of alcohol and water, made in certain known proportions. Hiſt. de l'Acad. Roy. Sciences, &c. Paris, for 1768. Memoire iv. Neumann's Chem. by Lewis, p. 450, note *r*. See *Specific* GRAVITY.

M. De Luc has publiſhed a ſcheme of the conſtruction of a comparable hydrometer, ſo that a workman, after having conſtructed one after his principles, may make all others ſimilar to each other, and capable of indicating the ſame degree on the ſcale, when immerſed in the ſame liquor of the ſame temperature.

For this purpoſe he propoſes to uſe an hydrometer of the common conſtruction, ſuch as is repreſented in *fig.* 5. made of flint glaſs; becauſe glaſs is a ſubſtance which undergoes the leaſt change of bulk by heat, and its changes are the moſt regular. The ball *a* ſhould be one and a half inch in diameter, with which ſhould communicate a ſmall hollow cylinder *b*, containing ſuch a quantity of quickſilver for a ballaſt, that the inſtrument may ſink nearly to the top in the moſt ſpirituous liquor, made as hot as poſſible. To the ball *a* is cemented a thin braſs tube ſilvered over, or a ſilver tube *c c*, made perfectly cylindrical, by drawing it through a hole. This tube, or *branch*, as he calls it, ſhould be long enough to admit the immerſion of a ſmall part of it in the leſs ſpirituous liquors, *e. g.* wine reduced to congelation. In order to determine a ſtandard for the conſtruction of the ſcale of this inſtrument, he forms a weak ſpirit of wine, by mixing one part of water with ſix parts of ſuch ſpirits of wine as fire gun-powder, or linen ſteeped in them. He alſo finds the ſpecific gravity of the mixture, at the temperature of fifty-four and a half of Fahrenheit's thermometer, by a nice hydroſtatical balance. Having dipped the hydrometer into this ſpirit of wine, at the fixed temperature, he marks upon its branch or ſtem with a thread, the point to which it ſinks; then preparing a ſort of brandy ſtronger than the common, by mixing three parts of water with ſeven parts of this ſame ſpirit of wine, he determines the point on the ſtem to which the inſtrument would ſink in it at the ſame temperature, and marks it with a thread. Theſe points, *viz.* 45 and 15 in the figure, are the fixed points of the hydrometer. The interval between them may be divided into thirty equal parts, each of which will repreſent one-thirtieth part of the total effect of the ſuperadded water, on the ſpecific gravity of the liquor. This fundamental interval in inſtruments for common uſe may be divided into fifteen parts, which will then be double degrees. In order to find a convenient place for the 0 of this ſcale, M. De Luc propoſes to reduce one of the wines of which brandy is commonly made, to the temperature of water in ice, and dipping the hydrometer in it, to obſerve how much higher it will ſtand than the inferior fixed point. This exceſs of emerſion, compared with the fundamental ſcale, and reduced to the neareſt number of degrees, which will be an aliquot part of it, will be a proportional quantity invariably fixed, to be added to the ſcale below the inferior fixed point, for determining the place of 0; *e. g.* let this exceſs of emerſion be about 15°, or half the fundamental ſcale; then one ſhould conſtantly add half the fundamental diſtance below the inferior fixed point, and thence begin to count the degrees: ſo that 0 would be at the bottom of the whole ſcale, the inferior fixed point would be at 15°, the ſuperior at 45°, and the ſcale could be prolonged at the top as much as may be neceſſary for the eſſays of the moſt ſpirituous liquors. Another ſcale may be applied on the oppoſite ſide of the ſtem, for trying merely the ſpecific gravity of the liquids in which the hydrometer may be dipped. The particular fixed points of this ſcale, *e. g. d, d*, may be taken in any two liquids, whoſe ſpecific gravities, tried by the hydroſtatic balance, ſhall have a convenient relation, and the ſpace between thoſe two points will be divided into a convenient number of equal parts. For the correction on account of the differences of heat, M. De Luc would take a liquor of mean ſpirituoſity, *e. g.* a mixture of one part of water, and ſeven parts of the ſpirits of wine determined by the hydroſtatic balance; reduce this liquor to the temperature of 45° of Fahrenheit; plunge into it the hydrometer already graduated, and obſerve the point to which it ſinks; he propoſes afterwards to heat the liquor to 65°, and then to obſerve the ſinking of the inſtrument. From this obſervation a table might eaſily be formed, in which we might expreſs in degrees of the hydrometer, the effects of the differences of heat correſponding to each degree of the thermometer, beginning from a fixed point: or, a particular ſcale might be prepared for experiments of this nature, by changing the number of degrees contained between the fixed points, in order to eſtabliſh an eaſy proportion between them and the degrees of the aerometer; and thus the correction might be made without tables. If an hydrometer of this kind were brought into general uſe, the police of the places in which the trade of ſpirituous liquors is carried on might take cognizance of it; and keep the public ſtandard of the hydrometer or aerometer, as they keep the ſtandard of weights and meaſures. Phil. Tranſ. vol. lxviii. part 1. art. 20. p. 500, &c. M. Le Roi has alſo publiſhed a propoſal for conſtructing comparable hydrometers. Hiſt. de l'Acad. des Scien. Paris, for 1770. Mem. 7.

Mr. William Nicholſon ſome years ago made an attempt to combine Boyle's and Fahrenheit's inſtruments, and thus to adapt the hydrometer to the general purpoſe of finding the ſpecific gravity, both of ſolids and fluids. A (*fig.* 6.) is a hollow ball of copper; B is a diſh affixed to the ball by a ſhort ſlender ſtem D; C is another diſh affixed to the oppoſite ſide of the ball by a kind of ſtirrup. In the inſtrument actually made by the inventor, the ſtem D is of hardened ſteel, $\frac{1}{40}$th of an inch in diameter, and the diſh C is ſo heavy as in all caſes to keep the ſtem vertical, when the inſtrument is made to float in any liquid. The parts are ſo adjuſted, that the addition of 1000 grains in the upper diſh B, will juſt ſink it in diſtilled water, at the temperature of 60° of Fahrenheit's thermometer, ſo that the ſurface ſhall interſect the middle of the ſtem D. Let it be required to find the ſpecific gravity of any fluid. Immerſe the inſtrument in it, and by placing weights in the diſh B cauſe it to float, ſo that the middle of its ſtem D ſhall be cut by the ſurface of the fluid. Then, as the known weight of the inſtrument, added to 1000 grains, is to the ſame known weight added to the weights uſed in producing the laſt equilibrium, ſo is the weight of a quantity of diſtilled water diſplaced by the floating inſtrument to the weight of an equal bulk of the fluid under conſideration. And theſe weights give the ratio of the ſpecific gravities. (See *Specific* GRAVITY.) Again, let it be required to find the ſpecific gravity of a ſolid body leſs than 1000 grains. Place the inſtrument in diſtilled water, and put the body in the diſh B. Make the adjuſtment of ſinking the inſtrument to the middle of the ſtem, by adding weights in the ſame diſh. Take thoſe weights from 1000 grains, and the remainder will be the weight of the body. Place now the body in the lower diſh C, and add more weight in the upper diſh B, till the adjuſtment is again obtained. The weight laſt added will be the loſs the ſolid ſuſtains by immerſion, and is the weight of an equal bulk of water. Conſequently the ſpecific gravity of the ſolid compared with water is as its weight to the loſs it ſuſtains by immerſion. (See *Specific* GRAVITY.) When the inſtrument has been once adjuſted in diſtilled water, common water may be afterwards uſed. Now the ratio of the ſpecific gravity of the water made uſe of to that of diſtilled water being known ($=\frac{b}{a}$), and the ratio of the ſpecific gravity of the ſolid to the water made uſe of being alſo known, ($=\frac{c}{b}$), the ratio of the ſpecific gravity of the ſolid to that of diſtilled water will be compounded of both, (that is, $\frac{cb}{ab}$.) This inſtrument has been found to be ſufficiently accurate to give weights true to leſs than one-twentieth of a grain. Mancheſter Memoirs, vol. ii. p. 386, &c. Nicholſon's Introd. to Nat. Phil. vol. ii.

The hydrometer of Mr. Nicholſon is highly commended by citizen Guyton in the deſcription which he has given of a gravimeter, or inſtrument for meaſuring the ſpecific gravity of ſolids and fluids, read to the National Inſtitute at Paris, and inſerted in the 21ſt volume of the Annales de Chemie. At preſent, he ſays, it is very much uſed; and gives, with conſiderable accuracy, the ratio of the ſpecific gravity to the fifth decimal, water being taken as unity. It is ſuſceptible of correction for the variations of temperature, and the impurity of the water which it is ſometimes more convenient to uſe. It does not appear that any better inſtrument need be wiſhed for in this reſpect. But this inſtrument, having hitherto been conſtructed in metal only, could not be applied either to ſalts or acids. M. Guyton, in order to remedy this and ſome other inconveniences to which hydrometers are ſubject, has propoſed, by following the principles of Fahrenheit, and executing the inſtrument of Nicholſon in glaſs, with a ſlight addition, to render it more generally uſeful and commodious, without diminiſhing its accuracy in any reſpect. To his inſtrument he has applied the name of gravimeter. It is made of glaſs, of a cylindric form, as being that which requires the ſmalleſt quantity of the fluid. Like the inſtrument of Nicholſon it carries two baſons; the one ſuperior, at the extremity of a thin ſtem, towards the middle of which the fixed point of immerſion is marked. The other lower baſon terminates in a point; it contains the ballaſt, and is attached to the cylinder by two branches. The moveable ſuſpenſion, by means of a hook, has the inconvenience of ſhortening the lever which is to ſecure the vertical poſition. The cylinder is 22 millimeters (0.71 inches) in diameter, and 21 centimeters (6.85) inches in length. It carries in the upper baſon an additional conſtant weight of five grammes. Guyton has added a piece which he calls the diver (plongeur), becauſe it is in fact placed in the lower baſon when uſed, and conſequently is entirely immerſed in the fluid. This is a bulb of glaſs, loaded with a ſufficient quantity of mercury, in order that its total weight may be equal to the conſtant additional weight, added to the weight of the volume of water diſplaced by this piece. The weight, being determined at the ſame temperature at which the inſtrument was originally adjuſted, will ſink to the ſame mark on the ſtem, whether it be loaded with a conſtant additional weight in the upper baſon, or whether the effect of this weight be produced by the additional piece (plongeur) in the lower diſh. In uſing this inſtrument for ſolids, it differs in no reſpect from the hydrometer of Nicholſon. The only condition being, like that in his, that the abſolute weight of the body to be examined ſhould be rather leſs than the conſtant additional weight, which in this inſtrument is five grammes (115 grains.) For liquids of leſs ſpecific gravity than water, the inſtrument, without the above additional weight, weighs about two decagrammes (459 grains) in the dimenſions before laid down. We have therefore the range of one-fifth of buoyancy, and conſequently the means of aſcertaining all the intermediate denſities from water to the moſt highly rectified ſpirit of wine, which is known to bear in this reſpect the ratio of eight to ten with regard to water. When liquids of greater ſpecific gravity than water are to be tried, the conſtant weight being applied below, by means of the additional piece (plongeur), which weighs about ſix grammes (138 grains), the inſtrument can receive in the upper baſon more than four times the uſual additional weight, without loſing the equilibrium of its vertical poſition. In this ſtate it is capable of ſhewing the ſpecific gravity of the moſt concentrated acids. It poſſeſſes another property in common with the inſtrument of Nicholſon, *viz.* that it may be uſed as a balance to determine the abſolute weight of ſuch bodies as do not exceed its additional load. And, laſtly, the purity of the water being know, it will indicate the degrees of rarefaction and condenſation in proportion to its own bulk. This inſtrument is rendered portable by means of a caſe, in which all the delicate parts are ſecured from preſſure, and the heavier parts ſo ſupported as to reſiſt the exceſs of motion which they are capable of acquiring in conſequence of their maſs. For a further account of this inſtrument, illuſtrated by figures, the manner of uſing it, and its application to the reſults of tables of ſpecific gravity, we refer to Nicholſon's Journal, vol. i.

HYDROMETRA, in *Medicine*, from ὕδωρ, *water*, and μήτρα, *metra*, *the womb*, ſignifies a dropſy of the womb.

If ſuch a diſeaſe as dropſy of the womb, or a collection of water in its cavity, independent of pregnancy, ever occurs, it is at leaſt a very rare diſeaſe, and its ſymptoms are not eaſily detected. Dr. Cullen, however, has given ſuch a diſeaſe a place in his ſyſtem of noſology, although he has made no mention of it in his Firſt Lines. (Noſol. Method. Gen. lxxx.) Boerhaave mentions it in his 1224th aphoriſm; but the commentary of Van Swieten ſeems to relate principally to larger collections than uſual of the fluids in the gravid uterus. Sauvages ſpeaks of a ſimple dropſy of the cavity of the uterus on the authority of Aſtruc (Hydrometra aſcitica, ſp. 1.), and includes the ovarial dropſy under the ſame genus, as well as the formation of hydatids in the uterus (H. hydatica), which, however, is altogether diſtinct from the true dropſy. (Noſol. Method. Claſs x. Gen 13.) See Dropsy and Hydatid.

HYDROMETRIA, Hydrometry, the menſuration of water, and other fluid bodies, their gravity, force, velocity, quantity, &c.

Hydrometria includes both hydroſtatics and hydraulics.

The term is modern, but very little in uſe. The firſt inſtance where we meet with it, is in the year 1694, when a new chair, or profeſſorſhip of hydrometry was founded in the univerſity of Bologna, in favour of S. Guglielmini, who had carried the doctrine of running waters, with reſpect to rivers, canals, dykes, bridges, &c. to an unuſual length.

HYDROMPHALON, in *Surgery*, a dropſical ſwelling of the navel. The word is compounded of ὕδωρ, *water*, and ὀμφαλος, *the navel*. See Dropsy.

HYDROMYSTES, or Hydromista, compounded of ὕδωρ, *water*, and μυστης, *a perſon ſet apart for the offices of religion*, a name anciently given to certain officers in the Greek church, whoſe buſineſs was to make the holy water, and ſprinkle it on the people.

HYDROPARASTATÆ, or Hydroparastæ, formed of ὕδωρ, *water*, and παριστημι, *I preſent*, in *Eccleſiaſtical Hiſtory*, a ſect of heretics, the followers of Tatian; called alſo Encratitæ, Apotactitæ, Saccophori, Severiani, and Aquarians.

The hydroparaſtatæ were a branch of Manichees, whoſe diſtinguiſhing tenet was, that water ſhould be uſed in the euchariſt inſtead of wine.

HYDROPELTIS, in *Botany*, from ὕδωρ, *water*, and πελτη, *a ſhield*, as being an aquatic plant with peltate leaves. Michaux. Boreal.-Amer. v. 1. 323. Sims in Curt. Mag. 1147.—Claſs and order, *Polyandria Polygynia*. Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ.

Gen. Ch. *Cal.* none. *Cor.* Petals ſix, oblong, permanent, ſomewhat ſpreading; the three outermoſt ſhorteſt, and externally reſembling a calyx. *Stam.* Filaments numerous, about 36, inſerted into the receptacle, thread-ſhaped, much ſhorter than the corolla; anthers vertical, erect, oblong, obtuſe. *Piſt.* Germens ſeveral, about 12 or 16, ſuperior, erect, oblong, acute, each ſeſſile on a mammillary point of the receptacle; ſtyles ſhort, thread-ſhaped, incurved; ſtigmas obtuſe. *Peric.* Capſules ſeveral, incloſed in the permanent corolla which exceeds them in length, erect, oblong-ovate, pointed, ſomewhat fleſhy, of one cell, not burſting. *Seeds* one or two, ſomewhat globoſe, inſerted at the ſuture on the inner edge of the capſule.

Eſſ. Ch. Calyx none. Petals ſix, permanent; three of them external and ſhorteſt. Nectaries none. Capſules ſeveral, ſuperior, with one cell and two ſeeds.

Obſ. The ſeed is deſcribed by Mr. Konig as monocotyledonous, if ſo it cannot belong to the *Ranunculaceæ*. Aquatic plants in general require reconſideration in this reſpect, ſome of them, as we have obſerved, having been judged monocotyledonous by analogy only, and few properly inveſtigated. The late Dr. Solander had made a genus of this plant which he referred to the Linnæan natural order of *Multiſiliquæ*, and called *Ixodia*, from ἰξωδης, *viſcid*, very aptly alluding to the extremely viſcid coating of the young ſhoots and buds, which is inſoluble in water; but the name given by Michaux being printed, and liable to no exception, is properly retained by Dr. Sims.

The only known ſpecies is

1. H. *purpurea.* Michaux. Boreal.-Amer. v. 1. 324. t. 29. Curt. Mag. t. 1147.—Native of lakes and ſtill pools in North America, from Upper Canada to South Carolina. It was communicated to Dr. Sims from the late collection of E. J. Woodford, eſq. at Springwell, Herts. The *ſtems* are long, floating, round, and leafy. *Leaves* alternate, ſtalked, floating, orbicular, entire, peltate, with many veins radiating from their centre, and branched towards the margin. *Flower-ſtalks* from the ſide of the leaf-ſtalks, ſimple, ſingle-flowered. *Flowers* dull purple, cloſing and lying down on the ſurface of the water at night, and expanding again in the morning, like thoſe of *Nymphæa alba*, as obſerved by Mr. S. Edwards while making his drawing for the Botanical Magazine.

HYDROPHACE. See Lemna.

HYDROPHANES, in *Mineralogy*, ſome varieties of opal which appear to have loſt the water which they naturally contain, from expoſure to the air, and in conſequence of this have become opaque, recover their tranſparency when immerſed in water; theſe have been named hydrophanes. See Opal.

HYDROPHILUS, in *Entomology*, a genus of the aquatic kind of coleoptera, nearly allied in appearance and manners of life to the dytiſci; its generical diſtinction conſiſts in having the antennæ clavated, and the club perfoliated; the feelers four and filiform; and the poſterior legs formed for ſwimming, with the inner edge in general ciliated and armed with ſmall claws.

Linnæus has not very accurately diſcriminated the difference between the dytiſci and the hydrophili, both which he confounds under the comprehenſive term dytiſcus, excepting only that he divides this genus into two ſections, one having clavated and perfoliated antennæ (as in hydrophilus) and the other antennæ of a ſetaceous ſtructure. His generic character is conſequently adapted to include both thoſe ſections, and is for this reaſon rather curiouſly, and ſomewhat too looſely defined; the antennæ of the dytiſcus, ſays Linnæus, are either ſetaceous, or increaſe in ſize towards the end, and have a perfoliated capitulum or head; the hind feet hairy, formed for ſwimming, and armed with ſmall claws. (Ord. et Gen.) And again in Syſt. Nat. "Antennæ ſetaceæ *aut* clavato-perfoliatæ; pedes poſtici villoſi, natatorii ſubmutici." In the tenth edition of Syſt. Nat. Linnæus however divides the dytiſci into three ſections inſtead of two, as **Antennis perfoliatis*, ***Antennis ſetaceis*, and ****Antennis clavatis*. Ray had long before his time called this tribe of water beetles by the ſignificant term of hydrocantharus.

The dytiſcus genus, as eſtabliſhed by Linnæus, is ſeparated by Geoffroy into two genera, dytiſcus and hydrophilus, the latter of which, according to this author, contains thoſe with perfoliated antennæ (which he obſerves are ſhorter than the feelers); the reſt, having the antennæ filiform, (and longer than the head,) he retains under the name aſſigned to them by Linnæus. Schæffer admits the two laſt-mentioned genera with ſome amendment; the tarſi of the dytiſcus, he remarks, have five joints, the body oblong, and the head obtuſe. The mouth of the hydrophilus, according to this author, is armed with jaws, and has four palpi or feelers, two of which are longer and two ſhorter than the antennæ.

In the Gmelinian edition of "Syſtema Naturæ," the two genera hydrophilus and dytiſcus are adopted nearly in the manner of the writers laſt-mentioned, except that, according to Fabricius, he adds that the hydrophili have only four feelers, the dytiſci ſix. Lamarck again obſerves of the "hydrophile" (hydrophilus), that the antennæ are ſhort, with a perfoliated club; feelers four and unequal, the anterior ones longer than the antennæ. The "dytique," (dytiſcus,) he adds, has filiform-ſetaceous antennæ of the ſame length as the corſelet (thorax); ſix unequal feelers; and ſimple jaws ciliated within. The body in both, he ſays, is elliptic; in hydrophilus the ſternum is ſpinous; and the four poſterior legs formed for ſwimming, in dytiſcus only the two behind. Mr. Marſham notices the trifid ſtructure of the antennæ in the hydrophili, the inſerted poſition of the head, the oval convex form of the body, and the ciliations obſervable on the poſterior legs in moſt ſpecies, "Antennæ clava perfoliata, trifida, palpis breviores; caput inſertum; thorax tranſverſus; corpus ovale, convexum; pedes poſtici in pleriſque ciliati." Ent. Brit. And theſe he divides into two families, the one having the thorax ſmooth, the other longitudinally rugoſe.

The hydrophili either as a genus (hydrophile), or a family (hydrophiliens), containing ſeveral diſtinct genera, appear to have been long ſince admitted among the French writers. Walcknær, in his "Faune Pariſienne," has the genera ſpercheus (from Fabricius) and alſo hydrachna, in addition to hydrophilus and dytiſcus, all which belong, according to moſt other writers, to one of the two genera laſt-mentioned. In deſcribing the hydrophilus, he notices the cleft on the jaw, and the texture as well as form of the lip, in addition to the characters aſſigned to it by others. "Palpes, quatre alongés filiformes. Machiore bifide. Lèvre cornée, légèrement échancrée. Languette légèrement échancrée. Antenne en maſſue perfoliée." The family hydrophiliens, as a ſub-diviſion of the "Sphéridiotes," is deſcribed at ſome length by Olivier; from which they have been laſtly removed by Latreille, and now conſtitute the fourteenth family of the "Pentameres."

Latreille divides the hydrophiliens into two ſections, one of which has the jaws entire at their extremity, the maxillary feelers rather ſhorter than the antennæ, the body oblong and nearly plain above, and the breadth of the thorax never much exceeding its length. This ſection contains the two genera elophorus and hydræna (the hydræna of Illiger.) The inſects of the ſecond ſection are known by having the jaws bidentated at their extremity; the maxillary feelers alſo as long, or longer than the antennæ; the body hemiſpherical, or ovoid and convex; and the thorax tranſverſe. This laſt contains likewiſe two genera, as ſpercheus and hydrophilus. The genus elophorus is diſtinguiſhed by clavated antennæ, the club of which commences at the ſixth joint; and the feelers terminate in a large oval joint. The club of the antennæ in hydræna begins at the third articulation; and the feelers end in a joint much ſmaller or thinner than that of the preceding. In ſpercheus the antennæ conſiſt of ſix joints, and the limbs are deſtitute of conſpicuous ſpines, or ſpurs. And laſtly, that genus, to which the name of hydrophilus is retained, includes thoſe only which have nine joints in the antennæ, and the limbs terminated in a kind of ſpurs or ſpines. The greater number, if not the whole, of thoſe, appear to be hydrophili of continental writers in other parts of Europe.

Like the dytiſci the hydrophili inhabit ponds of ſtagnant waters, reſiding in the aquatic element during the day-time, and venturing abroad on the wing in the night ſeaſon, at which period they become the prey of the owl, the goat-ſucker, and other nocturnal birds. The males are diſtinguiſhed from the females by having a horny flap or ſhield of a concave form on the anterior legs. The poſterior legs are adapted in an admirable and peculiar manner to its mode of life, being long, curved, and flattiſh, and furniſhed on the inner ſide with a ſeries of cloſe-ſet filaments, reſembling a fin, by means of which it is enabled to ſwim, and perform its various evolutions in the water with the utmoſt eaſe and velocity. The larvæ, as in the dytiſci, are hexapodal creatures which live in the waters and prey upon inſects, the fry of fiſhes, and other inhabitants of its aquatic regions. It is ſuppoſed to live between two and three years in the ſtate of larva before it aſſumes the pupa form, previous to which latter change it buries itſelf in ſome bank of earth or ſand contiguous to the boundaries of its uſual haunts, and remains, while in the ſtate of pupa, incloſed within a covering of its own formation, the ſhape of which is uſually oval or ſpherical. The opinion of Degeer that the hydrophili, in the laſt or winged ſtate, are carnivorous, ſeems to be in ſome degree refuted by the more recent obſervations of naturaliſts, the reſult of which appears to be that they ſubſiſt chiefly, if not entirely, on vegetable food; and we may further add that their internal conformation pretty clearly proves the truth of this intereſting diſcovery.

Species.

PICEUS. Black and ſmooth; ſternum furrowed, with a long ſpine pointing backwards. Fabr. Donov. Brit. Inſ. &c. *Hydrophilus ruficornis*, Degeer. *Le grand hydrophile*, Geoff. *Dytiſcus piceus*, Linn.

Native of Europe.

OLIVACEUS. Olive, ſternum grooved with a long recurved ſpine; wing-caſes emarginate. Fabr.

Inhabits Coromandel, and leſs than the former.

CARABOIDES. Black and poliſhed, the wing-caſes ſomewhat ſtriated. Fabr. Donov. Brit. Inſ. *Hydrophilus nigricornis*, Degeer. *Hydrocantharus niger ſubrotundus*, Ray.

An European ſpecies.

LATERALIS. Black and gloſſy; margin of the thorax and wing-caſes yellow. Fabr.

Half the ſize of the former, the ſternum projecting backwards into a ſharp point, with a yellow dot in the middle, and the legs ferruginous. Inhabits South America.

RUFIPES. Shining black; legs rufous; ſternum with a recurved ſpine. Fabr.

Size of the laſt, and inhabits China. The antennæ are ferruginous, with the club brown; the body glabrous, and without ſpots.

EMARGINATUS. Duſky-brown; ſhield emarginate. Fabr. &c.

Found on aquatic plants in Europe. Body gibbous and opaque.

FUSCIPES. Black; wing-caſes ſtriated with dots; margin livid; legs fuſcous. Marſh. Ent. Brit. *Dytiſcus fuſcipes*, Linn. Fn. Suec. *Dytiſcus gyrinoides*, Sehrank. *L'Hydrophile noir ſtrié*, Geoff.

An European ſpecies.

SCARABÆOIDES. Oval, convex, black, and very ſmooth; wing-caſes ſtriated: legs pitchy. *Dytiſcus ſcarabæoides*, Linn. Syſt. Nat. X. Roeſel. &c.

Native of waters in Europe.

PICIPES. Black; legs pitchy; wing-caſes ſmooth. Fabr.

Inhabits Germany.

ORBICULARIS. Subrotund; body glabrous and black; Fabr. *L'Hydrophile liſſe à points*, Geoff.

Same country as the preceding; and is likewiſe found in France and other parts of Europe.

Subrotundus. Roundiſh, glabrous and black; wing-caſes ſtriated. Fabr.

Smaller than the laſt, and inhabits America.

Bicolor. Ovate; above yellowiſh, beneath black. Fabr. &c.

Native of Denmark.

Collaris. Black; mouth, thorax at the ſides, and a few abbreviated lines on the wing-caſes ferruginous. Fabr.

Inhabits South America.

Undatus. Ovate, black; thorax pale; wing-caſes ſtriated grey. Fabr.

The head of this ſpecies is gloſſy black; antennæ and feelers yellow; thorax with a double black dorſal line; wing-caſes obſcurely undulated with black; body black, and legs yellow. This inſect inhabits South America.

Obscurus. Gloſſy black; wing-caſes ſtriated and ferruginous at the baſe and tip. Fabr.

Native of Germany; the head and thorax ſmooth and without ſpots; legs ſomewhat ferruginous. Obſ. This muſt not be confounded with hydrophilus obſcurus of Müller (Zool. Dan.), which is deſcribed of a livid colour, with the abdomen black, and the wing-caſes gloſſy with crowded ſpots. This laſt mentioned inſect is perhaps a variety of the following ſpecies.

Luridus. Thorax and ſtriated wing-caſes brown-cinereous; body black. Gmel. Degeer, &c.

Inhabits Europe.

Erythrocephala. Ovate, black; head, thorax, and border of the wing-caſes rufous. Fabr.

Country unknown. The legs rufous, thighs black.

Hæmorrhoidalis. Black; wing-caſes ſtriated, the tip with the ſhanks ferruginous. Fabr. &c.

Inhabits Germany.

Marginellus. Gloſſy black; thorax and wing-caſes edged with rufous. Fabr.

Size of the laſt, and inhabits the ſame country; the wing-caſes ſmooth; legs black; tarſi ferruginous.

Sordidus. Black, and ſomewhat gloſſy; margin of the thorax livid; wing-caſes livid, with black ſpots. Marſh.

Inhabits Britain in ſtagnant waters.

Verrucosus. Dull black, ferruginous; abdomen beneath verrucoſe. Marſh.

Legs and abdomen black; tubercles beneath reſembling thoſe on ſome ſpecies of the Lichen genus. Native of Britain.

Lividus. Ovate, livid, and very ſmooth. Oliv. *Dytiſcus lividus*, Forſter. *Hydrophilus lividus*, Marſh.

Antennæ teſtaceous at the baſe; legs black, the ſhanks and tarſi teſtaceous ferruginous. Found in maritime marſhes in Europe.

Dermestoides. Hemiſpherical-ovate, and lurid; head black; thorax at the ſides dull ferruginous. Marſh. *Dytiſcus dermeſtoides*, Forſter.

Inhabits ſtagnant waters; the head black and gloſſy; thorax black except the margins; legs ferruginous.

Torquatus. Ovate teſtaceous; head behind black. Marſh.

The head is yellow; abdomen black; legs pitchy black. A Britiſh ſpecies.

Minutus. Ovate and black; wing-caſes and legs grey. Fabr. &c.

Head pitchy, black and gloſſy; thorax at the ſides pale; abdomen beneath pitchy black. Native of Europe.

Griseus. Above cinereous, beneath fuſcous. Fabr.

Size of the laſt, and inhabits Europe.

Bipunctatus. Thorax black, edged with grey; wing-caſes brown with a whitiſh margin and dot behind. Fabr. *Hydrophilus coccinelloides*, Hellw. *Dytiſcus coccinelloides*, Schrank.

A ſmall ſpecies found in Europe.

Lutosus. Fuſcous; wing-caſes ſtriated with impreſſed dots. Marſh.

A ſmall ſpecies; the thorax is rugoſe, with tranſverſe flexuous raiſed lines. Native of Britain.

Nitidus. Black and poliſhed; margin of the thorax with the legs rufous. Marſh.

Inhabits Britain.

Mollis. Black and gloſſy; thorax and wing-caſes brown, teſtaceous. Marſh.

Head and abdomen black. A ſmall ſpecies found in Britain.

Picinus. Ovate, pitchy, and gloſſy; legs rufous. Marſh.

Size of the laſt, and inhabits Britain.

Longipalpis. Black; feelers antenniform; antennæ and feet red. Marſh.

Length rather more than one line; the feelers advanced and three-jointed, the firſt articulation long as in the antennæ of ſome curculiones; head black; thorax black and attenuated behind, line in front tranſverſe and impreſſed; wing-caſes black and ſtriated with dots. A Britiſh ſpecies.

Impressus. Black; thorax with a large impreſſed dot on each ſide; legs teſtaceous. Marſh.

Body entirely black; wing-caſes ſtriated. Inhabits Britain.

Fulvus. Fulvous; wing-caſes lineated with dull black; abdomen black. Marſh. *L'Hydrophile fauve*, Geoff.

Antennæ fuſcous; feelers teſtaceous, with the tip black; head fulvous and dotted; eyes black; thorax fulvous and dotted, the front black; wing-caſes fulvous with longitudinal obſolete lines of black; abdomen beneath black, covered with fine hairs; legs teſtaceous and downy. Native of Europe.

Margipallens. Pitchy and entirely gloſſy; margin of the thorax pale. Marſh.

A Britiſh ſpecies.

Ochropterus. Black; ſides of the thorax and wing-caſes, with a ſpot before each eye, lurid. Marſh.

Length two lines; the head black, except the two lurid ſpots before the eyes; thorax and wing-caſes very finely dotted; tarſi ferruginous. Native of Britain.

Affinis. Cinereous; wing-caſes each with two black dots, and ſtriated with punctures; thorax emarginate, braſſy-green. Marſh. *Hydrophilus griſeus?* Herbſt.

Inhabits ſtagnant waters in Europe.

Dorsalis. Fuſcous; thorax green; wing-caſes ſtriated, teſtaceous with a common black ſpot, incloſing two teſtaceous ones. Marſh.

Native of Britain.

Cincindeloides. Black braſſy; eyes prominent; wing-caſes with ridged ſtriæ. Marſh.

Body entirely black and braſſy; head advanced; thorax with three hollows; wing-caſes with two lines of impreſſed dots between the ridges.

A Britiſh ſpecies.

Pygmæus. Grey; head black behind; thorax yellowiſh. Fabr.

A minute kind found in South America; the wing-caſes without ſpots.

Tricolor. Black; wing-caſes pitchy edged with black, and ochraceous at the tip; legs tawny. Herbſt.

Inhabits Pruſſia.

Cordiger. Black; wing-caſes and margin of the thorax ferruginous,

ferruginous; the firſt with a common heart-ſhaped ſpot. Herbſt.

Inhabits ſame country as the former.

Pusillus. Black; wing-caſes very ſmooth; antennæ and tarſi brown. Müll.

Native of Denmark.

Pilula. Black; above poliſhed with crowded dots. Müll. *Hydrophilus punctatus*, Geoffr.

An European ſpecies; as are alſo the two following.

Niger. Gloſſy black; wing-caſes finely ſtriated with diſtant dots; antennæ and tips of the legs ferruginous. Linn.

Ater. Black and glabrous; antennæ and ſhanks reddiſh. Linn.

HYDROPHOBIA, in *Medicine*, from ὕδωρ, *water*, and φοβέω, *I fear*, ſignifying, literally, a *dread of water*, is the term employed by medical writers to denote the diſeaſe occaſioned by the bite of a rabid animal; an averſion to liquids being one of the characteriſtic ſymptoms of that diſeaſe. Some have uſed the more general term *hygrophobia*, from ὑγρὸν, *liquid.*

Of the impropriety of theſe appellations, deduced from one ſymptom only, and that neither excluſively belonging to the diſeaſe, nor invariably preſent in it, we ſhall have occaſion to ſpeak preſently. In the mean time, we may obſerve, that the older writers, as we are informed by Cælius Aurelianus (Acutor. Morb. lib. iii. cap. 9. and 12.) uſed the terms *aërophobia*, or a *dread of air*; and *pantophobia*, or a fear of *all things*, as appropriate names for the diſeaſe, ſince the impreſſion of cold air ſometimes excited terror, and the diſorder is marked by a ſingular degree of general timidity and diſtruſt. Others called it *phobodipſon* (δίψος, ſignifying *thirſt*), becauſe the patient is *thirſty*, yet *fears* to drink. Several modern authors, however, objecting to an appellation expreſſive only of one ſymptom, have more correctly denominated the diſeaſe *rabies*, and *rabies canina*, or canine madneſs. The French call it *la rage*.

It is uncertain at what period this diſeaſe became known. Its ſymptoms are never mentioned by Hippocrates, which affords a ſtrong preſumption that it did not exiſt in his time; for it is a diſeaſe ſo ſingular and ſtriking in its appearances, that it could never be ſeen by any one without leaving the deepeſt impreſſion upon the mind. Ariſtotle is the firſt writer who expreſsly mentions it. He ſays that all animals, except man, are infected by the bite of a mad dog, and deſtroyed by it. This imperfect ſtate of his knowledge reſpecting the malady, is a proof that it was a matter of recent obſervation; for although ſeveral perſons might be bitten without ſuffering the diſeaſe, and, from the length of time which commonly elapſes between the infliction of the bite and the appearance of the ſymptoms, ſeveral caſes might occur before it was referred to its true ſource; yet no very long time would be requiſite to clear up theſe doubtful points. Accordingly, we find ſubſequent writers treating of the diſeaſe in a familiar manner. Plutarch affirms that the hydrophobia was firſt ſeen at Rome in the days of Aſclepiades. See Ariſtot. Hiſt. Anim. lib. viii. cap. 22. Plutarch, Sympoſiacon, lib. viii. probl. 9. Le Clerc. Hiſt. de la Medécine, p. ii.

The origin of the poiſon, by which hydrophobia is generally communicated, is likewiſe a ſubject of much uncertainty. It is known that animals of the dog-kind, including the wolf and the fox, are moſt frequently the ſubjects of *rabies*; and ſome writers have maintained that, although it may be received and propagated by other animals, yet it always originates with ſome of the canine race. (See Hillary on Diſ. of Barbadoes, p. 246.) But it is ſtill a matter of doubt, whether it occaſionally ariſes ſpontaneouſly in theſe animals; or whether, like the ſmall-pox in the human ſpecies, it is propagated only by contagion. There are ſome facts, which, though they do not prove the negative, in reſpect to the ſpontaneous origin, yet afford ſufficient evidence that the diſorder, even among dogs, is moſt commonly the reſult of infection. Great heat has been ſaid to excite *rabies* in the dog-tribe. But if that were the caſe, it ought to be, as it were, endemic in tropical countries. Dogs are more numerous, Dr. J. Hunter has affirmed, in the iſland of Jamaica than perhaps in any other part of the world. It is the ambition of every negro to be maſter of a dog; "yet notwithſtanding their great numbers, particularly in the towns, *forty years* have elapſed without a dog being known to go mad. The inſular ſituation of the country ſecures to it in ſome degree the advantages of a quarantine; and the rare occurrence of the diſeaſe proves that it ſeldom, if at any time, originates of itſelf. (See Tranſ. of a Society for the Improvement of Med. and Chirurg. Knowledge, v. i. art. 17.) It is alſo ſtated, that the moſt eminent ſportſman in this country, Mr. Meynell, to whom the preſervation of his kennel from madneſs was an object of great importance, preſerved his dogs from the diſeaſe, during a long ſeries of years, by making every new hound perform a quarantine before he was allowed to join the pack. Ibid.

There is reaſon to believe, however, that the *rabies*, in the animal race, occurs at times ſpontaneouſly; but whether from the cauſes which have been ſtated by authors it were not eaſy to decide. Among theſe cauſes, Boerhaave enumerated "a very hot climate, or one expoſed to the extremes of heat and cold; a very hot and dry ſeaſon; feeding upon putrid, ſtinking, and maggotty fleſh; want of water; worms bred in the kidnies, inteſtines, brain, or cavities of the noſe (Aphoriſm 1134.); but the influence of theſe circumſtances in producing the diſeaſe is not eſtabliſhed by a ſufficient number of obſervations.

All domeſtic animals, birds as well as beaſts, are ſuſceptible of the poiſon of the rabid dog. Indeed our experience has not yet taught us that there is any race of animals exempted from its effects. But whether every animal labouring under the diſeaſe is capable of infecting others, or whether this power is confined to a few only, we are yet to learn. Boerhaave affirms that the diſeaſe has been communicated by infection to others by dogs, cats, wolves, foxes, horſes, aſſes, mules, ſwine, apes, cocks of the poultry breed, and men, when affected with rabies (Aph. 1132.); and the cow has alſo been ſaid to propagate it. Van Swieten has ſtated ſome inſtances, from old authors, of hydrophobia occaſioned by the beak of an enraged cock wounding the hand and arm. But there is little doubt that, in ſuch caſes, the ſpaſmodic and fatal diſeaſe, which enſued, was *tetanus*, and not hydrophobia. (See Tetanus.) This notion is confirmed by the early occurrence of the ſymptoms after the bite, namely, within the firſt or ſecond day, which is not unuſual in *tetanic* affections, but never perhaps occurs in hydrophobia. (See Van Swieten's Comment. on Aph. 1132. Alſo, Hamilton on Hydrophobia, vol. i. p. 107, 2d edit.) It is certain, however, that not only animals of the canine ſpecies, but cats, have produced hydrophobia in the human ſpecies by their bite. Were we to judge from analogy, from ſeeing two animals, ſo different from each other as the dog and the cat, capable of infecting others, we might be led to infer, that every animal ſuſceptible of the diſeaſe had the power of communicating it, provided their natural habits led them to bite and tear with their teeth ſuch animals as came in their way, while in an enraged ſtate. With reſpect to men, under the influence of hydrophobia, although the popular notion of their general diſpoſition to bite thoſe around them is erroneous, yet there are inſtances on record in which hydrophobic patients did bite ſome of their attendants, but no ill conſequences have been known to follow. From this, however, as Dr. John Hunter juſtly remarks, we can draw no poſitive inference; for it is but a ſmall proportion of ſuch perſons as are bit by dogs undoubtedly mad, who are infected with the poiſon. Tranſ. of a Society, &c. p. 300.

With regard to the activity of the poiſon of the rabid dog, the facts which have been collected have been as vaguely ſtated, and the inferences, therefore, are as inconcluſive as thoſe relative to the topics juſt mentioned. Among the older writers, indeed, there was much credulity, and they have tranſmitted to us many fabulous hiſtories in regard to the operation of the rabid virus. “ Scarce any poiſon known,” ſays Hillary, (relying upon the truth of thoſe tales,) “ is ſo infectious, or ſo eaſily and readily communicated by ſo many and various ways as this of a mad dog is; for the ſlighteſt bite, only tearing the ſkin, without drawing blood; or the ſmalleſt quantity of the ſlaver of the mad animal, either freſh or dried for ſome time, taken upon the tongue or lips; or rending a perſon's clothes and leaving the ſlaver on them to dry, has produced this diſeaſe; as a woman had her coat torn by a mad dog, which ſhe a conſiderable time after ſewed up, and bit off the thread with her teeth, and ſome time after died rabid from biting off that thread. (Hildanus Obſ. Chir.) Alſo a man only kiſſing his children to take his leave of them when he had the rabies upon him, they all ſoon after died rabid. (Palmarius de Morb. Contag.) Kiſſing a favourite dog that was mad had the ſame effect, &c. has produced this moſt fatal diſeaſe.” (On Diſeaſes of Barbadoes, p. 249. See ſeveral ſimilar caſes quoted by Dr. Hamilton, vol. i. p. 98—104.) Hillary admits, however, that the poiſon does not appear to infect a perſon through the unbroken ſkin: and there is certainly a defect of accurate detail, in the caſes quoted by Dr. Hamilton, where the infection was ſaid to have been communicated when no bite was inflicted. Some excoriation or rupture of the cuticle may have exiſted, although unnoticed, in the hands of thoſe who examined the mouths of dogs in this malady. (See Hamilton, caſe iii. p. 100, caſe ix. p. 103.) Where the diſeaſe was produced by a rabid dog, licking a ſore until it bled, we underſtand how the infection would be occaſioned by abſorption. See Dr. Hunter, in Tranſ. before quoted, p. 301.

As the bite only ſerves the purpoſe of *inoculation*, the danger ariſing from it will be various, as it happens to be inflicted in a part more or leſs vaſcular; or as the teeth are more or leſs loaded with the poiſon. There is the greateſt danger from bites in the face, and the ſymptoms come on ſooneſt; bites in the hands alſo, which are generally bare, are full of danger. In other parts of the body, the clothing, by wiping the teeth of the animal, greatly leſſens the danger of infection. It is fortunate that the human ſpecies is much leſs ſuſceptible of the infection than the dog. Four men and twelve dogs were bit by the ſame rabid dog, and every one of the dogs died rabid, while all the four men eſcaped, though they uſed no other means of prevention but ſuch as we ſee every day to fail. There is alſo an inſtance of twenty perſons being bit by the ſame mad dog, of whom only one had the diſeaſe. (See Dr. Hunter's paper, p. 302.) Some writers have calculated, indeed, that, on an average, only *one* perſon in *twenty-five*, who are bitten by rabid dogs, ſuffer hydrophobia. Dr. Hamilton, however, on collating a great number of inſtances of bites received, found that the average did not amount ſo high: he thinks that not more than *one* in *ſixteen* of the human ſpecies, who are bitten, take the diſeaſe. Loc. cit. vol. i. p. 31.

Some experiments, made by Mr. Cline, reſpecting the communication of rabies by inoculation with the ſaliva of a hydrophobic man, in the laſt ſtage of the diſeaſe, would throw great doubt on the infectious qualities of that ſecretion in the human ſubject. He took particular pains in inſerting the ſaliva, while perfectly freſh, into a dog, three rabbits, and ſeveral fowls: “ but in none of theſe inſtances was there the leaſt appearance of the diſorder at the expiration of three months.”—Mr. Aſtley Cooper, on the other hand, inoculated a dog, a pig, a fowl, and a rabbit, with the ſaliva of a dog, which had recently died of rabies, by inſerting, from the point of a lancet, between two and three drops under the ſkin of the inner part of the thigh of each.” The dog and fowl were kept confined for nine weeks, and the pig ſeven, but without any appearances of hydrophobia. The dog afterwards became the property of a gentleman, who kept him nearly twelve months, and he had never any marks of the diſeaſe. The rabbit was accidentally killed on the fourth day from the experiment.” See two caſes of Rabies Canina, by Dr. Babington, &c in the Medical Records and Reſearches, Lond. 1798, p. 136—8.

On the whole, therefore, the evidence is of an unſatisfactory and even contradictory nature, in reſpect to the qualities and operation of the *virus* of rabies; and much remains to be aſcertained by future experiment and inveſtigation. We know, however, too well, that the fatal conſequences of the poiſon have appeared, in ſome inſtances, in which every practice had been adopted, after the infliction of the bite, to remove the bitten part, as well as every portion of the poiſon that could be ſuppoſed to lodge in the wound.

We ſhould now have proceeded to deſcribe the ſymptoms of the diſeaſe, as it affects the dog, in order that it might be ſpeedily recogniſed, and diſtinguiſhed from other diſeaſes, to which that animal is ſubject: but this has been already ſo fully and diſtinctly done, by a writer poſſeſſed of an extraordinary degree of experience upon the ſubject, that we muſt refer our readers to his deſcription (ſee the article Dog); and proceed to give an account of the ſymptoms of the diſeaſe, as it occurs in the human ſubject. We may juſt remark, by the way, that the influence of *names*, in reſpect alſo to the diſeaſe in the dog, has led to ſome dangerous popular miſtakes, which are pointed out in the article juſt referred to. The term *hydrophobia*, being erroneouſly applied to the rabies of the dog, has induced a ſuppoſition that no dog is rabid, while he continues to drink; whereas he is conſtantly endeavouring to quench his thirſt in that diſeaſe. And again, the appellation of *madneſs* has led to a belief that violence and fury are characteriſtic of rabies in the dog; but, though he is irritable and peeviſh, there is nothing of wildneſs in his diſpoſition. In conſequence of this miſtake, dogs have been allowed to go about, fondled, and even ſlept with (ſee Mem. of Swediſh Acad. 1777) in a rabid ſtate.

Hiſtory of Symptoms.—The wound inflicted by the bite of a rabid animal has nothing peculiar in its appearance, and heals as readily as the bite of an animal that is not rabid. From the time of the bite until the period when the ſymptoms appear, there is no derangement of health, nor any perceptible change in the conſtitution, provided the perſon bitten be not under the influence of fear. The interval between the infection and the commencement of the diſeaſe varies conſiderably in different inſtances: the moſt common period, as it was long ago ſtated by Cœlius Aurelianus, appears to be about forty days or ſix weeks. Dr. Mead ſtates the ordinary interval at between thirty and forty days: (Mead on Poiſons, p. 130.) and Dr. Babington from three to five weeks; ſome inſtances occurring much earlier, and others not for many months, ſo that he conſiders the average from four to twelve weeks. (Med. Records and Reſearches, before quoted.) In the caſes laid before the Society for the Improvement of Medical and Chirurgical Knowledge, the interval varied from thirty-one days to ſeventeen months. Dr. Hamilton draws the following concluſions, as to the interval between the bite and the occurrence of the diſeaſe, from a table of 131 caſes. Only three took the diſeaſe before the 18th day, none before the 11th—from the 18th to the 30th, *ſeventeen* were ſeized:—*ſixty-three* began to be ill from 30 to 59 days after the bite;—*twenty-three* were attacked from two to three months incluſive;—*nine* from three to four months;—*two* at five months;—*one* at five months and eleven days;—*one* at ſix months;—*one* at ſeven months;—*two* at eight months;—*one* between eight and nine months;—*two* at nine months;—*one* at eleven months;—*one* at fourteen months;—*two* at eighteen months;—and *one* at nineteen months. (Vol. i. p. 113.) The laſt-mentioned interval is, he thinks, the longeſt to which any credit can be given. On the other hand, a caſe is related by Dr. Bardſley of Mancheſter, which proved fatal, as is uſual; and every inquiry reſpecting which corroborated the patient's repeated aſſertion, "that he had never ſuffered the leaſt injury from any animal, except the bite, inflicted *twelve years ſince*, by an apparent mad dog." (See Memoirs of the Liter. and Philoſ. Society of Mancheſter, vol. iv. part ii. p. 431.) In this inſtance, the nature of the diſeaſe was perfectly clear, and the evidence as to the bite not leſs ſatisfactory: ſo that we muſt either admit the latent ſtate of the poiſon for this long interval, or the *ſpontaneous* origin of hydrophobia in man. Dr. Bardſley's paper, which contains a reference to numerous caſes, in which the latent period of the poiſon was long, is worthy of peruſal. But to proceed.

At an uncertain time after the infliction of the bite, the patient feels ſome degree of pain or uneaſy ſenſation in the bitten part, which is ſometimes compared to a ſcorching by heat, is ſometimes attended with itching, and ſometimes ſuppoſed to be rheumatic. This pain, when the bite, as is moſt frequent, is in the hand, ſpreads up the outſide of the arm to the ſhoulder, (not affecting the axilla,) and the neck. In ſome caſes the cicatrix left by the bite is ſaid to become inflamed, and even to diſcharge. Theſe pains are ſoon ſucceeded by a general depreſſion of ſpirits, and eſpecially a ſenſe of undeſcribable liſtleſſneſs and anxiety. Sometimes a general rigor or chill occurs, as in the commencement of a fever. The night is paſſed in the ſame reſtleſs ſtate, without ſleep. The appetite begins to fail, and ſome thirſt is preſent. And now the peculiar ſymptom which gives the diſeaſe its name, the *dread of liquids*, is diſcovered, often accidentally, on attempting to take drink; as the liquid approaches the lips, a ſudden convulſive ſob, or catch in the breath, with a momentary ſenſation of choking, takes place, which is renewed at every attempt. As the diſeaſe advances, this attempt is not thought of without horror, and the very idea excites theſe ſpaſmodic fits of choking in the throat, and catching of the breath. This may be beſt illuſtrated by examples. "On our propoſing to him to drink," ſays Dr. Marcet, ſpeaking of a hydrophobic patient, "he ſtarted up, and recovered his breath by a deep convulſive inſpiration; yet he expreſſed much regret that he could not drink, as he conceived it would give him great relief, his mouth being extremely parched and clammy. On being urged to try, however, he took up a cup of water in one hand and a tea-ſpoon in the other. The thought of drinking out of the cup appeared to him intolerable; but he ſeemed determined to drink with the ſpoon. With an expreſſion of terror, yet with great reſolution, he filled the ſpoon, and proceeded to carry it to his lips: but before it reached his mouth, his courage forſook him, and he was forced to deſiſt. He repeatedly renewed the attempt, but with no more ſucceſs. His arm became rigid and immoveable, whenever he tried to raiſe it towards his mouth, and he ſtruggled in vain againſt this ſpaſmodic reſiſtance. At laſt ſhutting his eyes, and with a kind of convulſive effort, he ſuddenly threw into his mouth a few drops of the fluid, which he actually ſwallowed. But at the ſame inſtant he jumped up from his chair, and flew to the end of the room, panting for breath, and in a ſtate of indeſcribable terror." (See Medico-chirurgical Tranſactions, vol. i. p. 138. Lond. 1809.) A patient of Dr. Bardſley's, having eaten ſome bread and butter, with great difficulty, was requeſted to waſh down this ſolid food with ſome liquid; and he expreſſed a readineſs to make the trial. "On receiving a baſin of butter-milk, he haſtily applied it, with a determined countenance, to his lips;—when he was inſtantly ſeized with ſo ſevere a ſpaſm and rigidity of the muſcles of the neck, that he was compelled, in an agony, to deſiſt from drinking. Shortly after, he raiſed himſelf upon his knees in bed, took the bowl again into his hands, and by forcibly ſtretching his neck forward, at the moment he received the liquid into his mouth, and then violently throwing his head backwards, he ſucceeded in ſwallowing a ſmall portion. He appeared highly gratified by the ſucceſs of this effort, and the fortitude he had exhibited; and exultingly demanded another draught of the butter-milk, as he now thought he could conquer the difficulty he had hitherto experienced. But a violent return of the ſpaſms in the throat and neck checked this attempt. Theſe convulſions were terminated by the ſtomach diſcharging the liquid previouſly ſwallowed, highly tinged with bile." (Memoirs of Mancheſter Society, vol. iv. p. 439.) In a word, it is obvious to the byſtander, that every attempt to paſs liquid over the root of the tongue excites convulſions in the larynx and pharynx, and even in the muſcles of the cheſt and abdomen; and therefore this ſymptom, the *hydrophobia*, as Dr. Mead and others have remarked, is not a delirious dread, or hallucination of the mind, but a matter of experience, which at firſt excites the ſurpriſe of the patient. Mead affirms that it ſhould have been called, not *hydrophobia*, but δυσκαταποσις, *dyſcatapoſis*, or difficulty in ſwallowing. (See his Mechanical Account of Poiſons, p. 146, 3d edit.)

But the dread of ſwallowing liquids, although the moſt ſingular ſymptom of the diſeaſe, and the origin of its name, conſtitutes but a ſmall part of this diſtreſſing malady. It is only one among many other effects of the poiſon upon the nervous ſyſtem at large. The ſtate of diſeaſe into which the nervous ſyſtem is thrown, is evinced by the extreme irritability of the whole frame, mind and body, and the exceſſive ſuſceptibility to all impreſſions; hence the conſtant watching and inquietude; and the ſudden fits of anger and impatience, ariſing from the moſt trifling cauſes, as the patient himſelf readily allows, and even wonders at, and apologizes for, in the ſucceeding moments of compoſure. Hence alſo the diſtreſs, and even the recurrence of his ſpaſms, occaſioned often by the ſlighteſt motion of the air, as from opening the door, from the approach of any perſon, or even of a perſon's hand, in front of him; from hearing water poured from one veſſel to another; or even by the buzzing of a fly. This morbid excitability of the nervous ſyſtem, is farther manifeſted in the extreme timidity and ſuſpicion of the

the patient, in the imaginary objects of terror and uneaſineſs which the ſenſes frequently repreſent to him, and in the occaſional delirium and incoherence of ideas, from which, however, he eaſily collects himſelf. The circumſtances may be illuſtrated by referring to almoſt every caſe on record. Dr. Bardſley, ſpeaking of the patient before mentioned, ſays, "He was now alarmed to a degree of diſtraction at being left alone; he examined every object with a timid and ſuſpicious eye; and, upon the leaſt noiſe of a footſtep in the gallery, he begged, in the moſt piteous accents, to be protected from harm."—"I obſerved he frequently fixed his eyes, with horror and affright, on ſome ideal object; and then, with a ſudden and violent motion, buried his head underneath the bed-clothes. The laſt time I ſaw him repeat this action, I was induced to inquire into the cauſe of his terror. He eagerly aſked if I had not heard howlings and ſcratchings? On being anſwered in the negative, he ſuddenly threw himſelf upon his knees, extending his arms in a defenſive poſture, and forcibly throwing back his body and head. The muſcles of the face were agitated by various ſpaſmodic contortions;—his eye-balls glared, and ſeemed ready to ſtart from their ſockets; and at that moment, when crying out in an agonizing tone—'Do you not ſee that black dog?'—his countenance and attitude exhibited the moſt dreadful picture of complicated horror, diſtreſs, and rage, that words can deſcribe, or imagination paint."—"His mental faculties at this period (a ſhort time before death) ſuffered very little derangement; for although, when not attending to external objects, he would utter ſome incoherent ſentences; yet, the moment he was ſpoken to, he was perfectly collected, and returned rational anſwers." (Bardſley, loc. cit.) Dr. Marcet obſerves, in regard to his patient, on the fifth day of the diſeaſe—"He appeared ſtill coherent and diſtinct in his ideas; but ſome of his conceptions were conſiderably diſturbed. His ſight was not materially impaired, for he could tell what hour it was by looking at the clock: but he often fancied he beheld objects which were not before him. He thought, for inſtance, that he ſaw various inſects and reptiles crawl about him. 'My ſight is queer,' ſaid he, 'I think I ſee ſtrange animals,' &c. Once or twice he exclaimed with an accent of terror, 'Who is pouring cold water down my head?'—yet no one was near him. He was conſcious of his extreme irritability, and often prayed to be kept tranquil. This unfortunate man, in the height of his diſtreſs, ſtill apologized for his acts of violence, and declared that he could not conceive what occaſioned this extraordinary agitation." Medico-chirurgical Tranſac. vol. i. p. 147.

Theſe ſtatements may convey to the reader ſome notion of the miſerable condition of the ſufferer, afflicted by this malady, and of its peculiar and characteriſtic ſymptoms; the impreſſion of which cannot be eaſily effaced from the recollection of thoſe who have witneſſed them. There are ſome other circumſtances belonging to the diſeaſe, of leſs note, which remain to be mentioned. One of theſe is a conſtant collection of a thick, ropy, and tenacious ſaliva in the fauces, which is often productive of extreme diſtreſs; for as the miſerable ſufferer is unable to make the ſmalleſt attempt to ſwallow it, without exciting the convulſive choking, he ſpits it out inceſſantly, and with great vehemence and difficulty, often cautioning the byſtanders to keep out of the way. "Oh! do ſomething for me;" exclaimed Dr. Marcet's patient, "I would ſuffer myſelf to be cut to pieces! I cannot raiſe the phlegm; it ſticks to me like bird-lime." Dr. Wavell's patient, at times, drew the viſcid phlegm from his mouth with his fingers, and with inconceivable rapidity and eagerneſs, threw it againſt the wall. The pulſe in the beginning is not quick, nor is the ſkin hot; and there is none of the muſcular debility ſo remarkable in fever: but as the diſeaſe proceeds, there is ſome feveriſh heat, and the pulſe becomes quick, varying, however, exceedingly as ſlight cauſes of irritation influence the patient: as death approaches, it uſually becomes very quick and tremulous. Sickneſs and vomiting often occur, when a little phlegm, tinged with brown or yellow bile, is brought up. There is often a ſenſe of great oppreſſion and ſtricture about the breaſt, or what has been called anxiety about the præcordia, and which is probably an affection of the heart; for it is accompanied with ſighing and deep irregular inſpirations, and the patients find ſome relief from motion, as running and walking, which ſhew the lungs not to be the ſeat of the oppreſſion. The countenance is generally ſorrowful, and often expreſſive of a great degree of horror and diſtreſs.

There is a conſiderable variety in the ſymptoms in different conſtitutions: even the hydrophobia, or dread of ſwallowing liquids, occurs in very different degrees. But there is no part of the diſeaſe that admits of greater variation than the degree of mental derangement, which in ſome does not amount to more than extreme irritability and impatience; in others to muttering and incoherent talking, yet giving rational anſwers when queſtions are aſked; and in a few it riſes into ſhort fits of the moſt violent rage and fury, in which the patients bite and tear themſelves and every thing near them. In general they manifeſt no diſpoſition to miſchief; yet popular prejudice is ſtill on the watch for the "barking and biting like a dog," as the diſeaſe advances. In the caſe related by Dr. Marcet, the byſtanders confidently expected the ſymptom of *barking*, which they "thought at laſt to have clearly diſcovered in the peculiar noiſe which he made in breathing." Dr. Wavell, ſpeaking of this ſort of reſpiration, ſays, "the noiſe he made in drawing air into his lungs was undoubtedly peculiar; but neither in my opinion, nor in that of any other medical gentlemen who attended him, did it bear the leaſt reſemblance to the barking of a dog." (Med. Records and Reſearches, p. 151.) Were this notion of the canine metamorphoſis, which the diſeaſe has been ſuppoſed to effect in man, merely ſpeculative, it would be leſs important to confute it; but it is to be lamented, that the practical reſult of it, in the cruel and murderous plan of ſuffocating the patient, has been followed, both in France and in this country, within the laſt twenty years of the eighteenth century. See Hamilton on Hydrophobia, vol. ii. p. 140, and App. p. xxviii.

The duration of life, after the commencement of the ſymptoms of hydrophobia, has been on an average about *four days;* it varies from thirty-ſix hours to five, or even, though rarely, ſix days. The termination of life is likewiſe various in different inſtances: death is often very ſudden, being produced by one of the convulſive attacks, ſuch as occur on the attempts to drink; at other times, more general convulſions carry off the patient; while in other inſtances, again, the ſtrength ſinks ſuddenly, the patient becomes quiet and calm, and dies with a placid countenance, and without a ſtruggle.

Diſſections.—With the hope of acquiring ſome knowledge of the nature of this diſeaſe, and of the organs in which it is principally ſeated, phyſicians have ardently purſued the inveſtigation of the changes of ſtructure connected with it, by careful and almoſt innumerable diſſections of thoſe who have died of it. But it is to be lamented that no light whatever has been thrown upon the ſubject by theſe ample examinations. For, although in general ſome morbid changes in the ſtructure of different parts has been diſcovered, yet theſe have been found in various organs, in different caſes; thoſe organs, which appeared to be the principal ſeat of diſeaſe in one inſtance, being found altogether ſound in another, and *vice verſâ*; and the morbid changes obſerved in general, are by no means adequate to account for the phenomena of the diſeaſe.

The moſt frequent appearances which have preſented themſelves on diſſection, have been marks of ſlight inflammation in the inner coat of the ſtomach, near the *cardia* or upper orifice, conſiſting of red ſpots or blotches, or merely of an increaſed number of red veſſels, with ſmall ſtreaks of red blood; in many caſes a ſimilar inflammatory appearance has been found in the *pharynx*, or upper part of the gullet, ſometimes extending along the whole of that paſſage to the ſtomach. This ſtate of the throat, *æſophagus*, and ſtomach, ſeems to afford an explanation, in ſome meaſure, of the pain and difficulty of deglutition, eſpecially of liquids, which require a more active contraction of the paſſage: but the exceſſive dread at the attempt, and the convulſions excited by it, can only be aſcribed to that peculiar ſtate of irritability of the nervous ſyſtem, which characterizes the diſeaſe. On the other hand, however, caſes of hydrophobia have occurred, in which no inflammation in thoſe parts have been found. (See Dr. Babington's in Med. Records, &c. p. 124.) In ſome caſes, a glairy fluid has been found in the ſtomach in conſiderable quantities; in others a dark bilious matter has been ſaid to line its cavity. Hamilton, vol. i. p. 232.

Many diſſections of perſons who had died in a ſtate of rabies are recorded, in which appearances of inflammation and great congeſtion of the blood-veſſels were diſcovered in other viſcera, eſpecially in the brain and its ſurrounding membranes, and in the lungs. Sometimes not only an increaſed vaſcularity of the *pia mater*, the choroid *plexus*, and the brain itſelf has been found, but alſo ſlight watery effuſions on the ſurface of the brain. A ſtate of congeſtion in the lungs, reſembling that which is diſcovered after a fatal peripneumony, has occurred in many inſtances to a conſiderable extent; and the veſſels of the diaphragm have alſo been obſerved to be unuſually turgid. (See Dr. Babington's caſes in Med. Communic. and Med. Records, &c.—Mead on Poiſons.—Ferriar's Med. Hiſt. and Reflections, vol. iii.) Dr. Ferriar, indeed, is diſpoſed to attribute much of the diſeaſe to this pulmonary derangement. "If future diſſections ſhould prove," he ſays, "that congeſtion in the lungs generally appears in thoſe who die of rabies, I confeſs that I ſhould be diſpoſed to conſider this diſeaſe as dependent on the obſtruction of the circulation in that important organ. Accumulation of blood in the head, and compreſſion of the brain, muſt be the conſequence of ſuch an obſtruction, rapidly formed. The quick panting reſpiration, anxiety, and ſudden debility, may be referred to the ſame cauſe. In fact, we find a ſimilar degree of tremor attendant on the croup, which conſiſts in inflammation of the trachea, and deſtroys by ſuffocation. That degree of inflammation in the ſtomach and œſophagus, which produces the difficulty of ſwallowing liquids, may not only ariſe from ſympathy, but the ſymptom itſelf may occur in conſequence of the ſtate of the lungs alone." (Loc. cit. p. 34.) But in forming theſe conjectures, this intelligent phyſician has overlooked the circumſtance, that, however rapidly ſuch congeſtion may take place, in common peripneumony, no approximation of any of the ſymptoms to thoſe of hydrophobia is ever ſeen to occur; and the peculiar affection of the nervous ſyſtem is ſurely inexplicable upon any ſuch mechanical grounds.

Some writers have deſcribed various derangements of the liver and other abdominal viſcera, which diſſection has diſcovered, eſpecially appearances of congeſtion or ſlight inflammation: Mead, Hillary, and others, have mentioned a peculiar dryneſs of the pericardium, &c. But theſe changes appear to be accidental, and are more frequently not to be found. So that, on the whole, it would appear, that the nature of the malady is not manifeſted by any peculiar diſorder of ſtructure in any organ of the body, and therefore is beyond the reach of anatomical inveſtigation.

Diagnoſis.—From the peculiar nature of the ſymptoms above detailed, it might be conceived that no difficulty could occur, in diſtinguiſhing *rabies canina* from every other diſeaſe to which the human body is liable. But this is very far from being the caſe, as the records of medicine evince. For many hiſtories are related, in which, although the diſeaſe was the conſequence of a bite, it partook more of the nature of ſome other malady; and others are detailed, in which no bite had preceded the diſeaſe, or had occurred at ſo diſtant a period as to render its influence in exciting the diſeaſe extremely queſtionable: not to mention the number of miſtakes which have been committed, in conſequence of the ſymptom (*hydrophobia*, or *dread of water*,) being ſuppoſed to be the eſſence, or pathognomonic ſymptom of the diſeaſe.

In many circumſtances the *tetanus* bears a conſiderable reſemblance to *rabies*, and has, doubtleſs, been miſtaken for it. (See TETANUS.) This moſt violent and fatal diſeaſe is moſt frequently occaſioned by ſlight wounds, eſpecially about the hands or other tendinous parts; it ſeldom appears till after ſome little time has elapſed, and the wound has healed; it is marked by paroxyſms of violent general ſpaſms, beginning in the neck and throat, and accompanied by difficulty of ſwallowing, or total loſs of that power; theſe ſpaſms are excited by the ſlighteſt cauſes, "for almoſt every attempt at motion, as attempting a change of poſture, *endeavouring to ſwallow*, and even to ſpeak, ſometimes gives occaſion to a renewal of the ſpaſms over the whole body." (See Cullen, Firſt Lines, vol. iii. chap. on *Tetanus*); and the diſeaſe generally proves fatal by one of theſe convulſions about the fourth day. In all theſe circumſtances there is much ſimilarity with thoſe of rabies, inſomuch that ſome practitioners have denied the exiſtence of rabies, as the reſult of the poiſon of a rabid animal; and contended that the diſeaſe is, in all caſes, a tetanus, excited only by the wound which the teeth inflict. Inſtances certainly occur, in which, from a view of the ſymptoms, it might be difficult to decide, whether the diſeaſe were tetanus or hydrophobia. Dr. Bardſley deſcribes the caſe of a young gentleman, who, after having had his finger ſlightly wounded by a ſplinter of wood, was affected in about a week with ſpaſms about the lips, locked jaw, and paroxyſms of general ſpaſm. On the third day after the attack he could not ſwallow any watery fluids. "Whenever they approached his mouth, the convulſive ſpaſms of the face returned, and his head was forcibly drawn backwards." (Mem. of the Mancheſter Soc. vol. iv. p. 477.) The perſon who communicated this caſe, had formerly ſeen the ſame ſymptoms produced by the bite of a horſe. Both theſe patients recoverd. Similar examples of the occurrence of hydrophobic ſymptoms, ariſing in caſes of local injury, are mentioned by Hildanus, Cælius Aurelianus, and others.

It muſt be obſerved, however, that the *tetanic* ſpaſms generally commence within a few days after the injury, or in a much ſhorter period than thoſe of rabies; that the jaw is commonly rigidly locked in tetanus, and the muſcles of the neck and back moſt particularly affected; that the ſpaſms are of a more fixed or "*tonic*" ſpecies, (in the language of Cullen) conſiſting of rigid and long-continued contraction, rather than of ſhort convulſive action, and are relieved rather by remiſſion of their violence, than by a complete

plete ſolution of the ſpaſm; that there is leſs feveriſhneſs, quickneſs of pulſe, and thirſt in tetanus; and above all, that there is little of that extreme mobility of feeling, and anxious, impatient, and apprehenſive ſtate of mind, which marks the hydrophobic condition.

There is another diſeaſe, *hyſteria*, which, in ſome of the many forms which it aſſumes, occaſionally puts on a hydrophobic appearance. The leading ſymptoms of this diſeaſe are often of a violently ſpaſmodic nature; and one of them, which has been conſidered as pathognomonic, the *globus hyſtericus*, conſiſts in a ſpaſmodic affection of the gullet, and is often connected with difficulty of ſwallowing. But the concourſe of ſymptoms in hyſteria, generally differs altogether from thoſe of rabies, and could lead to no miſtake, had not the error of regarding the *dread of water* as the eſſence of that diſeaſe been adopted. In conſequence of this error, and the improper application of the term *hydrophobia*, as the name of the diſeaſe, extreme confuſion has occurred in the hiſtory of canine madneſs.

Thus while ſome phyſicians, miſled by this name, have deſcribed caſes of *ſpontaneous* hydrophobia, *i. e.* hydrophobia ariſing without any obvious exciting cauſe; others have referred the origin of the diſeaſe to various cauſes, altogether different from each other. Dr. Ruſh, for inſtance, enumerates *twelve* cauſes of hydrophobia, beſides the bite of a rabid animal; among theſe are cold night air, worms, eating beech nuts, great thirſt, fear, hydrocephalus, and typhus fever. (See Med. Inq. and Obſ. vol. v. p. 213.) The truth is, that the ſymptom *hydrophobia* is ſo far from being peculiar to canine madneſs, that it occurs in a number of other diſeaſes; and, on the other hand, it is in ſome caſes ſaid to be actually *abſent* from the true rabies. A fatal caſe of canine madneſs is related by Hildanus, (p. 365. obſerv. 88.), in which there was no hydrophobia. And three caſes of the ſame nature are mentioned by Dr. Mead. (On Poiſons, p. 147.) But the number of diſorders in which a difficulty of ſwallowing, and a concomitant hydrophobia occurred, is very great. Mead, Morgagni, Plater, and others notice it as accompanying hyſteria. "I have known it," ſays the firſt named phyſician, "in the height of a violent hyſteric diſorder, to have continued for many hours, till the convulſive motions in the throat were quieted by proper medicines; and I remember a caſe, in which fits of a palpitation of the heart were attended with ſo great a degree of it, that it ſeemed not to differ from the true hydrophobia." (Loc. cit.) Boerhaave uſed to mention an inſtance of it accompanying a fever occaſioned by heat and fatigue, joined to the abuſe of ſpirituous liquors. It has been obſerved connected with various inflammatory and ſpaſmodic affections of the throat, gullet, and ſtomach. Thus Sauvages quotes one caſe, where it ſupervened to typhus; and another, where it accompanied the variolous ſore throat. (See Noſol. Method.) But the moſt remarkable caſes of this nature are to be found in the Edin. Medical Eſſays, (vol. i. p. 222 and 227,) in which hydrophobia was produced by unuſual irritation in the ſtomach, without the moſt diſtant ſuſpicion of rabid poiſon. In one of theſe caſes there was violent inflammation of the ſtomach, the patient frequently ſpouted ſaliva from his mouth, and had all the horror at the ſight of water, which occurs in caſes of true rabies, where the difficulty of drinking has been experienced. Both theſe perſons recovered (See GASTRITIS.) The ſymptom hydrophobia, or *dread of water*, has alſo accompanied pleuriſy and peripneumony (ſee Ferriar's Med. Hiſt. and Refl. vol. iii. p. 24—26.); and the writer of this article once ſaw it connected with St. Vitus's Dance.

But farther, this ſymptom, the dread of liquids, unconnected with rabies, does not always ariſe from local irritation; it has been brought on by violent affections of the mind, in irritable and delicate habits, and terminated fatally. (See two caſes from Plater and Sauvages, quoted by Dr. Bardſley, in Mancheſter Tranſ. vol. iv. p 470) Dr. Percival has remarked, that it has ſometimes been brought on by the imagination alone; and Dr. Ferriar, in illuſtration of this remark, ſays, "I met with an inſtance of this kind lately, in which it was very difficult to prevent a perſon from rendering himſelf completely hydrophobic. Himſelf and his wife had been bitten by a dog which they ſuppoſed to be mad. The woman thought herſelf well, but the man, a meagre hypochondriacal ſubject, fancied that he had uneaſineſs in his throat, and that he could hardly ſwallow any thing. When he firſt applied to me, a medical friend who was preſent, aſked him whether he had any ſenſation of heat at the pit of the ſtomach. He anſwered in the negative, doubtfully; but, next day I found him in bed, complaining of *heat in the pit of the ſtomach*, difficulty of ſwallowing, tremors, and confuſion in the head. He continued to perſuade himſelf he was ill of rabies, and confined himſelf to bed, expecting death for near a fortnight. At laſt I remarked to him, that perſons who were attacked by rabies never ſurvived more than ſix days; this drew him out of bed, and he began to walk about. By a little indulgence of his fears, this might have been converted into a very clear caſe of *ſpontaneous hydrophobia*, and the patient would probably have died."

The uſe of the appellation hydrophobia, then, deduced from a ſingle ſymptom, which belongs to a variety of diſeaſes, evidently tends only to miſlead, as the reſpectable phyſician juſt quoted remarks, by diverting the attention of practitioners to ſuppoſed analogies, which have no other foundation than the abuſe of a word. To be correct, *we muſt preſerve the diſtinction* between *rabies*, and diſeaſes which are eſſentially different from it in their uſual appearance, and which only acquire an adventitious reſemblance to it under uncommon circumſtances. We may, therefore, reaſonably queſtion the exiſtence of ſuch a diſeaſe as *ſpontaneous* hydrophobia. "If thoſe caſes be analyzed," Dr. Ferriar remarks, "they will be found to belong to the claſs of hyſterical, febrile, mental, or ſpaſmodic diſorders, and by ranking them under their proper titles, we ſhall at once clear this ſubject from a great and accumulating maſs of error. By conſidering the matter in this point of view, we are alſo enabled to explain the contradictory reports hitherto ſo perplexing, on the effects of remedies in rabies. It is eaſy to perceive, that evacuant and antiſpaſmodic remedies would remove a difficulty in ſwallowing, occaſioned by inflammation or ſpaſm in the ſtomach or œſophagus; that bark and wine would cure it in caſes of typhus and low mania; and that opium and the cold bath would be ſucceſsful, when is it accompanied by tetanus." Vol. iii. p. 30. See alſo Hunter, in Tranſ. of a Society, &c. p. 203. Meaſe on Hydrophobia, p. 6—11.

Prevention and Cure.—As no remedy has been diſcovered which has any effect in the removal of this extraordinary diſeaſe, when its ſymptoms have commenced, the means of prevention have ever been deemed objects of the firſt importance. For this purpoſe numerous prophylactics have been propoſed from early times, and many are in general uſe, which are ſuppoſed to counteract or expel the poiſon, by their effects upon the conſtitution. Notwithſtanding, however, the teſtimony of diſcerning phyſicians, expreſſed in terms of the greateſt confidence, in favour of particular preventive medicines; upon fairly weighing the proofs of their efficacy, not one appears entitled to the ſmalleſt credit.

It will be almoſt ſufficient to enumerate the remedies which have been ſuggeſted for this purpoſe, without any comment. The abſurd jumbles of *theriacæ*, whether old or new, Mead admits to be unworthy of notice; and from this cenſure we cannot except the aſhes of river craw-fiſh, burnt alive upon copper, which Galen and Dioſcorides aver to be invariably ſucceſsful;—the roaſted liver of the mad dog;—the ſponge or excreſcence of the dog-roſe;—the famous aromatic opiate of Scribonius Largus;—the powder of tin with mithridate, ſo extolled by Mayerne, Grew, &c.;—nor even the *lichen-cinereus*, (aſh-coloured liver-wort,) or the *pulvis antilyſſus* (compoſed of this lichen and pepper), which Mead himſelf introduced into the pharmacopœia of the London college, and which he affirms he had never known to fail of ſucceſs, though he had uſed it a thouſand times. (See Mead on Poiſons, p. 158. et ſeq.—Boerhaave, Aphoriſm 1147, with Van Swieten's commentary.) So confident, indeed, was that learned phyſician in the powers of this drug, that he affirms, "I have often wiſhed, that I knew ſo *certain* a remedy in any other diſeaſe!" Another preventive, which was introduced from China by ſir George Cobb, and has been called the *Tonquin* medicine, has been equally extolled as an infallible prophylactic: this conſiſts of large doſes of *muſk* and native *cinnabar*. The Chineſe give it in the doſe of ſixteen grains of muſk, conjoined with a ſcruple of native, and the ſame quantity of factitious cinnabar, which, if it fail to procure ſleep and ſweating, is repeated in three hours. (See Hillary on the Diſ. of Barbadoes, p. 266.) But this medicine, like the preceding, has been found to fail altogether. There is another pretended ſpecific, which claims our attention chiefly becauſe it ſtood high in reputation for many years, and is even now ſcarcely laid aſide: this is the famous *Ormſkirk* medicine, prepared by Mr. Hill of that town. It has been too clearly proved, however, that this medicine is incapable of preventing the acceſſion of rabies in perſons bitten by rabid dogs. Dr. Fothergill was among the firſt to repreſent, from a very clear caſe, (that of Mr. Bellamy, Med. Obſ. and Inquiries, vol. v. art. 19.) that its virtues were not equal to its reputation; and other caſes have ſubſequently occurred, in which the diſeaſe enſued and terminated fatally, notwithſtanding the fulleſt uſe of the medicine. (See Dr. Babington's caſe in the Med. Records and Reſearches, Hamilton, vol. i. p. 165, &c.) Indeed, if the analyſis of Dr. Heyſham, which was repeated by Dr. Black, be correct, it would ſeem pretty evident *à priori*, that this celebrated Ormſkirk noſtrum could not poſſeſs any active properties; its principal ingredient being *chalk!* From the analyſis of this eminent profeſſor and his pupil, the whole compoſition is as follows; namely, half an ounce of powdered chalk, ten grains of alum, three drams of Armenian bole, one dram of the powder of elecampane root, and ſix drops of the oil of aniſe. (See Heyſham. Diſſ. Inaug. De Rabie Caniná, Edin. 1777.) After the failure of ſo many medicines, which have been reputed infallible, and after ſuch men as Dr. Mead could be deceived into the belief of ſuch infallibility, the writer of the article Dog, in this work, muſt expect that another "ſpecific" will be received by moſt readers with a great degree of ſcepticiſm, notwithſtanding the number of experiments which he alleges in its ſupport. This remedy conſiſts of a decoction of the freſh leaves of rue and of the tree-box, of each two ounces, and of ſage half an ounce. He avers that this medicine was given to ninety animals, of which only one went mad; and that about forty human perſons have taken it, of whom none ſuffered the diſeaſe. But we are diſpoſed to fear that this will be found liable to the ſame cenſure which is applicable to all the reſt.—"No one of them," to borrow the words of Dr. Ruſh, "has, I believe, done any more good, than the boaſted ſpecifics which have been uſed to eradicate the gout or to cure old age."

But how, it will be aſked, have theſe medicines obtained the credit which they have for a long time poſſeſſed? Probably, from ſome of the following circumſtances attending the bite. 1. The animal may have been enraged, but not diſeaſed. 2. He may have been diſeaſed, but not rabid. There is no doubt that *the diſtemper*, and other febrile diſorders of dogs, have been miſtaken for rabies. (See a paper of Dr. Jenner's on this ſubject, Medico-Chirurg. Tranſ. vol. i. p. 236.) 3. The ſaliva, when infectious, may have been ſo wiped off the teeth in paſſing through the clothes of the perſon bitten, as not to have entered the wound. This is rendered extremely probable by the circumſtance that bites in the face have been moſt frequently followed by hydrophobia. But 4th, and above all, it is now a well aſcertained fact, that of thoſe who have been bitten by dogs, actually rabid, a very ſmall number have been afterwards ſeized with hydrophobia, whatever treatment was adopted, or even when nothing whatever was done with a preventive view. It may be added, however, that, as mental impreſſions occaſionally both excite and cure hydrophobic ſymptoms, and eſpecially the ſuppoſed incipient ſymptoms, ſo any of theſe noſtrums, in which the patient placed confidence, would remove theſe imaginary threatenings of the diſeaſe. See Dr. Percival's Letter to Dr. Haygarth, in the London Med. Journal for 1789, vol. x. p. 300.

We are induced to notice another prophylactic, chiefly from the antiquity of its origin, and the general credit which it obtained even to recent times: this is the employment of cold-bathing. Celſus firſt mentions this remedy, but recommends it principally as a cure; and apparently upon theoretical principles, though he calls it *unicum remedium*. (De Med. lib. v. cap. 27.) For, as the patient both deſires liquids and fears to drink, he adviſes that he be thrown unawares into a fiſh-pond; and, if he cannot ſwim, that he be ducked ſeveral times and taken up again, and, if he can ſwim, that he be forcibly immerſed, and compelled to ſwallow water, "ſo that his thirſt and dread of water may be cured together." From this abſurd notion, apparently, the practice of half-drowning perſons bitten by rabid animals, in modern times, has ariſen: but ample experience has demonſtrated that the practice is not leſs frivolous than the theory upon which it was built; and among thoſe who have undergone the operation of immerſion, whether by mere dipping, or to the extent of "drowning and recovering by turns," as Mead calls the ancient practice, an equal proportion have been ſubſequently attacked with rabies, as among thoſe who have not been ſubmitted to this mode of treatment.

Notwithſtanding the inefficacy of all the alleged antidotes to the poiſon of a rabid animal, there ſtill remains a method by which it is probable that the occurrence of hydrophobia may be effectually prevented: this conſiſts in the local treatment of the wound occaſioned by the bite. As the ſubſequent malady originates from the operation of the poiſon, introduced with the ſaliva of the rabid animal, any expedient by which the poiſon could be deſtroyed or removed, previous to its operation on the conſtitution, would of courſe ſecure the individual from its effects. Upon this principle, the ancients recommended the enlargement of the wound by inciſion, the application of a cupping-glaſs, and of the actual cautery, and the maintenance of a diſcharge for many days, (ſee Celſus, lib. v. cap. 27. Galen. de Ther. lib. i. cap. 16.) a practice which has been followed by more modern practitioners. Hildanus Obſ. Cent. i. Obſ. 87. Mead, loc. cit. p. 156.

In order to fulfil this indication by the local treatment of the wound, the following points appear to deſerve attention; 1ſt. The removal of the poiſon by waſhing the parts ſimply; 2dly. The deſtruction of the part by *cauſtic;* and, 3dly. The *exciſion* of it by the knife. The firſt meaſure, or ablution of the wound, has been ſtrongly recommended by Drs. Haygarth and Percival, to be commenced immediately after it may have been inflicted. The practice is ſafe, and may poſſibly be beneficial, when thus early reſorted to; it may alſo be adviſable, where the wound has been inflicted in the face, near the eye, or near ſome large blood-veſſel; or where the patient reſiſts all ſolicitation to ſubmit to the knife; or where there may be ſo little probability of the madneſs of the dog, as to render it unjuſtifiable to ſubject the patient to preſent pain, and future deformity. (Percival, in Lond. Med. Journal, vol. x. p. 308.) This waſhing, however, muſt be conducted with the moſt perſevering attention, in bad caſes, for ſeveral hours, firſt by an abundant effuſion of cold water, and afterwards of warm water; "a continued ſtream of it, poured from the ſpout of a tea-kettle, held up at a conſiderable diſtance, is peculiarly well adapted to this purpoſe. If the canine poiſon infuſed into a wound were of a peculiar colour, as black like ink, we ſhould all be aware that plenty of water and patient diligence would effectually waſh out the dark dye; but this could not be expected by a ſlight and ſuperficial ablution." (Haygarth, ibid. p. 297.) Whence Dr. Haygarth adviſes the plan of colouring the wound with ſaliva tinged with ink, after it has been carefully waſhed; and, after a few hours, to waſh out the ſtain; by which we obtain a ſort of ocular proof of the complete ablution Dr. J. Hunter remarks, that as there may be caſes in which inſurmountable objections to more effectual ſteps may render this method worthy of trial, it would probably be more ſucceſsful, if, after waſhing copiouſly with cold water, the cauſtic alkali was to be added to the water, in ſuch proportion as the part could eaſily bear, and the waſhing to be continued with this for ſome time. Tranſ. of a Society, &c. before quoted.

The ſame author obſerves, that *cauſtics* may be admiſſible in ſome caſes, when the knife cannot be uſed; and though they have failed in certain inſtances, yet that was probably owing to their not having been applied to all the infected ſurfaces: and he ſuggeſts the propriety of employing for this purpoſe the cauſtic vegetable alkali in a ſolid form, becauſe it acts more ſpeedily, and alſo more completely deſtroys and diſſolves all animal ſubſtances. It appears that this cauſtic ſubſtance has actually been employed for many years by Mr. Simmons, and the other ſurgeons at the Mancheſter infirmary, with uniform ſucceſs; in upwards of forty caſes, in which Mr. Simmons applied the *kali purum*, or cauſtic potaſh, to the bitten parts, no hydrophobia enſued. Ferriar's Med. Hiſt. &c. vol. iii. append. p. 221.

The only certain means, however, hitherto employed as a preventive of the diſeaſe in queſtion, are to be found in the *exciſion* of the parts wounded; and, therefore, whenever the parts can be cut out, it ought always to be done. This operation muſt be performed with a bold hand, and the utmoſt care muſt be uſed to effect the removal of every part with which the dogs teeth may have come in contact; for the ſmalleſt portion left might produce the diſeaſe. It becomes, therefore, neceſſary for the operator to examine accurately every portion of the wound, and to aſcertain to what depth, and in what direction, the teeth may have penetrated, keeping in his mind the ſituation of the parts in the act of biting, in which the ſkin and fleſh are pinched up, and therefore put out of their natural poſition, before the teeth penetrate them. He ſhould again cautiouſly examine the wound, after the exciſion has been made, in order to aſcertain that every part lacerated by the teeth has been removed,

An important queſtion here ariſes, in regard to the period after the bite, at which the operation of exciſion may be performed with ſecurity to the patient. This can only be ſolved after a long and cautious experience, which, on this ſubject is rendered uncertain and difficult to be obtained, by the numerous failures of the poiſon to excite the diſeaſe, independently of any preventive meaſures. And, in a theoretical point of view, it may ſeem to involve another queſtion, which has been much diſcuſſed; namely, whether the poiſon produces its deleterious effects on the conſtitution, in conſequence of being taken up by the abſorbents, and carried into the circulation; or whether it acts merely upon the extremity of the nerves of the part, and through the medium of them influences the reſt of the nervous ſyſtem. Such a queſtion, however, is perhaps beyond our deciſion, and is not neceſſarily connected with the practical one previouſly ſtated. We may juſt mention, that, in the caſe related by Dr. Marcet (Medico-Chirurg. Tranſ.), in one of thoſe deſcribed by Dr. Babington, and in another, detailed in the Medical Communications, vol. ii. the pain, originating in the bitten part, at the commencement of the hydrophobia, ſeemed to follow the courſe of the nerves, rather than that of the abſorbents, and was not connected with any affection of the axillary glands, in the two former caſes, in which the bite was in the hand, nor of the inguinal glands in the latter, where the bite was in the leg. Mead imagined that, as the poiſon "*immediately* affects the nervous liquor, the miſchief muſt have taken place before any applications of this kind can be made." But while, on the one hand, we have inſtances on record, in which the exciſion was performed with ſucceſs many hours, and even four or five days, after the bite; ſo we obſerve, on the other, that the poiſon appears to lie long dormant in the part, and only to affect the ſyſtem, after the new inflammation or pain occurs, which gradually extends to the centre. Whence the moſt rational concluſion appears to be that, which Drs. Cullen, Babington, John Hunter, Marcet, and others have adopted, that the poiſoned part might be removed not only many days, but many weeks after the bite, or, in ſhort, *at any time antecedent to the appearance of the ſymptoms* juſt mentioned, which indicate the paſſage of the poiſon into the ſyſtem, and the conſequent impending rabies. Analogy, Dr. Babington remarks, as well as obſervation, ſeems to lead to this inference. "For it is univerſally underſtood, that, in other diſeaſes communicable by inoculation, that is to ſay, by the local application of the infection or poiſon producing them, there is a ſpecific period, prior to which the diſorder may be at any time prevented, by the removal of that part where the matter was at firſt introduced." (Med. Records and Reſearches, p. 127.) See alſo Mémoires de la Soc. Roy. de Médécine de Paris, where there are many inſtances of local treatment being effectual in preventing the diſorder in queſtion, at the expiration of many days.

An account of the *treatment of hydrophobia*, when the diſeaſe has already appeared, will not occupy much of our attention; as it muſt be a mere enumeration of fruitleſs expedients, and of medicines altogether deſtitute even of palliative influence. Nevertheleſs, it is well that we ſhould be acquainted with the unſucceſsful indications, which different practitioners have heretofore purſued, and with the active agents, which they have diligently, but in vain, employed; in order that we may not be occupied in uſeleſs repetitions in future. The want of preconcerted method, indeed, in inveſtigating the cure of this diſeaſe, is very apparent in moſt of the writers on the ſubject, and is probably one of the principal cauſes of the little progreſs that has been made in that important inquiry.

Among the various articles of the Materia Medica, that have been adminiſtered to perſons affected with hydrophobia, *opium* would ſeem, from analogy, to be peculiarly adapted to relieve the ſymptoms; eſpecially the extreme irritability of mind and body, the complete loſs of ſleep, and the convulſions. Accordingly it has been adminiſtered in various forms, in ſome caſes, to an extent that is ſcarcely conceivable *à priori*, and yet without having been found to do any evident good. In a caſe related by Dr. Vaughan, fifty-ſeven grains of ſolid opium were taken in the courſe of fourteen hours, in addition to half an ounce of liquid laudanum, which was injected in an enema: in another inſtance, attended by Dr. Wavell, four grains of opium were ſwallowed every hour, until fifty-four grains had been taken, beſides ten grains in an enema: and in a third, under the direction of Dr. Babington, the enormous doſes of twenty-five grains, and *half a drachm of ſolid opium*, were repeated at ſhort periods, ſo that in *eleven hours* no leſs than *a hundred and eighty grains of opium were taken without any benefit, and even without producing any ſleep*. (See Med. Records and Reſearches.—Vaughan on Hydrophobia, Meaſe on the ſame, &c.) After ſuch evidence of its inefficacy, we may almoſt affirm, with Dr. J. Hunter, "that it can be only imputed to the want of method and order above-mentioned, that this medicine ſtill continues to be given in almoſt every caſe of this diſeaſe."

Blood-letting has been a favourite expedient from the earlieſt records of the malady, and has been frequently employed to a very great degree. Boerhaave conſidered the diſeaſe as highly inflammatory, and Mead ſuggeſted the uſe of early and copious bleeding, till fainting was produced; Fothergill, and others of a later time, employed it freely; and Dr. Ferriar, deeming an inflammatory congeſtion in the lungs an eſſential part of the diſeaſe, as well as a ſimilar condition in the contents of the cranium, ſays that "blood ſhould be drawn from the jugular veins, and perhaps the head and lungs would be beſt relieved by the repetition of bleedings." Dr. Nugent's caſe is quoted as an example of the efficacy of blood-letting in the diſeaſe; but that caſe is a queſtionable example of rabies; and both from the ſeries of preceding ſymptoms of declining health and ſpirits, and from the courſe of the diſorder itſelf, appears to be rather referrable to hyſteria than to rabies. In one of the caſes, deſcribed by Dr. Babington, blood-letting was practiſed without the ſmalleſt benefit; and in the other it appeared to do harm.

Cold bathing, or the *affuſion of cold water* over the body of the patient, has been frequently employed as a curative, as well as a preventive meaſure. Celſus recommended it only when the hydrophobia had appeared; and Van Helmont affirms, that he cured an old man by ſubmerſion in ſalt water, (Ortus Medicinæ.) But in the hands of Boerhaave, Mead, Vaughan, and many others, this expedient has been as inert as any of the preceding. (See Mead, loc. cit. p. 173. 182. Hamilton, vol. ii. p. 14.) In tetanus the cold affuſion has of late been found beneficial; and it is probable that the ſpaſmodic affections, cured in this manner, were of a tetanic nature, and not rabies.

The *warm bath* has proved equally inert; and the free adminiſtration of *mercury*, both internally and by friction, has evinced no greater powers. The uſe of *oil*, which was recommended by Celſus and Cælius Aurelianus, and ſuggeſted more ſtrongly from its beneficial effects in caſes of poiſonous bites inflicted by inſects and reptiles, was revived a few years ago by Dr. Shadwell, of Brentwood (ſee Memoirs of the Med. Soc. of London, vol. ii.); and it has been employed in the way of a bath, by friction, and alſo taken internally; but it has proved altogether inert, and ſome patients, immerſed in an oil bath, have appeared to have their ſufferings increaſed. (See Hamilton, vol. ii. p. 54. 56.) In one caſe, indeed, the patient is ſaid to have recovered: but the courſe of the ſymptoms, and the duration of the diſeaſe, did not ſtrictly accord with the ordinary appearance and brevity of hydrophobia. The employment of various antiſpaſmodics, as *camphor*, *aſſafœtida*, *caſtor*, &c.; of the metallic tonics, as the oxyd or flowers of *zinc*, the *cuprum ammoniatum*, &c. (largely adminiſtered in Dr. Vaughan's caſes); and of *ſudorifics* and *diuretics*, (ſee Mead,) of *vinegar*, of *cantharides*, of *bliſters*, and *rubefacients*, has been attended with the ſame failure as that of the medicines already detailed.

Such being the inadequacy, then, of all the expedients hitherto adopted for the cure of rabies, and ſuch the difficulty of acquiring any accurate notion of the nature and ſeat of the diſeaſe, even by the moſt accurate anatomical inveſtigation, we acknowledge ourſelves altogether unable to ſuggeſt any ſyſtem of treatment, which might be particularly worthy of trial, in future caſes of the diſeaſe. Dr. John Hunter propoſes a trial of *arſenic*, which is the principal ingredient in a pill, uſed in the Eaſt Indies, and ſaid to be a ſpecific againſt the poiſon of ſerpents, and alſo againſt the bite of a mad dog. He alſo ſuggeſts the probability of diminiſhing the effects of the poiſon, (which is apparently confined to the part bitten, until the ſymptoms actually begin,) by making numerous and deep ſcarifications where the wound was, and applying cupping glaſſes repeatedly; by uſing ligatures; or by applying ice or a freezing mixture to the part, ſo as to benumb it, and to arreſt for a time all motion, and of courſe that of the abſorbent veſſels. Dr. Ruſh believes, that "the diſeaſe produced in the human ſpecies by the bite of a rabid animal is a *malignant* fever;" and that the great debility, which enſues in its courſe, is the reſult of inflammatory action, and to be removed only by early and copious blood-letting, according to circumſtances of the caſe, the ſtrength and age of the patient, the ſtate of the pulſe, &c.; and Dr. Ferriar has, like Dr. Ruſh, experienced a ſimilar change in his opinions, both having originally conſidered the debility as primary, and not as the reſult of increaſed excitement; and both have decided to treat future caſes of the diſeaſe upon that principle, by depletion, and evacuants.

HYDROPHORIA, formed of ὕδωρ, *water*, and φερω, *I bear*, in *Antiquity*, a feaſt, or funeral ceremony, held among the Athenians, and people of Ægina, in memory of thoſe who periſhed in the deluge of Deucalion and Ogyges.

HYDROPHTHALMIA, from ὕδωρ, *water*, and ὀφθαλμος, *the eye*, ſignifies in *Surgery*, a morbid enlargement of the eye, ariſing from a preternatural increaſe in the quantity of the aqueous and vitreous humours.

In certain caſes, it is the aqueous humour which collects in this manner, and then the diſeaſe is principally ſituated in the anterior and poſterior chambers of the eye. In other inſtances, the vitreous humour is chiefly concerned, not merely accumulating in a preternatural degree, but alſo in general loſing its wonted conſiſtence, and becoming thinner and more watery. In the commencement of the diſorder, the patient experiences no complaints, excepting a ſenſe of tenſion about the eyeball, a kind of ſtiffneſs when the organ is moved, and a diminution in the acuteneſs of viſion. The globe of the eye by degrees acquires a ſtate, in which its enlargement is quite manifeſt, its feel harder than natural, the pupil dilated, the motion of the iris feeble, the impairment of ſight much more ſerious, and the painful ſenſation of tightneſs about the affected organ a great deal more diſtreſſing. At length, the eyeball attains ſuch magnitude, that it projects out of the orbit, and the patient is afflicted with complete blindneſs.

The pain now becomes exceſſively ſevere, extending all over one ſide of the head, and frequently affecting the teeth, ſo as to diſturb the patient's reſt day and night. As the eyelids can no longer be cloſed, the tears fall over the cheek, and the friction of the eyelaſhes againſt the eye make this latter part inflame and ulcerate. The caſe, when it has made ſuch progreſs, often receives the name of buphthalmos, the eyeball being, indeed, in many inſtances, as large as a hen's egg.

When the diſeaſe is principally ſituated in the anterior and poſterior chambers, the cornea, not only becomes diſtended forwards away from the iris, but undergoes a conſiderable enlargement in diameter, ſo that the anterior chamber is frequently of extraordinary ſize. When the vitreous humour has the chief ſhare in the diſorder, no increaſe in the dimenſions of the cornea is obſervable, and the iris, inſtead of being at a greater diſtance than uſual from this membrane, is often approximated to it.

We are then to underſtand by the term hydrophthalmia, a dropſical enlargement of the eye, and not a ſwelling, or protruſion, of this organ from other cauſes, a caſe to which ſurgical writers aſſign the name of exophthalmia. See EXOPHTHALMIA.

No doubt, the cauſes of the dropſy of the eye are as numerous as thoſe which give riſe to the ſame diſeaſe in other parts of the body. But, even the moſt credulous writers are willing to own the difficulty of aſcertaining ſuch cauſes in a clear and ſatisfactory manner. If we can truſt the aſſertions of Richter, all the known cauſes of hydrophthalmia have the immediate effect of interrupting the due abſorption of the humours of the eye, and act in this manner, either by producing obſtruction, weakneſs, or irritation. The celebrated oculiſt, Janin, fancied, that in the healthy ſtate there was a continual excretion of the aqueous humour through the pores of the cornea, and that the dropſy of the eye was principally owing to a cloſure of theſe pores, and a conſequent ſtoppage to the exudation of the above mentioned fluid. Scarpa, in criticiſing this opinion, maintains, with much reaſon, that its adherents evince their imperfect acquaintance with the activity of the abſorbent ſyſtem in the animal economy. Beſides, as Richter has well obſerved, the cornea, in moſt caſes of hydrophthalmia, retains its tranſparency, and is to all appearances free from diſeaſe; while, in the leucoma, where it is completely opaque, indurated, and thickened, and where, in all probability, its pores are entirely impervious, we find not the leaſt tendency to hydrophthalmia.

The dropſy of the eye is very difficult of cure, and, indeed, frequently incurable. When the diſorder has once made ſuch progreſs, as to have entirely deprived the patient of ſight, the caſe no longer admits of a complete recovery. Nothing can be more obvious, than the impoſſibility of rectifying the injury, which the interior parts of the eye muſt ſuffer from much diſtention; and hence, if a perfect cure can ever be effected, it is only when the ſurgeon has it in his power to hinder the exceſſive enlargement of the eyeball. The diſeaſe may even increaſe in ſuch a degree as to prove fatal. (Louis, Mem. de l'Acad. de Chir. tom. 5. Terras, Journ. de Médecine, tom. 45.) In caſes of this aggravated deſcription, the bones of the orbit are in general carious. A radical cure of hydrophthalmia is reckoned a very difficult thing to accompliſh, for, when the complaint has been removed it generally returns, and the relapſes are not eaſily prevented. The cure is equally difficult, whether the diſeaſe be chiefly occaſioned by the aqueous, or the vitreous humour.

In the treatment, it is an indication of the higheſt importance to trace, and remove the cauſes of the diſeaſe. This is the only way to effect a radical and laſting cure. In proportion as the cauſe is removed, the preternatural accumulation of fluid in the eye ſpontaneouſly diminiſhes, and does not take place again. Authors inform us, that the ſame cauſes, which produce dropſy in other parts, may alſo produce it in the eye. However this may be, certain it is, that practitioners are ſeldom enabled to aſcertain the cauſe of the complaint with preciſion, and they are, therefore, compelled to treat the caſe on empirical principles. We learn from Scarpa, that hydrophthalmia is ſometimes preceded by blows on the eye, or adjoining temple; ſometimes, by an obſtinate internal ophthalmy; that, in certain inſtances, it is preceded by no inconvenience, except an uneaſy ſenſation of tumefaction and diſtention in the orbit, a difficulty of moving the eye-ball, and an impairment of ſight; and, laſtly, that it is occaſionally preceded by none of theſe cauſes, and no other manifeſt one whatſoever, eſpecially when the complaint occurs in young children, from whom no information can be obtained.

The ſurgeon, who acts empirically, merely endeavours to procure a diſperſion, or removal, of the preternatural accumulation of fluid, and though he afterwards generally employs tonics to obviate the weakneſs, which he ſuppoſes to have been produced in the eye by diſtention, and to be likely to bring on a return of the diſeaſe, yet, as he does nothing towards the removal of the original cauſe, he ſeldom ſucceeds in preventing a relapſe.

The internal remedies, which have been adminiſtered with a view of diſperſing the redundance of fluid in the eye, conſiſt of emetics, purgatives, diaphoretics, and diuretics, and the ſelection is regulated by the particular conſtitution of the patient. Sometimes one claſs of medicines have powerful effects, while the operation of another is quite inefficacious; and a ſhort trial of the various kinds will ſoon inform the ſkilful ſurgeon which ought to be preferred. Nitre and ſquills, juniper berries in powder, or decoction, &c. are mentioned by authors as proper diuretics. The digitalis purpurea is alleged to have proved beneficial. With regard to purgatives, the kali tartarizatum is ſaid to be the beſt in the generality of inſtances. In obſtinate caſes, emetics are frequently of conſiderable ſervice, and, even when unaided by other means, often diſperſe the fluid collected in dropſical diſeaſes. They alſo not unfrequently promote the efficacy of diuretics and purgatives, and the latter remedies, after appearing to be ineffectual, are often rendered productive of the deſired effect, by being preceded by emetics.

When none of the foregoing medicines anſwer the purpoſe, reſolvents may occaſionally be preſcribed with advantage. Mercurial and antimonial preparations are particularly recommended. The proper plan is to give them alternately with doſes of purgative and diuretic medicines. The patient may take a grain of calomel, ten grains of cicuta in powder, and a grain of ſulphur auratum antimonii. When there is any reaſon for ſuſpecting that the dropſy of the eye is owing to an irritation, acting on that organ, opium, caſtor, and ſaffron are recommended, in conjunction with evacuants. When debility is thought to have a ſhare in bringing on the diſeaſe, bark, ſteel, and aromatic bitters, may be ordered together with diuretics.

Beſides theſe internal remedies, ſeveral topical means have been tried, for the purpoſe of promoting the abſorption, or diſperſion of the redundant fluid in the eye. 1. Bliſters applied either behind the ears, or over the eyebrows, and kept open a conſiderable time. 2. Iſſues and ſetons in the arms, or nape of the neck. 3. Sternutatories. Richter menmentions an inſtance of inveterate hydrophthalmia being cured in a few days, by the patient introducing every now and then into his noſtrils a kind of ſnuff thus compoſed:

hellebori albi gr. x. herb. majoran. ℈iv. miſce. 4. Electricity ſometimes appears to have done good. 5. Bathing the eye with emollient collyria was recommended by Janin, under the idea, that this method would tend to open the pores of the cornea, ſo as to let the aqueous humour exude. 6. Spirituous and ammoniacal vapours to excite the action of the abſorbents of the eye. 7. Applications, containing borax, muriate of ammonia, &c.

It is not to be diſſembled, that, in the treatment of the preſent diſeaſe, all internal and external remedies are, for the moſt part, quite unavailing. Scarpa acknowledges, that he has never yet met with a ſingle well-detailed hiſtory of a dropſy of the eye being cured by ſuch internal medicines as are moſt recommended by the beſt ſurgical authors. With regard to externals, he has learnt from his own experience, that when the diſorder is manifeſt, aſtringent and corroborant collyria, as well as compreſſion of the protuberant eye, are highly prejudicial. In this circumſtance, a ſeton in the nape of the neck, bathing the eye in a lotion of mallows, and applying a plaſter compoſed of this plant, have enabled him to calm, for a time, the tenſe and painful ſenſation generally experienced in the orbit, and about the temple and forehead. But Scarpa aſſures us, that as ſoon as the eyeball begins to project from the orbit, beyond the eyelids, there is no means of oppoſing the grievous dangers, likely to be induced by the diſeaſe, except an operation, which conſiſts in letting out the ſuperabundant humours of the eye by an inciſion, and afterwards cauſing the interior of the organ to inflame and ſuppurate, ſo that the eye may gradually ſhrink within the orbit, and heal. Were the operation deferred, the patient would be left to ſuffer frequent attacks of ophthalmy, and to run the riſk of ulceration taking place in the eyeball and ſubjacent cheek: nay, what is worſe, the diſeaſe is liable to degenerate into carcinoma.

The operation, which, until lately, has been generally adviſed for the relief of hydrophthalmia, is, what has been named, paracenteſis oculi. When the aqueous humour is ſuppoſed to be too abundant, certain authors direct us to puncture the cornea, at a little diſtance from its edge with a lancet, or cataract-knife. When the vitreous humour is principally concerned in the diſeaſe, they tell us to proceed as in the extraction of the cataract, divide one-half of the cornea, open the cryſtalline capſule, and preſs out, together with the lens, a ſufficient quantity of the vitreous humour to reduce the eyeball to its natural ſize. In doing this, conſiderable caution is neceſſary; for, too much of the vitreous humour is apt to be loſt, eſpecially when it is preternaturally liquid, and a permanent and irremediable collapſe of the eye may even happen.

The apprehenſion of ſuch an event introduced the plan of puncturing the eyeball with a very ſmall trocar, at the diſtance of about two or three lines from the margin of the cornea, and thus diſcharge as much of the humours as neceſſary.

The redundant contents of the eye may, indeed, be evacuated by an operation; but there is greater difficulty in preventing a freſh accumulation of fluid, and the diſeaſe generally returns. The operation, when done only once, promiſes ſome chance of durable benefit, if the ſurgeon perform it in an early ſtage of the caſe. Benjamin Bell met with ſuch ſucceſs. Nuck alſo effected a radical cure by repeating the operation a certain number of times. We are not then to relinquiſh all hope, even though the diſorder may recur. But, one thing ſeems now to be quite eſtabliſhed, namely, the impoſſibility of accompliſhing a perfect cure, and reſtoring the original integrity of the eye, when once this organ has ſuffered ſuch diſtention, that the function of viſion is deſtroyed.

If the ſurgeon prefers letting out the redundant quantity of the humours in one of the foregoing ways, an endeavour is afterwards to be made to improve the tone of the eye with corroberant applications. The eye may be bathed with cold water, a decoction of oak bark, or any ſpirituous aromatic collyrium.

When the diſeaſe has attained ſuch a degree, that the ſight is entirely loſt, and the eyeball diſtended far above its natural ſize, it is beſt to give up all idea of attempting a radical cure; the humours may be diſcharged, and an artificial eye afterwards worn.

Scarpa places little reliance in the paracenteſis oculi as a means of effecting a permanent cure of hydrophthalmia. Indeed, he maintains, that it can never ſucceed, unleſs the puncture, made by the trocar, excite inflammation and ſuppuration of the interior of the eye. The method recommended by this eminent writer, is to remove a circular piece of the centre of the cornea, about three lines in diameter. Thus, an opening is made, which at once ſerves for the diſcharge of the humours, and to excite the requiſite degree of inflammation within the eye. The inciſion ſhould on no account be made in the ſclerotica.

The ſight being irrecoverably loſt, Scarpa adviſes ſurgeons to introduce a ſmall biſtoury acroſs the apex of the cornea, at one line and a half from the central point of this membrane, whether affected with opacity or not. The little ſemilunar flap is then to be raiſed with a pair of forceps, and the inciſion continued into a complete circle by directing the edge of the knife upwards. Through the circular aperture, thus made in the middle of the cornea, the ſurgeon is gently to preſs out as much of the ſuperabundant humours of the eye as is requiſite to leſſen the eyeball, and make it return into the orbit, ſo as to admit of being covered by the eyelids.

Scarpa recommends merely applying a pledget of dry lint, and a retentive bandage, till inflammation begins, which generally happens about the third or fifth day. Such remedies are now to be employed as appear beſt calculated to moderate the inflammation; and a bread and milk poultice is to be applied to the eyelids, and changed every two hours. When, on the commencement of inflammation, the eyeball ſwells ſo conſiderably, as to project from the orbit again, the prominent part is to be covered with a liniment of oil and wax, or the yolk of an egg mixed with ſome oleum hyperici. Either of theſe dreſſings is to be laid under the bread and milk poultice. In proportion as the internal ſuppuration of the eye begins, the ſwollen ſtate of this organ undergoes a gradual diminution.

When the removal of a piece of the cornea, to the extent above ſpecified, fails to excite a mild inflammation and ſuppuration of the interior of the eye by the fifth day, Scarpa adviſes us either to expoſe the eye to the air, or to cut away a little of the whole edge of the opening already made in the cornea, ſo as to bring on the kind of inflammation and ſuppuration eſſential to the cure. Scarpa ſulle principali malattie degli occhi, cap. 18.

The late Mr. Ford introduced a ſeton through the eyeball, for the purpoſe of leſſening the ſize of the organ when affected with hydrophthalmia. Medical Communications, vol. i.

After operating for the relief of the preſent affliction, a fungus occaſionally grows out of the internal part of the eye. Such an excreſcence was, in one inſtance, deſtroyed by the external employment of belladonna. (Terras, Journal de Médécine, tom. 45.) But in caſe this or other means fail in preventing the reproduction of the fungus, the ſurgeon is called upon to recommend the entire extirpation of the eye. See Eye, *Extirpation of.*

HYDROPHTHALMION, from ὕδωρ, *water*, and ὀφθαλμος, *the eye*, a ſwelling which ſometimes happens juſt under the eye, in dropſical and cachectic habits.

HYDROPHYLACIA, of ὕδωρ, *water*, and φυλαττω, *I keep*; a word uſed by Kircher, and ſome others who have written in the ſame ſyſtem, to expreſs thoſe great reſervoirs of water which he places in the Alps, and other mountains, for the ſupply of the rivers which run through the ſeveral lower countries. This he makes to be one of the great uſes of mountains in the economy of the univerſe.

HYDROPHYLAX, in *Botany*, from ὕδωρ, *water*, and φυλαξ, *a guardian*, or *keeper*, probably from the circumſtance of its being always found inhabiting the ſea ſhore.—Schreb. 68. Linn. Suppl. 14. Willd. Sp. Pl. v. 1. 581. Mart. Mill. Dict. v. 2. Juſſ. 210. Lamarck Dict. v. 3. 156. Illuſtr. t. 76. (Sariſſus; Gærtn. t. 25.) Claſs and order, *Tetrandria Monogynia.* Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, erect, ſuperior, permanent, divided into four, ovate, acute, bordered, ſomewhat fleſhy ſegments. *Cor.* of one petal, funnel-ſhaped; tube longer than the calyx; limb angulated, divided into four ovate, revolute ſegments; throat bearded. *Stam.* Filaments four, inſerted at the ſummit of the tube, decurrent, erect, longer than the corolla; anthers ſomewhat ſpear-ſhaped. *Piſt.* Germen oblong, inferior; ſtyle thread-ſhaped, curved; ſtigma bifid. *Peric.* *Berry* dry, ovate, compreſſed, having three ribs on each ſide, the middle one higheſt, with an attenuated margin, a little incurved, fungous, two-celled, with a tranſverſe partition. *Seeds* ſolitary, oblong, triangular, roughiſh, having two furrows on the inner ſide.

Eſſ. Ch. Corolla a funnel-ſhaped petal. Calyx four-cleft. Capſule angulated, of two cells, with a tranverſe partition. Seeds ſolitary.

1. *H. maritima.* Linn. Suppl. 126. (Sariſſus anceps; Gærtn. 118. t. 25. f. 4.)—Found by Kœnig on looſe ſand by the ſea, near Guduluhr, in the Eaſt Indies.—This is the only ſpecies known. It has the habit and appearance of *Arenaria marina*, but is larger.—*Root* ſimple, thread-ſhaped, red, fleſhy, ſweet. *Stem* creeping, ſmooth, coloured, jointed, very long, furniſhed with obtuſe, membranaceous, permanent ſheaths. *Leaves* oppoſite, ſpreading, ovate, acute, entire, fleſhy, ſhining, interſperſed with ſmall, whitiſh, pellucid tubercles; leaf-ſtalks ſhort, ſheathing the ſtem, and becoming, when the leaves fall, permanent ſheaths. *Flowers* axillary, uſually in pairs, but not oppoſite, erect, of a pale blue colour. *Anthers* blue.

HYDROPHYLLUM, from ὕδωρ, *water*, and φυλλον, *a leaf*, expreſſive of an aquatic leaf, but Tournefort cenſures this appellation, ſaying the plant grows in a rich, but not very watery ſoil. Miller conjectures that M. Morin gave the genus this name becauſe, in ſpring, water is uſually found in the cavity of its leaves.—Hence its Engliſh appellation, Water-leaf.—Linn. Gen. 83. Schreb. 109. Tournef. t. 16. Willd. Sp. Pl. v. 1. 814. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 1. 197. Juſſ. 129. Lamarck Dict. v. 3. 157. Illuſtr. t. 97. Gærtn. t. 110.—Claſs and order, *Pentandria Monogynia.* Nat. Ord. *Borragineæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſcarcely ſhorter than the corolla, ſpreading, permanent, of five deep, awl-ſhaped ſegments. *Cor.* of one petal, campanulate, cloven into five, erect, obtuſe, emarginate ſegments; nectary, a chink cloſed by two longitudinal converging plates, faſtened to the petal, within the middle of each ſegment. *Stam.* Filaments five, awl-ſhaped, longer than the corolla; anthers incumbent, oblong. *Piſt.* Germen ovate, pointed; ſtyle awl-ſhaped, the length of the ſtamens; ſtigma bifid, acute, ſpreading. *Peric.* Capſule globoſe, of one cell and two valves. *Seed* ſolitary, round, large.

Eſſ. Ch. Corolla bell-ſhaped, having five, longitudinal, honey-bearing ſtreaks on the inſide. Stigma bifid, capſule globoſe, two-valved.

1. *H. virginianum.* Linn. Sp. Pl. 208. Lamarck. Illuſtr. t. 97. f. 1.—"Leaves pinnatifid."—Native of Virginia and Carolina, on a moiſt boggy ſoil; flowering in May and June. A hardy herb, whoſe *root* is fibrous, and ſpreading. *Leaves* riſing from the root on footſtalks, indented on their edges, veiny, of a ſhining green. *Flowers* alſo coming from the root, hanging down in looſe cluſters, rather inconſpicuous. *Seeds* irregularly ovate and angular, elegantly reticulated with very minute excavations, yellowiſh white.

2. *H. canadenſe.* Linn. Sp. Pl. 208. Lamarck Illuſtr. t. 97. f. 2.—"Leaves lobate-angular."—Native of Canada, and flowering in May.—Very ſimilar to the laſt except in foliage, and in this reſpect *H. canadenſe* is not unlike the *Acer* or Maple, for its leaves are half five-lobed, ſmooth, with the lobes acute, ſlightly toothed, and having a ſinus at the inſertion of the footſtalk.

Theſe plants are very hardy, and ſhould be placed in a moiſt rich ſoil.

3. *H. appendiculatum.* Michaux. Boreal.-Amer. v. 1. 134. "Very hairy all over. Radical leaves ſomewhat pinnatifid. Sinuſes of the calyx with reflexed appendages."—Michaux found this in mountainous woods of North America. He deſcribes the *flowers* as in ſomewhat panicled cluſters, of a blueiſh colour, their calyx having reflexed appendages, like ſome ſpecies of *Campanula.*

HYDROPHYSOCELE, an old term in *Surgery*, implying a hernia, in which a good deal of fluid and air is contained. The word is compounded of ὕδωρ, *water*, φυσα, *a flatus*, and κηλη, *a hernia.*

HYDROPIC, ſynonimous with *dropſical*, being the adjective from *hydrops*; which ſee.

HYDROPIPER, in *Botany.* See Elatine.

HYDROPNEUMATOCELE, from ὕδωρ, *water*, πνευμα, *wind*, and κηλη, *a tumour*, a hernial ſwelling containing a large proportion of air and fluid.

HYDROPNEUMOSARCA, an ancient term in *Surgery*, ſignifying a tumour containing water, air, and any fleſhy ſubſtance. The word is derived from ὕδωρ, *water*, πνευμα, *wind*, and σαρξ, *fleſh.*

HYDROPOTA, of Ὑδροποτης, formed of ὕδωρ, *water*, and ποτης, *drinker*; of πινω, *I drink*, in *Medicine*, a perſon who drinks nothing but water.

It has long been controverted among phyſicians, whether or no the hydropotæ lived longer than other perſons? See Drink.

HYDROPS, ὑδρωψ, of ὕδωρ, *aqua*, and ὠψ, *vultus.* See Dropsy.

Hydrops *ad matulam*, literally "a dropſy into the chamber-pot," a term ſometimes uſed to ſignify a *diabetes.*

HYDROPYRETOS, formed of ὕδωρ, *water*, and πυρετος, *fever*, a word uſed by ſome authors to expreſs a malignant fever, attended with very copious ſweats. Some make it the ſame with the ſudor Anglicus, or ſweating ſickneſs.

HYDRORACHITIS, from ὕδωρ, *water*, and ῥαχις, *the ſpine*, denotes, in *Surgery*, a particular kind of tumour ſituated on the vertebræ, remarkable for being of a moſt incurable nature; and proving fatal, when it burſts or is punctured,

punctured. The caſe will be conſidered hereafter. See Spina *bifida*.

HYDRORHODINON, formed of ὕδωρ, *water*, and ῥοδος, *roſe*; a name given by the ancients to a mixture of water and oil of roſes. This, as it was at once cooling and emetic, was very much uſed by the ancients, to provoke vomiting after the taking of poiſons.

HYDROROSATON, in the *Writings of the Ancient Phyſicians*, a name given to a drink made of water, honey, and the juice of roſes. The proportions were four pounds of roſes, five pints of water, and two pints of honey.

HYDROSA'RCA, from ὕδωρ, *water*, and σαρξ, *fleſh*, in *Surgery*, any fleſhy tumour containing fluid.

HYDROSA'RCOCELE, from ὕδωρ, *water*, σαρξ, *fleſh*, and κηλη, *a tumour*, ſignifies a hydrocele, or preternatural accumulation of fluid in the tunica vaginalis, attended with a chronic enlargement or induration of the teſticle. See Hydrocele and Sarcocele.

HYDROSCOPE, ὑδροσκοπιον, formed of ὕδωρ, *water*, and σκοπεω, *I conſider*; an inſtrument anciently uſed for the meaſuring of time.

The hydroſcope was a kind of water-clock, conſiſting of a cylindrical tube, conical at bottom; the cylinder was graduated, or marked out with diviſions, to which the top of the water becoming ſucceſſively contiguous, as it trickled out of the vertex of the cone, pointed out the hour.

Syneſius deſcribes the hydroſcope at large in one of his letters. See Clepsydra.

HYDROSELINUM, in *Botany*, a name given by ſome authors to ſmallage.

HYDROSTATIC Balance, a kind of balance contrived for the eaſy and exact finding the ſpecific gravities of bodies, both liquid and ſolid.

The inſtrument is of conſiderable uſe in eſtimating the degree of purity of bodies of all kinds; the quality and richneſs of metals, ores, minerals, &c. the proportions in any mixture, adulteration, or the like; of all which the ſpecific weight is the only adequate teſt.

The hydroſtatical balance is founded on this theorem of Archimedes, that a body heavier than water weighs leſs in water than in air, by the weight of as much water as is equal to it in bulk. Whence, if we ſubtract the weight of the body in water from its weight in air, the difference gives the weight of as much water as is equal in magnitude to the ſolid propoſed.

Having, therefore, two bodies, the one firm, the other fluid, together with the weight of each apart; to find their proportion, divide the greater by the leſſer; the quotient compared to one, that is, unity, will be the antecedent of the proportion deſired.

The inſtrument, with its apparatus, is repreſented *Plate* X. *figs.* 7 and 8, *Hydraulics*, and needs little deſcription. See Gold.

A B is a nice balance, turning with a ſmall part of a grain, and furniſhed with a long examen D, for determining the exact horizontal poſition of the balance.

1. To find the ſpecific gravity of a fluid: hang to the end B of the beam the little ſcale S, and to the bottom of the ſcale S, by a horſe-hair, which is of the ſame ſpecific gravity with water, the glaſs bubble G, which muſt be ſpecifically heavier than any fluid except mercury. To the oppoſite end A of the beam hang a braſs ſcale E, which is a counterpoiſe to the bubble G, immerſed in water; but when the bubble hangs out of the water, a weight muſt be laid on E to keep it *in equilibrio*, which weight will be equal to what the bubble loſt in water, or to a bulk of water equal to the bubble; when rain-water is uſed, this weight will be a thouſand grains. Then fill a cylindrical veſſel I, about two-thirds with common water; and when the bubble is let into it, the beam will remain in a horizontal poſition, if the water be of the ſame ſpecific gravity as that in which the bubble was adjuſted; if it be not, there will be a variation, which is to be corrected by means of little weights for that purpoſe. Having thus adjuſted the bubble in water, the ſpecific gravity of any other fluid will be found by weighing the bubble in it; and ſince you always weigh ſo much of the liquid as is equal to the bulk of the bubble, if there be any difference between ſuch quantity and the like quantity of water, it will be diſcovered by putting weights into the aſcending ſcale. *E. g.* if red port wine be put into the veſſel I, the bubble will ſink, and require the addition of ten grains in the ſcale E, when the balance has been adjuſted in rain-water, for reſtoring the equilibrium; which ſhews that port wine is lighter than rain-water ten parts in a thouſand, or one hundredth part. If proof brandy be uſed, ſeventy-ſeven grains will be required to reſtore the equilibrium, and therefore brandy, or proof ſpirits weighs, ſeventy-ſeven parts in a thouſand, or one-thirteenth part leſs than rain-water. But in a denſer medium G would riſe; and if ſea-water be uſed, twenty-ſix grains muſt be put into the ſcale S to reſtore the equilibrium, which ſhews that ſea-water is twenty-ſix parts in one thouſand, or one thirty-eighth part heavier than rain water.

2. To find the ſpecific weight of a ſolid; inſtead of the bubble, hang on the glaſs bucket K, *fig.* 8. which with its ſuſpending piece H, will be *in equilibrio* with the counterpoiſing ſcale E. Having weighed the ſolid in air in the bucket, by counterpoiſing it with weights on the ſcale E, note its weight; but becauſe not only the ſolid to be tried, but the glaſs bucket itſelf will loſe of its weight when immerſed in water, you muſt reſtore to the bucket the weight that it loſes by being immerſed, that the body in it alone may be examined: this is done by means of the piece F, which weighs juſt as much as a bulk of water equal to the bucket; and being ſlipped on the ſuſpending piece at H, it not only reſtores to the bucket what it had loſt by being immerſed in water, but makes a ſcale for receiving weights, in order to reſtore the equilibrium to the ſolid contained in the bucket, and to ſhew how much it has loſt of its weight in water. When many bodies are to be weighed hydroſtatically, it is beſt to weigh them all in the air ſucceſſively, and ſet down their weights before you begin to weigh them in water, becauſe it would be troubleſome to dry the bucket every time. Care muſt alſo be taken that no bubbles of air adhere to the bodies weighed in water, which would make them lighter.

Dr. Deſaguliers has added a contrivance to this machine to make it more nice, ſee *fig.* 9. S, S, S, are three ſcrews which ſerve to ſet the foot and ſtem upright; and O M is a ſtring and plummet, whoſe point hanging over M, ſhews when the piece P C is truly vertical. There is alſo a piece E O, which has a ſlit to compare with the examen D playing in the notches C *c*. Deſag. Exp. Phil. vol. ii. p. 196.

Mr. Martin propoſes the following conſtruction of an accurate hydroſtatical balance. A B, (ſee *fig.* 10.) is the foot on which it ſtands; C D, a pillar ſupporting a moveable braſs plate E F, faſtened to it by the ſcrew in the knob *e*. In the end of this plate is fixed an upright piece I K, ſupporting another plate G H, which ſlides backwards and forwards thereon, and is moveable every way about it. In the end of this plate at H, is fixed (by a nut beneath) a wire L M, taped with a fine thread from one end to the other;

other; upon this moves the ſwan-neck ſlip of braſs N O, to which a very exact balance is hung at the point N; to one of whoſe ſcales P, is appended the heavy body R, by a fine horſe-hair, or piece of ſilk S; the weight of the ſaid body R in the air is expreſſed by the weights put into the ſcale Q to make an equilibrium therewith, which being deſtroyed by immerging the ſolid in the fluid T V, contained in the glaſs W V, is again reſtored by weights put into the ſcale P. So that the weights in the ſcale Q compared with thoſe in the ſcale P, ſhew at once the ſpecific gravity of the ſolid R to that of the fluid T V.

For ſeveral other conſtructions of this inſtrument, deſigned for greater accuracy than that of the common ſort, the reader may conſult s'Graveſande's Phyſices Elem. Math. &c. tom. i. lib. 3. cap. 3. The ſpecific gravities of ſmall weights may be determined by ſuſpending them in loops of horſe-hair, or ſilk threads, to hook at the bottom of the ſcale of the common hydroſtatical balance. *E. g.* if a guinea ſuſpended in air be counterbalanced by 129 grains in the oppoſite ſcale; and upon being immerſed in water, requires $7\frac{1}{4}$ grains to be put into the ſcale over it, in order to reſtore the equilibrium; we thus find that a quantity of water of equal bulk with the guinea, weighs $7\frac{1}{4}$ grains, or 7.25; by which divide 129, the weight of the guinea in air, and the quotient, or 17.793, ſhews that the guinea is ſo many times heavier than its bulk of water. Whence, if any piece of gold be tried, by weighing it firſt in air, then in water, and if upon dividing the weight in air by the loſs in water, the quotient is 17.793, the gold is good; if the quotient be 18, or between 18 or 19, the gold is very fine; but if it be leſs than $17\frac{1}{2}$, the gold is too much alloyed with other metal. If ſilver be tried in this manner, and found to be eleven times heavier than water, it is very fine; if it be $10\frac{1}{2}$ times heavier it is ſtandard: but if it be any leſs weight, compared with water, it is mixed with ſome lighter metal, ſuch as tin.

In order to find the ſpecific gravities of thoſe bodies that are lighter than water, let any upright ſtud be fixed into a thick flat piece of braſs, and in this ſtud let a ſmall lever, whoſe arms are equally long, turn upon a fine pin as an axis. Let the thread which hangs from the ſcale of the balance be tied to one end of the lever, and a thread from the body to be weighed, be tied to the other end. This done, put the braſs and lever into a veſſel; then pour water into the veſſel, and the body will riſe and float upon it, and draw down the end of the balance from which it hangs; then put as much weight in the oppoſite ſcale as will raiſe that end of the balance, ſo as to pull the body down into the water by means of the lever; and this weight in the ſcale will ſhew how much the body is lighter than its bulk of water. Ferguſon's Lect. p. 160, 8vo.

Otherwiſe: Take another body of a compact form, but much heavier than an equal bulk of water, ſo that when this body is connected with the body in queſtion, they may both ſink in water. This being prepared, aſcertain the weight of the lighter body in air, and the weight of the heavier body in water. Then tie, by means of thread, both bodies together, but not ſo cloſely as to exclude the water from, or to harbour bubbles of air between them; and weigh them both in water. Now ſince the heavy body is partly buoyed up by the lighter body, the weight of both in water will be leſs than the weight of the heavier body alone. Subtract the former from the latter, and add the remainder to the weight of the lighter body in air; for this ſum is the weight of a quantity of water equal in bulk to the lighter body. Therefore the weight of the lighter body in air muſt be divided by the laſt-mentioned ſum, and the quotient will expreſs the ſpecific gravity of the lighter body.

E. g.—A piece of elm being varniſhed in order to prevent its abſorbing any water, was found to weigh in air 920 grains. A piece of lead, which was choſen for this purpoſe, was found to weigh in water 911.7 grains. The piece of elm and the piece of lead were tied together, and being ſuſpended from the hook of the ſcale, &c. in the uſual manner, were found to weigh in water 331.7 grains, *viz.* 580 grains leſs than the lead alone; therefore 580 was added to 920 (*viz.* to the weight of the elm in air) and made up the ſum of 1500. Laſtly, 920 was divided by 1500, and the quotient 0.6133 expreſſed the ſpecific gravity of the piece of elm.

In the uſe of the hydroſtatical balance, it will be proper to obſerve the following general precautions. The water in which the ſolid is to be weighed, beſides its being either diſtilled or rain water, muſt be quite clean. Its temperature, as well as that of the ſolid, muſt be as near as poſſible to 62° of Fahrenheit's thermometer; for which purpoſe the ball of the thermometer muſt be placed in the water, and the temperature is adjuſted by the addition of hot or cold water. If the ſolid body be ſoluble in water, or if it be porous enough to abſorb any water, then it muſt be varniſhed, or ſmeared over with ſome oily or greaſy ſubſtance; but in that caſe ſome allowance muſt be made on account of the varniſh, &c. When the ſolid is weighed in water, its upper part ought to be a little way below the ſurface of the water; for inſtance, about an inch; and it muſt by no means be ſuffered to touch the ſides or bottom of the jar. Care muſt be had that no bubbles of air adhere to the ſolid under water; for they would partly buoy it up. Theſe may be eaſily removed by means of a feather. The ſolid muſt be of a compact form, and free from accidental or artificial vacuities, ſo as not to harbour any air; for otherwiſe its ſpecific gravity cannot be aſcertained by weighing in water, &c. Thus a piece of ſilver, which is much heavier than water, may be formed into a hollow ſphere, which will appear to be much lighter than water; for if this ſphere were immerſed in water, it would diſplace a quantity of water which is equal not only to the ſilver, but alſo to the ſpace which is contained in the ſphere. It is for this reaſon that a ſhip might be made of iron, or of copper, or, in ſhort, of any ſubſtance whoſe ſpecific gravity far exceeds that of water, and yet it would float as well as a ſhip which is made of wood, in the uſual way. See *Specific* GRAVITY.

HYDROSTATIC *Bellows*, in *Hydroſtatics*, is a machine for demonſtrating the upward preſſure of fluids (ſee FLUID), conſiſting of two thick oval boards A, (*Plate* X. *Hydraulics*, &c. *fig.* 11.) each about ſixteen inches broad, and eighteen inches long, covered with leather, to open and ſhut like a common bellows, but without valves, only a pipe B, about three feet high, is fixed into the bellows at *e*; let water be poured into the pipe at C, which will run into the bellows, and ſeparate the boards a little. Then lay three weights *b*, *c*, *d*, each weighing a hundred pounds, upon the upper board; and pour more water into the pipe B, which will run into the bellows, and raiſe up the board with all the weights upon it; and if the pipe be kept full until the weights are raiſed as high as the leather, which covers the bellows, will allow, the water will remain in the pipe, and ſupport all the weights upon it; even though it ſhould weigh no more than a quarter of a pound, and theſe three hundred pounds; nor will all their force be able to cauſe them to deſcend and force the water out of the top of the pipe. The reaſon of this will appear, if we conſider that if a hole be made in the upper board, and a tube be put into it, the water will riſe in the tube to the ſame height as it riſes in the pipe; and would riſe as high by ſupplying the pipe in as many tubes as the board could contain holes.

Now, ſuppoſe only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe B, and that the pipe holds juſt a quarter of a pound of water; if a perſon puts his finger upon the hole, and the pipe be filled with water, he will find his finger to be preſſed upward with a force equal to that of a quarter of a pound. As the ſame preſſure is equal upon all equal parts of the board, each part, whoſe area is equal to the area of the hole, will be puſhed upward, with a force equal to that of a quarter of a pound: the ſum of all which preſſures againſt the under ſide of an oval board, ſixteen inches broad, and eighteen inches long, will amount to three hundred pounds: and, therefore, ſo much weight will be raiſed up and ſupported by a quarter of a pound of water in the pipe. Hence if a man ſtands upon the upper board, and blows into the bellows through the pipe B, he will raiſe himſelf upon the board; and the ſmaller the bore of the pipe is, the eaſier he will be able to raiſe himſelf; and then by putting his finger upon the top of the pipe, he can ſupport himſelf as long as he pleaſes; provided that the bellows be air-tight. Mr. Ferguſon has deſcribed another machine, which may be ſubſtituted inſtead of this common hydroſtatical bellows: A B C D, *fig.* 12, is an oblong ſquare box, in one end of which is a round groove, as at *a*, from top to bottom, for receiving the upright glaſs tube I, which is bent to a right angle at the lower end as at *i*, in *fig.* 13, and to that part is tied the end of a large bladder K, which lies in the bottom of the box. Over this bladder is laid the moveable board L, *figs.* 12. and 14, in which is fixed an upright wire M; and leaden weights N, N, to the amount of ſixteen pounds, with holes in their middle, are put upon the wire over the board, and preſs upon it with all their force. The croſs bar *p* is then put on to ſecure the tube from falling, and keep it in an upright poſition; and then the piece E F G is to be put on, the part G ſliding tight into the dove-tailed groove H, to keep the weights N, N, horizontal, and the wire M upright, which is received into a round hole *e*, in the part E F. There are four upright pins in the four corners of the box within, each almoſt an inch long, for the board L to reſt upon, in order to keep it from preſſing the ſides of the bladder below it cloſe together at firſt. The whole machine being thus put together, pour water into the tube at top, and the water will run down the tube into the bladder below the board, and after the bladder has been filled up to the board, continue pouring water into the tube, and the upward preſſure of the bladder will raiſe the board with all the weight upon it, even though the bore of the tube ſhould be ſo ſmall, that leſs than an ounce of water would fill it. Ferguſon's Lectures, Supplement, 1767. p. 16.

HYDROSTATIC *Inſtrument, Bradford's*, is an invention for weighing money and diſcovering its defect either of weight or purity.

It conſiſts of a thin flat braſs ruler, about half a foot long; on each ſide of which are two graduated lines, thoſe on the upper ſide marked A and W (ſee *Plate* X. *Hydraulics*, *fig.* 15. N° 1.) and thoſe on the other ſide B and W, ibid. N° 2. There are alſo a ſmall chain and pincers wherein to fix the piece of money intended to be weighed and proved, together with two pair of centre pins, marked A and B, ibid. N° 2 and 3. being the points of ſuſpenſion of the rod when uſed; whereof the former pair A are to be uſed for proving all pieces of gold under thirty-ſix ſhillings value; and the other pair, marked B, for all pieces from thirty-ſix ſhillings to ſeventy-two ſhillings, or three pounds twelve ſhillings. Laſtly, there is a ſliding piece, or index C, ibid. N° 3, by the motion of which, backward or forward, until the point of equilibrium is diſcovered, the value of any piece ſuſpended in the pincers is found upon the graduated lines already mentioned. Of theſe lines, thoſe marked A and B are called ſtatical lines, as being calculated for weighing the piece in air, and thoſe marked W W, are called hydroſtatical lines, as ſerving to point out the alloy or adulteration of the piece weighed. A whole diviſion on each line is equal to the weight or value of one ſhilling in gold; a half diviſion to ſix-pence, and a quarter diviſion to three-pence.

To prove a guinea: firſt ſuſpend it in the pincers, and then placing the inſide of the ſliding-piece C to twenty-one on the line A on the upper ſide of the ruler, which muſt move freely on the centre pin marked A, and if the guinea and ſliding-piece exactly balance each other, the guinea is full weight; if not, move the ſlider backwards or forwards until they equiponderate; when the diviſion cut by the inſide of the ſlider is the true weight of the gold; and if it reſts for inſtance, at twenty and a half, then the guinea weighs only twenty ſhillings and ſixpence. In the next place, to prove the alloy of this piece, let the ſlider be brought to the diviſion twenty and a half, upon the hydroſtatical line marked W, for whatever diviſion is cut by the ſlider in weighing on the ſtatical line, it muſt be placed at the ſame on the hydroſtatical line adjoining. Then let the piece, together with the pincers, and the braſs link whereon it is ſuſpended, be immerſed in water (ibid. N° 3.) as far as the notch on the ſaid link; if then the inſtrument acts in equilibrio, or the piece ſink deeper in the water, the guinea is ſtandard gold; but if the ſlider muſt be moved farther backward before it will equiponderate, the guinea is adulterated. If it is alloyed with ſilver, allow two ſhillings for every penny it wants in the hydroſtatical weight; and then if the number of pence the piece is deficient in weight hydroſtatically, when doubled, exceed the number of ſhillings it weighs ſtatically, it may be concluded to be adulterated with ſome baſer metal than ſilver. However, a more ſpeedy method of diſcovering whether a piece of gold be adulterated or not, without moving the ſlider more than once, is this: when the piece is weighed ſtatically, bring the ſlider to the diviſion on the hydroſtatical line expreſſing its weight: and immerſing the piece and pincers as before, ſo that the ſurface of the water may be exactly at the mark on the long link, if the inſtrument does not then equiponderate, gently lower the hand that holds the fluid, until the inſtrument comes to an equilibrium; at which time, if the guinea be a counterfeit, great part of the pincers will appear above the water; if a 36*s.* piece be tried, not only the pincers, but a ſmall part of the coin, will appear above the ſurface, if the piece be counterfeit. This laſt method is ſufficiently near the truth for common practice.

If there is occaſion to weigh and prove a very ſmall piece of gold, as a 2*s.* 3*d.* 4*s.* 6*d.*, &c. the method is, to put the ſaid pieces in the pincers, with ſome other piece that has been approved before; by which means the weight and alloy of the ſmall piece may be eaſily diſcovered, as above. If the piece be above 36*s.* the ſlider is to be placed according to the diviſions of the ſtatical and hydroſtatical lines on the under ſide of the inſtrument, which are fitted to the ſtandard of the mint; by which a guinea weighs 129 grains.

HYDROSTATICAL *Paradox*, is a principle, which has been already ſtated, and in ſome degree illuſtrated and evinced under the article FLUID, and alſo under the article of HYDROSTATIC *Bellows*. It is ſo denominated, becauſe at firſt view it ſeems to be paradoxical; but it reſults from the nature of fluids, which preſs every way alike. The paradox is this, that any quantity of water, or any other fluid, how ſmall ſoever, may be made to balance and ſupport any quantity, or any weight, how great ſoever. Thus, water in a pipe or canal, open at both ends, always riſes to the ſame height at both ends, whether thoſe ends be wide or narrow, equal or unequal. And ſince the preſſure of fluids is directly as their perpendicular heights, without any regard to their quantities, it follows that whatever the figure or ſize of the veſſels may be, provided their heights be equal, and the areas of their bottoms equal, the preſſures of equal heights of water are equal upon the bottoms of thoſe veſſels; even though the one ſhould contain a thouſand or ten thouſand times as much as the other. Mr. Ferguſon has illuſtrated and confirmed this paradox by the following apparatus. Let two veſſels, (*Plate* XI. *Hydraulics*, *fig.* 16.) ſuch as A B and C D, be of equal heights, but very unequal capacity; let each veſſel be open at both ends, and their bottoms E and F of equal widths. Let the braſs bottoms G and H be exactly fitted to each veſſel, not ſo as to go into them, but for each veſſel to reſt upon reſpectively; and let a piece of wet leather be put between each veſſel and its braſs bottom, for the ſake of keeping them cloſe. Join each bottom to its veſſel by a hinge D, ſo that it may open like the lid of a box; and let each bottom be kept up to its veſſel by equal weights W, hung to lines which paſs over the pulley P, whoſe blocks are fixed to the ſides of the veſſels at F, and the lines tied to hooks at *d*, fixed in the braſs bottoms oppoſite to the hinges D. Things being thus prepared, hold one veſſel upright in the hands over a baſon on a table, and cauſe water to be poured ſlowly into it, till the preſſure of the water bears down its bottom at the ſide *d*, and raiſes the weight E; and then part of the water will run out at *d*. Mark the height at which the ſurface H of the water ſtood in the veſſel, when the bottom began to give way at *d*; and then, holding up the other veſſel in the ſame manner, cauſe water to be poured into it; and it will be ſeen that when the water riſes in this veſſel juſt as high as it did in the former, its bottom will alſo give way at *d*, and it will loſe part of the water.

The natural reaſon of this ſurpriſing phenomenon is, that ſince all parts of a fluid at equal depths below the ſurface, are equally preſſed in all directions, the water immediately below the fixed part B *f* will be preſſed as much upward againſt its lower ſurface within the veſſel, by the action of the column A *g*, as it would be by a column of the ſame height, and of any diameter whatever; and therefore ſince action and re-action are equal, and contrary to each other, the water immediately below the ſurface B *f* will be preſſed as much downwards by it as if it were immediately touched, and preſſed by a column of the height A *g*, and of the diameter B *f*; and therefore the water in the cavity B D *d f* will be preſſed as much downward upon its bottom G, as the bottom of the other veſſel is preſſed by all the water above it. Ferguſon's Lectures, p. 105.

HYDROSTATICS, compoſed of ὑδωρ, *water*, and ϛατικη, *ſtatics*, of ϛατος, *ſtans*, *ſtanding*, of ιϛημι, *ſto*, *I ſtand*, hydroſtatics being conceived as the doctrine of the equilibrium of liquors, is the doctrine of gravitation in fluids; or that part of mechanics which conſiders the weight or gravity of fluid bodies, particularly of water, and of ſolid bodies immerged in them.

To hydroſtatics belongs whatever relates to the gravities and equilibria of liquors, with the art of weighing bodies in water, in order to eſtimate their ſpecific gravities.

Mr. Boyle has applied hydroſtatics to good purpoſe, in examining and proving the goodneſs and purity of metals, minerals, and other bodies, particularly fluids, in an expreſs treatiſe, entitled "Medicina Hydroſtatica."

The laws of hydroſtatics, with the application of them, ſee delivered at large under the articles FLUID and *Specific* GRAVITY.

Hydroſtatics are frequently confounded with hydraulics, on account of the affinity of the ſubjects; and ſeveral authors chuſe to treat of the two promiſcuouſly. See HYDRAULICS.

The oldeſt writer on hydroſtatics is Archimedes, who firſt delivered the laws of them in his book "De inſidentibus humido." Marin Ghetaldus firſt brought his doctrine to experiment, in his "Archimedes Promotus;" and from him Mr. Oughtred took the greateſt part of what he has given us on this ſubject. The celebrated M. Paſchal has written an excellent treatiſe on this ſubject, entitled "Traité de l'Equilibre des Liqueurs et de la Peſanteur de l'Air." M. Mariotte, in a French treatiſe, publiſhed at Paris in 1686, "Of the Motion of Water and other Fluids," gives moſt of the propoſitions of hydroſtatics and hydraulics, proved by reaſon, and confirmed by experiments. The Jeſuit F. Tertius de Lanis, in the third tome of his "Magiſterium Naturæ et Artis," lays down the doctrines of hydroſtatics more amply than they are elſewhere found. F. Lamy, in the ſecond part of his mechanics, entitled "Traité de l'Equilibre des Liqueurs," delivers the fundamental laws of hydroſtatics and hydraulics; and the like is done by Dr. Wallis, in his "Mechanica." Laſtly, ſir Iſaac Newton gives ſome of the ſublimer matters in the ſecond book of his Philoſoph. Nat. Princip. Mathematic. For an account of other writers on this ſcience, ſee HYDRAULICS.

HYDRO-SULPHURET, in *Chemiſtry*, a compound of ſulphuretted hydrogen with alkaline and earthy baſes, and likewiſe with metallic oxyds. The properties of the hydro-ſulphurets are: that they are abundantly ſoluble in water, and are cryſtallizable; the ſolution is colourleſs as long as the action of the air is excluded; but when it is admitted, a yellow colour is ſoon acquired, owing to the oxygen of the atmoſphere combining with the hydrogen of a portion of the ſulphuretted hydrogen, while the ſulphur combines with the remaining portion of it, forming a ſuperſulphuretted hydrogen in union with the baſe. The principal hydro-ſulphurets are as follow: *viz.* 1. Hydro ſulphuret of potaſh: this ſalt is white, and perfectly tranſparent, reſembling the ſulphate of ſoda by its tranſparency and the ſize of its cryſtals. Its taſte is at firſt alkaline, and afterwards extremely bitter; when dry it is without ſmell, but when liquid it exhales a fœtid odour. It attracts humidity from the atmoſphere, and paſſes into a liquid ſyrup. When fluid, it gives a green colour to bodies in contact with it; it is ſoluble in water and alcohol, abſtracting heat during the ſolution: with acids, it gives riſe to a briſk effervеſcence, without depoſiting any ſulphur. It precipitates the metallic ſolutions: the precipitates from different metals being of different colours and ſhades. 2. The properties of the hydro-ſulphuret of ſoda are very like thoſe juſt enumerated of the potaſh; but the nitrous and oxy-muriatic acids produce a precipitate of ſulphur, owing to their decompoſing the ſulphuretted hydrogen, by affording oxygen to its hydrogen, while the other acids merely expel it. To diſtinguiſh the hydro-ſulphuret of potaſh from that of ſoda; add a few drops of the ſolution of each to a ſolution of alumine in ſulphuric acid: the potaſh gives riſe immediately to a cryſtallization of alum; while that of ſoda has no ſuch effect. 3. Hydro-ſulphuret of ammonia is thus produced: when equal parts of ſulphuretted hydrogen and ammonia, in their elaſtic ſtates, are mixed together, they immediately combine; a white cloud is produced, which is condenſed, and a thin, ſoft depoſit is formed on the ſides of the veſſel, which exhales a penetrating vapour when expoſed to the air: this is the hydro-ſulphuret of ammonia.

HYDROTHORAX. See Dropsy.

HYDROTICS, formed of ὕδωρ, *water*, in *Medicine*. See Hydropic.

HYDRUNTUM, Otrante, in *Ancient Geography*, the moſt eaſterly part of Italy, having a port, from which it was uſual to paſs over to Greece: the gulf in that place being ſcarcely 12 leagues broad. Near it was a cape, called "Hydrus Mons."

HYDRUS, or *Water Serpent*, in *Aſtronomy*, is a ſouthern conſtellation, including ten ſtars. See Constellation.

Hydrus, in *Zoology*, a genus of ſerpents lately eſtabliſhed by Dr. Schneider, and which is deſigned to contain a number of thoſe ſpecies of the ſerpent tribe that are of the aquatic kind, whether thoſe which reſide in freſh waters, or the marine elements; or ſuch as indiſcriminately inhabit either.

Moſt of the ſnake tribe poſſeſs the power of moving in the water without difficulty, and ſome, from their peculiar conformation, perform the act of ſwimming with much facility; but the ſtructure of the hydrus is in an eminent manner adapted to this particular purpoſe, the tail being broad, flat, and compreſſed, like that of ſome kinds of fiſhes, and by means of which it is enabled to direct its courſe with equal certainty, and ſwim with equal eaſe and ſwiftneſs. Water ſerpents are mentioned by various writers of antiquity, as Ariſtotle, Ælian, and Pliny, and alſo by others of the middle ages, as well as thoſe of modern times. Ælian ſpeaks of ſnakes of large ſize, with flat tails, produced in the Indian ſea, and Ariſtotle mentions others reſembling the conger. It is, therefore, very probable that ſome few of the genus may have been known to them, though it is not leſs likely they might have confounded the muræna with their ſea ſerpents, or perhaps even ſome of the terreſtrial kinds of ſerpents, as the uninformed among the moderns too frequently denominate all thoſe ſnakes "water ſnakes" which they happen to diſcover in the water; without reflecting that thoſe ſnakes may have only ſought ſhelter in the water in the moment of purſuit, or been diſcovered in the very inſtant of time when they have plunged into that element in ſearch of prey.

Boſc, and after him other writers of credit on the tribe amphibia, reject the name of hydrus, given by Schneider; that term having been previouſly aſſigned to a tribe of vermes, the polype or hydra of Linnæus. They, therefore, ſince it appears deſirable the genus ſhould be retained, adopt it by the name of *Hydrophis* inſtead of *Hydrus*, and under this appellation it is received by the beſt writers at this time. Daudin, it is true, eſteems the diſtinction too diffuſe, and with the exception of a few ſpecies continued under the name of enhydris, returns the hydrus genus of Schneider to the Linnæan coluber, but his example is not followed by his own countrymen, among whom the three genera, as before mentioned, ſeem very generally admitted at this period.

It ſhould be diſtinctly underſtood that Mr. Schneider does not include the whole of the water ſerpents under one genus; he conſiders their reſidence in the water as the characteriſtic only of a tribe, which he ſubdivides into two genera, the firſt of which he calls *Hydrus*, the other *Enhydris*. In both the form of the tail is alike, flat, broad, and formed for ſwimming, but in the ſhape of the ſcales and ſome other particulars they differ materially, thoſe of the hydrus correſponding with the viper (coluber), and the enhydrus with the ſnake (anguis). A third genus is conſtituted by ſtill later naturaliſts of the Hydrus colubrinus of that author, under the name of *Platurus*, this ſpecies being furniſhed by nature with venomous fangs like the poiſonous kinds of ſnakes. The genus laſt adverted to was ſuppoſed to conſiſt only of a ſingle ſpecies, but we find among the Indian ſerpents deſcribed by Dr. Ruſſel, ſome other poiſonous kinds, which perhaps belong to this particular genus.

Species.

* Genus *Hydrus*, Schneider. *Hydrophis.*

Laticauda. Pale yellowiſh, with tranſverſe brown bands; tail pointed. *Anguis laticauda*, Linn. *Hydrus faſciatus*, Schneider. *Tatta Pam*, Ruſſel.

The form of this ſpecies is long and ſlender; the head ſmall, not broader than the neck, and covered with large ſcales; the neck cylindrical; the back carinated; ſides declining, and belly roundiſh. The ſcales on the trunk, tail, and belly are orbicular, cloſe and not imbricated; thoſe on the under part of the body amount to two hundred, and are placed in two rows; thoſe beneath the tail fifty; the teeth ſmall. Schneider ſuppoſes this may be of the poiſonous kind, as he obſerved a large curved fang-like tooth on each ſide, concealed as it were in a kind of ſheath. The ſpecimen deſcribed by Dr. Ruſſel was found on the ſea beach at Vizagapatam, and appeared very alert in its motions, yet when put into a veſſel of ſea-water to be preſerved alive, in order to aſcertain the effects of its bite, it very ſoon died. The length of this was about two feet; according to Schneider it grows to a much larger ſize.

Bicolor. Body above black, beneath yellowiſh; tail ſpotted with black. *Hydrus bicolor*, Schneider. *Anguis platura*, Linn. *Nixboa Quanquecolla*, Seba. *Nalia Wablagillee Pam*, Ruſſel.

A native of the Indian ſeas, and ſaid by Forſter to be very common near the coaſts of the iſland of Otaheite, where it is called by the natives *Etoona-toree*, and conſtitutes an article of food; it is about two feet ſix inches long, and feeds on fiſh and molluſcous animals, which, according to Forſter, it ſeizes with the utmoſt addreſs. The ſame ſpecies is found in various parts of the Pacific ocean.

Cæruleus. Blue, with numerous yellow bands. *Shootur*, Ruſſel.

Length three feet and a half; abdominal ſcales three hundred and thirty-two; caudal forty. Native of India.

Major. Livid, with brown decurrent bands, and hexagonal abruptly carinated ſcales. Shaw.

Deſcribed from a ſpecimen in the Britiſh Muſeum. Its length is more than three feet; its colour pale or livid, marked throughout the whole length of the back by a ſeries of large tranſverſe, ſemi-current duſky bands; the tail banded more deeply. The length of the tail is about four inches, and the ſcales which cover it are of a ſomewhat ſquare or lozenge form, and ſo diſpoſed as to reſemble in ſome degree thoſe of a fiſh; they are all marked by an abrupt middle carina; the ſcales on the body are chiefly hexagonal, and are carinated in the ſame manner. It appears to be of the poiſonous kind, as one of the teeth on each ſide in the upper jaw is larger than the reſt, and on being examined with a lens is evidently tubular, the ſlit towards the end being much longer in proportion than in that of the rattle-ſnake. The ſpecies is a native of the Indian ſeas.

Gracilis. Anterior part of the body ſlender, and covered with ſmooth ovate ſcales; the poſterior end thicker, and covered with ſmooth abruptly-carinated hexagonal ſcales. Shaw.

Length two feet; head very ſmall, and not of greater diameter than the neck; the tail about an inch and three-quarters in length, colour uncertain, but appears to have been banded all along the upper parts, from the head to the tail, with numerous, equidiſtant, brown, and ſomewhat obtuſely pointed bands reaching almoſt to the abdomen, thoſe on the ſmall or cylindrical part of the body being continued into annuli.

Cærulescens. Blueiſh with duſky blue decurrent bands, and white abdomen. Shaw.

A native of the Eaſt Indies, the length two feet; in appearance reſembles Hydrus major, but the abdomen has a ſingle and perfectly undivided row of hexagonal ſcales, from the throat to the beginning of the tail, of about the length of an inch in diameter, and forming a carina on that part; back marked by a carina alſo; tail two inches and a quarter long, and moderately broad. Colour above pale livid blue, beneath white, and marked throughout its whole length by decurrent bands of deeper blue.

Curtus. Short, yellowiſh, with duſky decurrent ſubacuminated bands, ſomewhat confluent above. Shaw.

A native of the Eaſt Indies; the length one foot, the body compreſſed, and conſiderably thicker in proportion to its length than the ſpecies cæruleſcens; the head flattiſh; neck and anterior part but little thinner than the reſt of the body; tail about an inch long, and of the uſual form; back and abdomen carinated, the carina of the latter more obtuſe. The general colour is pale yellow, with a pretty cloſe ſeries of deeply decurrent duſky bands from head to tail, and which are ſo diſpoſed as to appear alternately confluent on the upper part of the back, more eſpecially near the head. Deſcribed from a ſpecimen in the Britiſh Muſeum.

Spiralis. Yellowiſh, with brown bands longitudinally confluent beneath; the body ſpirally contorted. Shaw.

An elegant ſpecies, of a ſlender form, and about two feet in length, the body much compreſſed throughout; the dorſal carina very acute, that of the abdomen with a flattened edge of ſcales ſomewhat wider than the reſt, and about the fifteenth of an inch in diameter; the head ſmall; mouth wide; ſcales on the head large, thoſe on the body moderately ſmall, ovate, and ſlightly carinated. The general colour is yellow, with bars of deep cheſnut brown, each dilating on the abdomen; and the back from about the middle nearly to the tail is marked with a ſeries of large, round, blackiſh ſpots. "The moſt remarkable circumſtance in this ſnake (ſays Dr. Shaw) is the ſingular obliquity of its form; the body in different parts being alternately flatter on one ſide than the other, and the pattern completely expreſſed on the flattened ſide only; the other, or more convex ſide, being unmarked by round ſpots, and lying as it were beneath; thus conſtituting ſeveral alternate ſpiral curves." Gen. Zool.

** Genus *Enhydris*.

Caspius. Cinereous olive with four rows of orbicular black ſpots diſpoſed in quincunx order down the back; abdomen yellow, teſſellated with black. *Coluber hydrus*, Pallas.

Inhabits the Caſpian ſea and alſo the Rhine, the length about three feet; tail almoſt black, and terminated by a ſmall double point, one beneath the other. The head is ſmall, the eyes ſurrounded by a yellow circle; teeth numerous, ſmall, and placed in two rows; the tongue very long and black.

Atrocæruleus. Black blue; abdomen yellow, with a central longitudinal line of blue. *Hydrus enhydris*, Schneid. *Mutta Pam*, Ruſſel.

Deſcribed by Dr. Ruſſel as being about twenty inches in length, the colour dark blue and changeable; the yellow of the abdomen inclining to white; head ſmall and covered with large ſcales; anterior part of the body ſlender, the circumference of the trunk, in the thickeſt part, about two inches and a quarter; and the tail ſhort, ſmall, taper and compreſſed. The ſpecimen mentioned by Dr. Ruſſel was taken in an Indian lake called Ankapilly in one of the traps placed there for catching eels. It is ſuppoſed to be harmleſs, having no viſible fangs.

Cinereus. Aſh colour; ſnout broad, obtuſe, and black; abdomen yellowiſh. *Hydrus rynchops*, Schneider. *Karoo Bokadam*, Ruſſel.

Inhabits India; the length three feet and a half, the thickneſs near the head three inches; in the middle of the body four inches and a half; the ſnout projecting, broader than the neck, and forming a kind of beak which is covered with ſmall laminæ, the remainder of the head, with the whole of the upper parts, beſet with ovate or ſub-orbicular carinated ſcales; eyes ſmall and vertical; mouth moderate; teeth cloſe ſet, ſmall, irregular, and not reflex. Colour of the ſcaly part of the ſnout pale cinereous. Tail rather compreſſed, eight inches in length, ſomewhat tapering, and obtuſe at the end.

Piscatorus. Yellowiſh brown, with numerous round black ſpots united by black lines, and diſpoſed in oblique rows. *Hydrus piſcator*, Schneider. *Neeli Koea*, Ruſſel.

Length two feet nine inches; circumference three inches and a half; head rather broad, ovate, and ſomewhat depreſſed, with the ſides compreſſed; covered with large ſcales; tail eleven inches in length, ſlightly carinated, tapering very gradually, and terminating acutely; the abdomen yellowiſh white. The ſpecies is a native of India, and is eſteemed a water ſnake, as it frequents the wet paddy fields; it moves ſwiftly, and carries its head high, with a menacing air, but is not a poiſonous ſpecies, and cannot eaſily be irritated. When provoked it would neither hiſs nor ſnap at a ſtick preſented to it; nor was it provoked to bite a chicken though pecked ſeveral times by the animal. It is known to feed on fiſh.

Palustris. Browniſh yellow, with rhomboid brown ſpots edged with black; abdomen pearl colour; tail above reddiſh white. *Hydrus paluſtris*, Schneider. *Paragoodoo*, Ruſſel.

Reſembles the laſt; the length more than two feet; trunk round; head broadiſh, oblong, and covered with large ſcales; tail round, about five inches and a half long and very taper; between each of the oblique rows of brown rhomboidal ſpots is a ferruginous line, the whole having a decuſſated appearance; the tail plain and immaculate. According to Dr. Ruſſel, this ſpecies is not uncommon in India, frequenting the damp grounds, and the borders of tanks, and growing to a ſize much ſuperior to the former.

Dorsalis. Dirty white, with a dorſal black band ſinuated at the edges. *L'Enhydre dorſale*, Boſc.

The length about one foot; head ovoid; abdomen carinated. Country unknown.

*** Genus *Platurus*. *Armed with venomous Fangs.*

Fasciatus. Lead colour, with broad black ſurrounding bands. *Coluber laticaudatus*, Linn. *Hydrus colubrinus*, Schneider. *Platurus faſciatus*, Latreille.

Native of the Indian and American ſeas; its general length two feet ſix inches, or more; the head is covered with large ſcales; the body cylindrical; tail flattened and ſomewhat dilated at the tip. This is a poiſonous ſerpent, but the fangs are remarkably ſmall in proportion to the ſize of the creature.

Lanceolatus. Back blue, under the belly yellowiſh; tail lanceolate and entirely blue.

A native of the Indian ſeas, and is called by the inhabitants

ants in the Engliſh ſettlements Hoglin; it is two feet and a half in length; the ſeries of abdominal ſcales three hundred and ſix, and thoſe of the tail forty-eight. This and the following ſpecies are extremely dangerous, their bite proving mortal in a few minutes.

Albus. White with numerous blue bands; tail obtuſe.

Deſcribed by Dr. Ruſſel as a native of India, under the name of Chittul. The length is three feet, the number of abdominal ſcales is three hundred and eight; and thoſe of the tail forty-eight.

HYELA, in *Ancient Geography*, a river of Aſia, in Bithynia, called by Pliny *Hylas.*—Alſo, a town of Arabia Felix. Ptol.

HYELLA, a maritime town of Magna Græcia, in Lucania, called alſo *Hyalé.* Strabo.

HYELLIUM, a town of Aſia, in Phrygia, upon the Meander.

HYEMAL Solstice, the ſame with *winter ſolſtice.* See Solstice.

HYEMANTES, in the *Primitive Church*, offenders who had been guilty of ſuch enormities, that they were not allowed to enter the porch of the churches with the other penitents, but were obliged to ſtand without, expoſed to all the inclemency of the weather.

HYES, in *Mythology*, a ſurname given to Bacchus, from the name Hye given to his mother Semele: or, according to others, becauſe her feaſt commonly happened in a rainy ſeaſon; from ὕω, *to rain.* The Athenians worſhipped Jupiter under the character Pluvialis, and erected an altar to him on mount Hymetta.

HYETUSSA, in *Ancient Geography*, a ſmall iſland ſituated on the coaſt of Ionia, over-againſt the mouth of the Meander, and ſouth of the promontory of Trogilium.

HYGEIA, or Hygieia, in *Mythology*, an epithet given to Minerva, as the goddeſs of health. Hygieia was repreſented as one of the four daughters of Eſculapius. She often accompanies her father in the monuments of him now remaining, and appears like a young woman, commonly holding a ſerpent in one hand, and a patera in the other; ſometimes the ſerpent drinks out of the patera; ſometimes he twines about the whole body of the goddeſs.

HYGIEINE, Ὑγιεινη, formed of ὑγιης, *ſound*, *healthy*, that branch of medicine which conſiders *health*, and diſcovers proper means and remedies, with their uſe in the preſervation of that ſtate.

The objects of this branch of medicine are, the non-naturals. See Air, Diet, Exercise, &c.

Hygieine, more largely taken, is divided into three parts; *prophylactice*, which foreſees and prevents diſeaſes; *ſynteritice*, employed in preſerving health; and *analeptice*, whoſe office is to cure diſeaſes, and reſtore health.

HYGINUS, pope, in *Biography*, is thought to have been a native of Athens, flouriſhed in the ſecond century, and was brought up as a philoſopher by profeſſion. He was elected to the office of biſhop of Rome upon the martyrdom of Teleſphorus about the year 140, and filled it till his death, which took place three years after. He was the zealous opponent of the doctrines propagated at that period by Valentine and Cerdo, but could not prevent them from making conſiderable progreſs. He ſettled and confirmed the ſeveral orders and degrees of the clergy; ordained the ſolemn conſecration of churches, and did many other acts which were regarded, at that period, as of great importance to the intereſts of the prevailing religion. Moreri.

Hyginus, Caius Julius, one of the ancient grammarians, is mentioned by Suetonius as a native of Spain, though ſome have ſuppoſed him an Alexandrian, and to have been brought to Rome after the capture of that city by Julius Cæſar. He was appointed keeper of the Palatine library, and received pupils for inſtruction. He was intimately acquainted with Ovid and other literary characters of the age: he was ſaid to be the imitator of Cornelius Alexander, a Greek grammarian; wrote the lives of illuſtrious men, which are referred to by Aulus Gellius; a volume of examples, and a copious treatiſe on the cities of Italy. Other works have been attributed to him: but the only pieces that have come down to us, are entitled "Poëticon Aſtronomicon, de Mundi et Spheræ, ac utriuſque Partium, Declaratione, lib. iv." and a book of fables. The beſt edition of theſe works in conjunction is contained in Munker's "Mythographi Latini." Gen. Biog.

HYGRA, of ὑγρος, *moiſt*, a name given by the ancients to what they called liquid plaſters, in oppoſition to thoſe called xeria, or dry ones. Theſe firſt were a ſort of liniments.

HYGROCIRSOCELE, compounded of ὑγρος, *moiſt*, and κιρσοκηλη, *ramex varicoſus*, in *Medicine*, a branch of a vein ſwelled with ill blood, or other humours; or a varicoſe tumour of ſome of the veins of the teſtes, attended with a gathering of water in the ſcrotum.

HYGROMETER, or Notiometer, compounded of ὑγρος, *moiſt*, and μετρεω, *I meaſure*, a machine, or inſtrument, whereby to meaſure the degrees of dryneſs, or moiſture, of the air. It is alſo called *Hygroſcope.* See the next article.

HYGROMETRY is the term uſed by Lambert, Sauſſure, and other writers to denote the ſcience concerning the nature and quantity of aqueous vapour in the atmoſphere, and its relation to certain inſtruments called *hygrometers.* This branch of meteorology has been greatly improved of late years, and is juſtly conſidered of importance, as being intimately connected with *hygrology*, or the ſcience of aqueous meteors in general.

The two great objects of hygrometry are, 1ſt, To find what quantity of water exiſts in ſolution, or in an elaſtic ſtate, in a given volume of the atmoſphere, or, which is ſtill better, in a given perpendicular column reaching to its ſummit; and, 2dly, To aſcertain the diſpoſition of the atmoſphere on any occaſion to depoſit water or to abſorb it, or, in more familiar language, its diſpoſition to rain or to be fair.

The earlier philoſophers had the ſecond object chiefly in view, on account of the more immediate benefit which ſeemed likely to be derived from the knowledge of it; but latterly both objects have engaged the attention of thoſe who have purſued this branch of phyſical inveſtigation. Various means have been applied and inſtruments uſed under the name of hygrometers or hygroſcopes, to indicate the fluctuations of moiſture exiſting in the atmoſphere. The detail of experimental enquiry may be conveniently digeſted under five heads; namely, 1. The alternate expanſion and contraction of animal and vegetable ſubſtances, by dryneſs and moiſture. 2. The quantity of water abſorbed from the air by chemical agents having an affinity for it. 3. The quantity of water evaporated under given circumſtances. 4. The cold produced by the evaporation of water; and, 5. The dew-point; or that point of temperature at or below which dew is depoſited from the atmoſphere upon glaſs or any other ſmooth ſubſtance.

1. *On the Expanſion and Contraction of Animal and Vegetable Subſtances by Dryneſs and Moiſture.*—It has been long known that animal and vegetable ſubſtances of different kinds are ſubject to contraction and dilatation by moiſture and dryneſs. Mr. Boyle made experiments on ropes, by ſuſpending weights of 50 or 100lb. to them, which he found were raiſed

and lowered alternately by the moiſture and dryneſs of the air. Amongſt the hygrometrical ſubſtances of this kind, that have been more or leſs noticed, may be reckoned ropes and cords of various kinds, ſuch as whip-cord, catgut, &c., wood, particularly deal, ivory, whalebone, hair, beard of a wild oat, and ſeveral other vegetable productions, &c. If theſe bodies retained the property of being affected by moiſture undiminiſhed, they would form comparable inſtruments for hygrometers or rather hygroſcopes; but unfortunately they all in time become leſs ſenſible than at firſt.

We ſhall here give in brief detail an account of the manner in which hygrometers, conſiſting of the above-mentioned materials, have been conſtructed.

Stretch a hempen cord or a fiddle-ſtring, as A B (*Plate* XII. *Hydraulics*, *fig*. 1.) along a wall, bringing it over a truckle or pulley B, and to the other extreme D tie a weight E, into which fit a ſtyle, or index, F G. On the ſame wall fit a plate of metal H I, divided into any number of equal parts, and the hygrometer is complete.

For it is a matter of undoubted obſervation, that moiſture ſenſibly ſhortens the length of cords and ſtrings; and that as the moiſture evaporates they return to their former length; and the like may be ſaid of a fiddle-ſtring. The weight, therefore, in the preſent caſe, upon an increaſe of the moiſture of the air, will aſcend; and upon a diminution of the ſame, it will deſcend.

Hence, as the index F G will ſhew the ſpaces of aſcent and deſcent, and thoſe ſpaces are equal to the increments and decrements of the length of the cord or gut A B D, the inſtrument will diſcover whether the air be more or leſs humid now than it was at another given time.

Or thus: if a more ſenſible and accurate hygrometer be required, ſtrain a whip-cord, or fiddle-ſtring, over ſeveral truckles, or pullies, A, D, E, F, and G (*fig*. 2.), and proceed with the reſt as in the former example. Nor does it matter whether the ſeveral parts of the cord A B, C D, D E, E F, F G, be parallel to the horizon, as expreſſed in the preſent figure, or perpendicular to the ſame. The advantage of this, above the former hygrometer, is, that we have a greater length of cord in the ſame compaſs; and the longer the cord, the greater its contraction and dilatation.

Or thus: faſten a twiſted hempen cord, or fiddle-ſtring, H W, by one end, ſuſtaining a weight W (*fig*. 3.) to an iron hook; and let the other end deſcend upon the middle of an horizontal board, or table, A B, and fit an index I. Laſtly, from the centre B deſcribe a circle; which divide into any number of equal parts.

Now, it is matter of obſervation, that a cord or gut twiſts itſelf as it is moiſtened, and untwiſts again as it dries. Mr. Molyneux, ſecretary of the Dublin ſociety, writes, that he could perceive this alternate twiſting and untwiſting in a cord, by only breathing on it eight or ten times, and then applying a candle towards it. Hence, upon an increaſe or decreaſe of the humidity of the air, the index will ſhew the quantity of twiſting or untwiſting; and, conſequently, the increment or decrement of humidity, or dryneſs.

Or thus, faſten one end of a cord or fiddle-ſtring, H I, (*fig*. 4.) to a hook H; and to the other end faſten a ball K, of a pound weight. Draw two concentric circles on the ball, and divide them into any number of equal parts; fit a ſtyle, or index, N O, into a proper ſupport, N, ſo as the extremity O may almoſt touch the diviſions of the ball.

Here the cord or gut twiſting or untwiſting, as in the former caſe, will indicate the change of moiſture, &c. by the ſucceſſive application of ſeveral diviſions of the circles to the index.

Or thus: provide two wooden frames, A B and C D, (*fig*. 5.) with grooves in them; and between theſe grooves fit two thin leaves of aſh, A E F C and G B D H, ſo as they may eaſily ſlide either way. At the extremes of the frames A, B, C, D, confine the leaves with nails, leaving between them the ſpace E G H F, about an inch wide. On I faſten a ſlip of braſs dented, I K; and in L a little dented wheel, upon whoſe axis, on the other ſide of the machine, an index is to be put. Laſtly, from the centre of the axis, on the ſame ſide, draw a circle, and divide it into any number of equal parts.

Now, it being found by experience, that aſhen wood readily imbibes the moiſture of the air, and ſwells with it; and as that moiſture ſlackens, ſhrinks again; upon any increaſe of the moiſture of the air, the two leaves A F and B H, growing turgid, will approach nearer each other: and, again, as the moiſture abates they will ſhrink, and again recede. Hence, as the diſtance of the leaves can neither be increaſed nor diminiſhed without turning the wheel L, the index will point out the changes in reſpect of humidity and dryneſs.

It is to be noted, that all the hygrometers above deſcribed become ſenſibly leſs and leſs accurate; and, at length, undergo no ſenſible alteration at all from the humidity of the air. The following is much more laſting; though no hygrometer will ſerve for years, like a barometer and thermometer; but whatever be the ſubſtance of which it is made, will be ſo altered as to become in a great degree uſeleſs.

Take the manoſcope deſcribed under that article, and inſtead of the exhauſted ball E, (*fig*. 6.) ſubſtitute a ſponge, or other body which eaſily imbibes moiſture. To prepare the ſponge, it may be neceſſary to waſh it firſt in water; and when dry again, in water or vinegar, wherein ſal ammoniac, or ſalt of tartar, has been diſſolved, and let it dry again.

Now, if the air become moiſt, the ſponge, growing heavier, will preponderate; if dry the ſponge will be hoiſted up, and, conſequently, the index will ſhew the increaſe or decreaſe of humidity of the air.

In the laſt mentioned hygrometer, Mr. Gould, in the Philoſophical Tranſactions, inſtead of a ſponge, recommends oil of vitriol, which is found to grow ſenſibly lighter or heavier, in proportion to the leſſer or greater quantity of moiſture it imbibes from the air; ſo that being ſatiated in the moiſteſt weather, it afterwards retains or loſes its acquired weight, as the air proves more or leſs moiſt. The alteration in this liquor is ſo great, that in the ſpace of fifty-ſeven days it has been known to change its weight from three drachms to nine; and has ſhifted an index or tongue of a balance thirty degrees. A ſingle grain, after its full increaſe, has varied its equilibrium ſo ſenſibly, that the tongue of a balance, only an inch and a half long, has deſcribed an arch one-third of an inch in compaſs; which arch would have been almoſt three inches, if the tongue had been one foot, even with ſo ſmall a quantity of liquor; conſequently, if more liquor, expanded under a large ſurface, were uſed, a pair of ſcales might afford as nice an hygrometer as any kind yet invented. The ſame author ſuggeſts, that oil of ſulphur per campanam, or oil of tartar per deliquium, or the liquor of fixed nitre, might be ſubſtituted in lieu of the oil of vitriol.

This balance may be contrived two ways; by either having the pin in the middle of the beam, with a ſlender tongue, a foot and a half long, pointing to the diviſions on an arched plate, as repreſented in *fig*. 6:

Or, the ſcale with the liquor may be hung to the point of the beam near the pin, and the other extreme be made ſo long, as to deſcribe a large arch on a board placed for the purpoſe, as repreſented in *fig.* 7.

Mr. Arderon has propoſed ſome amendment in the ſponge hygrometer. He directs the ſponge A (*fig.* 8.) to be ſo cut as to contain as large a ſuperficies as poſſible, and to hang by a fine thread of ſilk, upon the beam of a balance B, and exactly balanced on the other ſide by another thread of ſilk at D, ſtrung with the ſmalleſt lead-ſhot, at equal diſtances, ſo adjuſted as to cauſe an index E, to point at G, the middle of a graduated arch, F G H, when the air is in a middle-ſtate, between the greateſt moiſture and the greateſt dryneſs. Under this ſilk ſo ſtrung with ſhot, is placed a little table or ſhelf I, for that part of the ſilk and ſhot which is not ſuſpended to reſt upon. When the moiſture imbibed by the ſponge increaſes its weight, it will raiſe the index, and alſo part of the ſhot, from the table, and *vice verſâ* when the air is dry. Phil. Tranſ. N° 479. vol. xliv. p. 96.

From a ſeries of hygroſcopial obſervations, made with an apparatus of deal wood, deſcribed in the Philoſophical Tranſactions, N° 480, Mr. Coniers concludes, 1. That the wood ſhrinks moſt in ſummer, and ſwells moſt in winter, but is moſt liable to change at ſpring and fall. 2. That this motion happens chiefly in the day-time, there being ſcarcely any variation in the night. 3. That there is a motion even in dry weather, the wood ſwelling in the morning, and ſhrinking in the afternoon. 4. The wood, by night as well as day, uſually ſhrinks when the wind is in the north, north-eaſt, and eaſt, both in winter and ſummer. 5. That by conſtant obſervation of the motion and reſt of the wood, with the help of a thermometer, one may tell the ſituation of the wind without a weather-cock.

He adds that the time of the year may be known by it; for in ſpring it moves quicker and more than in winter; in ſummer it is more ſhrunk than in ſpring; and has leſs motion in autumn than in ſummer.

See an account of the method of conſtructing theſe and other hygrometers in Lowthorp's Abridg. Phil. Tranſ. vol. ii. p. 30, &c. and plate 1. annexed. See alſo Phil. Tranſ. vol. xliii. N° 473. p. 6, &c. vol. xliv. p. 169, and p. 184.

Dr. Hooke's hygrometer was made of the beard of a wild oat, ſet in a ſmall box, with a dial plate and an index. See his Micrographia, p. 150, &c.

An hygrometer of this kind may be conſtructed in the following manner. Let A B C D (*fig.* 9.) be a ſquare braſs plate, about four inches ſquare, with a ring or circle fixed to it, graduated on the flat and the inner edge. I C repreſents a very light index of braſs or ſteel, with a ſmall cylindric lump in its centre, into which is faſtened the top of the beard of a wild oat, by a little peg, and the other end of it in another lump, about an inch under the plate, which, having a little hole under C, allows the beard of the oat to come through, in order to carry the hand, and yet keep it in its place, without hindering it to twiſt and untwiſt. There are alſo two wires coming down under the middle of the plate, which hold a little croſs bar, making a ſmall frame to carry the lump that holds the bottom of the beard expoſed to the air. The four feet of this inſtrument, two of which are ſeen at C, D, muſt be about one inch and a quarter long, to keep the frame under the plate from touching any thing which the inſtrument is ſet upon. AB, in *fig.* 10, repreſents the plate, F and F two of its feet, C and D the little lumps to which the wild oat-beard, C D, is faſtened; *e f* and *g h* the wires ſupporting the piece *f h*, and all together form an open frame, to hold the lump D. The beard paſſes through the hole *i*, in order to carry the index I *i*, which points to the degrees on the graduated circle A B.

The following hygrometer was contrived by Dr. Hales and Deſaguliers. P *c p w* C, (*fig.* 11.) is a piece of lignum vitæ, cylindric at C *w* P, but from C *w* to *p* a truncated cone, and ſcrewed like the fuzee of a watch, but not ſo taper. The length of the inſtrument is about a foot, the cylindric part an inch in diameter, and half an inch long; the large part of the ſcrew about three quarters of an inch, and the ſmall part half an inch; at each end there are fine ſteel pivots, bearing on two fine conic holes in braſſes in the frame that carries the inſtrument, that it may turn eaſily. A ſponge, S, hangs by a ſilk from the cylinder of the inſtrument, ſo as to turn it by its riſing or falling; a weight W, hanging from another ſilk *u*, coiled upon the ſcrew C *p*, keeps the ſponge in equilibrio. When the ſponge becomes heavier, by imbibing moiſture from the air, it runs down, and draws up W; but as W comes up, its ſtrings muſt advance towards C *w*, where, hanging farther from its centre, its power will be ſo increaſed, that it will keep the ſponge in equilibrio, though its weight be increaſed. But as the weight riſes, it will ſhew on the ſcale, D D, how much the ſponge is heavier, and conſequently the air moiſter. This inſtrument will be made ſtill more ſenſible, when its pivots are ſupported by four friction wheels. Salt of tartar, or any other ſalt, or pot-aſhes, may be put into the ſcale of a balance, and uſed inſtead of the ſponge. Deſag. Exp. Phil. vol. ii. p. 300.

In an hygrometer invented and deſcribed by Mr. Ferguſon, A A A A (*fig.* 12.) is a frame of wainſcot or mahogany, grooved in the longeſt ſides, to hold the pannel B B B B of white deal board, without pinching it. The pannel is about the thickneſs of a crown-piece, and fifteen inches long croſs-wiſe to the grain of the wood. The middle part projects at C and C, where it is faſtened into the frame by two ſcrews; ſo that this part always remains in the ſame place, whilſt the reſt of the pannel expands by moiſt air towards both ends of the frame, and contracts towards the middle, when the air is dry. To a pin at F is faſtened one end of a ſmall flexible cord D E, and the other end goes round the pulley G, and is fixed into the bottom of its groove at *h*. One end of another ſmall cord, I K, is fixed into the groove of the large pulley H, at *a*, going round the part *a i* H, and paſſing round to M, round a ſmall pulley L, the axis of which turns in the piece O, lying above it, and ſcrewed to the frame at C. To the end of the cord is ſuſpended a flattiſh weight N. The diameters of the pullies G and L are equal, and about one-tenth of the diameter of H. The diſtance of the pullies G, and pin F, will determine the expanſion of the pannel between F and G: which will cauſe the pulley, G, to turn backward, and any point in H ten times as much; and in this proportion will the weight N be raiſed: therefore, if the pannel extend one-tenth of an inch by moiſt air, the pulley L will be turned quite round. As the air grows dry, the pannel contracts, the weight N deſcends, and turns all the pullies the contrary way. The back of the plate A A, (*fig.* 13.) is ſcrewed to the other ſide of the frame, ſo that the ſtraight edge of the plate may be even with the uppermoſt ſide of the frame, and the centre B may be directly over the centre of the pulley L (*fig.* 12.), on whoſe axis the index B C (*fig.* 13.) is fixed, which, by moving on the graduated edge of the plate, indicates the moiſture or dryneſs of the air. The pannel ſhould be changed in three or four years. (Phil. Tranſ. vol. liv. art. 47.) Mr. Smeaton has given the conſtruction of an hygrometer of cord: it is, doubtleſs, the beſt that has been publiſhed conſtituted of that ſubſtance.

Mr. Smeaton's hygrometer is exhibited in (*Plate* XIII. *figs.* 1 and 2. A B C (*fig.* 1.) is an orthographic delineation of the whole inſtrument ſeen in front, with the box-cover H, which defends the index, &c. from injury, and by a glaſs expoſes the ſcale to view. F G in both figures repreſents a flaxen cord, about 35 inches long, ſuſpended by the turning peg F, attached to a loop of braſs wire at A. This cord is that which is called by net makers in London *flaxen three-threads laid*, and is between one 20th and one 30th of an inch in diameter. It is previouſly boiled in a ſolution of two pennyweights troy of common ſalt in one pound avoirdupoiſe of water, boiled till the whole is reduced to ſix ounces avoirdupoiſe. The cord ſoaked in this brine is dried, and then ſtretched, by tying three or four yards of it to two nails againſt a wall, in a horizontal poſition, and hanging a weight of a pound or two to the middle. When it has remained in this poſition for a week or more in a room, it will be fit for uſe. G, I, (*fig.* 2.) are two loops, or long links of braſs-wire, laying hold of the index K L, which is moveable on a ſmall ſtud or centre K. The cord F G is kept moderately ſtrained by a weight M, about half a pound avoirdupoiſe. As the cord lengthens or ſhortens, the end of the index paſſes over the ſcale N Q, diſpoſed in the arc of a circle, and containing 100 equal diviſions. This ſcale is attached to the braſs ſliding ruler Q P, which moves upon the directing piece R R, fixed by ſcrews to the board, which makes the frame or baſe of the whole; and the ſcale and ruler, N Q P, are retained in any place nearer to or farther from the centre K, by the ſcrew S. *Fig.* 3. repreſents in profile the ſliding piece and ſtud I, which traverſes on that part of the index next the centre K; and which can, by the two ſcrews of the ſtud, be retained upon any part of the index that is made parallel, and which is done for three or four inches from the centre, for that purpoſe. The ſtud is filed to the edges like the fulcrum of a ſcale-beam, one being formed on the under-ſide, and the other upon the upper, as near as poſſible to one another. A hook formed at the lower end of the wire loops, G, I, retains the index by the lowermoſt end of the ſtud, while the weight M hangs by a ſmall hook upon the upper edge. By theſe means the index is kept ſteady, and the cords ſtrained by the weight, with very little friction or burthen upon the central ſtud K. *Fig.* 4. is a parallelogram of plate braſs to keep out duſt, which is attached to the upper edge of the box-cover H, and ſerves to ſhut the part of the cover, neceſſarily cut away, to give leave for the wire, G I, to traverſe with the ſliding ſtud (*fig.* 3.) nearer to or farther from the centre of the index K. In this (*fig* 4.) there is a hole *a*, about one-fifth of an inch diameter, for the wire G I to paſs through, in the motion of the index, without touching; *b* is a ſlit of a leſſer ſize, ſufficient for the wire to paſs, and allow the cover to come off without deranging the end of the index; *c, c,* are two ſmall ſcrews applied to two ſlits, by which the plate ſlides lengthways, in order to adapt the hole *a* to the wire G I, at any place of the ſtud I, upon the index K L. This index is 12 inches long, four inches of which, from the extreme end, are filed ſo narrow, that any part of them may ſerve for an index to the diviſions of the ſcale; the ſcale itſelf alſo ſlides four inches. The directing piece, R R, is parallel to a line drawn from 0 upon the ſcale to the centre, K, of the index; conſequently, as the attenuated part of the index forms a part of a right line drawn from the ſame centre, whenever the index points to 0 upon the ſcale, though the ſcale be removed nearer to or farther from the centre of the index, yet it produces no change in the place to which the index points. When the divided arc of the ſcale is at 10 inches from the centre, which is its mean diſtance, then the centre of the arc and the centre of the index are coincident. At other diſtances, the extremes of which are eight or 12 inches, the centre of the diviſions, and the centre of the index, pointing to them, not being coincident, the index cannot move over ſpaces geometrically proportionable to one another in all ſituations of the ſcale; yet the whole ſcale not exceeding 30 degrees of a circle, it will be found, on computation, that the error can never be ſo great as $\frac{1}{100}$dth part of the ſcale, or one degree of the hygrometer.

For adjuſting the inſtrument, take off the box-cover, and ſet the inſtrument nearly upright about a yard from a moderate fire; there let it remain, till the index ſinks as low as it will go, ſtroking the cord occaſionally between the thumb and finger downwards. When it is become ſtationary, raiſe or depreſs the index by means of the peg at top, till it lies over the point 0; then remove the inſtrument from the fire, and with a camel-hair pencil dipped in warm water, moiſten the cord, without ſuffering any drops of wet to fall from it till it is ſaturated, and the index becomes ſtationary. If the index lies over the degree marked 100, all is right; if not, ſlacken the ſcrew S, and ſlide the ſcale nearer to or farther from the centre, till the point 100 come under the index, and the inſtrument is adjuſted for uſe. The intermediate ſpace muſt then be divided into equal parts. The adjuſtment may be repeated two or three times a year, or as often as may be judged neceſſary to adapt the ſcale to the exiſting capacity of the cord. If the compaſs of the ſlide be not ſufficient to effect this, ſlacken the proper ſcrews, and move the ſliding ſtud I nearer to or farther from the centre of the index, as the angle, formed by the index between the points of dry and wet, happens to be too ſmall or too large for the ſcale. Mr. Smeaton was led by obſervation to mark the point of 0 *dry*, 20° the *mean*, 40° *moiſt*, 70° *very moiſt*, and 100° *wet*. Phil. Tranſ. vol. lxi. part i. art. 24.

Other inſtruments of a more delicate and portable nature have ſince been invented. We may form an idea of the ſlow and gradual manner by which a cord of this kind loſes its power, by the reſult of a ſeries of experiments made by Mr. Dalton, and publiſhed in his Meteorological Eſſays, 1793. A piece of whip-cord, ſix yards long, was hung up in a room and thrown over a pulley; it was then ſtretched by a weight of three ounces for ſome months; after which an index and a ſcale of inches and decimals were attached to the end having the weight. A regular ſeries of obſervations were made on it three times a day for two years, and once a day for three ſucceeding years. The room was without fire, but airy.

The reſults are below: the higher numbers denote greater dryneſs, all other circumſtances being the ſame.

	1788	1789	1790	1791	1792
Annual means	9.33	10.77	11.21	11.59	11.92
Drieſt - -	13.8	14	14.1	14.4	15
Moiſteſt - -	1.5	6.3	7.1	6 5	8.3

The general monthly means for the five years were,

January - - - - -	7.93
February - - - - -	8.52
March - - - - -	10.27
April - - - - -	11.39
May - - - - -	12.38
June - - - - -	13.10
July - - - - -	12.42
Auguſt - - - - -	12.68
September - - - - -	11.72
October - - - - -	11.15
November - - - - -	10.2
December - - - - -	9.75

Hence it appears that a cord, in theſe circumſtances, increaſes every year in length, but leſs and leſs each year, and that the range of variation diminiſhes each year. The quantity, however, is ſuch as to render inſtruments of Smeaton's conſtruction occaſionally adjuſted very comparable.

Another ſtill more ſimple form of this ſort of hygrometer conſiſts of a ſhort piece of cord or cat-gut, from four to ten inches, ſuſpended by a hook over a horizontal board; to the lower end of the cord is fixed a horizontal index having a circular graduated ſcale on the board. As the cord attracts moiſture or the contrary, it twiſts or untwiſts, and thereby turns the index. On this principle, the Dutch toys, called weather-houſes, are made; one end of the index ſupports a ſmall image of a man, and the other that of a woman; the former appears, or is brought out, in wet weather, and the latter in fair weather.

M. de Luc ſome time ago conſtructed an hydrometer of ivory. The part of his hygrometer which is affected by the moiſture of the air, is a hollow tube of ivory *a a b* (*fig.* 5.) two inches eight lines long, and internally two lines and a half in diameter. This tube is open at the end *a a*, and cloſed at *b*, terminating in a point; and the thickneſs of its ſides, for the length of two inches ſix lines from the bottom, is but three ſixteenths of a line: it is this thin part which does the office of an hygrometer; the remaining part of the cylinder, towards its orifice *a a*, muſt be kept a little thicker, in order to bear the preſſure of a tube of glaſs, about fourteen inches long, the lower end of which is ſeen at *d d e e*. The internal diameter of this tube is about three-eighths of a line, and the outſide diameter about two lines, in order that the part *g g* of a braſs piece *f f g g*, through which it paſſes, and which is to enter into the ivory pipe, be as thick as poſſible. In order to hinder that part of the tube which incloſes the braſs piece from being affected by the variations of moiſture, it is covered with a braſs ferril *h h i i*. Theſe pieces are united together with gum lac or maſtich, which melts by the heating of the glaſs and braſs. M. de Luc's reaſon for chuſing ivory for his hygrometer, is, that this matter appeared to him more proper than any other for receiving the impreſſion of the moiſture of the air, without ſuffering thereby any material change. The cylinder made of it becomes more capacious, in proportion as it grows moiſter; and this is the fundamental principle of the inſtrument. M. de Luc has alſo found, that upon letting this cylinder lie for ſome time in water of an uniform temperature, it ſwells to a certain point, after which it dilates no farther. This circumſtance furniſhed him with a *maximum* of humidity; and, conſequently, with one point of compariſon in the ſcale of the hygrometer; and this point he has fixed at the temperature of melting ice. For meaſuring the differences in the capacity of this ivory cylinder, and thereby diſcovering its different degrees of moiſture, M. de Luc makes uſe of quickſilver, with which he fills the cylinder, and a part of the communicating glaſs tube. The more capacious this cylinder is, or, which is the ſame, the moiſter it is, the lower does the mercury ſtand in the glaſs tube, and *vice verſâ*. Now M. de Luc has found, that the loweſt point to which it can ſink, is that where it ſtands when the ivory cylinder is ſoaked in melting ice: he therefore names or graduates this point 0 in the ſcale of his hygrometer; and, conſequently, the degrees of this ſcale are degrees of dryneſs, counted from below upwards, as the quickſilver riſes in the glaſs tube. To give theſe degrees a determinate length, and thus to render the hygrometers capable of being compared with each other, M. de Luc employs in conſtructing them ſuch glaſs tubes as have been previouſly prepared, by being made into thermometers, and filled with mercury, ſo as to aſcertain upon them the points of melting ice and boiling water, and to take exactly the diſtance between theſe points by any ſcale at pleaſure. When this is done, the bulb of this preparatory thermometer muſt be broken, and the quickſilver it contains exactly weighed. It is by knowing the weight of this, together with the diſtance between the fixed points of the thermometer, that the ſcale of the hygrometer is determined. *E. gr.* Let the weight of the quickſilver be one ounce, and the diſtance between the above-mentioned points one thouſand parts of a certain ſcale; then ſuppoſe that the quickſilver in the hygrometer to which this tube is to be applied, weighs only half an ounce; this will give a fundamental line, conſiſting of 500 parts of the ſame ſcale. The fundamental line, thus found, is applied to the ſcale of the hygrometer, beginning at 0, and meaſuring it off about four times over, that the whole variation of the inſtrument may be comprehended. Each of thoſe ſpaces being afterwards divided into 40 equal parts, gives ſuch degrees as M. de Luc has found moſt convenient. In general terms, the length of the fundamental line of the hygrometer muſt be to the interval between the two fixed points of the preparatory thermometer, as the weight of the quickſilver in the hygrometer is to the weight of the quickſilver in that thermometer. This proportion between the ſcale of the hygrometer, and that of the preparatory thermometer, furniſhes an eaſy method of correcting in this inſtrument the effects of heat upon the mercury which it contains. It will eaſily be conceived, from the conſtruction of the ſcale of this hygrometer, that if its cylinder of ivory was ſuddenly changed into glaſs, the inſtrument would become a true thermometer, in which the interval between the points, anſwering to melting ice and boiling water, would be divided into 40 parts. If, therefore, a thermometer with a ſcale ſimilarly divided into 40 parts between the fixed points, be placed near the hygrometer, it will ſhew immediately the correction to be made on that inſtrument for its variations as a thermometer, under particular reſtrictions, which M. de Luc has ſtated.

The part of the frame of the inſtrument on which the ſcale is marked is immoveable; ſo that, before obſerving the point at which the mercury ſtands, it may be puſhed upwards or downwards, according as the thermometer has riſen or fallen with reſpect to the point of melting ice; and thus the indications of the hygrometer can at once be freed from the errors which would ariſe from the difference in the volume of the quickſilver, on account of the different degrees of heat.

For this purpoſe, at the top of this ſcale, there is an index over-againſt another ſmall ſcale, marked upon the unmoveable part of the frame: the degrees of this ſmall ſcale are eightieth parts of the fundamental line, and anſwering to the degrees of the thermometer on the ſame frame. When the index points to 0 of the ſmall ſcale, the thread which indicates upon the tube of the hygrometer the point to which the mercury ſunk in the melting ice, anſwers likewiſe to 0 in the ſcale of the hygrometer. See an elaborate account of the principles and advantages of this hygrometer, the particular proceſs of its conſtruction, and obſervations made with it by M. de Luc, in the Phil. Tranſ. vol. lxiii. part ii. art. 38.

The inſtrument, with its frame, is ſeen in *fig.* 6. It is mounted on deal, becauſe this wood ſuffers the leaſt change in the length of its fibres. The lower part of the frame is ſlit through the whole length of the ivory pipe, in order that the air may circulate freely round this pipe, and the bulb of an annexed thermometer. The hygrometer is faſtened in three parts, *viz.* at bottom on a ſmall bracket, at top by a tube paſſing through a piece either of hard wood or of metal faſtened by ſcrews, and chiefly by means of a braſs wire on the neck of the braſs piece, which unites the glaſs with the ivory pipe. This piece is laid in a ſmall plate of a hard wood, which in that place fills a groove originally made through the whole length of the board. To prevent duſt from getting through the opening of the tube, it is ſhut up in a ſmall ivory caſe. The ſcale of the hygrometer is marked upon a deal ſlip, which ſlides along the groove juſt mentioned. This and all the other parts of the frame muſt be lined with paper, for marking the neceſſary ſcales, and this paper is afterwards varniſhed over. The ſcale of the hygrometer is carried to the upper point, by means of a knob fixed on a ſmall piece of hard wood or metal ſcrewed to the bottom of the board, and which affords a free paſſage to the tube of the hygrometer.

Meſſrs. Sauſſure and De Luc have both ſucceſsfully proſecuted their inveſtigations in the ſcience of hygrometry. The former of theſe gentlemen wrote an eſſay on hygrometry, which was publiſhed in 1783. In this elaborate, and in many reſpects excellent work, Sauſſure contends for the ſuperiority of human *hair*, for the purpoſe of hygrometers. Hair, he finds, after it has been boiled in a weak alkaline lixivium, will expand by moiſture nearly $\frac{1}{40}$th of its length, and contract again by dryneſs; and that it is leſs liable to loſe this effect by time than moſt other ſubſtances, and is moreover, from its tenuity, very quickly reduced to the preſent ſtate of the atmoſphere. On theſe accounts he gives it the preference to other ſubſtances, and conſtructs his hygrometer with it accordingly. The principle of the conſtruction is to faſten one end of the hair to a fixed point, and the other to the arbor of a ſmall wheel, which carries a fine needle at one extremity; this needle points out, upon a graduated circular arch, the hygrometric degrees. The hair is ſtretched by a counterpoiſe of three or four grains, ſuſpended from the ſame arbor by a fine ſilk thread. A more particular deſcription of the conſtruction is given by the author, in reference to plate 1, fig. 1, of the eſſays. See *Plate* XIII. *Hydraulics*, *fig.* 7.

“ The inferior extremity of the hair, *a b*, is held by the mouth of the ſcrew-pincers, *b*; theſe pincers, repreſented ſeparately in B, terminate in a ſcrew, which enters into the female ſcrew at C: this ſcrew turns continually in its ſupporter, and ſerves to raiſe or depreſs B at pleaſure. The other extremity, *a*, of the hair is held by the inferior mouth of the double moveable pincers, repreſented ſeparately in A. Theſe pincers, at their lower mouth, take hold of the hair, and at their upper a fine well tempered ſilver wire, which is wound round the arbor *d*, which is repreſented ſeparately in D F. This arbor, which carries the needle *e e*, marked E in the ſeparate figure, is cut like a ſcrew, and the bottom of the thread is flat and cut ſquare to receive the ſilver wire faſtened to *a*, and connected to the hair. I was forced to uſe a ſilver wire, becauſe, when the hair was fixed to the cylinder and wound round it, it grew rough, and contracted a ſtiffneſs, which the counterpoiſe could not overcome; whereas, a well tempered ſilver wire always keeps the ſame flexibility. It was neceſſary to cut the arbor like a ſcrew, in order that this wire might not be wound upon itſelf and thicken the arbor, nor take a ſituation too oblique and variable. The wire is fixed to the arbor by a ſmall pin F. The other end of the arbor, D, has the form of a pulley, flat at the bottom, to receive a fine flexible ſilk thread, to which is ſuſpended the counterpoiſe marked *g* in the great figure, and G in the ſeparate figure. This counterpoiſe, intended to ſtretch the hair, acts in a direction contrary to that of the hair, and of the moveable pincers to which it is faſtened. If then it is deſired the hair ſhould be ſtretched with a weight of four grains, it is neceſſary the counterpoiſe ſhould weigh four grains more than the pincers. The ſame arbor paſſes on one end through the centre of the dial, and turns in a very ſmall hole upon a true and well poliſhed pivot. The other end has a ſimilar pivot, which is recieved in a hole made at the end of the arm *h* of the double ſquare *h i*, H I. This double ſquare is fixed behind to the dial by the ſcrew I. The dial *k e e k*, divided into 360 degrees, is ſupported by two ears *l*, *l*; theſe are ſoldered to two tubes, which ſurround the cylindric columns *m m*, *m m*. The ſcrews of preſſure, *n*, *n*, paſs through theſe tubes, and ſerve to fix the dial, and the arbor attached to it, to any deſired height. Theſe two columns which ſupport the dial, are firmly fixed to the baſe of the hygrometer, which reſts on the four ſcrews *o*, *o*, *o*, *o*, by which it may be placed in a vertical poſition. The ſquare column *p p*, which reſts upon the farther croſs bar of the baſe of the hygrometer, carries a box *q*, to which is fixed a kind of pencil caſe *r*, the vacuity of which is of the ſame diameter as the cylindric counterpoiſe *g*. When the hygrometer is to be tranſported from one place to another, and ſome fear may be entertained that the vibrations of the counterpoiſe may do harm, the caſe is raiſed to receive the counterpoiſe which is then fixed by the ſcrew preſs *s*, and the box itſelf is fixed by another ſcrew *t*. When the hygrometer is to act, the counterpoiſe is diſengaged and the box lowered, as in the figure. Laſtly, there is ſeen on the top of the inſtrument a piece of crooked metal *x y z*, which binds together the three columns juſt deſcribed. This piece is pierced in *y* with a ſquare hole, which is convenient when the hygrometer is to be ſuſpended.”

M. de Luc, however contends, in his “ Idées ſur la Meteorologie, 1786,” that hairs, and all other animal or vegetable hygrometric ſubſtances taken lengthwiſe, or in the direction of their fibres, undergo contrary changes from different variations of humidity; that when immerſed in water they lengthen firſt and then ſhorten; that when they are neareſt the extreme of humidity, they ſhorten with an increaſe and lengthen with a diminution of humidity. Theſe obſervations may be juſt; but the irregularities happening only in or near one extreme, and being ſmall, may be neglected. Sauſſure takes his point of extreme moiſture from the air confined under a glaſs bell, the ſides of which are kept moiſt: De Luc objects to this as not exhibiting the maximum of moiſture, and obſerves, that ſteam in an elaſtic ſtate does not render bodies moiſt, as is proved by the experience of Mr. Watt, who found that wood, expoſed to the ſteam of a ſteam-engine, was conſtantly dried and cracked as if expoſed to the fire. This objection can ſcarcely apply, however, to the caſe. For the ſteam in an engine is generally ſome degrees warmer than the temperature neceſſary for its ſupport as an elaſtic fluid, and a degree or two in temperature at the heat of the boiling water, have an infinitely greater effect in drying than they have at the ordinary temperature of the atmoſphere. Beſides, the point of extreme moiſture in a hygrometer ſhould moſt evidently indicate that ſtate of the atmoſphere when evaporation is at a ſtand, or the air is ſaturated with moiſture without any viſible depoſition of water. It cannot be ſuppoſed that there is any interval between ſaturation and precipitation. De Luc prefers whale-bone upon the whole for an hygrometer, and of that a ſmall thin ſlip cut acroſs the grain. The deſcription of his whale-bone hygrometer is given in the 81ſt vol. of the Philoſ. Tranſac. part ii. as follows.

The frame will be ſufficiently known from the figure (*fig.* 8.) therefore, we ſhall confine ourſelves to the deſcription of ſome particulars. “ The *ſlip of whale-bone* is repreſented by *a b*, and at its end, *a*, is ſeen a ſort of pincers made only of a flattened bent wire, tapering in the part that holds the ſlip, and preſſed by a ſliding ring. The end *b* is fixed to a moveable bar *c*, which is moved by a ſcrew for adjuſting at firſt the index. The end *a* of the ſlip is hooked to a thin braſs wire, to the other end of which is alſo hooked a very thin ſilver gilt *lamina*, that has at that end pincers ſimilar to thoſe of the ſlip, and which is fixed by the other end to the axis, by a pin in a proper hole. The ſpring *d*, by which the ſlip is ſtretched, is made of ſilver-gilt wire; it acts on the ſlip as a weight of about 12 grains, and with this advantage over a weight (beſides avoiding ſome other inconveniences) that in proportion as the ſlip is weakened with lengthenings by the penetration of moiſture, the ſpring, by unbending at the ſame time, loſes a part of its power. The axis has very ſmall pivots, the ſhoulders of which are prevented from coming againſt the frame, by the ends being confined, though freely, between the flat bearings of the heads of two ſcrews, the front one of which is ſeen near *e*." The ſection of that axis, of the ſize that belongs to a ſlip of about eight inches, is repreſented in fig. 9, the ſlip acts on the diameter *a a*, and the ſpring on the ſmaller diameter *b b*.

The point of extreme dryneſs is obtained in both inſtruments by incloſing them in a receiver of air, in which is a quantity of quicklime, which abſorbs the moiſture from the air and inſtrument; that of extreme moiſture is found by De Luc, by immerſing the inſtrument in water, or at leaſt by wetting the whale-bone with water; but it is found by Sauſſure as above deſcribed.

The mean height of De Luc's hygrometer, for the whole year, in London, is about 79°. The mean height of Sauſſure's at Paris, (according to Bouvard's obſervations) for 1807, was 81° 5′, the drieſt 53° and the moiſteſt 100°. The monthly means ſhew the air to be much drier in March, April, May, June, July, and Auguſt, than in the ſix ſucceeding months, every where in high north latitude.

2. *On the quantity of water abſorbed from the air by chemical agents having an affinity for it.*—Though the action of animal and vegetable fibres on the atmoſphere or the vapour in it muſt be of a chemical nature, yet in the inſtruments above noticed the *quantity* of waters abſorbed by them makes no part of their hiſtory. In ſome ſort of bodies however, the quantity of water they abſorb from the atmoſphere or part with into it, is the meaſure of their hygrometric action, and is determined by actually weighing the body expoſed to the atmoſphere. A ſponge, ſuſpended from the extremity of a balance beam, is heavier or lighter according to the hygrometrical ſtate of the air; ſulphuric acid, carbonate of potaſh, and other bodies, attract moiſture from the air in great abundance, and when ſaturated according to the exiſting ſtate of the atmoſphere, will give or take moiſture with the changes of the air, which of courſe may be determined by the balance. This ſort of inſtrument however, being leſs portable than the other, and ſubject to other inconveniencies, has been very generally abandoned.

3. *On the quantity of water evaporated under given circumſtances.*—Some philoſophers, conceiving that the beſt way to aſcertain the diſpoſition of the atmoſphere to receive moiſture, is to find by actual experiment how much water is evaporated from a given ſurface of water in a given time, have adopted this ſort of experience as the moſt direct and accurate method of obtaining one object of hygrometry. Suppoſing the labour to be no objection, the method would anſwer the purpoſe completely, were not the influence of a greater or leſs current of air of ſo much conſequence in evaporation. When the hygrometers, ſuch as have been deſcribed, indicate dry, there can be no doubt that the air is diſpoſed to quick evaporation; and it may be concluded converſely, that when evaporation is quick, an hygrometer would point to conſiderable dryneſs. It would be deſireable to aſcertain whether a direct ratio ſubſiſts between theſe two effects in any given temperature; and alſo whether a change of temperature would diſturb the ratio. Some account is given of a ſeries of experiments on evaporation under that head, and their application to the preſent ſubject is obvious; but it is unneceſſary to repeat them here.

4. *On the cold produced by the evaporation of water.*—Mr. Leſlie has propoſed a new hygrometer, or rather a new method of finding the rate of evaporation of water in the air; it may be ſeen in Nicholſon's Journal, 4to. vol. 2. or in the 35th vol. of the Annales de Chimie. It is founded on the principle that evaporation produces cold, and conſiſts of a kind of air-thermometer nicely adjuſted, the bulk of which, by being moiſtened with water, immediately cools to a lower degree in conſequence of the evaporation of the water, and the more the quicker the evaporation. Hence a law might be found to indicate, from the degree of cold produced, the rapidity of evaporation. If ſo, it would be a convenient ſubſtitute for the method pointed out in the preceding diviſion. The author has not yet developed the advantages of this inſtrument ſo as to bring it into general uſe.

5. *On the dew-point; or that point of temperature at or below which dew is depoſited from the atmoſphere upon glaſs or any other ſmooth ſubſtance.*—M. Le Roi was the firſt, according to Sauſſure, who made a practice to find the dew-point of the air with hygrometrical views; he uſed to take a glaſs nearly full of water; then he gradually put into it ice-cold water, till a dew was depoſited on the outſide of the glaſs, and noted the temperature of the water. This temperature may be called the dew-point. Inſtead of ice-water, Sauſſure uſed pounded ſal-ammoniac to cool the water; and a mixture of nitre and ſal-ammoniac is ſtill better. Sauſſure, however, conceives this expedient inſufficient to anſwer the purpoſes of an hygrometer; though he allows the value of it taken in conjunction with the others previouſly deſcribed. Of late Mr. Dalton has revived the practice of Le Roi, ſhewn the rationale of the experiment, and founded upon it a new ſyſtem of hygrometry. See Mancheſter Memoirs, vol. 5. part 2. pages 535 and 671: alſo vol. 1. *ſecond ſeries*, page 252. Some account of his views may be ſeen under Evaporation.

Mr. Dalton firſt eſtabliſhes the fact, which indeed had been ably maintained before by De Luc, that the extreme quantity and force of vapour, in a vacuum of given dimenſions, are the ſame as the extreme quantity of force of vapour in the ſame volume of any kind of air, *provided the temperature is the ſame in both caſes*. That is, aqueous vapour exiſts juſt the ſame whether air is preſent or abſent, and its maximum is regulated ſolely by the *temperature*, ſuppoſing water as a ſource always to be preſent. He finds experimentally the utmoſt force of ſteam in a vacuum for each temperature, from 0° to 212° of Fahrenheit or upwards. This force is expreſſed in inches and decimals of mercury, which it can ſupport in a barometer. When the force of ſteam in the air is required, it may be found from the dew-point; as this manifeſtly ſhews the temperature at which the ſteam of the air begins to be condenſed. For inſtance, ſuppoſe the dew-point is at 45°: then the extreme force of vapour of that temperature, in a vacuum or in air, is per table, .316 of an inch of mercury, or $\frac{1}{95}$th of the force of the atmoſphere. Or, in a given volume of air, the *weight* of the vapour is $\frac{1}{136}$th of the weight of the whole, allowing .7 for the ſpecific gravity of pure ſteam. Hence we ſee the great importance of the dew-point, as from it the quantity of ſteam in any given volume of atmoſpheric air may be determined. Mr. Dalton extends his principles ſtill farther than this; he not only determines the quantity of vapour in a given volume of air, as above, for the dew-point, but he finds the whole quantity of ſteam in a column reaching to the top of the atmoſphere; he argues, that as in an atmoſphere of pure ſteam the force of it at the earth's ſurface would be its weight, ſo in a mixture of atmoſphere, ſtill the elaſtic force of each at the earth's ſurface is the weight of the whole atmoſphere of that kind. Hence, in the above inſtance, the weight of the incumbent aqueous vapours in the atmoſphere is [illegible] th of the whole weight of the atmoſphere, and is equal to 4.3 inches of water. That is, if a perpendicular column of air to the top of the atmoſphere had the whole of its ſteam (or water) precipitated to the bottom, leaving the air perfectly dry, the depth of the water ſo precipitated would be $4\frac{1}{3}$d inches nearly.

Thus it appears of what uſe is the dew-point in finding the quantity of water actually exiſting in the atmoſphere at any time in the form of ſteam or elaſtic vapour, which is the firſt great object of hygrometry. But the uſe of the dew-point in aſcertaining the other great object of hygrometry may be eaſily ſhewn. Mr. Dalton has proved, in the Eſſays above-mentioned, that the quantity of water evaporated from any given ſurface is proportional to the maximum force of vapour at the temperature which the ſurface has, the vapour being always underſtood to be in contact with water. But that if the force of ſteam be ſmall, as in low temperatures, then the force of the ſteam already exiſting in the atmoſphere muſt be deducted from the former, as having great influence in this laſt caſe, but very little in other caſes where the evaporating force is comparatively large. Thus for inſtance, taking the dew-point at 45° as before, and aſſuming the temperature of the air at the ſame time to be 50°; we have $.375 - .316 = .059$ for the evaporating force; but if the temperature was 54°, 58°, or 62°, the evaporating force would be 2.3, or four times as great reſpectively. This force does not, however, increaſe directly with the temperature; as 5° above 45 only produce the ſame evaporating force as 3° above 65 would produce, or as ¼th of a degree above 162 would produce. Hence principally ariſes the much greater evaporation in ſummer than in winter.

In the Eſſays above referred to, Mr. Dalton has given an abſtract of a ſeries of obſervations on the dew-point for Mancheſter, lat. 53° 20′ N., which it may be proper to ſubjoin.

1800. July. Mean dew-point for 21 days = 53°, higheſt 62°, loweſt 40°.
Aug. Mean for 11 days = 56°, but too high for the monthly mean; higheſt 60°.
Sept. Dew-point above 50° for 6 days; higheſt 60°.
Oct. Dew-point moſtly below 52°, higheſt 59°.
1801. May. Dew-point above 50° for 4 days; higheſt 55°.
June. Mean for 10 days 49°½; higheſt 57½; loweſt 30°. *
July. Mean for 8 days 53°; higheſt 56°.
Aug. Mean for 22 days 54°½; higheſt 61°.
Sept. Mean for 14 days 54°; higheſt 60°.
Oct. Dew-point for 5 days above 50°; higheſt 57°.
Nov. Higheſt 54°; loweſt 22°.
Dec. Higheſt 44°; loweſt 18°.

* On the 13th, great damage done to potatoes, &c. by the cold which accompanied this remarkably low ſtate of vapour for the ſeaſon. The dew-point was 46° on the 12th, and 40° on the 14th.

In order to make the obſervations on the dew-point ſubſervient to the purpoſe of a complete hygrometer, that is, one to denote both the actual quantity of vapour in the air, and the rate at which evaporation is going on, it is neceſſary to notice the temperature of the air at the time of obſervation. In a ſeries of meteorological obſervations this would be almoſt matter of courſe. Then the rate of evaporation obtained as above would indicate the drying power of the air at the time. A ſeries of hygrometrical obſervations might then be thrown into the following form. The numbers in the laſt column are all multiplied by 100, to make them more ſuitable to common notation.

Temperature of the Air.			Hygrometer.		
			Dew-point.	Correſponding quantity of Water in a vertical Column of the Atmoſphere.	Evaporating force.
				Inches in depth	
June 1.	Morn.	50°	45°	4.30	5.9
	Noon	70	45	4.30	40.5
	Even.	60	45	4.30	20.8
2.	Morn.	50	48	4.77	2.4
	Noon	65	50	5.10	24.1
	Even.	54	49	4.92	6.6

Sauſſure determined by ſome very important experiments the quantity of water in a cubic foot of air at the temperature 66°, both by abſtracting the vapour from ſaturated air, and by ſaturating previouſly dried air. The reſults agree very nearly with the above theory. But when he attempted to aſcertain the quantity of vapour in other temperatures, above and below, by means of his hygrometer, not by direct experiment, he did not ſucceed; at leaſt the reſults will not agree with thoſe deduced as above. He finds the quantities of water too large in the lower temperatures, and too ſmall in the higher. This will be ſhewn by the following table.

TABLE of the Quantity of aqueous Vapour in the Atmoſphere at different Temperatures.

Dew-point. Temperature.	Water in a cubic Foot of air, in Grains, according to		Whole Quantity of Vapour in a vertical Column to the Top of the Atmoſphere, being condenſed into Water, according to Dalton, amounts to
	Sauſſure.	Dalton.	
			Inches in Depth.
0°	—	.81	.88
5	—	.96	1.04
10	2.6	1.13	1.22
15	2.8	1.36	1.56
20	3.1	1.62	1.74
25	3.4	1.97	2.11

70	8.0	9.08	9.80
75	8.7	10.72	11.58
80	9.5	12.60	13.62

In the conſtruction of this table, the force of vapour is taken from the table in the Mancheſter Memoirs, vol. v. part 2, and it is ſuppoſed to reſult from the preſſure of an atmoſphere of ſteam, when the fourth vertical column is calculated. The ſpecific gravity of ſteam is ſuppoſed to be .7, that of common air being 1. Sauſſure's table in his Hygrometry, 8vo, page 261, is reduced from French grains and feet to Engliſh, by multiplying by two, and dividing by three; the grains which he gives as contained in ſaturated air. A reduction is alſo made from Reaumur's ſcale to Fahrenheit's.

Mr. B. M. Forſter has favoured us with the following deſcription of the winding oat-beard *hygrometer*.

The principal differences in this hygrometer from thoſe uſually made of oat-beards are the following.

The graduated circle (*Plate* XIII. *Hydraulics, fig.* 2.) is numbered *completely round* inſtead of *half round* each way, as uſual. On the top of the oat-beard, (the *avena ſterilis* of Linnæus, preferred on account of its ſize to the common oat,) is cemented a circular piece of paper A, on which is fixed a tubular piece of ſtraw B, which is capped with another piece of paper C: D is a ſupport to keep the beard upright, made of card paper. On the ſtraw tube, or little cylinder, is faſtened a piece of fine ſilken ſtring, on which is hung a pea, to ſerve as a weight to keep the ſtring ſtretched.

As the oat-beard untwiſts with moiſture, the index (made of ſtraw) moves the ſame way round as the hand of a watch, and thus moving coils the ſtring round the ſtraw tube or axis, by which means the number of revolutions from any time obſerved may be known, and thus the confuſion will be avoided, which is occaſioned by the index moving more than once round, which it does in paſſing from extreme dryneſs to wet.

The ſpring may be ſo placed as to wind *up* when the index moves the contrary way, that is, from moiſt to dry, if the maker ſo chuſes; and in this caſe the circle muſt be numbered the contrary way from the above. The oat-beard is *fixed*, and the index is not to be turned or ſet to a certain point, as is the caſe with the common hygrometer, by a contrivance behind the caſe. The method of keeping a regiſter of this hygrometer will be thus.

When on the upper part of the axis there is one coil, and
the index points at - - - 6, ſet down 1 — 6.
two coils - - - - 6, ——— 2 — 6. &c.

If the circle be divided into 100 diviſions, the reckoning
will be no coil, and the hand at 10 ſet down 10,
1 Coil - - 10 ——— 110,
2 Coils - - 10 ——— 210, &c.

which, if the circle be large enough, will be a very convenient mode of regiſtering. An account of this inſtrument was communicated by the inventor to the editor of the Philoſophical Magazine. See vol. xi. p. 167.

Kater's *hygrometer*, as conſtructed by Mr. Thomas Jones, of Kenton-ſtreet. (See *fig.* 3.) The ſubſtance of which this hygrometer is compoſed, was diſcovered in India by captain Kater about the year 1800; and is the Andropogon contortum of Linnæus, a ſpecies of graſs, and is called in the Myſore country, in the Canareſe language, "Oobeena Hocloo." It is beſt when gathered in the month of January, and ſhould be thoroughly dried in the ſun (in India) before it is uſed. While captain Kater was in India he had one made, which he uſed with great effect, for the refraction, during a ſeries of obſervations, which he was then officially employed in making. The inſtrument was deſcribed in the Aſiatic Reſearches, and was afterwards brought to England in the year 1806. Mr. Thomas Jones then made ſeveral on that plan; but it is now laid aſide in conſequence of a ſuperior method which he has contrived. It may be proper to remark, that this hygrometric ſubſtance acts in the ſame manner as our beard of the Engliſh oat, but it poſſeſſes much greater durability, and is exceedingly ſenſible, making from eight to twelve revolutions from extreme dry to extreme moiſt, ſimply of itſelf, without the means of an increaſed ſcale, by wheels and pinions. Each of thoſe revolutions being divided into one hundred parts, gives the obſerver a ſcale of from 800 to 1200 parts from dry to moiſt, being an extent of ſcale which no other hygrometer poſſeſſes. The revolutions and parts are ſeen on a dial plate by means of two ſmall hands. The inſtrument is of a cylindrical form, one inch and a half in diameter, and two inches long, extremely portable, and not in the leaſt liable to injury in travelling in a carriage. Its ſenſibility is ſo great, that it may be truly ſaid to be hardly ever at reſt in the open air, particularly in the ſummer ſeaſon, when the opening or ſhutting a door or window, or the approach of a perſon, is ſure to be indicated. Perhaps it may not be amiſs to remark, that it is ſenſibly affected in the hand of a perſon who may be in health or otherwiſe. The great ſenſibility of this inſtrument makes it particularly valuable where ſmall quantities of moiſture, &c. are required to be meaſured, in chemical or philoſophical experiments; likewiſe for agricultural operations, and iron, ſteel, and cotton manufactories, &c. &c.

HYGROPHILA, in *Botany*, ſo named by Mr. Brown, from ὑγρος, *wet*, and φιλεω, *to love*, or *delight in*, becauſe of the attachment of this genus to a moiſt, marſhy ſoil. Brown. Prodr. Nov. Holl. v. 1. 479.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Acanthi*, Juſſ.

Eſſ. Ch. Calyx tubular, half five-cleft, equal. Corolla ringent. Cells of the anthers parallel, unarmed. Seeds ſeveral in each cell. Partition attached to the valves.

This genus is removed from *Ruellia* on account of the ringent corolla and tubular calyx, which latter ſeparates moreover into five deep ſegments, in conſequence of the ſwelling of the capſule. R. *ringens* of Linnæus is one ſpecies, for which the Flora Zeylanica of that author, and the Hortus Malabaricus of Rheede, are, according to Mr. Brown, improperly quoted in the Species Plantarum. Another ſpecies, very nearly allied to the former, is

H. *anguſtifolia* of Brown. "Leaves lanceolate-linear, approximated in pairs, with hairy axillas. Upper joints of the ſtem ſhorter than the corolla. Found by ſir Joſeph Banks in the tropical part of New Holland.

Theſe are cauleſcent plants, with narrow leaves, and axillary, crowded, nearly ſeſſile flowers. The bracteas are ſmall and fringed. Capſule ſeſſile, its valves compreſſed at the back. Each ſeed is ſupported by a ſmall prop, or elaſtic appendage.

HYGROPHOBIA, in *Medicine*, is ſometimes uſed in the ſame ſenſe with hydrophobia.

HYGROSCOPE, compounded of ὑγρος, *moiſt*, and σκοπεω, *I obſerve*, or *conſider*, is commonly uſed in the ſame ſenſe with *hygrometer*, which ſee.

Wolfius, however, regarding the etymology of the word, makes ſome difference. According to him, the hygroſcope only ſhews the alterations of the air in reſpect of humidity and dryneſs; but the hygrometer meaſures them. A hygroſcope, therefore, is a leſs accurate hygrometer.

HYIOTES, Ὑιωτης, *Filiation*. See ADOPTION.

HYKES, a ſort of blankets, in great uſe among the natives of Barbary. They are woven by the women, who make no uſe of a ſhuttle therein, but conduct every thread of the woof with their fingers. One of theſe hykes is uſually ſix yards long, and five or ſix broad, ſerving the Kabyle as well as Arab, both male and female, for a complete dreſs in the day, and for his bed and covering in the night. It is a looſe and troubleſome kind of garment, being frequently diſconcerted, and falling on the ground, ſo that the wearer is every moment to be taking it up, and folding it anew round his body. Dr. Shaw (Trav. p. 286.) takes it to be much the ſame with the peplus, if not with the toga, of the ancients.

HYLÆA, in *Ancient Geography*, a country of Europe, in Scythia.

HYLARCHIUS, formed of ὑλη, *matter*, and αρχη, *government*, or *hylarchic principle*, a word by which ſome authors expreſs what they call a ruling and preſiding ſpirit, which governs and actuates all matter. See Plastic.

HYLAS, in *Ancient Geography*, a river, fountain, and lake in Bithynia.

Hylas, in *Biography*, a muſician and a dancer, brought up at Rome, under Pylades the Pantomime, and paſſionately beloved by him. He was ſo vain of his talents, that he arrogantly challenged his maſter. The challenge was accepted, the day fixed, and all Rome thronged to the theatre.

The two actors had to repreſent Agamemnon. The young Hylas, to add to his ſtature, had buſkins on, which made him taller than uſual, and he ſtood a tip-toe on the ſtage with all his might. The Roman youth were in raptures, and applauded with unbounded fury, crying out that he was divine!

Pylades then appeared, with a noble and dignified countenance, expreſſing by his ſteps and geſtures, all the different ſentiments which occupied the mind of the great king. The ſpectators, unanimouſly impelled by an irreſiſtible approbation, rapturouſly cried out that he had obtained the victory. "Young man," ſays Pylades to Hylas, "we had to repreſent a king who commanded twenty kings; you have made him tall, and I have made him great."

HYLE, or Hylec, from ὑλη, which ſignifies *matter*, among *Alchemiſts*, is their firſt matter, or it is matter conſidered as produced by nature herſelf; called alſo chaos.

HYLEG, or Hylech, in *Aſtrology*, an Arabic term for a planet, or for a point of the heavens, which in a man's nativity becomes, as is pretended, the moderator and ſignificator of life.

HYLEGIAL Places, among *Aſtrologers*, are thoſe wherein a planet being found, is qualified to have the government of life attributed to it.

HYLLEHROG, in *Geography*, a very narrow iſland, about three miles long, on the Baltic, near the S. coaſt of Lapland. N. lat. 54° 36'. E. long. 11° 32'.

HYLLIS, in *Ancient Geography*, a peninſula, called alſo the "Promontory of Diomedes," a cape of Liburnia, on the Adriatic ſea.

HYLOBII, or Hylobians, compounded of ὑλη, which, beſides *matter*, ſignifies alſo *wood*, *foreſt*, and βιος, *life*, a ſect of Indian philoſophers, thus denominated by the Greeks, becauſe they retired to foreſts, to be more at leiſure for the contemplation of nature

HYLOPATHIANS, formed of ὑλη, *matter*, and παθος, of πασχω, *I ſuffer*. See the following article, and Anaximandrians.

HOLOZOISTS, formed of ὑλη, *matter*, and ζωη, *life*, the name of a ſect of atheiſts among the ancient Greek philoſophers, who held matter to be animated; maintaining that matter had ſome natural perception, without animal ſenſation, or reflection, in itſelf conſidered; but that this imperfect life occaſioned that organization, whence ſenſation and reflection afterwards aroſe. Of theſe, ſome held only one life which they called a *plaſtic* nature, preſiding regularly and invariably over the whole corporeal univerſe, which they repreſented as a kind of large plant or vegetable: theſe were called the coſmoplaſtic and ſtoical atheiſts, becauſe the Stoics held ſuch a nature, though many of them ſuppoſed it to be the inſtrument of the Deity. Others thought that every particle of matter was endued with life, and made the mundane ſyſtem to depend upon a certain mixture of chance and plaſtic or orderly nature united together. Theſe were called the Stratonici, from Strato Lampſacenus, a diſciple of Theophraſtus, called alſo Phyſicus, (Cicero, De Nat. Deor. lib. i. cap. 13.) who was firſt a celebrated Peripatetic, and afterwards formed this new ſyſtem of atheiſm for himſelf. Beſides theſe two forms of atheiſm, ſome of the ancient philoſophers were Hylopathians, or Anaximandrians, deriving all things from dead and ſtupid matter, in the way of qualities and forms, generable and corruptible; and others again adopted the anatomical or Democritical ſyſtem, who aſcribe the production of the univerſe to atoms and figures. See on this ſubject Cudworth's Intellectual Syſtem, vol. i. book i. chap. 3. Birch's edit. 1743.

HYLOGYNÆ and Hylophagi, in *Ancient Geography*, a people of Ethiopia, who lived near one another, and were diſtinguiſhed by ſimilar manners; they made their habitations in the trees during the night for fear of wild beaſts. Diodorus has deſcribed them.

HYMÆAS, in the *Ancient Greek Muſic*. See Epiaulia.

HYMEN, in *Anatomy*, from ὑμην, *a membrane*, a fold of membrane of various ſizes in different individuals, cloſing to a greater or leſs degree the entrance of the vagina in the virgin, but not found after marriage. See Generation.

Hymen, *Imperforate*. See Vagina, *Imperforate*.

Hymen, in *Botany*, is uſed for a fine, delicate ſkin, wherewith flowers are incloſed while in the bud, and which burſts as the flower blows or opens.

The term hymen, in this ſenſe, is particularly uſed in ſpeaking of roſes.

Hymen, in *Mythology* and *Poetry*, a term of invocation. Hymen, or Hymenæus, is properly a fabulous divinity, ſuppoſed by the ancients to preſide over marriages; and who accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen o Hymenæe!*

The poets generally crown this deity with a chaplet, ſometimes of roſes, at other times of ſweet marjoram; and repreſent him, as it were, diſſolved and enervated with pleaſures; dreſſed in a yellow robe, and ſhoes of the ſame colour, with a torch in his right-hand, and a flame-coloured veil in his left. Catullus, in one of his epigrams, addreſſes him thus:

> "Cinge tempora floribus,
> Suaveolentis amaraci."

It was for this reaſon, that the new married couple bore garlands of flowers on the wedding day; which cuſtom alſo obtained among the Hebrews, and even among the Chriſtians during the firſt ages of the church, as appears from Tertullian, De Corona Militari, where he ſays *Coronant et nuptæ ſponſos*. St. Chryſoſtom likewiſe mentions theſe crowns of flowers; and to this day the Greeks call marriages στεφανωμα, in reſpect of this crown or garland.

HYMENÆA, in *Botany*, from Hymen, the god of marriage, becauſe, as Linnæus informs us, its younger leaves cohere together in pairs throughout the night. This genus is the *Courbaril* of Plumier, who adopted that barbarous term from the inhabitants of South America, where the plant grows ſpontaneouſly. May not the ſimilitude which its gum, when burnt, bears to the torch of Hymen, by emitting a clear flame, and grateful ſmell, be another ſatisfactory explanation of the above name?—Linn. Gen. 206. Schreb. 276. Willd. Sp. Pl. v. 2. 512. Mart. Mill. Dict.

v. 2. Ait. Hort. Kew. v. 2. 49. Juſſ. 351. Lamarck. Illuſtr. t. 330. Gærtn. t. 145.—Claſs and order, *Decandria Monogynia.* Nat. Ord. *Lomentaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, leathery; tube ſhort, turbinate, compreſſed, permanent, having an oblique mouth; limb four-cleft, nearly equal, erect, deciduous; ſegments ovate, obtuſe, two oppoſite ones flattiſh, a little broader; the two others concave, with one ſide narrower. *Cor.* ſomewhat papilionaceous, of five, nearly equal petals, inſerted into the neck of the calyx; ſtandard, the two uppermoſt petals obliquely ovate, obtuſe, ſeſſile, at the upper concave ſegment of the calyx; wings, two petals, ſimilar, lateral, a little narrower; keel, the bottom petal, channelled or hollowed out, approximating to the wings, within the lower concave ſegment of the calyx. *Stam.* Filaments ten, diſtinct, awl ſhaped, erect, deflexed nearly half way down, very long, within the keel and wings, inſerted into the neck of the calyx; anthers linear, affixed to the back. *Piſt.* Germen ſabre-ſhaped, compreſſed, ſtanding on a ſtalk; ſtyle very long, taper, deflexed; ſtigma thickened, obliquely truncated. *Peric.* Legume very large, ovate-oblong, obtuſe, of one cell, filled with a powdery pulp. *Seeds* many, ovate, imbedded in duſt and fibres.

Obſ. Schreber has paid great attention to the above generic character, which is conſiderably dilated beyond the Linnæan deſcription.

Eſſ. Ch. Calyx five-cleft. Petals five, nearly equal. Style twiſted inwards. Legume filled with a farinaceous pulp.

1. *H. Courbaril.* Locuſt-tree. Linn. Sp. Pl. 537. (Courbaril; Plum. Gen. 49. t. 36. Ceratia diphyllos; Pluk. Phyt. t. 82. f 3.)—Native of the Weſt India iſlands, and the continent of America. A large ſpreading tree, its thick *ſtem* being covered with a ruſſet *bark*. It is eſteemed an excellent timber-tree if ſuffered to be old before it is felled. *Leaves* in pairs, pointed. *Flowers* in looſe panicles at the end of the branches, of a yellow colour, ſtriped with purple. *Pods* fleſhy, brown, ſhaped like the common garden bean, about ſix inches long and half as broad, of a purpliſh brown colour and woody conſiſtence, each containing a few ſeeds ſeparated by tranſverſe partitions, and incloſed in a whitiſh ſubſtance, intermixed with filaments, as ſweet as honey, which is eaten by the Indians with great avidity. Between the principal roots of the tree exudes a fine tranſparent reſin, yellowiſh or red, which is the *Gum Anime* of our ſhops. This is the fineſt varniſh known, when diſſolved in rectified ſpirits of wine. It has been remarked that the wild-bees are very fond of building their neſts in the branches of this tree. Its wood is in great requeſt for wheel-work in the ſugar-mills, particularly for cogs to the wheels, being extremely hard and tough, as well as capable of a fine poliſh. It is ſo heavy that a cubic foot of it weighs about a quarter of an hundred weight. The *Hymenæa* is a very tender ſtove-plant, and muſt conſtantly remain in the tan-bed. In growth it is very like the *Anacardium*, or Caſhew-nut.

Willdenow has deſcribed two other ſpecies, *H. venoſa* of Vahl, and *H. verrucoſa* of Gærtner; the former brought from Cayenne, the latter from Madagaſcar, but they both nearly reſemble the Courbaril, nor have we materials ſufficient to decide concerning them.

HYMENÆUM, in the *Ancient Greek Muſic*, the nuptial ſong or epithalamium.

HYMENIUM, in *Botanical* phraſeology, from ὑμην, a *membrane*, is uſed by Perſoon for the membranous ſmooth expanded ſurface in which the ſeeds of Fungi are imbedded. See Fungi.

HYMENODES, of ὑμην, *membrane*, and ειδος, *form*, an epithet applied by the old authors to ſuch urine as is found to be full of little films and pellicles. Hippocrates alſo applies it to the menſtrual diſcharges, when they are mixed with a tough viſcid phlegm.

HYMENOPAPPUS, in *Botany*, from ὑμην, *a film* or *membrane*, and παππος, *the ſeed-down*, ſo called by l'Heritier from the crown of its ſeed being compoſed of membranous leaves or ſcales.—Willd. Sp. Pl. v. 3. 1776. L'Herit. Monograph.—Michaux Boreal. Amer. v. 2. 103. (Rothia; Lamarck. Illuſtr. t. 667.) Claſs and order, *Syngeneſia Polygamia Æqualis*. Nat. Ord. *Compoſitæ diſcoideæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common calyx* of many leaves, ſet in a double row, theſe leaves are looſely ſpreading, oblong, obtuſe, green and downy at the baſe, white above, permanent. *Cor.* compound, tubular, uniform; florets all ſimilar, perfect, fertile, longer than the calyx, funnel-ſhaped, hairy on the outſide; tube thread-ſhaped; limb five-cleft, lanceolate, acute, revolute. *Stam.* Filaments five, capillary, erect; united anthers cylindrical, tubular, five-toothed, as long as the florets. *Piſt.* Germen inferior, turbinate, hairy, crowned with the ſeed-down, and terminated by a roundiſh body which the thread-ſhaped ſtyle perforates; ſtigma on the outſide, bifid, revolute. *Peric.* none; except the permanent calyx. *Seeds* ſolitary, angulated, truncated, elevated by the diſk in two concentric rows, umbilicated, villoſe, brown; down of 12 or 15 approximating, erect, ovate, concave, ſomewhat torn or entire, membranous, pellucid ſcales. *Recept.* naked, rather ſmall.

Eſſ. Ch. Receptacle naked. Seed-down of many ſcales, chaffy. Calyx of many leaves, ſpreading.

1. *H. ſcabioſæus.* L'Heritier Monog. cum icone.—Native of Carolina, flowering towards the end of autumn. *Root* annual, ſomewhat tapering, and fleſhy, a little branched at the ſides, of a cheſnut colour. *Stem* erect, branching, angulated, rather woolly, two feet high. *Leaves* alternate; radical ones on footſtalks; ſtem-leaves gradually ſeſſile, bipinnatifid; ſegments lanceolate, acute, green above dotted with little tubercles; downy and grey beneath; ſpreading. *Flowers* forming a corymbus, white, very fragrant.

The publication of l'Heritier, in which this new genus is founded and delineated, is one of thoſe monographs, of which twelve copies only were printed, mentioned in our account of that author. See l'Heritier.—Lamarck has deſcribed the ſame plant under the name of *Rothia caroliniensis*, in the Journal d'Hiſt. Nat. vol. i.

HYMENOPHYLLUM, from ὑμην, *a film*, or *membrane*, and φυλλον, *a leaf*, becauſe the foliage of this fern is remarkable for its filmy texture. Sm. Mem. of the Turin Acad. v. 5. 418. t. 9. f. 8. Tracts on Nat. Hiſt. 256. Fl. Brit. v. 3. 1141. (Trichomanes; Linn. Gen. 560. Juſſ. 16.)—Claſs and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, Linn. Juſſ.

Gen. Ch. Fructifications inſerted into the margin of the frond, diſtinct. *Involucrum* two-valved, flattiſh, ſtraight, opening outwards; including the column.

Eſſ. Ch. Fructifications placed at the edge of the frond. Involucrum of two valves, opening outwardly.

Obſ. "The bivalve involucrum and ſhort column ſo diſtinct from the urn-ſhaped undivided involucrum, and long column or ſtyle, of the true Trichomanes," have induced Dr. Smith to eſtabliſh this new genus in his diſſertation on Ferns, printed by the academy of Turin.

1. *H. Tunbridgenſe.* Tunbridge Filmy-leaf. Sm. Fl. Brit. 1141. Engl. Bot. t. 162. (Trichomanes Tunbridgenſe; Linn. Sp. Pl. 1561.)—"Fronds alternately bipinnate, decurrent, ſharply ſerrated as well as the involucrum. Fructifications ſolitary at the upper edge of the baſe of each general diviſion of the frond."—A native of moiſt and ſhady

rocks which it clothes in large tufts in Wales, Weſtmoreland, and the north of Yorkſhire, and alſo by Powers-court caſcade near Dublin, but more eſpecially about Tunbridge, which is its original habitat. It flowers in May and June.—*Root* creeping, capillary, wiry, throwing out fibres occaſionally and producing numerous upright *fronds*, which curl backwards from drought. Their ſubſtance is extremely membranous and pellucid, appearing finely reticulated under a microſcope; their ſegments linear, ſharply ſerrated and furniſhed with a ſtrong central rib. *Fructifications* in the place of the firſt ſegment, each terminating its appropriate nerve and pointing upwards. *Involucrum* ariſing from the ſubſtance of the leaf, of two ſlightly concave valves, between which is a ſhort column, beſet with ſmall, round, bivalve capſules, each embraced with an elaſtic ring as in the more common ferns.

2. *H. alatum.* Wing-ſtalked Filmy-leaf. Engl. Bot. t. 1417. (H. Tunbridgenſe β. Sm. Fl. Brit. 1142.)—"Fronds tripinnate, lobed, decurrent; ſegments linear, bluntiſh, entire. Main ſtalk and branches winged. *Fructifications* oblong, crenate, ſolitary at the upper edge of the baſe of each ſubdiviſion of the frond."—Gathered in the county of Kerry, by Mr. Mackay, gardener to the botanic garden at Dublin.—This rare fern manifeſtly differs from the laſt in having a larger and more compound frond, and in its *main ſtalk* being winged from the very bottom; but more eſpecially in the margin of the ſegments being always entire, and in the *involucrum* or *calyx* being oblong and cylindrical, not obovate and compreſſed, except towards the ſummit; neither is its margin ſerrated or toothed, but ſlightly and obtuſely crenate. Dr. Smith remarks of this ſpecies, "Few of our Britiſh plants have been more enveloped in doubt than this; very few could better repay the ſcrutiny of the curious botaniſt." We are now competent to deſcribe it as a new ſpecies, for it does not agree with the character of any *Hymenophyllum* in Dr. Swartz's Eſſay on Ferns in Schrader's Journal. Dr. Swartz has there deſcribed 20 ſpecies, but the only two Britiſh ones known may ſerve as a ſufficient epitome of the genus. We muſt not omit to mention that Mr. Brown, in his Prodr. Nov. Holl. v. 1. 159, refers the *H. alatum* to *Trichomanes.*

HYMENOPTERA, in *Entomology*, an order inſtituted by Linnæus for the reception of thoſe inſects which have four membranaceous wings, and the abdomen of the female moſtly armed with a ſting. The genera are cynips, tenthredo, ſirex, ichneumon, ſphex, ammophila, ſcolia, thynnus, leucopſis, tiphia, chalcis, chryſis, veſpa, apis, formica, and mutilla.

HYMETTIUM MARMOR. See MARBLE.

HYMETTUS, in *Ancient Geography*, a mountain of Attica, S.W. of Athens, and of the Iſſus, extending from the S.W. to the N.E., at the diſtance of a league from the city. It was celebrated for the excellent quality of its honey, which is highly extolled by Strabo, l. ix. It was alſo famous for its marble. On this mountain were altars, one conſecrated to Jupiter, and the other to Apollo. See Pauſanias, in Attica, c. 32.

HYMN, a ſong, or ode in honour of God; or a poem proper to be ſung, compoſed in honour of ſome deity. See ODE and SONG.

The word is Greek, ὕμνος, *hymn*; formed of the verb ὕδω, *celebro, I celebrate.*

Iſidore, on this word, remarks, that hymn is properly a ſong of joy, full of the praiſes of God; by which, according to him, it is diſtinguiſhed from *threna*, which is a mourning ſong, full of lamentation.

The hymns, or odes, of the ancients, generally conſiſted of three ſtanzas or couplets; the firſt called *ſtrophe*; the ſecond, *antiſtrophe*; and the laſt, *epode.*

St. Hilary, biſhop of Poitiers, is ſaid to have been the firſt that compoſed hymns to be ſung in churches; he was followed by St. Ambroſe. Moſt of thoſe in the Roman breviary were compoſed by Prudentius. They have been tranſlated into French verſe by Meſſieurs De Port Royal. The Te Deum is alſo commonly called a hymn, though it be not in verſe; ſo alſo is the *Gloria in excelſis.*

In the Greek Liturgy there are four kinds of hymns; but then the word is not taken in the ſenſe of a praiſe offered in verſe, but ſimply of laud, or praiſe. The angelic hymn, or *Gloria in excelſis*, makes the firſt kind; the *triſagion*, the ſecond; the cherubic hymn, the third; and the hymn of victory and triumph, called ἐπινίκιος, the laſt.

HYMN *of Caſtor*, in the *Muſic of the Ancients.* The Lacedemonians, in marching to battle, played on the flute what they called *Caſtoreum Melos.* Some authors pretend that Caſtor himſelf invented this hymn, and that from him it had its name; others that Minerva invented the hymn of Caſtor, and that this air ſerved at firſt for the Pyrrhic dance.

HYMN of Ariſtotle to Hermias.

Ariſtotle honoured his friend and kinſman, Hermias, prince of Atarnea, with a hymn, or canticle, which is preſerved in Athenæus, and in Diogenes Laertius, for which he is ſaid to have been arraigned at a court of juſtice, where he was accuſed of impiouſly laviſhing upon a mortal ſuch honour and praiſe, as were due only to the gods.

Ariſtotle's Hymn to Hermias.

"Virtue! thou ſource of pure delight,
Whoſe rugged mien can ne'er affright
The man with courage fir'd;
For thee the ſons of Greece have run
To certain ills, which others ſhun,
And gloriouſly expir'd.

"When'er thy ſacred ſeeds take root,
Immortal are the flow'rs and fruit,
Unfading are the leaves;
Dearer than ſmiles of parent kind,
Than balmy ſleep, or gold refin'd,
The joys thy triumph gives.

"For thee the Twins of mighty Jove,
For thee divine Alcides ſtrove
From vice the world to free;
For thee Achilles quits the light,
And Ajax plunges into night,
Eternal night, for thee.

"Hermias, the darling of mankind,
Shall leave a deathleſs name behind
For the untimely ſlain;
As long as Jove's bright altars blaze,
His worth ſhall furniſh grateful praiſe,
To all the Muſe's train."

The offence given by Ariſtotle in this poem, which his enemies denominated a Pæan, ſeems to have been the ſaying that the actions of his friend would be ſung by the Muſes, as long as the worſhip of Jupiter Hoſpitalis continued. Athenæus, however, did not regard it as a true Pæan, becauſe the characteriſtic exclamation *Io Pæan* did not occur in any part of it.

HYMN *of Battle*, a kind of air which was ſung by the Greeks when they advanced to battle, and began to charge inſtead of the ſhout, which was uſed at other times. Traces of this cuſtom are ſtill found amongſt the Arnauts, inhabitants of Macedonia, now ſubject to the Turks. Theſe people, ſtout and bold, like their anceſtors, engage with a rapid pace; the chief ſings, and his troops anſwer, whilſt they preſs forward with an accelerated velocity. Theſe hymns ought to be ſhort, and conſiſt of ſhort verſes, ſet to a lively air. Horace ſpeaks in one of his odes of a poet called Tyrtæus, who, in the wars of Meſſina, animated by his verſes the Lacedæmonians to ſuch a degree, that they thus gained a complete victory. In the time of Thucydides, however, the Lacedæmonians marched in ſilence to the ſound of flutes, and by its cadence regulated their ſteps, the better to preſerve their ranks. It was this, without doubt, which gave marſhal Saxe the firſt idea of marching to time; one of the beſt plans that could be deviſed to perfect the military art.

HYMNIA, in *Mythology*, a ſurname given to Diana, under which appellation ſhe was worſhipped, and had a temple in Arcadia.

HYMNUS, *Lat.* ὕμνος, *Gr.* a ſong in honour of gods or heroes. The difference between a *hymn* and a *canticle* conſiſts in this, that the canticle more generally relates to actions, and the hymn to perſons. The firſt ſongs of all nations have been canticles or hymns. Orpheus and Linus paſſed among the Greeks for the authors of the firſt hymns, and there remain among the works of Homer a collection of hymns to the gods.

We have a fine tranſlation of the hymn of Callimachus to Apollo, by Prior, and of Homer's hymn to Venus, by Congreve.

HYNE-Lough, in *Geography*, the name given to a ſmall bay on the ſouth coaſt of Ireland, in the county of Cork, which lies weſt of Toe-head, between it and Baltimore.

HYNNERY, a town of Sweden, in the province of Smaland; 45 miles W.S.W. of Wexio.

HYOBANCHE, in *Botany*, from ὗς, ὑὸς, *a hog*, and *αγχω*, *to choke* or *ſtrangle*; at leaſt ſo it appears by the analogy of *Orobanche*, which Linnæus certainly had in view.

Schreb. 421. Willd. Sp. Pl. v. 3. 354. Mart. Mill. Dict. v. 2. Juſſ. 101. Lamarck Dict. v. 3. 158.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Pediculares*, Juſſ.

Gen. Ch. *Cal.* Perianth of ſeven, linear, pointed, erect leaves, as long as the corolla. *Cor.* of one petal, ringent; upper lip vaulted, emarginate; lower lip none. *Stam.* Filaments four, in pairs, inſerted at the baſe of the corolla, of a middling length; anthers ovate, drooping, burſting on the upper ſide. *Piſt.* Germen ſuperior, ovate; ſtyle thread-ſhaped, curved at the top; ſtigma thickiſh, obtuſe, emarginate. *Peric.* Capſule roundiſh, two-celled. *Seeds* numerous, ſmall.

Obſ. This genus is ſeparated from *Orobanche* on account of the ſtructure of its calyx and corolla.

Eſſ. Ch. Calyx of ſeven leaves. Corolla ringent, having no lower lip. Capſule of two cells and many ſeeds.

1. *H. ſanguinea.* Linn. Mant. 253. (Orobanche mauritanica, flore purpureo; Pet. Gaz. t. 37. f. 4.)—Found at the Cape of Good Hope growing paraſitically on other roots. *Stem* about ſix inches high, quite ſimple, woody, imbricated with *leaves* which are formed of ovate, thickly imbricated, outwardly convex, ſmooth, obtuſe ſcales. *Spike* terminal, villoſe, imbricated with *bracteas* and *flowers*, which latter are ſolitary and ſeſſile. In habit and ſtructure this genus is nearly allied to *Orobanche*, but is of a blood-red colour throughout.

HYO-GLOSSUS, in *Anatomy*, a muſcle of the tongue. See Deglutition.

HYOIDES, from υ, and ειδος, *form*, a bone reſembling the Greek letter upſilon in its ſhape, and connected to the root of the tongue. See Deglutition.

HYO-PHARYNGEUS, a name ſometimes given to the middle conſtrictor pharyngis muſcle. See Deglutition.

HYOSCYAMUS, in *Botany*, from ὗς, ὑὸς, *a hog*, and *κυαμος*, *a bean*. Ælian relates that if this plant be devoured by ſwine its effects are extremely noxious, and that the animals which partake of it will die, unleſs they are well drenched with water both internally and externally.—Linn. Gen. 98. Schreb. 133. Willd. Sp. Pl. 1010. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 254. Ait. Hort. Kew. v. 1. 240. Tournef. t. 42. Juſſ. 124. Lamarck Dict. v. 3. 327. Illuſtr. t. 117. Gærtn. t. 76.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Luridæ*, Linn. *Solaneæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, tubular, ventricoſe below, with a five-cleft, acute mouth, permanent. *Cor.* of one petal, funnel-ſhaped; tube cylindrical, ſhort; limb ſtraight and ſpreading, five-cleft half way down, its ſegments obtuſe, one broader than the reſt. *Stam.* Filaments five, awl-ſhaped, inclining; anthers roundiſh. *Piſt.* Germen roundiſh; ſtyle thread-ſhaped, as long as the ſtamens; ſtigma capitate. *Peric.* Capſule ovate, obtuſe, marked with a line on each ſide, two-celled, ſeeming to be formed of two capſules cloſely approximating, with a lid opening horizontally; receptacles half-ovate, affixed to the partition. *Seeds* numerous, rugged.

Eſſ. Ch. Corolla funnel-ſhaped, obtuſe, irregular. Stamens inclined. Capſule with a lid, two-celled.

1. *H. niger.* Common Henbane. Linn. Sp. Pl. 257. Engl. Bot. t. 591. Woodv. Med. Bot. t. 52.—"Leaves ſinuated, embracing the ſtem. Flowers ſeſſile."—Common in waſte ground by the road ſide throughout England, more eſpecially on a dry calcareous ſoil, flowering in July. *Root* annual, ſpindle-ſhaped. *Stem* branched, round. *Leaves* alternate, ſeſſile, oblong, ſharply ſinuated. *Spikes* terminal, ſimple, recurved, accompanied with leaves. *Flowers* ſeſſile, erect. *Calyx* pitcher-ſhaped, reticulated with veins. *Corolla* yellow, very gracefully pencilled with a net-work of purple veins. The whole plant is hairy, viſcous, poiſonous, and narcotic, except its ſeeds, whoſe oil counteracts their noxious properties. "The ſeeds and capſules together, ſmoked as tobacco, are in ſome places a popular remedy for the tooth-ache, but convulſions and temporary inſanity ſometimes follow its uſe."

2. *H. reticulatus.* Ægyptian Henbane. Linn. Sp. Pl. 257. (H. flore rubello; Ger. em. 355. f. 5.)—"Stem-leaves on footſtalks, ſinuated, acute; floral-leaves entire. Flowers ventricoſe." Native of Crete, Syria and Egypt.—It flowers in July.—This annual is very ſimilar to the common Henbane, but differs in having its ſtem-leaves ovate, bent upwards, and ſmoother on the upper ſide; the floral-ones ſeſſile and entire. *Flowers* on a very ſhort ſtalk, bell-ſhaped, red, beautifully reticulated with dark veins; their tube ſwollen.

3. *H. albus.* White Henbane. Linn. Sp. Pl. 257. Ger. em. 353.—"Leaves on footſtalks, ſinuated, obtuſe. Flowers ſeſſile."—Native of the ſouth of Europe, flowering in Auguſt.—This alſo reſembles *H. niger* in habit and ſtructure, but the leaves are more rounded or obtuſe, very ſoft, clothed with white hairs, as is alſo the *ſtem*. *Flowers* fewer; lower ones on longer ſtalks than the upper. *Capſule* membranaceous, ventricoſe at the bottom. *Seeds* numerous, ſmall, kidney-ſhaped, of a whitiſh aſh-colour.

Linnæus obſerved a variety of this ſpecies having the throat of the corolla coloured with dark purple and green.

4. *H. aureus.* Golden-flowered or ſhrubby Henbane. Linn. Sp. Pl. 257. Curt. Mag. t. 87.—"Leaves on footſtalks,

ſtalks, lobed, dentate, acute. Flowers on ſtalks. Fruit pendulous."—A native of Crete and other parts of the Eaſt. It is very commonly cultivated in this country, as it flowers almoſt through the ſummer, and is extremely ornamental.—*Root* biennial (perhaps perennial.) *Leaves* roundiſh, acutely indented on their edges, hairy. *Flowers* at each joint of the ſtem, of a bright yellow colour with a dark purple baſe. *Style* much longer than the corolla. Alpinus and other authors make two varieties of this, differing only in ſize and the ſhade of colour in the corolla.

5. *H. muticus.* Smooth or beardleſs Henbane. Linn. Mant. 45. Willd. n. 5. Schmidel. Ic. t. 71.—Leaves on footſtalks, ovate, acutely angled. Calyx without awns. Bracteas undivided.—Native of Egypt and Arabia.—*Stem* a foot high, erect, roundiſh, ſomewhat pubeſcent. *Branches* axillary, ſhorter. *Leaves* alternate, obtuſely ſinuated, acute, entire, paliſh. *Raceme of flowers* all directed one way, curved in at the top. *Calyx* bell-funnel-ſhaped, not at all ſpinous. *Flowers* campanulate; at firſt green on the outſide, then whitiſh; on the inſide very dark purple, but finally, the whole flower becomes white and unſpotted. *Stamens* declining, purple, a little longer than the corolla. *Piſtil* longer, declining.

6. *H. puſillus.* Dwarf Henbane. Linn. Sp. Pl. 258. (H. puſillus aureus americanus; Pluk. Phyt. t. 37. f. 5.)—"Stem-leaves lanceolate, toothed; floral-leaves in pairs, entire. Calyx furniſhed with ſpines."—Native of Perſia.—*Root* annual. *Stem* ſix inches in height, brittle, hairy. *Leaves* alternate, on long hairy ſtalks. *Calyx* turbinate, ten-angled, nearly the length of the corolla, and broader than its tube, ſpiny at top. *Corolla* yellow with a black throat, divided on the lower ſide beyond the limb. *Stamens* declining.

7. *H. phyſalodes.* Purple-flowered Henbane. Linn. Sp. Pl. 258. Amœn. Acad. v. 7. t. 6. f. 1. Curt. Mag. t. 852.—"Leaves ovate, quite entire. Calyx inflated, ſub-globular."—A native of Siberia, flowering in March and April. *Root* perennial. *Stems* a foot high, ſimple, erect, round, rough with hairs. *Leaves* alternate, heart-ſhaped, entire, dark-green, hairy underneath, the upper ones gradually larger. *Flowers* in bundles, terminal, of a purple colour, funnel-ſhaped, erect. *Stamens* a little ſhorter than the corolla; converging. *Style* as long as the corolla. *Stigma* capitate, emarginate, whitiſh. This plant ſeems to be *Pulmonaria hirta,* Linn. Sp. Pl. App. 1667.

8. *H. Scopolia.* Night-ſhade leaved Henbane. Linn. Mant. 46. Willd. n. 8. Curt. Mag. t. 1126.—"Leaves ovate, entire. Calyx inflated, campanulate."—A native of Carniola, flowering in May.—*Root* perennial; *ſtem* nearly a foot high, forked. *Leaves* alternate, occaſionally oppoſite, lanceolate-ovate, naked, entire. *Stalks* axillary, ſingle-flowered. *Flowers* pendulous. *Calyx* ſmooth, beardleſs. *Corolla* bell-ſhaped, very ſimilar to that of *Atropa Belladonna,* the deadly night-ſhade. *Filaments* hairy, ſtraight. *Capſule* globoſe, of two cells.

Obſ. Theſe two laſt ſpecies *H. phyſalodes* and *Scopolia* differ from the reſt in having the fruit ſeldom opening, and a more regular corolla.

Hyosciamus *Peruvianus, henbane of Peru,* a name by which Dodonæus and many other authors have called the tobacco plants, more uſually known by the name nicotiana.

HYOSERIS, from ὗς, ὑος, *a ſwine,* and σερις, *a kind of lettuce,* whence its Engliſh appellation ſwine's lettuce, or ſwine's ſuccory. Linn. Gen. 404. Schreb. 531. Willd. Sp. Pl. v. 3. 1612. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 839. Ait. Hort. Kew. v. 3. 130. Juſſ. 169. Lamarck. Dict. v. 3. 158. Illuſtr. t. 654. Gærtn. t. 160. (Taraxaconaſtrum; Vaill. Mem. Acad. des Sc.—ann. 1721.) Claſs and order, *Syngeneſia Polygamia Æqualis.* Nat. Ord. *Compoſitæ Semifloſculoſæ,* Linn. *Cichoraceæ,* Juſſ.

Gen. Ch. *Common calyx* cylindric-angular, about eight or ten-cleft, permanent; ſcales lanceolate, erect, acute, ſomewhat keeled, equal, calycled at the baſe with very ſhort cloſe ſcales. *Cor.* compound, ſomewhat imbricated, uniform; each flower hermaphrodite; proper, of one petal, tongue-ſhaped, linear, truncated, five-toothed. *Stam.* Filaments five, capillary, very ſhort; anthers united, tubular. *Piſt.* Germen oblong; ſtyle thread-ſhaped, the length of the ſtamens; ſtigmas two, reflexed. *Peric.* none; common permanent calyx cloſe or ſpreading. *Seeds* ſolitary, oblong, membranaceous, ſtreaked on one ſide along the middle, almoſt the length of the calyx; the marginal ones broadeſt; down ſeſſile, chaffy. *Receptacle* naked.

Eſſ. Ch. Calyx almoſt equal. Down ſimple, chaffy. Receptacle naked.

1. *H. minima.* Swine's ſuccory. Linn. Sp. Pl. 1138. Engl. Bot. t. 95. (H. maſcula; Ger. em. 288.)—"Stem divided, deſtitute of leaves. Flower-ſtalks ſwelling upwards."—Found in barren ſandy gravelly fields, but rather ſparingly, flowering in June.—*Root* annual, ſmall, ſpindle-ſhaped. *Leaves* radical, depreſſed, oblong, toothed, now and then entire, rough, particularly at their edges. *Stems* three, four, or more, round, ſmooth, taper, and purpliſh at the bottom, under the flowers hollow and inflated, with here and there a few ſcattered, pointed, erect bracteas. *Flowers* ſolitary, ſmall, lemon-coloured; florets very obtuſe, and toothed. *Seeds* crowned with an elevated chaffy border.

Several ſpecies of this genus, of which Willdenow reckons eight in all, require reviſion, nor are the generic characters well defined. In ſome inſtances the crown of the ſeed is encompaſſed with hairs.

HYOSYRIS, a name given by Pliny and ſome other authors to the common knapweed, or *jacea nigra.*

HYO-THYROIDEUS, in *Anatomy,* a muſcle paſſing between the os hyoides and the thyroid cartilage, and deſcribed in the article Deglutition.

HYPACARIS, or Hypacyris, in *Ancient Geography,* a river of Scythia, which ſprung, according to Herodotus, from a lake, and paſſing through the middle of the country of the Scythian Nomades, diſcharged itſelf into the Euxine ſea, near the town of Carcinites, forming on the right Hylæa and the Curſus Achilles.

HYPACTIC Medicines, formed of ὑπαγω, *I take away,* a term uſed by ſome authors for cathartic medicines.

HYPÆA, in *Ancient Geography,* one of the iſlands called Stæchades, now Hieres, ſituated on the coaſt of Gallia Narbonnenſis.

HYPÆPA, a town of Lydia, between the Tmolus and the Cayſter.

HYPÆSIA, a country of the Peloponneſus, in Triphylia.

HYPÆTHROS, or Hypæthrion, Ὑπαιθριον, formed of ὑπο, *under,* and αιθρα, *air,* in the *Ancient Architecture,* a kind of temple, open at the top, and thereby expoſed to the air.

The hypæthron, according to Vitruvius, is an open building or portico, ſuch as anciently were certain temples that had no roof or covering. Of this we have an inſtance, in the temple of Jupiter Olympius, built by Coſſutius, a Roman architect at Athens.

Of hypæthrons, ſome were decaſtyle, others pycnoſtyle; but they had all rows of columns within-ſide, forming a kind of periſtyle; which was eſſential to this ſort of temple.

HYPALLAGE, Immutation, a grammatical figure, whereby, of different expreſſions which give the ſame idea, we make choice of that which is leaſt natural and obvious; or, when there is a mutual permutation or change of caſes, moods, regimens, &c.

The term is formed of ὑπαλλαττω, *I change*, compoſed of ὑπο and αλλαττω, *I change*; of αλλος, *another*.

As in this inſtance, *Dare claſſibus auſtros*; inſtead of *Dare claſſes auſtris*.

HYPANA, in *Ancient Geography*, a town of Triphylia, E. of Acheron and N. of Typanæa.

HYPANIA, a town of the Peloponneſus in the Elide; probably the ſame with Hypana.

HYPANIS, a river of European Scythia, ſince named the *Bog*. According to the ancients it originated in a large lake, called the "Sea of the Hypanis."

HYPAPANTE, or HYPANTE, a name which the Greeks give to the feaſt of the purification of the holy Virgin, or the preſentation of Jeſus in the temple.

The words are Greek, ὑπαντη, and ὑπαπαντη, which properly ſignify *humble*, and *lowly meeting*; being compounded of ὑπο, *under*, *beneath*, and αντάω, or απαντάω, *I meet*, of αντι, *contra*, *againſt*. The denominations are taken from the meeting of old Simeon, and Anna the propheteſs, in the temple, at the time the child Chriſt Jeſus was brought thither.

HYPARNA, in *Ancient Geography*, a town of Aſia, in Lycia, according to Arrian.

HYPATA, a town of Greece, and one of the principal towns of Theſſaly, according to Apuleius, Aſin. Aur. l. i.—Alſo, a country of Aſia, on the river Sangar.

HYPATE, ὑπατη, in the *Greek Muſic*, an epithet by which the Greeks diſtinguiſhed the loweſt tetrachord, and the loweſt ſtring of each of the two loweſt tetrachords.

HYPATE *Hypaton*, was a tone higher than the *proſlambanomenos*. See *Greek* SCALE and NOTATION.

HYPATE *Meſon*, υπατη μεσων, the loweſt ſtring of the ſecond tetrachord, which was alſo the moſt acute of the firſt, as theſe tetrachords were conjoint. See CONJOINT.

HYPATE *Prima*, in *Muſic*, is an interval, ſo called by M. Henfling, whoſe ratio is $\frac{2}{3} = 358\,\Sigma + 7\,f + 31\,m$, or the FIFTH, which ſee.

HYPATIA, in *Biography*, a female philoſopher of the Eclectic ſect, was the daughter of Theon, a celebrated mathematician of Alexandria, who flouriſhed in the fourth and fifth centuries. The talents of his daughter were cultivated with great aſſiduity, and ſhe was made miſtreſs of the different branches of polite learning, and became intimately converſant in the ſciences of geometry and aſtronomy, as they were at that day underſtood. She next applied herſelf to philoſophy, and is ſaid to have excelled all the philoſophers of her time. So high was her reputation, that ſhe was ſtrongly ſolicited to become a public preceptreſs in the ſchool where Ammonius, Hierocles, and other celebrated philoſophers taught: and ſuch was her attachment to ſcience, that ſhe yielded to the public voice, and became an inſtructor in the ſchools. Here ſhe explained the principles of philoſophy, and endeavoured to reconcile the ſyſtems of Plato, Ariſtotle, and other maſters. The celebrity of her name attracted ſcholars from all parts, and ſhe gained the reſpect and admiration not only of thoſe who formed her auditories in the ſchools, but the moſt eminent characters in Alexandria, and was even conſulted by the magiſtrates in caſes of importance. She is ſaid, however, not to have been intoxicated by the reſpect which was paid to her from all quarters; that though ſhe excelled moſt of the philoſophers of the age in mathematical learning and ſcience, ſhe diſcovered no pride, and though ſhe was in perſon exceedingly beautiful, ſhe never yielded to the impulſe of vanity, nor ever gave occaſion to the ſlighteſt ſuſpicion againſt her chaſtity. Poſſeſſed of ſuch extraordinary accompliſhments and virtues, her houſe became the reſort of perſons of learning and diſtinction; but her talents excited the jealouſy of mean and little minds, and the attainments to which ſhe was indebted for her celebrity proved the occaſion of her deſtruction. Oreſtes, a man of liberal education, and intimately acquainted with Hypatia, whom he frequently conſulted, was governor of Alexandria; and Cyril, a biſhop of great authority, but haughty, violent, and intolerant in the higheſt degree, filled the patriarchal chair of that city. This prelate, who perhaps did not wiſh to appear the avowed perſecutor, inſtigated the populace to plunder the property of the Jews, by forcibly expelling them from Alexandria. Oreſtes, reſenting his conduct, laid the affair before the emperor; who, declining to interfere in the diſpute, the city became a ſcene of frequent tumults and conteſts between the partizans of the prelate and governor. The intimacy of Oreſtes with Hypatia now became a ground of jealouſy to Cyril, who felt indignant that his rival ſhould have it in his power to be benefited by her ſage advice, on which account ſhe was calumniated by the biſhop's friends among the monks and Chriſtian populace, and at length ſhe fell a ſacrifice to their malignity. Not ſatisfied with her life, they put her to the moſt extreme torture, and then treated her dead body with the utmoſt indignity. Hypatia was murdered in the year 415, under the reign of Theodoſius II. by the conſent and wiſhes, if not by the direct inſtigation, of Cyril, a biſhop of what was falſely called Chriſtianity. The Chriſtian religion teaches every thing that is excellent, kind, and praiſeworthy, and the actions of malignant prieſts are not to be imputed to the creed which they profeſs, but to the rancour of heart, which is but too frequently found in the tyrants of the world, in eccleſiaſtical as well as civil polity. Moreri. Enfield's Hiſt. Phil.

HYPATOIDE, in *Muſic*, a nome, or air, in a low pitch.

HYPATOIDES, grave ſounds. See LEPSIS.

HYPATON, DIATONOS. See DIATONUS and SYSTEM.

HYPÆLYPTUM, in *Botany*, a name of whoſe meaning we can diſcover nothing. Can it have been corrupted from the *Hypolytrum* of Richard and Perſoon, which has a great appearance of being the ſame genus? For this ſuggeſtion we are indebted to Mr. Brown.—Vahl. Enum. v. 2. 283. Brown. Prodr. Nov. Holl. v. 1. 219.—Claſs and order, *Triandria Monogynia*. Nat. Ord. *Calamariæ*, Linn. *Cyperoideæ*, Juſſ.

Gen. Ch. *Cal.* Spike cloſely imbricated on all ſides, with obovate concave ſcales, one of them to each flower; perianth of two membranous linear valves, nearly as long, and oppoſite to each ſcale. *Cor.* none. *Stam.* Filaments three; anthers linear. *Piſt.* Germen ſuperior, oblong-ovate; ſtyle one, cloven, deciduous; ſtigmas two or three, undivided. *Peric.* none. *Seed* ſolitary, naked, obſcurely triangular, without any hairs at the baſe.

Eſſ. Ch. Scales imbricated every way, ſingle-flowered. Perianth of two valves, oppoſite to each ſcale. Corolla none. Seed one, naked, beardleſs.

This genus is allied to *Kyllingia*, with which it agrees in habit. The ſpecies in Vahl are four;

1. H. *pungens*. "Spikes ovate-oblong. Scales obtuſe. Involucrum ſpinous-pointed."—Suppoſed to be a native of South America. *Stems* two feet high.

2. H. *argenteum*. "Spikes ovate. Scales acute. Style three-cleft. Leaves linear."—Native of the Eaſt Indies and of Senegal. *Stem* a foot high. *Flowers* very white.

3. H. *ſphacelatum*. "Spikes ovate. Styles two-cleft.

Leaves linear."—Found at Tranquebar. A foot high. *Spikes* whitiſh, brown when old.

4. H. *filiforme.* " Spikes oblong. *Stem* thread-ſhaped. Leaves briſtle-ſhaped."—Native of Guinea. Glaucous, ſix inches or more in height. *Spikes* dark brown when old.

The *roots* of all are fibrous and purple. *Stems* triangular, erect, without joints. *Leaves* two or three, channelled, rigid, rough-edged, ſheathing. *Involucrum* moſtly two-leaved. *Spikes* terminal, ſeſſile.

To theſe Mr. Brown adds a fifth.

5. H. *microcephalum.* " Spikes ternate, nearly globoſe. Scales linear-wedge-ſhaped, awned. Involucrum of two very long leaves."—Native of the tropical part of New Holland. The *ſtem* is ſlender, triangular.

HYPECOUM, appears to be derived from ὑπηχεῖν, *to reſound,* becauſe its ſeed-veſſels when touched by the hand burſt with a crackling noiſe. This genus is the ὑπήκοον of Dioſcorides, and Hypecoum of Pliny.—Linn. Gen. 66. Schreb. 90 Willd. Sp. Pl. v. 1. 704. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 1. 168. Sm. Prodr. Fl. Græc. v. 1. 107. Juſſ. 236. Lamarck Dict. v. 3. 160 Illuſtr. t. 88. Gærtn. t. 115. (Hypecoon; Tournef. t. 115.) Claſs and order, *Tetrandria Digynia.* Nat. Ord. *Corydales,* Linn. *Papaveraceæ,* Juſſ.

Gen. Ch. *Cal.* Perianth ſmall, of two, ovate, acute, erect, oppoſite, deciduous leaves. *Cor.* of four petals, the two exterior ones oppoſite, broader, trifid, obtuſe; the two inner alternate with the others, trifid half way down; the middle ſegment concave, compreſſed, erect. *Stam.* Filaments four, awl-ſhaped, erect, covered by the middle ſegment of the inner petals; anthers erect, oblong. *Piſt.* Germen ſuperior, oblong, cylindrical; ſtyles two, very ſhort; ſtigmas acute. *Peric.* Pod long, curved inwards, jointed. *Seeds* globoſe, compreſſed, a ſingle one in each articulation of the ſeed-veſſel.

Obſ. The ſtamens of *H. erectum* appear to be tetradynamous.

Eſſ. Ch. Calyx of two leaves. Petals four, the two outer ones broader. Fruit a pod.

1. *H. procumbens.* Linn. Sp. Pl. 181. (Cuminum corniculatum, ſive Hypecoum Cluſii; Ger. em. 1067. 3.)—" Pods curved, compreſſed, jointed. The two larger petals obtuſely three-lobed." Native of the ſouth of Europe, and cultivated, by Gerarde, in this country, before 1597. It flowers in June and July, ripening ſeed in Auguſt.—*Root* ſimple, annual, fibrous. *Leaves* chiefly radical, much divided, pale green, with a greyiſh or glaucous tinge. *Stems* ſeveral, ſlender, compreſſed, naked at bottom, but furniſhed with a few leaves at the upper part, amongſt which the flower-ſtalks appear, each ſupporting a ſmall yellow flower. *Pod* grooved with longitudinal ſtreaks. *Seeds* from ten to twenty, dark brown.—H. *patens,* Willd. Hort. Berol. t. 5, ſeems not different from this.

2. *H. littorale.* Willd. n. 2. Jacq. Collect. v. 2. 205. Ic. Rar. v. 2. t. 309.—" Pods jointed, compreſſed, curved. Petals entire, the outer ones longer and linear-ſpatulate."—A native of dry ſand on the ſhores of Germany.—This is ſcarcely more than a variety of the laſt, as it differs only in the leaves being ſhorter and more acutely toothed, with entire and paler petals.

3. *H. pendulum.* Linn. Sp. Pl. 181. (Cuminum ſiliquoſum; Ger. em. 1067. 2.)—" Pods drooping, round, cylindrical. The larger petals obtuſely three-lobed."—A native of the ſouth of France, flowering in June and July.—*Stem* more ſlender, and ſtanding more erect than in *H. procumbens.* Leaves alſo longer and narrower. *Flowers* ſmaller, appearing at the diviſions of the branches, they are yellow like thoſe of the greater Celandine, but leſs.

4. *H. erectum.* Linn. Sp. Pl. 181. Amm. Ruth. 58. t. 9. " Pods erect, round, toruloſe. The larger petals emarginate, three-lobed." Amman received ſeeds of this plant from Dauria, and Miller from Iſtria; the latter cultivated it here before 1759. This has much the appearance of the laſt in *leaf* and *flower,* but its *pods* grow erect, and are writhed and twiſted about.

5. H. *imberbe.* Sm. Prodr. Fl. Græc. n. 378.—Pods curved, compreſſed, jointed. All the petals beardleſs.—Found by Dr. J. Sibthorp in the iſle of Cyprus. A figure of this ſpecies is deſtined for the Fl. Græca, t. 156. It has the habit of the reſt.

Obſ. The juice of theſe plants is of a yellow colour, reſembling that of Celandine, and is ſaid to have the ſame narcotic effect as opium.

HYPELATE, from ὑπο, *under,* and ἐλάτη, *a fir-tree,* ſo named by Dr. Patrick Browne. Schreb. 730. Browne Jam. 208. Swartz Prodr. 61. Claſs and order, *Polygamia Monœcia.* Schreb. rather *Octandria Monogynia.*

Gen. Ch. Perfect Flowers, *Cal.* Perianth of five (ſeldom four) ovate, concave, ſpreading, deciduous leaves, two of which are leſs than the reſt. *Cor.* Petals five, ovate, a little leſs than the calyx, deciduous, with a nectariferous cell about the germen. *Stam.* Filaments eight, ſpreading, placed round the baſe of the germen, the length of the corolla; anthers ovate-cordate. *Piſt.* Germen globoſe, ſuperior; ſtyle ſhort, erect; ſtigma deflexed, triangular, three-furrowed, acute. *Peric.* Drupa pulpy, roundiſh. *Seed.* Nut oval, very ſmooth; kernel ſolitary. Male Flowers on the ſame tree, but in a diſtinct panicle. *Cal. Cor.* and *Nect.* the ſame as in the perfect flowers, from the middle of which laſt ariſe the *Stam.* Filaments eight, converging at the baſe, either erect, reflexed or aſcending, broader at the baſe; anthers ovate-cordate. *Piſt.* The triangular rudiment of a germen; ſtyle awl-ſhaped, very ſmall.

Eſſ. Ch. Calyx five-leaved. Corolla of five petals. Stigma bent down, triangular. Drupa ſingle-ſeeded.

1. *H. trifoliata.* Swartz Prod. 61. Browne Jam. 208. (Cytiſus arboreus, foliis obtuſis glabris; Sloane Jam. v. 2. 33.) Found at Jamaica by the river-ſide under the town and on the red hills very plentifully. This *tree* has many trunks, each about four or five inches in diameter, covered with a ſmooth cinnamon-coloured bark. *Branches* upright. *Leaves* always three together at the end of a common footſtalk, of a yellowiſh green colour, very ſmooth, having one middle rib, and ſome tranſverſe ones. Dr. Browne obſerves that it is full of ſlender branches, and furniſhed with many leaves of the ſame texture and grain with thoſe of *Lignum Vitæ,* but remarkably different in form and diſpoſition. He never ſaw the fruit in a perfect ſtate.

HYPENEMIUS, an epithet applied by authors to barren eggs, or ſuch as a hen lays before ſhe has been trod by the cock. They are alſo called *zephyria ova,* and had both theſe names from the winds being ſuppoſed to generate them.

HYPER, a Greek word uſed in the compoſition of divers terms derived from that language.

The Greek prepoſition ὑπερ, *hyper,* literally ſignifies *above, beyond;* and in compoſition it expreſſes ſome exceſs, or ſomething beyond the ſignification of the ſimple word it is joined with.

Hyper, *Supra,* below. See Epi.

HYPER-ÆOLIAN, the penultima in the acute of the fifteen modes in Greek muſic, of which the fundamental or key-note was a fourth above the Æolian mode. Neither the hyper-æolian, nor the hyper-lydian mode was ſo ancient as the reſt; nor is either of them mentioned by

Ariſtoxenus; and Ptolemy, who admitted only ſeven modes, comprehended neither of them in his liſt.

HYPERANTHERA, in *Botany*, from ὑπερ, *upon*, and ανθηρα, *an anther*, ſo named by Forſkall, in alluſion to the ſuperior length or projection of two of the ſtamens. Forſk. Egypt. Arab. 67. Willd. Sp. Pl. v. 2. 535. Vahl. Symb. v. 1. 30. (Anoma; Loureir. Cochinch. v. 1. 278. Moringa; Schreb. 741. Burmann. Zeylan. t. 75. Juſſ. Gen. 348. Lamarck. Illuſtr. t. 337.) Claſs and order, *Decandria Monogynia*. Nat. Ord. *Lomentaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, in five deep ſegments, inferior. *Cor.* irregular, of five obovate petals, inſerted betwixt the ſegments of the calyx: the upper one largeſt. *Stam.* Filaments 10, awl-ſhaped, unequal; anthers roundiſh, ſome of them often imperfect. *Piſt.* Germen linear, ſuperior; ſtyle longer than the ſtamens; ſtigma ſimple. *Peric.* Pod long, ſtraight, pulpy, of one cell, and three rugoſe, ſpongy valves. *Seeds* numerous, roundiſh, with three wings.

Eſſ. Ch. Calyx in five deep ſegments. Petals unequal, inſerted into the calyx. Legume long, ſtraight, of three valves. Seeds winged.

Obſ. The laſt ſpecies has a bivalve legume, and ſeeds without wings.

1. *H. decandra.* Willd. n. 1. (Anoma Moringa; Loureir. Cochinch.)—"Flowers decandrous. Leaves bipinnate; lower leaflets ternate. *Legumes* ſomewhat octagonal."—A native of many parts of India; obſerved by Loureiro at Bengal. This *tree* is of a middling ſize. *Branches* ſpreading. *Leaves* alternate, unequally bipinnate; leaflets obovate, ſmooth, entire. *Flowers* white, in ſcattered panicles. *Legume* awl-ſhaped. *Seeds* furniſhed with three membranous wings, and arranged in a ſtraight and ſimple order along the valves.

2. *H. Moringa.* Willd. n. 2. (Anoma Moringa; Loureir. Cochinch. Guilandina Moringa; Linn. Sp. Pl. 546. Jacq. Ic. Rar. v. 3. t. 461.)—"Flowers ſemi-decandrous. Leaves bipinnate, lower leaflets ternate. Legumes triangular."—A native of Ceylon and Egypt. This ſpecies very nearly approaches the laſt in ſize and habit, but its *leaves* are oppoſite, and *flowers* leſs brilliant. *Legume* more than a foot long, triangular, ſometimes ſquare. *Seeds* triangular and winged, diſpoſed in a ſingle row; theſe are the "Ben-nuts," formerly much uſed by perfumers for their oil, which abſorbs and retains ſcents very powerfully.

3. *H. ſemidecandra.* Willd. n. 3. Vahl. Symb. v. 1. 30.—"Flowers ſemi-decandrous. Leaves bipinnate, ſimply pinnate at the top."—A native of Arabia. *Leaves* unequally bipinnate, conſiſting of ſix or eight pair of oppoſite leaflets, on ſhort ſtalks, larger by degrees towards the top, remote, ſmooth. *Flowers* in panicled cluſters. The common and partial flower-ſtalks alternate.

4. *H. cochinchinenſis.* Willd. n. 4. (Anoma cochinchinenſis; Loureir. Cochinch.)—"Flowers ſemi-decandrous. Leaves bipinnate, downy. Legumes two-valved. Seeds naked."—Found in the woods of Cochinchina. A *tree* about ten feet high with aſcending *branches*. *Leaves* oppoſite, unequally bipinnate; leaflets nearly ovate, downy. *Flowers* white, in ſcattered panicles. *Legume* oblong, ſomewhat compreſſed, attenuated at either end.

HYPERBATON, or Hyperbasis, in *Grammar* and *Rhetoric*, is a tranſpoſition, or a figurative conſtruction, inverting the natural and proper order of the terms of a diſcourſe.

The word is ὑπερβατον, or ὑπερβασις, derived of ὑπερβαινω, *tranſgredior, I go beyond;* formed of ὑπερ, *ultra, beyond,* and βαινω, *eo, I go.*

The hyberbaton, Longinus obſerves, is no other than a tranſpoſal of ſentiments, or words, out of the natural order and method of diſcourſe, and always implies great violence, or ſtrength of paſſion, which naturally hurries a man out of himſelf, and diſtracts him variouſly. Thucydides is very liberal in hyperbatons.

Quintilian calls the hyberbaton *verbi tranſgreſſio.* It is of uſe to enliven and animate the diſcourſe: it is very proper to expreſs a violent paſſion, and repreſent an agitation of mind in the livelieſt manner.

HYPERBIBASMUS, Ὑπερβιβασμος, in *Rhetoric*, a figure which inverts the order of conſtruction. Cornelius Nepos gives an inſtance of it in his life of Chabrias: "Athenienſes diem certam Chabriæ præſtituerunt, quam ante domum niſi rediſſet, &c. for ante quam."

HYPERBOLA, in *Geometry*, one of the Conic Sections, is formed by the common ſection of a plane and a conic ſurface, when the cutting plane neither meets the whole contour of the cone, nor is parallel to a plane that touches the conic ſurface.

A plane, ſuch as we have juſt deſcribed, being indefinitely extended, will likewiſe cut the oppoſite conic ſurface, and the common ſection will be another hyperbola perfectly ſimilar to the former one. The two curves, formed by the interſection of the ſame plane, with two oppoſite conic ſurfaces, are called oppoſite ſections, or oppoſite hyperbolas.

For the definitions relating to the hyperbola, and oppoſite hyperbolas, we muſt refer to the article Conics; as we muſt likewiſe do for the chief properties which theſe curves have in common with the other conic ſections: in this place we intend to treat of the more noted properties peculiar to the particular curves under conſideration.

1. If a parallelogram be completed by drawing parallels to the aſymptotes of an hyberbola from any point in the curve, that parallelogram will be conſtantly of the ſame magnitude.

Let C A, C B (*Plate* X. *Conics, fig.* 1.) be the aſymptotes of an hyperbola, and let two parallelograms C P M Q, C *p m q*, be formed by drawing parallels to C A, C B, through M and *m*, any two points in the curve: theſe parallelograms are equal. Let two lines, G F and H K, parallel to one another, be drawn through M and *m* to cut the aſymptotes. Then by ſimilar triangles,

$$GM : MP :: Hm : mp,$$
$$FM : MQ :: Km : mq.$$

Therefore, $GM \times MF : PM \times MQ :: Hm \times Km : mp \times mq$.

But (Cor. 27. Con.) $GM \times MF = Hm \times Km$.

Therefore $MP \times MQ = mp \times mq$.

Therefore the parallelograms C P M Q, C *p m q*, are equal (23. 6. E.)

Cor.—If M P, a parallel to one aſymptote, meet the other aſymptote in P, then the rectangle $CP \times PM$ is conſtantly of the ſame magnitude.

2. A triangle formed by two aſymptotes of an hyperbola, and a tangent of the curve which meets them, is conſtantly of the ſame magnitude.

Let a tangent of a hyperbola cut the aſymptotes C A, C B (*fig.* 1.); from the point of contact M, draw M P parallel to C B, and M Q parallel to C A; then the line T S will be biſected in M (21. Con.); hence it is plain that the triangle C T S is the double of the parallelogram C P M Q, and conſequently the triangle is conſtantly of the ſame magnitude (1).

3. *Lemma.*—Let D E (*fig.* 2.) be parallel to A C, one ſide of a triangle, then the line B F, drawn from the angle

oppoſite to A C, through O, the interſection of A E and D C, will biſect A C.

Let B F cut D E in G. Then, becauſe the parallels D E and A C are cut by three lines drawn through B,

$$DE : EG :: AC : CF.$$

And becauſe the ſame parallels are cut by three lines drawn through O,

$$DE : EG :: AC : AF.$$

Therefore (11. 5. E.)

$$AC : CF :: AC : AF.$$

Conſequently (9. 5. E.) $AF = FC$.

4. A ſtraight line drawn from the interſection of two tangents of an hyperbola (*figs.* 3. and 4.), or oppoſite hyperbolas, through the centre, will biſect the line drawn between the points of contact.

Let T M and T N be two lines touching an hyperbola, or oppoſite hyperbolas in M and N; then T C, drawn through the centre, will biſect M N. Let the line which touches the curve in M meet the aſymptotes in G and H; and the line touching in N, meet the ſame lines in K and L; join H K and G L. Then the two triangles G C H and L C K are equal (2); take away, or add, the triangle K C H, and the two triangles K G H and K L H will likewiſe be equal: therefore K H is parallel to L G (39 1. E.); and M N, which biſects H G and K L (21. Con.), will likewiſe be parallel to K H and G L (2. 6. E.) Now T C will biſect G L (Lem.), therefore it will alſo biſect M N parallel to G L.

5. If a tangent of an hyperbola meet a diameter, and an ordinate be applied to the ſame diameter from the point of contact; then the ſemi-diameter will be a mean proportional between the ſegments lying between the centre and the tangent, and the centre and the ordinate.

Firſt let a tangent H B (*figs.* 5. and 6.) meet a tranſverſe diameter C A, and let H F be an ordinate to the ſame; draw A M a tangent of the curve to meet B H in M; draw H A and C M cutting A H in O, and H F in N; join A N. Becauſe A H is biſected in O (4), and A M parallel to H F (1. Cor. 16. Con.), it is manifeſt that A M H N is a parallelogram. Becauſe A M is parallel to H F, therefore

$$CM : CN :: BA : BF.$$

And becauſe A N is parallel to B H, therefore

$$CM : CN :: CB : BA.$$

Conſequently (11. 5. E.)

$$CB : BA :: BA : BF.$$

Secondly, let the tangent H B and ordinate H F be drawn to a ſecond diameter C A; draw the diameter C D, conjugate to C A, and therefore parallel to H F; draw alſo H T parallel to C A, and therefore an ordinate to C D; let H B cut C D in S.

Then (29. Con. et alternando)

$$CA^2 : CA^2 + CF^2 :: CD^2 : HF^2.$$

But, on account of ſimilar triangles,

$$CB : BF :: CS : HF, \text{ or } CS \times HF : HF^2.$$

But, by the firſt caſe, $CS \times HF = CS \times CT = CD^2$; therefore (11. 5. E.)

$$CA^2 : CA^2 + CF^2 :: CB : BF.$$

Convertendo $CA^2 : CF^2 :: CB : CF$, or $CB \times CF : CF^2$;

$$\text{therefore } CA^2 = CB \times CF.$$

6. The difference of the ſquares of any two conjugate diameters of an hyperbola, is equal to the difference of the ſquares of the two axes.

Let C D (*fig.* 7.) be the tranſverſe axis of an hyperbola, and C M any other tranſverſe diameter, and draw the tangents B D E, P M Q, limited by the aſymptotes; alſo draw C R from the centre perpendicular to P Q. Then becauſe the triangles B C E and P C Q are equal (2), the rectangles $BC \times CE$ and $PC \times CQ$ will alſo be equal (23. 6. E.); but,

$$\left.\begin{aligned} 2\,BC \cdot CE &= BC^2 + CE^2 - BE^2 \\ 2\,PC \cdot CQ &= PC^2 + CQ^2 - PQ^2 \end{aligned}\right\} \text{(12 \& 13. 2. E.)}$$

therefore $BC^2 + CE^2 - BE^2 = PC^2 + CQ^2 - PQ^2 =$

(becauſe B E and P Q are biſected in D and M (21. Con.))

$2\,CD^2 - 2\,BD^2 = 2\,CM^2 - 2\,MP^2$. Therefore

$$CD^2 - BD^2 = CM^2 - MP^2,$$

and B D is half the conjugate axis, and M P half the diameter conjugate to C M.

7. If a parallelogram be completed by drawing ſtraight lines through the extremities of two conjugate diameters of oppoſite hyperbolas, ſo as to be parallel to the diameters themſelves, that parallelogram will be conſtantly of the ſame magnitude, and equal to the rectangle contained by the two axes.

Let M N and P Q (*fig.* 8.) be two conjugate diameters of oppoſite hyperbolas, and let the parallelogram F H K G be formed by drawing parallels to M N and P Q through the extremities of the ſame lines; then, becauſe H M and M K, as well as F N and N G, are all equal to P C or C Q (Def. 16. Con.); and H K and F G, both parallel to P Q, are tangents of the hyperbolas; it is plain that the four angular points of the parallelogram will be upon the aſymptotes of the curves (Def. 16. Con.); therefore the triangle H C K is always of the ſame magnitude (2); and conſequently the parallelogram F H K G, which is quadruple of the triangle, is likewiſe conſtantly of the ſame magnitude. And the ſame parallelogram is equal to the rectangle contained by the axes; becauſe the parallelogram becomes a rectangle when the conjugate diameters M N and P Q become the two axes of the hyperbolas.

8. If N E and M F (*fig.* 9.), two tangents of oppoſite hyperbolas, be both parallel to the ſemi-diameter C P, and be interſected by a third tangent D E F, which cuts them in E and F; then $CP^2 = NE \times MF$: and if the ſemi-diameter C Q be parallel to the tangent D E F; then $CQ^2 = DE \times DF$.

Join M N, which will paſs through the centre C (Cor. 18. Con.), and draw D O parallel to N E and M F, and D R parallel to M N. Then M C and C P are conjugate ſemi-diameters, and D O is an ordinate to M C, and D R an ordinate to P C; therefore

$$OC : CN :: CN : CL \ (5)$$

Convertendo et Alternando, $ON : NL :: CN : CL$

Componendo $OL : LN :: ML : CL$

therefore, by ſimilar triangles

$$OD, \text{ or } RC : NE :: MF : CS;$$

Conſequently $MF \times NE = RC \times CS = CP^2$ (5).

Again,

$$DE : EN :: CQ : CP \quad \text{(Cor. 1. 28. Con.)}$$

$$DF : MF :: CQ : CP;$$

therefore $DE \times DF : MF \times EN :: CQ^2 : CP^2$

and becauſe $MF \times EN = CP^2$

therefore $DE \times DF = CQ^2$.

9. Two ſtraight lines M F and M *f* (*fig.* 10.), drawn from any point in the curve of an hyperbola, make equal angles with the tangent M T drawn from the ſame point.

Let M T meet the tranſverſe axis in T, and draw M K perpendicular to the ſame axis produced. Then

$$Mf^2 - MF^2 = fK^2 - KF^2 \quad \text{(47. 1. E.)}$$

that is, $(Mf + MF) \times (Mf - MF) = Ff \times (fK + KF)$:

but $Mf - MF = 2AC$ (42. Con.); $fK + KF = 2CK$;

$$\text{therefore } AC \times \frac{Mf + MF}{2} = CF \times CK:$$

$$\text{Conſequently, } AC : CF :: CK : \frac{MF + Mf}{2};$$

$$\text{but (5), } CT : CA :: CA : CK,$$

$$\text{ex æquo, } CT : CF :: CA, \text{ or } \frac{Mf - MF}{2} : \frac{Mf + MF}{2}:$$

and, componendo et dividendo

$$fT : TF :: Mf : MF.$$

Therefore (3. 6. E.) M T biſects the angle FMf.

10. If M P (*fig.* 10.) touch an hyperbola, and M F be drawn from the point of contact to either focus; then C P, drawn from the centre parallel to M F, and limited by the tangent, will be equal to A C, half the tranſverſe axis.

Draw Mf to the other focus, and draw fP meeting M F, produced if neceſſary, in H: becauſe $fC = FC$, and C P is parallel to F H, therefore $fP = PH$: conſequently, ſince M P biſects the angle fMF (9), $MH = Mf$ (3. 6. E.): therefore $FH = Mf - MF = AB$ (42. Con.); and $CP = \frac{1}{2} FH = AC$.

Cor. 1.—The line fP will be perpendicular to the tangent M P.

For M P, which biſects the vertical angle of the iſoſceles triangle fMH, will cut the baſe M H at right angles.

Cor. 2.—If fP and Fp be drawn from the two foci perpendicular to a tangent of the hyperbola, the points P and p will be in the circumference of the circle deſcribed upon the tranſverſe axis as a diameter.

11. The rectangle under F P and fp (*fig.* 10.), two perpendiculars drawn to any tangent of the curve, is equal to the ſquare of half the conjugate axis.

For the points P and p are in the circumference of the circle deſcribed upon the greater axis A B; therefore if fP meet the circle again in O, the ſegment OPp, which contains a right angle, will be a ſemi-circle, and O C and Cp will be one ſtraight line, and the triangles fCO and FCp will be equal, and $AO = pF$. But $Pf \times fO = Pf \times Fp = fA \times fB = fC^2 - CA^2 =$ ſquare of half the conjugate axis (Def. 23. Con.).

12. A ſtraight line T F, (*fig.* 11.) drawn from the interſection of two tangents of an hyperbola, or oppoſite hyperbolas, to one of the foci, will make equal angles with the lines M F and N F drawn from the points of contact to the ſame focus.

Draw Mf, Nf to the other focus, and in M F, N F, produced, if neceſſary, take $MQ = Mf$, and $NP = Nf$; and join Tf. Becauſe T N biſects the angle fNF (9), and $Nf = NP$, therefore $TP = Tf$ (4. 1. E.): for a like reaſon $TQ = Tf$: therefore $TP = TQ$; becauſe $PF = NF - Nf$, and $FQ = Mf - MF$, therefore $PF = FQ$ (42. Con.) Hence it is plain that the angle $TFN = = TFQ$ (8. 1. E.)

Cor. 1.—The angles which T F makes with one tangent, are equal to the angles which Tf makes with the other tangent.

For the triangles MTf and M T Q are equal, and the angle $MTf =$ the angle M T Q; alſo, the angle F T P = the angle F T Q.

And taking the differences of theſe equals,

$$fTP - MTF = MTF;$$

$$\text{therefore } fTP = 2NTf = 2MTF.$$

$$\text{And } NTf = MTF$$

$$MTf = NTF.$$

Cor. 2.—If two tangents of an hyperbola, drawn from the extremities of a chord paſſing through the focus, meet in T (*fig.* 12.); then T F will be perpendicular to the chord M N. For the angles M F T, N F T, are in all caſes equal; and when M F and F N become one right line, each of the angles is a right angle.

13. If M N (*fig.* 12.) be any chord drawn through the focus of an hyperbola, and P Q, likewiſe drawn through the focus, be ordinately applied to the tranſverſe axis, then $4MF \times FN = MN \times PQ$.

Draw M S, N R, perpendicular to the tranſverſe axis, and N G, P H, M K, perpendicular to the directrix that correſponds to the focus F. Then (43. Conics)

$$PF : PH, \text{ or } FL :: MF : MK \text{ or } LS$$

(17. 5. E.) $PF : PH :: MF - PF : FS$;

in like manner, $PF : PH :: PF - FN : FR$

(11. 5. E.) and alternando, $MF - PF : PF - FN :: FS : FR$.

By ſimilar triangles, $FS : FR :: MF : FN$;

therefore $MF - PF : PF - FN :: MF : FN$;

and $(MF - PF) \times FN = (PF - FN) \times MF$;

whence $2MF \times FN = MN \times PF$,

and $4MF \times FN = MN \times PQ$.

14. If a tangent of an hyperbola, as D E (*Plate* XI. *fig.* 13.), interſect two perpendiculars drawn from the extremities of the tranſverſe axis in the points D and E; then two right lines, drawn from theſe points to one of the foci, as F, will contain a right angle.

Draw F M to the point in which D E touches the curve, and produce F M to S: then, becauſe D B and D M are tangents, therefore the angle $DFM =$ angle D F B (12). And, in like manner, becauſe A E and E M are tangents, the angle $AFE =$ angle E F S: therefore the angle E F D is half the ſum of the angles A F S and A F M, or a right angle.

Of Conjugate Hyperbolas.—It has been proved, that if M N (*fig.* 14.), limited by the aſymptotes of an hyperbola, touch the curve in P, then M N will be biſected in P (21. Con.), and the triangle M C N will be conſtantly of the ſame magnitude: whence it follows that, ſuppoſing M N to be drawn ſo as to make the triangle M C N always of one conſtant magnitude, the middle point P of M N will be conſtantly in the curve of an hyperbola, of which C P and C Q (C Q being parallel and equal to P M) are conjugate ſemidiameters, and the lines C M and C N are the aſymptotes. Draw M G, in the angle adjacent to M C N, to paſs through Q; then the triangle M C G will be equal to the triangle M C N, and Q will be the middle of M G: therefore, according to what has been obſerved, Q will always be found in the curve of an hyperbola, of which M G is a tangent, and M C and C G are the aſymptotes: and this hyperbola is ſo related to the firſt one, that the terminations of the ſecond ſemidiameters of the one curve are in the other curve, as is plain from what has already been ſaid. Four hyperbolas, comprehending the two we have been deſcribing, and their correſponding oppoſite hyperbolas are called *conjugate hyperbolas:* ſuch curves lie in oppoſite angles of the ſame aſymptotes, and the extremities of the ſecond diameters of two of the oppoſite hyperbolas are in the two remaining oppoſite hyperbolas.

The moſt remarkable properties of conjugate hyperbolas are as follows:

1. The ſecond diameters of two of the oppoſite hyperbolas are all tranſverſe diameters of the other two.

2. Two conjugate diameters of two of the oppoſite hyperbolas are alſo conjugate diameters of the other two curves.

3. If a parallelogram F H C L be completed, by drawing parallels to the aſymptotes through any point in one of

four conjugate hyperbolas, as F, that parallelogram will be conſtantly of one and the ſame magnitude.

For ſuch a parallelogram will be equal to one-fourth of the triangle M C N, or to one-fourth of the triangle M C G, which is equal to M C N.

4. And hence, if from any point F, in one of the curves, F H be drawn parallel to one aſymptote to meet the other; then $CH \times HF$ will be conſtantly of the ſame magnitude.

5. A line F K, terminated by two adjacent hyperbolas, and parallel to one aſymptote, is biſected by the other aſymptote.

$$\text{For } CH \times HF = CH \times HK.$$

It may be remarked, that while oppoſite hyperbolas muſt be regarded as two different branches of the ſame curve, conjugate hyperbolas are two different curves, poſſeſſing, indeed, ſome analogous properties, but really unconnected by the law of continuity. For, in the firſt place, when a plane cuts two oppoſite conic ſurfaces, it produces no more than two oppoſite hyperbolas, without the ſmalleſt trace of the conjugate hyperbolas. And in the next place, if we conſider the hyperbola as it is determined by an algebraic equation, no ſuch equation can be found that, preſerving the ſame ſyſtem of the co-ordinates, will comprehend all the four conjugate hyperbolas. Let the curves be defined by two rectangular co-ordinates x and y, parallel to the two axes; then if, in the equation which belongs to two oppoſite hyperbolas, the ordinate x be neceſſarily greater than y, in the equation of the two conjugate hyperbolas, the ſame ordinate x will neceſſarily be leſs than y; a circumſtance which plainly excludes the two latter curves from the equation that defines the two firſt. Again, if we define the curves by means of two co-ordinates x and y, parallel to the aſymptotes, which leads to this equation, $a \times b = x \times y$; then, making x and y both poſitive in one of the angles of the aſymptotes, they will become $-x$ and $-y$ in the oppoſite angles; and in the two angles adjacent to theſe, they will be x and $-y$, and $-x$ and y: now, the equations $a \times b = x \times y$, and $a \times b = -x \times -y$, which belong to the two oppoſite hyperbolas, are conſiſtent with one another, but they are both inconſiſtent with the equations $a \times b = x \times -y$, and $a \times b = -x \times y$, which would belong to the conjugate hyperbolas, if the ſame ſyſtem of the co-ordinates were preſerved.

Of the Deſcription of a Hyperbola in Plano.—1. When the tranſverſe axis and the two foci are given (*fig.* 15.), any number of points in the oppoſite hyperbolas may be thus found: Take any point O, in the tranſverſe axis produced beyond the foci, and deſcribe a triangle upon F *f* (22. 1. E.), that ſhall have its ſides reſpectively equal to the diſtances of O from A and B, the vertices of the tranſverſe axis; then the vertex of this triangle, M or *m*, will be in one of the hyperbolas: and in this way, may as many points in both curves be found as ſhall be thought neceſſary.

When the two axes are given, the foci may be readily found (Cor. Def. 23. Con.), and then the curves may be deſcribed by this method.

2. A hyperbola that has its two axes equal to one another, and the angle of the aſymptotes equal to a right angle, is called an equilateral hyperbola: ſuch a curve may be thus deſcribed, by finding an indefinite number of points. Let $AB = Dd$ be the two ſemi-axes; in A B, produced either way, aſſume any point O, and, having drawn an indefinite perpendicular through O, cut C O in L with a circle deſcribed from the centre D with the radius C O, and ſet off O P, *o p* upon the perpendicular, each equal to C L; then will P and *p* be points in one of the oppoſite curves.

3. When the two foci *f* and F, and the tranſverſe axis A B (*fig.* 16.) are given, the hyperbola may be deſcribed by the following mechanical contrivance. Provide a ſtraight ruler, and let it be made to turn round one focus *f*, ſo as to have its ſtraight edge *f* E always directed to *f*; take a thread, which is ſhorter than the whole length of the ruler, by the length of the tranſverſe axis A B, and having fixed one end of the thread in the other focus F, attach the other end to the extremity of the ruler at E: then if the ruler be turned round about *f*, while the thread is ſtretched tight by a pin P which ſlides along the ſtraight edge of the ruler, the point of the pin will trace the hyperbola required. For the exceſs of *f p* above P F is equal to the exceſs of the whole ruler above the whole length of the thread; that is, to the tranſverſe axis A B.

4. When the directrix A M (*fig.* 17.), the correſponding focus F, and the vertex V are given; from V, as a centre with the diſtance V F, deſcribe a circle, and it will cut the directrix in a point, as H; for F V A cuts the directrix at right angles, and V F is greater than V A (43. Con.): join V H, and provide a ruler M E N, with two ſtraight edges, making an angle equal to the angle V H A, and place it on the ſame ſide of the directrix M A with the focus F, ſo that the edge M E may be in the direction of M A, and the other edge E N may be turned toward F; fix one end of a thread, which is equal in length to E N in F, and attach the other end to N: then, if the thread be ſtretched tight by a pin P, which ſlides along E N, the point of that pin will deſcribe the hyperbola required. For, draw P R perpendicular to the directrix, then $PE = PF$; and, becauſe the angles M E N and A H V are equal, by ſimilar triangles

$$PE \text{ or } PF : PR :: VH \text{ or } VF : VA.$$

Therefore P deſcribes the hyperbola required (43. Con.).

Of the Area of the Hyperbola.—In the treating of the ellipſe we have ſhewn that the area of a whole ellipſe, or of any ſegment of it, has to the area of the whole circle deſcribed on the tranſverſe axis, or to the correſponding ſegment of that circle, the ſame proportion that the conjugate axis has to the tranſverſe axis; and the ſame reaſoning by which this was proved will apply equally to any two curves whatever which have their ordinates anſwering to the ſame abſciſs every where in the ſame proportion: whence it follows, that the conſtant proportion of the co-ordinates will be that of the areas taken between the ſame limits. Now, if we ſuppoſe any number of hyperbolas to be deſcribed upon the ſame tranſverſe axis, then, as it is eaſy to prove, the ordinates of theſe curves drawn to the common axis, and anſwering to the ſame abſciſs, will be proportional to the ſecond axis of the ſeveral curves: and therefore, according to what has been obſerved, the hyperbolic areas cut off by the ordinates will be proportional to the ſecond axis. This propoſition does not, indeed, enable us to ſquare the hyperbolic ſpaces: but we learn from it that the problem will be accompliſhed generally for all hyperbolas, if we can find the quadrature of any one in particular, as the equilateral hyperbola, which is the ſimpleſt of all.

In farther treating of the quadrature of the hyperbola, we ſhall conſider the area contained between the curve and its aſymptote, and ſhall begin with ſhewing that the ſpaces comprehended between the ordinates are the meaſures of the ratio of the abſciſſes taken on the aſymptotes; in other words, that the aſymptotic ſpaces are the logarithms of the abſciſſes.

1. If through F and G (*fig.* 18.) two points aſſumed in a hyperbola, two ordinates T H and G K be drawn parallel to

to one aſymptote to cut the other in H and K; then the hyperbolic ſector F C G will be equal to the mixtilineal ſpace F H K G.

For the triangle C F H will be equal to the triangle C G K, and when theſe are taken from the ſpace C F G K, the remainders, which are the ſector F C G and the ſpace F H K G, will likewiſe be equal.

2. If the abſciſſes C H, C K, C M, be taken in continued proportion, the aſymptotic ſpaces F H K G, G K M L will be equal.

Draw F L, C F, C G, C L, and let C G cut F H in N, F L in O, and M L produced in P. Becauſe C H, C L, C M are in continued proportion, therefore H N, G K, and P M will alſo be in continued proportion. Again,

L M : K G :: C K : C M (Cor. 1.)
by ſimilar triangles, G K : M P :: C K : C M;
therefore L M : K G :: G K : M P.

And, becauſe H N, K G, and P M were before ſhewn to be in continued proportion, therefore L M = H N. In like manner, it may be ſhewn that F H = P M. Therefore P L = F N, and F L will be biſected in O. Therefore every line drawn in the hyperbola parallel to F L will be biſected by the diameter C G (15. Con.): and hence it is eaſy to infer that the hyperbolic ſegment cut off by F L will be biſected by G O. And becauſe C O likewiſe biſects the triangle F C L, it is plain that the ſectors F C G and G C L are equal; and conſequently ſo are the ſpaces F H K G and G K M L, which are equal to the ſectors.

3. If the ratio of the abſciſſes C G and C H (*fig.* 19.) be equal to the ratio of the abſciſſes C D and C F; then will the aſymptotic ſpaces K G H L and E D F I, comprehended between the ordinates, be equal.

For if we take C S a mean proportional between C G and C F, it will alſo be a mean proportional between C H and C D. Therefore the ſpace K G R S = ſpace R S F I, and the ſpace L H R S = ſpace R S E D: conſequently the ſpace K G H L = ſpace E D F I.

4. The aſymptotic ſpaces comprehended between the ordinates are the meaſures of the ratios of the abſciſſes.

Let the ratio of C B to C *m* be a ſmall ratio, and ſuppoſe that of C G to C F to be an exact multiple of the ratio of C B to C *m*: then, according to what has been ſhewn, it is plain that the aſymptotic ſpace K G F I will be the like multiple of the ſpace A B *m n*. Now, the ratio of C B to C *m* may be taken ſo ſmall that all other ratios may be conſidered as exact multiples of it; and then the correſponding hyperbolic ſpaces will be the like multiples of the area A B *m n*: which proves what was propoſed.

What has here been demonſtrated of the abſciſſes and the aſymptotic ſpaces is exactly the ſame relation that ſubſiſts between numbers and their logarithms: and therefore if the abſciſſes be taken to repreſent the ſeries of natural numbers, the hyperbolic ſpaces comprehended between the ordinates will be proportional to the logarithms of the numbers.

5. Suppoſing the abſciſs to be given, it is propoſed to inveſtigate a ſeries for the aſymptotic ſpace in the equilateral hyperbola.

The vertex of the hyperbola being at A, let the ordinate A B = B C = 1, B F = x, and put z to repreſent the hyperbolic area A B F I: between C B and C F interpoſe as many mean proportionals C *m*, C *p*, &c. as there are units in the whole number denoted by i: then, according to what has been proved, all the ſpaces A B *m n*, *m n* G K, &c. of which the number is i, will be equal; and therefore, the ſpace A B *m n* = $\frac{z}{i}$: but, becauſe C F = $1 + x$, therefore C *m* = $(1 + x)^{\frac{1}{i}}$; and B *m* × B A = $(1 + x)^{\frac{1}{i}} - 1$: now when i is a very great number, and conſequently B *m* very ſmall, the rectangle B *m* × B A may be conſidered as equivalent to the hyperbolic ſpace A B *m n*; therefore $\frac{z}{i} = (1 + x)^{\frac{1}{i}} - 1$; and $z = i \times \left\{ (1 + x)^{\frac{1}{i}} - 1 \right\}$; and by expanding the radical by the binomial theorem, we get

$$z = x - \frac{i-1}{2i} \cdot x^2 + \frac{i-1}{2i} \cdot \frac{2i-1}{3i} \cdot x^3 - \&c.$$

This expreſſion of the value of z is greater than the truth for all values of i, but it differs leſs and leſs from the truth as i is taken greater and greater; and therefore, by taking the limit to which the expreſſion conſtantly approaches as i increaſes, we ſhall have accurately

$$z = x - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \frac{1}{4} x^4 + \&c.$$

This is the ſeries which Mercator invented for the quadrature of the hyperbola, and which he publiſhed (in 1667) in his Logarithmotechnia. If the area denoted by z lie on the other ſide of A B, and B f = x, then it may be ſhewn, in the ſame manner as before, that $z = i \times \left\{ 1 - (1 - x)^{\frac{1}{i}} \right\}$: and, by expanding and taking the limit we ſhall get

$$z = x + \frac{1}{2} x^2 + \frac{1}{3} x^3 + \frac{1}{4} x^4 + \&c.$$

This ſeries, which may appear to be a very eaſy extenſion of Mercator's invention, was firſt given by Dr. Wallis of Oxford, in a letter to lord Brouncker, publiſhed in the third volume of the Philoſophical Tranſactions.

The ſame inveſtigation will apply to any hyperbola (*fig.* 20.): for preſerving the ſame denominations as before, we ſtill have the ſpace A B *m n* = $\frac{z}{i}$; and if m denote the ſine of the angle of the aſymptotes, then the ſpace A B *m n* = $m \times$ A B $\times$ m B $= m \times \left\{ (1 + x)^{\frac{1}{i}} - 1 \right\}$; therefore $z = m \times i \times \left\{ (1 + x)^{\frac{1}{i}} - 1 \right\}$; whence

$$z = m \times \left\{ x - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \frac{1}{4} x^4 + \&c. \right\}$$

And in like manner when the area is on the other ſide of the ordinate A B, we ſhall have

$$z = m \times \left\{ x + \frac{1}{2} x^2 + \frac{1}{3} x^3 + \frac{1}{4} x^4 + \&c. \right\}$$

It readily follows from what has been proved, that, in different hyperbolas (*figs.* 19 and 20.), if we take C F to C B in the ſame proportion, the aſymptotic ſpaces A B F I, or the equivalent ſectors A C I, will be proportional to the ſines of the angles formed by the aſymptotes: this ſuppoſes that B C is unit in all the hyperbolas; when this is not the caſe, the ſpace of every hyperbola will be proportional to the ſquare of B C multiplied by the ſine of the angle of the aſymptotes, or, which is an equivalent ſpace, to half the product of the two axes of the curve.

It has already been remarked that the hyperbolic trapeziums, or ſectors, bear the ſame relation to the correſponding abſciſſes, that the logarithms of numbers do to the numbers themſelves; and by taking m, or the ſine of the angle contained by the aſymptotes of a proper magnitude, the hyperbolic trapeziums or ſectors will be meaſured by the very ſame numbers as the logarithms in any propoſed ſyſtem. Thus in the equilateral hyperbola, when $m = 1$, the hyperbolic ſpaces agree in numerical value with the logarithms of Napier's ſyſtem; and if $m = .434294$, the hyperbolic ſpaces will be equivalent to the logarithms of Briggs's ſyſtem, which are thoſe contained in the tables in common uſe. From what has now been ſaid we derive an eaſy rule for computing the area of any hyperbola by means of a table of logarithms. Let the ſemi-tranſverſe axis of an hyperbola $= a$ (*fig.* 20.), the ſemi-conjugate $AY = b$, the abſciſs of the tranſverſe $CX = y$; then the ordinate $XI = \frac{b}{a} \sqrt{y^2 - a^2}$; and if X I cut the aſymptotes in O and E, then $XO = \frac{b}{a} \times y$; therefore $IO = \frac{b}{a} \times (y + \sqrt{y^2 - a^2})$: now

$$IE : EF :: AY : BY, \text{ or } BC :: OI : CF;$$

therefore $\frac{OI}{AY} = \frac{OI}{b} = \frac{y + \sqrt{y^2 - a^2}}{a} = \frac{CF}{BC} =$ value of C F when B C is unit: then the hyperbolic trapezium A B F I, or the equivalent ſector A C I, will be equal to

$$\frac{a \times b}{2} \times \text{Napier's logarithm of } \frac{y + \sqrt{y^2 - a^2}}{a};$$

or if $M = .434294$, the ſame ſpace will be equal to

$$\frac{a \times b}{2\,M} \times \text{Briggs's logarithm of } \frac{y + \sqrt{y^2 - a^2}}{a}.$$

With regard to the area X A I, it is the difference of the triangle I C X and the ſector A C I.

Napier's logarithms, which are expreſſed by the ſectors, or aſymptotic trapeziums of an equilateral hyperbola, in which C B is unit, have obtained the appellation of hyperbolic logarithms: but they do not ſeem to be better entitled to this name than Briggs's logarithms, which are equivalent to the ſectors, or aſymptotic trapeziums of the hyperbola, in which B C is unit, and the ſine of the angle of the aſymptotes $= .434294$. Nay, what is more, the latter ſort of logarithms may be expreſſed by the areas of an equilateral hyperbola, as well as the former: for this purpoſe we have only to make $BC = \sqrt{.434294}$; and the ſector A C I, or the trapezium A B F I, will be equal to Briggs's logarithm of the number equal to $\frac{CF}{BC}$.

6. We ſhall now finiſh what we have to ſay on the quadrature of the hyperbola with conſidering the inverſe problem, for determining the abſciſs when the hyperbolic area is given; or, which is the ſame thing, for determining the number when the logarithm is given. Now, according to what has already been ſhewn, we have, in a hyperbola that has the ſine of the angle of the aſymptotes $= m$, $z = m \times i \times \left\{(1 + x)^{\frac{1}{i}} - 1\right\}$: therefore $1 + x = \left(1 + \frac{1}{i} \cdot \frac{z}{m}\right)^i$; and, by expanding by the binomial theorem, we get $1 + x = 1 + \frac{z}{m} + \frac{i-1}{2i} \cdot \frac{z^2}{m^2} + \frac{i-1 \,.\, i-2}{2i \,.\, 3i} \frac{z^3}{m^3} + \frac{i-1}{2i} \cdot \frac{i-2}{3i} \cdot \frac{i-3}{4i} \cdot \frac{z^4}{m^4} + \&c.$ This equation is not rigorouſly exact for any value of i, but it is the more nearly true, the greater is the number that i ſtands for; and therefore when we take the limit to which the ſeries continually approaches, we ſhall have accurately $1 + x = 1 + \frac{z}{m} + \frac{1}{1 \,.\, 2} \cdot \frac{z^2}{m^2} + \frac{1}{1.2.3} \cdot \frac{z^3}{m^3} + \frac{1}{1.2.3.4} \cdot \frac{z^4}{m^4} + \&c.$ And if the area z be taken on the other ſide of the ordinate A B, then, in like manner, $1 - x = 1 - \frac{z}{m} + \frac{1}{1 \,.\, 2} \cdot \frac{z^2}{m^2} - \frac{1}{1.2.3} \cdot \frac{z^3}{m^3} + \frac{1}{1.2.3.4} \cdot \frac{z^4}{m^4} + \&c.$

Of the Rectification of the Hyperbola.—1. Let C B (*fig.* 21.) the ſemi-tranſverſe axis of an hyperbola, be unit, the diſtance of the focus from the centre $CF = e$; and conſequently the ſemi-conjugate axis $= \sqrt{e^2 - 1} = CD$: let C P, an abſciſs of the tranſverſe axis, $= x$; the correſponding ordinate $MP = y$; and draw M T a tangent of the curve: then, by the property of the curve, we have

$$CB^2 : CD^2 :: CP^2 - CB^2 : PM^2;$$
$$\text{or } 1 : e^2 - 1 :: x^2 - 1 : y^2;$$

hence $y = \sqrt{e^2 - 1 \,.\, x^2 - 1}$. Let the length of the arc B M of the hyperbola be denoted by H; then $\dot{H} = \sqrt{\dot{x}^2 + \dot{y}^2} = \dot{x} \sqrt{1 + \frac{x^2(e^2 - 1)}{x^2 - 1}} = \frac{\dot{x}\sqrt{e^2 x^2 - 1}}{\sqrt{x^2 - 1}}$. If the tangent M T cut the tranſverſe in T, then $CT \times CP = CB^2$; hence $CT = \frac{1}{x}$; and $TP = x - \frac{1}{x} = \frac{x^2 - 1}{x}$; therefore $MT = \sqrt{TP^2 + MP^2} = \frac{\sqrt{(x^2 - 1)(e^2 x^2 - 1)}}{x}$: Put $\tau = MT$, then by taking the fluxions in the value of τ, we ſhall get

$$\dot{\tau} = \frac{\dot{x}\sqrt{e^2 x^2 - 1}}{\sqrt{x^2 - 1}} + \frac{\dot{x}\sqrt{x^2 - 1}}{x^2 \sqrt{e^2 x^2 - 1}};$$

$$\text{therefore } \dot{\tau} - \dot{H} = \frac{\dot{x}\sqrt{x^2 - 1}}{x^2 \sqrt{e^2 x^2 - 1}}:$$

thus the rectification of the hyperbola is reduced to the inveſtigation of the fluent of $\frac{\dot{x}\sqrt{x^2 - 1}}{x^2 \sqrt{e^2 x^2 - 1}}$, generated while the abſciſs increaſes from unit to any indefinite value; for it is clear from what has been proved, that this fluent will expreſs the difference between the hyperbolic arc M B and its tangent M T. And becauſe a tangent of the hyperbola approaches indefinitely to the aſymptote as the point of contact recedes from the vertex, we may likewiſe infer from what has been ſaid, that the whole fluent generated while x increaſes from being equal to unit to be infinitely great, is equivalent to the exceſs of the aſymptote above the curve, when both are indefinitely extended: this laſt caſe being the moſt intereſting one of the problem, we ſhall principally have it in view in what we have farther to add on this ſubject.

Let $\sqrt{x^2 - 1} = \tan. \phi$, and while x increaſes from 1 to be infinitely great, the arc ϕ will increaſe from 0 to be a quadrant, or $\frac{\pi}{2}$ (π denoting 3.14159, &c.): then $x = \frac{1}{\text{coſ.}\, \phi}$. $\sqrt{e^2 x^2 - 1} = \frac{\sqrt{e^2 - \text{coſ.}^2 \phi}}{\text{coſ.}\, \phi}$; and $\dot{x} = \frac{\dot{\phi}\, \text{ſin.}\, \phi}{\text{coſ.}^2 \phi}$: therefore by ſubſtitution

$$\tau - H = \int . \frac{\dot{x}\sqrt{x^2 - 1}}{x^2 \sqrt{e^2 x^2 - 1}} = \int . \frac{\dot{\phi}\, \text{ſin.}^2 \phi}{\sqrt{e^2 - \text{coſ.}^2 \phi}};$$

and, becauſe $\text{ſin.}^2 \phi = \frac{1}{2} - \frac{1}{2}\, \text{coſ.}\, 2\phi$, and $\text{coſ.}^2 \phi = \frac{1}{2} + \frac{1}{2}\, \text{coſ.}\, 2\phi$, therefore

$$\tau - H = \tfrac{1}{2} \cdot \int . \frac{\dot{\phi}\,(1 - \text{coſ.}\, 2\phi)}{\sqrt{e^2 - \frac{1}{2} - \frac{1}{2}\, \text{coſ.}\, 2\phi}}:$$

aſſume, $a^2 + b^2 = e^2 - \frac{1}{2}$, $2ab = \frac{1}{2}$; then $a + b = e$,

$$a - b = \sqrt{e^2 - 1}; \text{ and } a = \frac{e + \sqrt{e^2 - 1}}{2},$$

$$b = \frac{e - \sqrt{e^2 - 1}}{2};$$ conſequently, $\sqrt{e^2 - \frac{1}{2} - \frac{1}{2}\,\text{coſ.}\ 2\phi}$ $= \sqrt{a^2 + b^2 - 2ab\,\text{coſ.}\ 2\phi} = \left(\text{putting } f = \frac{b}{a}\right)$ $a \times \sqrt{1 + f^2 - 2f\,\text{coſ.}\ 2\phi}$: again, let $\Delta = \sqrt{1 + f^2 - 2f\,\text{coſ.}\ 2\phi}$, then $\text{coſ.}\ 2\phi = \frac{1 + f^2 - \Delta^2}{2f}$; and $(1 - \text{coſ.}\ 2\phi) = \frac{1}{2}\cdot\frac{\Delta^2}{f} - \frac{1}{2}\cdot\frac{(1-f)^2}{f}$: therefore $\tau - \text{H} = \frac{1}{2a}$.

$$\int\!.\frac{\dot\phi\,(1 - \text{coſ.}\ 2\phi)}{\sqrt{1 + f^2 - 2f\,\text{coſ.}\ 2\phi}} = \frac{1}{4af}\cdot\left\{\int\!.\Delta.\dot\phi - (1-f)^2\cdot\int\!.\frac{\dot\phi}{\Delta}\right\}$$

: and, becauſe $\frac{1}{4af} = \frac{e + \sqrt{e^2 - 1}}{2}$, and $\frac{(1-f)^2}{4af} = \frac{2(e^2 - 1)}{e + \sqrt{e^2 - 1}}$, therefore

$$\tau - \text{H} = \frac{e + \sqrt{e^2 - 1}}{2} \times \int\!.\Delta.\dot\phi - \frac{2(e^2 - 1)}{e + \sqrt{e^2 - 1}}.\int\!.\frac{\dot\phi}{\Delta}.$$

Now, let Δ and $\frac{1}{\Delta}$ be developed into ſeries containing the coſines of the multiples of 2ϕ; as thus,

$$\Delta = \text{A}^{(0)} + \text{A}^{(1)}\,\text{coſ.}\ 2\phi + \text{A}^{(2)}\,\text{coſ.}\ 4\phi + \text{\&c.}$$

$$\frac{1}{\Delta} = \text{B}^{(0)} + \text{B}^{(1)}\,\text{coſ.}\ 2\phi + \text{B}^{(2)}\,\text{coſ.}\ 4\phi + \text{\&c.};$$

then, taking the whole fluents from $\phi = 0$ to $\phi = \frac{\pi}{2}$, we have $\int \Delta.\dot\phi = \text{A}^{(0)} \times \frac{\pi}{2}$, and $\int \frac{\dot\phi}{\Delta} = \text{B}^{(0)} \times \frac{\pi}{2}$: with regard to $\text{A}^{(0)}$ and $\text{B}^{(0)}$, they will be found by theſe ſeries, *viz.*

$$\text{A}^{(0)} = 1 + (\tfrac{1}{2})^2.f^2 + \left(\frac{1\,.\,1}{2\,.\,4}\right)^2.f^4 + \left(\frac{1\,.\,1\,.\,3}{2\,.\,4\,.\,6}\right)^2.f^6 + \text{\&c.}$$

$$\text{B}^{(0)} = 1 + (\tfrac{1}{2})^2.f^2 + \left(\frac{1\,.\,3}{2\,.\,4}\right)^2 f^4 + \left(\frac{1\,.\,3\,.\,5}{2\,.\,4\,.\,6}\right)^2.f^6 + \text{\&c.}$$

and thus we get the following value of the exceſs of the aſymptote above the hyperbolic curve, when both are infinitely extended, *viz.*

$$\frac{\pi}{2} \times \left\{\frac{e + \sqrt{e^2 - 1}}{2}.\text{A}^{(0)} - \frac{2(e^2 - 1)}{e + \sqrt{e^2 - 1}}\cdot\text{B}^{(0)}\right\};$$

and this expreſſion is, in moſt caſes, very commodious for computation, becauſe, on account of the ſmallneſs of $f^2 = \left(\frac{e - \sqrt{e^2 - 1}}{e + \sqrt{e^2 - 1}}\right)^2$, the ſeries for $\text{A}^{(0)}$ and $\text{B}^{(0)}$ converge very rapidly.

HYPERBOLA, *Acute*, an hyperbola whoſe aſymptotes make an acute angle.

HYPERBOLA, *Ambigenal*, is that which has one of its infinite legs inſcribed, and the other circumſcribed. See AMBIGENAL.

HYPERBOLA, *Equilateral* or *Rectangular*, is that wherein the conjugate axes are equal, and whoſe aſymptotes make a right angle. Since the parameter is a third proportional to the conjugate axis, it is alſo equal to the axis: wherefore if in the equation $y^2 = bx + \frac{bxx}{a}$, expreſſing the nature of the hyperbola, you ſuppoſe $b = a$; the equation $y^2 = ax + x^2$ will expreſs the nature of the equilateral hyperbola. And hence the ſquares of the ordinates y^2 and z^2 are to each other as $ax + x^2$ and $av + v^2$: that is, as the rectangles of the abſciſſes into right lines compoſed of the abſciſs and parameter. See HYPERBOLA, *ſupra.*

HYPERBOLAS, *Infinite*, or HYPERBOLAS *of the higher kind*, are thoſe defined by the equation $a y^{m+n} = b x^m (d + x)^n$. Hence in the infinite hyperbolas $a y^{m+n} : a v^{m+n} = b x^m (a + x)^n : b z^m (a + z)^n$; that is $y^{m+n} : v^{m+n} :: x^m (a + x)^n : z^m (a + z)^n$. See HYPERBOLOID.

As the hyperbola of the firſt kind, or order, has two aſymptotes; that of the ſecond kind, or order, has three; that of the third four, &c.

In reſpect of theſe, the hyperbola of the firſt kind is called the *Apollonian* or *conical* hyperbola: it is thus called in contradiſtinction to the hyperbolas of the higher kinds. It is called hyperbola from ὑπερβάλλειν, *to exceed*, becauſe in this curve the ſquare of the ordinate or y^2 is equal to $bx + \frac{b\,x^2}{a}$, and therefore exceeds the product of the parameter b, by the abſciſs x.

HYPERBOLA, *Inſcribed.* See INSCRIBED.

HYPERBOLA, *for the locus of an*, ſee LOCUS.

HYPERBOLA, *for the quadrature of an*, ſee QUADRATURE and HYPERBOLA, *ſupra.*

HYPERBOLAS, *Conjugated*, a name given to four hyperbolas, when the firſt and ſecond axes of two oppoſite hyperbolas are the ſecond and firſt axes of two other oppoſite hyperbolas. See HYPERBOLA, *ſupra.*

Hyperbolas of all degrees may be expreſſed by the equation $x^m y^n = a^{m+n}$ where a is a given quantity, x an abſciſſa taken on the aſymptote, and y an ordinate to the aſymptote.

HYPERBOLÆON. The hyperbolæon tetrachord was the moſt acute of the five tetrachords in the Greek ſyſtem. This word is the genitive caſe of the plural ſubſtantive ὑπερβολαι, *ſummits, extremes*; the moſt acute ſounds being at the ſummit of the reſt.

HYPERBOLE, Ὑπερβολη, *ſuperlatio*, formed of the verb ὑπερβαλλειν, *to exceed*, in *Rhetoric*, a figure, whereby the truth and reality of things are either exceſſively enlarged or diminiſhed. See EXAGGERATION.

The character of an hyperbole is to exaggerate or extenuate the idea of the thing ſpoken of, beyond the bounds of truth, or even probability. As, he ran ſwifter than the wind; he went ſlower than a tortoiſe, &c.

Hyperboles, ſays Seneca, lie without deceiving; they lead the mind to truth by fictions; they convey the ſentiment intended, though by expreſſing it in terms which render it incredible. The hyperbole promiſes too much, in order to make you conceive enough. There is nothing faulty in an hyperbole, when it is *ultrà fidem*, as Quintilian ſays, provided that it be not *ultrà modum*.

Ariſtotle obſerves, that hyperboles are the favourite figures of young authors, who love exceſs and exaggeration; but that philoſophers ſhould not uſe them without a great deal of reſerve.

The pitch to which an hyperbole may be carried, is a point of great delicacy; to carry it too far is to deſtroy it: it is of the nature of a bow-ſtring, which by immoderate tenſion, ſlackens; and frequently has an effect quite contrary to that intended. Longinus.

Thoſe hyperboles are beſt, which are latent, and are not taken for hyperboles. For this reaſon, they ſhould ſcarcely ever be uſed but in a paſſion; and in the middle of ſome important incident: ſuch as the hyperbole of Herodotus ſpeaking of the Lacedæmonians, who fought at Thermopylæ: "They defended themſelves, for ſome time, with the arms that were left them, and at laſt with their hands and teeth; till the barbarians, continually ſhooting, buried them, as it were, with their arrows." Now what likelihood is there, that naked men ſhould defend themſelves with their hands and teeth againſt armed men; and that ſo many perſons ſhould be buried under their enemies' arrows? Yet does there appear ſome probability in the thing, by reaſon it is not ſought for the ſake of the figure; but the hyperbole ſeems to ariſe out of the ſubject itſelf. Id.

Of the like kind is that paſſage of a comic poet, mentioned by Longinus: "He had lands in the country no larger than a Lacedæmonian epiſtle."

There are certain manners of tempering the harſhneſs of hyperboles, and giving them an air of probability. Virgil ſays, that to ſee the fleets of Antony and Auguſtus at the battle of Actium, one would have taken them for the Cyclades floating on the water: and Florus, ſpeaking of the expedition wherewith the Romans built a number of veſſels in the firſt Punic war, ſays, 'It ſeemed not that the ſhips were built by workmen, but that the trees were transformed into ſhips by the gods." They do not ſay, that the ſhips were floating iſlands; nor that the trees were metamorphoſed into ſhips; but only that one might have taken them to be ſo. This precaution ſerves as a kind of paſſport to the hyperbole, if we may be allowed the phraſe, and makes it go down even in proſe; for what is excuſed before it is ſaid, is always heard favourably, how incredible ſoever it be. Bouhours. The exceſs in this trope is called *auxeſis;* as when we ſay of any thing that is very high, *it reaches to the ſkies:* the defect or contrary extreme is termed *meioſis;* as when we ſay of a very lean perſon, *he is nothing but ſkin and bones*, or *a mere ſkeleton.*

HYPERBOLIC, or Hyperbolical, ſomething relating either to an hyperbole, or an hyperbola.

Hyperbolic *Conoid.* See Conoid.

Hyperbolic *Cylindroid,* is a ſolid figure, whoſe generation is given by ſir Chriſtopher Wren, in the Philoſophical Tranſactions.

Two oppoſite hyperbolas being joined by the tranſverſe axis, and through the centre, a right line being drawn at right angles to that axis; and above that, as an axis, the hyperboles being ſuppoſed to revolve; by ſuch revolution, a body will be generated, which is called the hyperbolic cylindroid, whoſe baſes, and all ſections parallel to them, will be circles. In a ſubſequent tranſaction, the ſame author applies the new figure to the grinding of hyperbolical glaſſes; affirming, that they muſt be formed this way, or not at all. Phil. Tranſ. vol. iv. p. 961.

Hyperbolic *Leg* of a curve, is that which has an aſymptote, or tangent at an infinite diſtance.

Sir Iſaac Newton reduces all curves, both of the firſt and of the higher kinds, into thoſe with hyperbolic legs, and thoſe with parabolic ones; that is, ſuch as have aſymptotes, and ſuch as have not, or ſuch as have tangents at an infinite diſtance, and ſuch as have not. See Curve.

Hyperbolic *Line* is uſed by ſome authors for what we call the hyperbola itſelf.

In this ſenſe the plane ſurface, terminated by the curve line, is called the hyperbola; and the curve line that terminates it, the hyperbolic line.

Hyperbolic *Logarithms*, or *Napierian Logarithms*, are a ſeries of numbers, particularly uſeful in the determination and computation of fluents, ariſing from various problems in the higher branches of the mathematics; at the ſame time they have the property of common logarithms in facilitating many arithmetical operations, ſuch as multiplication, diviſion, extraction of roots, &c. &c.

Theſe numbers are called hyperbolic logarithms, becauſe they expreſs the areas or ſpaces contained between the aſymptote and curve of the hyperbola; thoſe areas being limited by ordinates parallel to the other aſymptote; the ordinates themſelves decreaſing in a geometrical progreſſion. But this does not appear to be a proper method of denominating them, as ſuch areas may be made to denote any ſyſtem of logarithms whatever; for which reaſon they are now generally termed Napierian logarithms; from the name of their illuſtrious inventor, John Napier, baron of Merchiſton, in Scotland. (See Logarithms.) As we ſhall, under the article Logarithms, enter at ſome length on the hiſtory of the invention, and the ſucceſſive improvements of theſe very uſeful numbers; it will only be neceſſary, under the preſent article, to attend to the particular ſyſtem which is the ſubject of our immediate conſideration; by ſhewing, 1ſt, how it happened, that Napier fell upon this ſyſtem, excluſively of all others; 2dly, in what reſpect it is inferior to that of the common logarithms, for arithmetical and trigonometrical operations; 3dly, that theſe numbers neceſſarily ariſe in the determination and computation of fluents; 4thly, we ſhall ſhew their application to the problems before mentioned; and laſtly, preſent the reader with the moſt extenſive table of hyperbolic logarithms that has yet been publiſhed; being for every number from 1 to 10,000, and each true to the eighth place of decimals.

Napier, in the conſtruction of his logarithms, did not adapt them to the ſeries of natural numbers 1, 2, 3, 4, 5, 6, &c. as it was not his intention to extend them to arithmetical operations in general; but he confined his labours to that circumſtance which firſt ſuggeſted to him the neceſſity of the invention; and therefore he adapted his logarithms to the approximate numbers, which expreſs the natural ſines of every minute in the quadrant.

The ſame reſtricted idea was purſued through his method of conſtructing the logarithms. As the lines of the ſines, of all arcs, are parts of the radius, or ſine of the quadrant; he conceived the line of the radius to be deſcribed or run over by a point moving along it, in ſuch a manner, that in equal portions of time it generated or cut off parts in a decreaſing geometrical progreſſion; leaving the ſeveral remainders, or lines, in geometrical progreſſion alſo; while another point in an indefinite line, deſcribed equal parts of it in the ſame equal portions of time; ſo that the reſpective ſums of theſe, or the whole lines generated, were always the arithmeticals or logarithms of theſe ſines.

Thus *a z* is the given radius on which all the ſines are to be taken, and A, 1, 2, &c. the indefinite line containing the logarithms; theſe lines being both generated by the motion of points, beginning at A and *a*. Now at the end of the 1ſt, 2d, 3d, &c. moments or equal portions of time, the moving points being found at the places marked 1, 2, 3, &c. then will *z a*, *z* 1, *z* 2, *z* 3, &c. be the ſeries of natural ſines; and A 0, or (0), A 1, A 2, A 3, &c. will be their logarithms, ſuppoſing the point which generates $a\,z$ to move every where, with a velocity decreaſing in proportion to its diſtance from z; *viz.* its velocity in the points 0, 1, 2, 3, &c. to be reſpectively as the diſtances $z\,0$, $z\,1$, $z\,2$, $z\,3$, &c.; while the velocity of the point generating the logarithmic line remains always the ſame as in the firſt point A, or 0. Hutton's Introduction to Logarithms.

In this ſtate the ſyſtem of logarithms was undetermined, having only ſuppoſed one condition or limitation; namely, that the logarithm of $a\,z$, or radius, ſhould be 0, or radius itſelf equal to unity, which was aſſumed, in order to render the trigonometrical operations the more eaſy; but another condition was ſtill neceſſary to limit the ſcale or ſyſtem; and as the one which we have deſcribed was contrived in order to ſimplify the operations; ſo the ſecond was aſſumed, in order to render the calculation of the tables as eaſy as poſſible; for which reaſon he ſuppoſed, that the two generating points ſhould begin to move from A and a with equal velocities, or that the increments, as A 1, deſcribed in the firſt moments, ſhould be equal; and this ſuppoſition gave at once to every number its particular logarithm, and thus he found that his logarithm of the ratio of 10 to 1 became 2.30258509, and hence it happened, that by means of theſe two accidental and arbitrary aſſumptions, Napier's ſyſtem of logarithms was of that kind which we deſignate by hyperbolic logarithms.

It would, however, be unintereſting to the reader to follow Napier any further in his conſtruction, as methods much more ſimple have been ſince diſcovered for the formation of logarithmic tables; and which ſhew far more diſtinctly the nature of thoſe numbers; in order to the explanation of which, it will be proper to begin by defining logarithms in general: thus,

The logarithm of a number is the exponent of that power of ſome other number, which is equal to the firſt: hence, if $r^x = a$, then will x repreſent the logarithm of a; and r will be the radix of the ſyſtem, which it is obvious may be aſſumed at pleaſure. If we take $r = 10$, it will be the common logarithmic ſyſtem; and if r be taken $= 2.7182818$, it gives the hyperbolic logarithmic ſcale; and the reaſon for aſſigning to r the above value will be evident from the following inveſtigation. Since $r^x = a$, we muſt, in order to find the logarithm of a, obtain an expreſſion for x, in the above equation in terms of r and a; which may be effected thus:

Let $a = 1 + p$, and $\frac{1}{x} = z$; then from $r^x = a$, we deduce $r = (1+p)^z = 1 + \left(p - \frac{p^2}{2} + \frac{p^3}{3} - \frac{p^4}{4} + \text{\&c.}\right) z + \frac{1}{2} \left(p - \frac{p^2}{2} + \frac{p^3}{3} - \frac{p^4}{4} + \text{\&c.}\right)^2 z^2 + \frac{1}{2 \cdot 3} \left(p - \frac{p^2}{2} + \frac{p^3}{3} - \frac{p^4}{4} + \text{\&c.}\right)^3 z^3 + \frac{1}{2 \cdot 3 \cdot 4} \left(p - \frac{p^2}{2} + \frac{p^3}{3} - \frac{p^4}{4} + \text{\&c.}\right)^4 z^4 + \text{\&c.}$; and by making $p - \frac{p^2}{2} + \frac{p^3}{3} - \frac{p^4}{4} + \text{\&c.} = s$; we ſhall have $1 + sz + \frac{1}{2} s^2 z^2 + \frac{1}{2 \cdot 3} s^3 z^3 + \frac{1}{2 \cdot 3 \cdot 4} s^4 z^4 + \frac{1}{2 \cdot 3 \cdot 4 \cdot 5} s^5 z^5 + \text{\&c.} = r$; or $s z + \frac{1}{2} s^2 z^2 + \frac{1}{2 \cdot 3} s^3 z^3 + \frac{1}{2 \cdot 3 \cdot 4} s^4 z^4 + \frac{1}{2 \cdot 3 \cdot 4 \cdot 5} s^5 z^5 + \text{\&c.} = r - 1$; which let be put equal to q; then by reverting the ſeries, z or $\frac{1}{x}$ will be found $= \frac{q - \frac{1}{2} q^2 + \frac{1}{3} q^3 - \frac{1}{4} q^4 + \frac{1}{5} q^5 - \text{\&c.}}{s} = \frac{q - \frac{1}{2} q^2 + \frac{1}{3} q^3 - \frac{1}{4} q^4 + \frac{1}{5} q^5 - \text{\&c.}}{p - \frac{1}{2} p^2 + \frac{1}{3} p^3 - \frac{1}{4} p^4 + \frac{1}{5} p^5 - \text{\&c.}}$; and, conſequently, $x = \frac{p - \frac{1}{2} p^2 + \frac{1}{3} p^3 - \frac{1}{4} p^4 + \frac{1}{5} p^5 - \text{\&c.}}{q - \frac{1}{2} q^2 + \frac{1}{3} p^3 - \frac{1}{4} p^4 + \frac{1}{5} p^5 - \text{\&c.}}$ or, ſubſtituting for p and q their reſpective values; that is, $p = a - 1$, and $q = r - 1$, we have the following general expreſſion for the logarithm of a; *viz.* log. a

$$= \frac{(a-1) - \frac{1}{2}(a-1)^2 + \frac{1}{3}(a-1)^3 - \frac{1}{4}(a-1)^4 + \frac{1}{5}(a-1)^5 - \text{\&c.}}{(r-1) - \frac{1}{2}(r-1)^2 + \frac{1}{3}(x-1)^3 - \frac{1}{4}(r-1)^4 + \frac{1}{5}(r-1)^5 - \text{\&c.}}$$

which is a general expreſſion, in terms of a and the radix r, which laſt may, therefore, be aſſumed any number at pleaſure, greater or leſs than unity. Now as r, in every ſyſtem, is a conſtant quantity, being always the number whoſe logarithm, in the ſyſtem to which it belongs, is 1; the above expreſſion may be ſimplified, either by aſſuming r equal to ſome particular number, and from thence finding the value of the ſeries conſtituting the denominator; or, by aſſuming the whole ſeries equal to ſome particular number, and from thence finding the value that muſt be given to the radix r.

By the latter of theſe methods the denominator may be made to vaniſh, by aſſuming the value of the ſeries of which it conſiſts equal to 1; in which caſe the logarithm of a becomes, log. $a = (a-1) - \frac{1}{2}(a-1)^2 + \frac{1}{3}(a-1)^3 - \frac{1}{4}(a-1)^4 + \frac{1}{5}(a-1)^5 - \text{\&c.}$; or, making again $a = 1 + p$; we have log. $(1+p) = p - \frac{1}{2} p^2 + \frac{1}{3} p^3 - \frac{1}{4} p^4 + \frac{1}{5} p^5 - \text{\&c.}$ and by means of the expreſſion, $(r-1) - \frac{1}{2}(r-1)^2 + \frac{1}{3}(r-1)^3 - \frac{1}{4}(r-1)^4 + \text{\&c.} = 1$, we find $r = 2.7182818$, &c. which is the number we before ſtated to be the radix of the hyperbolic ſyſtem.

The above is evidently the ſimpleſt form that the logarithmic ſeries admits of; and, therefore, ſuch as would be naturally adopted by any perſon, before he was aware of the advantages or diſadvantages of it in other reſpects, when compared with a different ſyſtem; and thus it was Napier firſt employed theſe numbers, although he did not know of the above method of arriving at them. But as ſoon as Briggs had conſidered the nature of their generation, and the purpoſes they were intended to anſwer, he ſoon convinced himſelf, and Napier likewiſe, that much advantage would ariſe in their application, by taking for the radix of the ſyſtem of logarithms the ſame number, as was the radix of the ſcale of notation; that is, by aſſuming $r = 10$; by which means, the logarithm of the ſame digits in the ſame order was always conſtant, whether theſe were integral, decimal, or compounded of both; and only the index or characteriſtic was to be changed; and various other advantages that this method poſſeſſes over the other, will be explained under the article LOGARITHMS: we ſhall, therefore, only obſerve here, that the advantages of Briggs's ſyſtem are ſo deciſive, that Napier's would, before this time, have been forgotten, had not the invention of fluxions again called into action the dormant powers of hyperbolic logarithms.

We have already ſeen that the hyperbolic logarithm of $1 + p$, or of $1 + x$, by writing x inſtead of p, is hyp. log. $(1+x) = x - \frac{1}{2} x^2 + \frac{1}{3} x^3 - \frac{1}{4} x^4 + \frac{1}{5} x^5 - \text{\&c.}$

Now let it be required to find the fluent of the fluxion $\frac{\dot{x}}{1+x}$: this in a ſeries becomes $\dot{x}\left(\frac{1}{1+x}\right) = \dot{x}\,(1 - x + x^2 - x^3 + x^4 - x^5\,\text{\&c.}) = \dot{x} - x\dot{x} + x^2\dot{x} - x^3\dot{x} + x^4\dot{x} - \text{\&c.}$; or, taking the fluents by the common rule, we have the fluent of $\frac{\dot{x}}{1 + x} = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \frac{1}{5}x^5 -$ &c.

but this laſt ſeries is the ſame as that expreſſing the hyp. log. of $(1 + x)$, therefore the fluent of $\frac{\dot{x}}{1 + x}$ is the hyp. log. of $1 + x$. And the ſame rule is general for every quantity, of which the numerator is the fluxion, or any multiple of the fluxion of the denominator; theſe being all reducible to the ſame form. (See Fluxions and Fluents.) Thus we have

the fluent of $\frac{\dot{x}}{x \pm a} =$ hyp. log. of $(x \pm a)$

the fluent of $\frac{2x\dot{x}}{a^2 + x^2} =$ hyp. log. of $(a^2 + x^2)$

the fluent of $\frac{nx^{n-1}\dot{x}}{a^n + x^n} =$ hyp. log. of $(a^n + x^n)$

the fluent of $\frac{\dot{x}}{\sqrt{x^2 \pm 2a^2}} =$ hyp. log. of $(x + \sqrt{x^2 \pm a^2})$

the fluent of $\frac{\dot{x}}{\sqrt{x^2 \pm 2a\dot{x}}} =$ hyp. log. of $(x \pm a + \sqrt{x^2 \pm 2ax})$

the fluent of $\frac{2a\dot{x}}{a^2 - x^2} =$ hyp. log. of $\left(\frac{a + x}{a - x}\right)$

the fluent of $\frac{2a\dot{x}}{x\sqrt{a^2 + x^2}} =$ hyp. log. of $\left(\frac{\sqrt{a^2 + x^2} - a}{\sqrt{a^2 + x^2} + a}\right)$

the fluent of $\frac{x^{-2}\dot{x}}{\sqrt{b^2 + x^{-2}}} = -$ hyp. log. of $\left(\frac{1 + \sqrt{1 + b^2x^2}}{x}\right)$

Theſe are only a few of the caſes in which hyperbolic logarithms are applied to the computation of fluents; and for the application of which to practice, the following table will be found very uſeful: it will need little or no explanation, being the ſame in form as the common tables of logarithms; and all that is neceſſary to be obſerved is, that as the index of the logarithm is not repeated in every column, a ſmall daſh (—) is placed over the firſt figure of the decimal, when any change takes place in the index. Thus, for example, the hyp. log. of 1097 is 7.00033446, the ſmall daſh indicating, that the index in that place changes from 6 to 7. If the hyperbolic logarithm of a fraction be required, we have only to ſubtract the log. of the denominator from that of the numerator for the log. ſought: thus, the hyp. log. of $\frac{119}{1172} = 4.77912349 - 7.06646697 = -2.28734348$; the whole of which expreſſion is negative, whereas in the common ſyſtem, the decimal part always retains a poſitive value, and the index only becomes negative; and this is again one of the inconveniences attending the hyperbolic ſyſtem. When the natural number correſponding to any given hyp. log. is required, whether the given log. be poſitive or negative, it is always beſt to add to the given log. the log. of ſuch a power of 10 as will bring it as near the end of the tables as poſſible, and then having found the natural number the ſame as in the common tables; divide the reſult by the ſame power of 10 for the natural number ſought: the reaſon for which is, that the differences are too variable in the beginning of the table to be of any aſſiſtance in deducing the proportional parts. Suppoſe, for example, the given hyperbolic logarithm was − 3.28734348, and it was required to find the correſponding natural number. Now the hyp. log. of 10 = 2.30258509, multiply this by 5, we have $10^5 =$ 11.51292545, which being added to the given log. we have − 3.28734348 + 11.51292545 = 8.22558197. Again,

$$\begin{array}{lcl}
\text{Nat. number to } 8.22550309 = 3735 & \left\{ \begin{array}{l} 8.22558197 \\ 8.22550309 \end{array} \right. \\
\text{———————— } 8.22587090 = 3736 & \\
\hline
\text{Difference} \quad 36781 : 1 :: & 7888 : .2
\end{array}$$

hence $\frac{3735.2}{100000} = .037352$ is the natural number required.

And in this manner may the natural number anſwering to any given hyp. log. not in the table, be reduced to another within the limits of the table, by adding or ſubtracting from it ſuch powers of 10 as are ſufficient for that purpoſe; obſerving always to repeat the reverſe operation after the number is obtained. And by a ſimilar method, the hyp. log. of any number not found in the table may be reduced to another, that is, by either multiplying or dividing it by ſuch powers of 10 as may be neceſſary for that purpoſe; only remembering to ſubtract or add to the logarithm thus found the logarithm of the ſame power of 10, as that by which the given number was multiplied or divided. This will be more evident from the following examples:

Exam. 1.—Find the hyperbolic logarithm of .7854.

Firſt, $.7854 = \frac{7854}{10000}$; and, therefore, the hyp. log. of .7854 = hyp. log. 7854 − hyp. log. 10^4 = 8.96877824 − 4 × 2.30258509 = − 0.24156212, the logarithm ſought.

Exam. 2.—Find the hyperbolic logarithm of 78.54.

Here $78.54 = \frac{7854}{100}$; and, therefore, the hyp. log. of 78.54 = hyp. log. of 7854 − hyp. log. 10^2 = 8.96877824 − 2 × 2.30258509 = 4.36360806, the log. required.

The following table of hyperbolic logarithms has been computed by Mr. Peter Barlow, of the Royal Military Academy, Woolwich; and it is preſumed that it will be conſidered as an acquiſition to mathematicians: it forms only a ſmall portion of an extenſive ſet of mathematical tables calculated by the ſame gentleman; moſt of which are entirely new, but the ſlow demand that ſuch works experience will, it is feared, prevent the appearance of this uſeful performance.

Hyperbolic *Mirror*. See Mirror.

Hyperbolic *Space*, in the *Higher Geometry*, the area or ſpace contained between the curve of the hyperbola, the aſymptote, and the ordinate.

HYPERBOLICUM Acutum, a ſolid made by the revolution of the infinite area of the ſpace contained between the curve of the hyperbola and its aſymptote. This produces a ſolid infinitely long, and yet is demonſtrated to be equal to a finite ſolid or body. See *Logarithmic* Curve.

HYPERBOLIFORM Figures, are ſuch curves as approach, in their properties, to the nature of the hyperbola; called alſo *hyperboloids*.

HYPERBOLOIDS, are hyperbolas of the higher kind, whoſe nature is expreſſed by this equation, $a\,y^{m+n} = b\,x^{m}(a+x)^{n}$. See Hyperbola.

Hyperboloid denotes alſo the hyperbolic conoid. See Conoid.

HYPERBOREAN, Ὑπερβόρεος, in the *Ancient Geography*. The ancients denominated thoſe people and places Hyperborean, which were to the northward of the Scythians. They had but very little acquaintance with theſe Hyperborean regions; and all they tell us of them is very precarious, and much of it falſe.

Diodorus Siculus ſays, the Hyperboreans were thus called becauſe they dwelt beyond the wind Boreas; ὑπὲρ ſignifying *above* or *beyond*; and Βορέας, *Boreas*, the north wind. This etymology is very natural and plauſible, notwithſtanding all that Rudbecks has ſaid againſt it, who would have the word to be generally Gothic, and to ſignify *nobility*.

Herodotus doubts whether or not there were any ſuch thing as Hyperborean nations: Strabo, who profeſſed that he believed there were, does not take Hyperborean to ſignify *beyond Boreas*, or the north, as Herodotus underſtood it: the prepoſition ὑπὲρ, in this caſe, he ſuppoſes only to help in forming a ſuperlative; ſo that hyperborean, on his principle, means no more than *moſt northern*: by which it appears the ancients ſcarcely knew themſelves what the name meant by it. Strabo aſſigns for their habitation the country in the vicinity of the Euxine ſea. Callimachus the poet places them near the Palus Mæotides. Pliny and Pomponius Mela place them behind the Riphæan mountains, towards the Icy ſea. Virgil and Catullus are of the ſame opinion. According to Mela, Pliny, and others, they inhabited a country in which they had a day and night of ſix months each. Moſt of our modern geographers, as Hoffman, Cellarius, &c. have placed the Hyperboreans in the northern part of the European continent, among the Siberians and Samoieds: according to them the Hyperboreans of the ancients were thoſe, in general, who lived fartheſt to the north. The Hyperboreans of our days are thoſe Ruſſians who inhabit between the Volga and the White ſea. According to Cluvier, the name Celtes was ſynonymous with that of Hyperboreans. Theſe people, it is ſaid, were accuſtomed to ſend the firſt productions of their fruits to Delos, to be conſecrated to Apollo, whom they principally honoured.

HYPERCATALECTIC, Ὑπερκαταληκτικὸς, compoſed of ὑπὲρ, *over*, *beyond*, and καταλήγω, *I put to the number*, *I add*; ſo that hypercatalectic denotes as much as *ſuperadded*; in the *Greek* and *Latin Poetry*, is applied to verſes which have one or two ſyllables too much; or beyond the regular meaſure. See Verse.

The Greek and Latin verſes are diſtinguiſhed, with reſpect to their meaſure, into four kinds: *acatalectic* verſes, where nothing is wanting at the end; *catalectic*, which want a ſyllable at the end; *brachycatalectic*, which want a whole foot at the end; and, laſtly, *hypercatalectic*, which have one or two ſyllables too many. Theſe laſt are alſo called *hypermeters*.

HYPERCATHARSIS, in *Medicine*, from the Greek ὑπὲρ, *ſupra*, and καθαίρω, *I purge*, ſignifies an *over-purgation*, or exceſſive purging induced by medicine.

A hypercatharſis is ſaid to take place, when the frequency of looſe ſtools, after any cathartic has been adminiſtered, continues great, after the operation of the cathartic might have been expected to ceaſe; or when the purging operation is very ſevere, being accompanied with a great diſcharge of ſerous or mucous fluids from the bowels, or with bloody evacuations. Such extreme purgation is moſt commonly occaſioned by cathartics of a draſtic nature; but we have ſeen it produced, in certain conditions of the conſtitution, by thoſe of a milder quality, ſuch as the cryſtals of tartar. In old and debilitated habits, violent purgatives ſhould be employed with great caution, and only when more lenient ones appear to be altogether inadequate to accompliſh the object in view; ſince a hypercatharſis, induced in ſuch habits, may occaſion ſo ſudden a depreſſion of the powers of life as may be irrecoverable. The ancients, from the paucity of their catalogue of purgative drugs, were compelled to adminiſter the white hellebore, where an active cathartic was required; and it would appear, from the aphoriſms of Hippocrates, that convulſions and death occaſionally followed the hypercatharſis, which that acrid medicine produced.

The moſt effectual remedy for allaying the inordinate action and irritation in the bowels, in a hypercatharſis, is opium, under any form. If the ſtrength is already conſiderably reduced, it may be combined with cordial and ſtimulant medicines, wine, and light but cordial nutriment. The abſorbent and aſtringent ſubſtances may be advantageouſly united with the opiates, but are inefficacious alone; ſuch are chalk, gum kino, the extract of log-wood, and eſpecially the extract of catechu, which, when joined with aromatics and opium, as in the *confectio catechu* of the Edinburgh Pharmacopeia, is a very effectual ſoother of exceſſive irritation in the alimentary canal. As the irritation, thus excited, is often chiefly ſeated in the large inteſtines, the opiates may be frequently adminiſtered in mucilaginous or ſtarch glyſters with great and ſpeedy benefit.

HYPERCHIRIA, in *Mythology*, a title of Juno, under which ſhe was worſhipped in Laconia.

HYPERCRISIS, in *Medicine*, a term uſed by Galen and other ancient writers to denote any immoderate critical excretion, or *ſuper-criſis*, as it were. (See Crisis.) Thus when a fever terminates by a profuſe ſweating or diarrhœa, the diſcharge being greater than the ſtrength of the patient is able to bear, a hypercriſis was ſaid to take place. See Galen, cap. 3. prognoſt.

HYPERCRITIC, compounded of ὑπὲρ, *ſupra*, and κριτικὸς, of κριτὴς, *judex*, of κρίνω, *I judge*; an over-rigid cenſor, or critic; one who will let nothing paſs, but animadverts ſeverely on the ſlighteſt fault.

HYPER-DIEZEUXIS, in *Muſic*, the disjunction of the two tetrachords, ſeparated by the interval of an octave, as the tetrachord hypaton and hyperbolæon.

HYPER-DORIAN, a mode ſo called in Greek muſic, and ſometimes denominated Mixo-Lydian; the fundamental or key-note of which was a fourth above the Dorian. See Mode.

The invention of the hyperdorian mode is aſcribed to Pythoclides.

HYPERDULIA, Ὑπερδουλεία, compoſed of ὑπὲρ, *above*, and δουλεία, *worſhip*, in the *Romiſh Theology*, is the worſhip rendered to the Holy Virgin.

The worſhip offered to ſaints is called *dulia*; and that to the Mother of God, *hyperdulia*; as being ſuperior to the former.

HYPERICOIDES, in *Botany*. See Ascyrum.

HYPERICUM, ὑπερικον of Dioſcorides, as appears by his deſcription; and the *Hypericum* of Pliny. Linnæus deduces the name from ὑπερ, *above*, and εικων, *a figure* or *image*, which does not ſeem to bring us a ſtep nearer to its meaning. Linn. Gen. 392. Schreb. 517. Willd. Sp. Pl. v. 3. 1437. Mart. Mill. Dict. v. 2. Sm Fl. Brit. 800. Juſſ. 255. Tourn. t. 131. Lamarck. Illuſtr. t. 643. Gærtn. t. 62. (Aſcyrum; Tourn. t. 131. Lamarck Illuſtr. t. 642.) Claſs and order, *Polyadelphia Polyandria*. Nat. Ord. *Rotaceæ*, Linn. *Hyperica*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, in five deep, nearly ovate, concave, permanent ſegments. *Cor.* Petals five, oblong-ovate, obtuſe, ſpreading, obliquely twiſted according to the ſun's motion. *Stam.* Filaments numerous, capillary, united at the baſe into three or five bundles; anthers ſmall, roundiſh. *Piſt.* Germen ſuperior, roundiſh; ſtyles three or five, ſometimes one or two, ſimple, diſtant, the length of the ſtamens; ſtigmas ſimple. *Peric.* Capſule roundiſh, the number of its cells agreeing with that of the ſtyles. *Seeds* numerous, oblong, affixed to the central column.

Eſſ. Ch. Calyx in five deep ſegments, inferior. Petals five. Filaments numerous, united by the baſe into three or five ſets. Capſule with many ſeeds.

A copious and handſome genus, chiefly European, American, or Chineſe, rarely tropical. Willdenow has 88 ſpecies; 11 are now known as belonging to the Britiſh Flora. The *ſtems* are either ſhrubby or herbaceous, uſually angular. *Roots* perennial. *Leaves* ſimple, oppoſite, ſeſſile, entire. Whole herbage generally ſmooth, with glandular pellucid dots, and an aromatic ſcent, rarely downy. *Flowers* terminal, cymoſe, yellow and brilliant. *Calyx* often fringed.

Common wild ſpecies are,

H. quadrangulum, Engl. Bot. t. 370. Curt. Lond. faſc. 4. t. 52, found about ditches and rivers; *perforatum*, Engl. Bot. t. 295. Curt. Lond. faſc. 1. t. 57, more abundant in dry buſhy places; and *pulchrum*, Curt. Lond. faſc. t. 56. Engl. Bot. t. 1227, which forms an elegant decoration to healthy buſhy ground.

H. *calycinum*, Curt. Mag. t. 146. Engl. Bot. t. 2017, now known to be wild near Cork, in Ireland, is a frequent ornament to ſhrubberies and parks, where its ample bloſſoms are very conſpicuous.

Several ſhrubby American ſpecies are cultivated with us for ornament, as the *hircinum*, remarkable for its ſtrong fox or goat-like ſcent.

HYPERIDES, in *Biography*, an eminent Grecian orator, the ſon of Glaucippus, was born at Athens, and ſtudied under Plato and Iſocrates. He cultivated the art of eloquence, became one of the moſt diſtinguiſhed orators of his time, and acquired that ſway in ſtate affairs which popular oratorical talents never failed to obtain in the ancient democracies. He was the ſteady and zealous opponent of Philip of Macedon, and his zeal cauſed him to be made commander of a galley, in which capacity he gained much credit by his promptneſs and zeal in ſuccouring the Byzantians. When Philip threatened an invaſion of Eubœa, Hyperides procured a tax to be levied for the equipment of 40 galleys, and ſet the example by contributing one for himſelf and another for his ſon. In the time of Alexander he was poſſeſſed of the chief influence in Athens, and when that prince demanded galleys and officers from the Athenians he oppoſed the grant of either. His life was fully devoted to his country. He moved diſtinguiſhed honours to Demoſthenes his great competitor in eloquence; but when this prince of orators was ſuſpected of having taken a bribe from Harpalus, he was appointed to conduct the proſecution againſt him. Hyperides was himſelf accuſed of having acted contrary to the laws, by procuring a decree for granting citizenſhip to foreigners, and liberty to the ſlaves, whoſe families he cauſed to be tranſported to the Piræus, but he juſtified himſelf on the ground of ſtate neceſſity, and proved that it was not he who paſſed the decrees, but the alarm with which Athens was ſeized, and the defeat of the Chæronea. Hyperides continued his oppoſition to the Macedonian power after the death of Alexander; and when Antipater ſent deputies to Athens, who made a high eulogy upon their maſter as the worthieſt of men: "I know," replied Hyperides, "that he is a very worthy man, but we will have no maſter however worthy he may be." The approach of Antipater obliged Hyperides and the other leading characters to quit Athens, and he had an interview with Demoſthenes, alſo a fugitive at Ægina. Departing thence, he was ſeeking for a ſafer place of refuge, when he was apprehended by Archias in the temple where he had taken ſanctuary, and carried to Antipater at Cleonæ. He was put to the torture with the hope of obtaining from him ſome ſtate ſecrets: to prevent this he is ſaid to have bit off part of his tongue; but another account relates that his tongue was cut out by the tyrant as a puniſhment due to his ſilence. His body was left unburied till ſome of his relations ſecretly committed it to the funeral pile, and brought his aſhes to Athens. Quintilian characteriſes the oratory of Hyperides as ſingularly ſweet and acute, better adapted to little than to great cauſes. In the time of Photius 52 of his orations were extant. Gen. Biog.

HYPERIDROSIS, the diſtention of a part by water.

HYPERINESIS, of ὑπερ and ινησις, *purgation*, a word uſed by Hippocrates for any exceſſive evacuation, but moſt frequently in the ſame ſenſe as hypercatharſis, an over-purging.

HYPER-IONIAN, in *Ancient Muſic*, one of the Greek modes, whoſe fundamental was one fourth above the Ionian. It is the 12th mode aſcending in the ſcale.

HYPERIUS, Gerard Andrew, in *Biography*, was born at Ypres in Flanders, whence he took his ſurname, in the year 1511. He was ſent to Paris to complete thoſe ſtudies which he had ſucceſsfully commenced in the Flemiſh ſchools. He entered on the ſtudy of divinity, which he proſecuted with much diligence till the year 1535. During the vacations he travelled much in different countries, and after he had completed his ſtudies at Paris he ſpent ſome time at Louvain, and then viſited ſeveral other German univerſities. Theſe viſits into heretical countries not only prevented him from being preferred in the church, but obliged him to ſeek the ſecurity of his perſon in England, which at almoſt every period of her hiſtory has been more or leſs friendly to the votaries of freedom. He lived four years in the houſe of Charles lord Montjoy, who ſettled on him a handſome ſtipend, which enabled him to apply himſelf to the purſuits of literature. During this period he embraced the opportunities offered him of viſiting the univerſities of Cambridge and Oxford, but, alarmed at ſome proceedings of Henry VIII., he returned to the continent, ſettled at Marpurg in 1542, and was appointed to the theological chair. The duties of this office he performed with great reputation 22 years. He died in the year 1564, about the age of 53. He was author of numerous works, ſome of which were publiſhed by himſelf, and the reſt were given to the world after his death. They conſiſt of "Commentaries on the Scriptures;" "Theological Diſſertations;" "Controverſial Tracts;" treatiſes in rhetoric, logic, arithmetic, geometry, aſtronomy, optics, natural philoſophy, &c. Hyperius, ſays his biographer, had a very clear head, and a very happy talent in conveying inſtruction. He was meek and polite in converſation, and delighted in ſocial convivial intercourſe. In a word, he was a man who poſſeſſed true wit and good ſenſe, and who added to thoſe qualities a high degree of virtue and zeal. Bayle.

HYPER-LYDIAN, in *Muſic*, was the moſt acute of the 15 Greek modes. Its fundamental was a fourth above the Lydian.

HYPERMETER, compoſed of ὑπερ, *ſupra*, and μετρον, *meaſure*, in the *Ancient Poetry*, the ſame with hypercatalectic.

HYPEROA, a word applied by authors to the upper part, or palate of the mouth, and the baſis cerebri. It properly ſignifies any upper place.

HYPEROCHE *of Dr. Buſby*, in *Muſic*, (Muſ. Dict.) is "the difference between the enharmonic and chromatic dieſis," an interval, whoſe ratio is $\frac{2097152}{2109375} = 5\,\Sigma + f$, which is the SEMI-COMMA *maxime* of Rameau, ſee that article. A doubt, however, remains with us, as Dr. B. has quoted no author, only mentioning the ancient authors generally, nor given the ratios, whether by the term "chromatic dieſis," he did not mean the leaſt chromatic dieſis of Holder, Chambers, &c. in which caſe his hyperoche would coincide with the hyperoche of Henfling and others below.

HYPEROCHE *of Dr. Callcott*. In peruſing the additions by Dr. Callcott to the Overend MS. which we have ſo often quoted, we met with an interval ſo named, whoſe ratio is $\frac{16{,}677{,}181{,}699{,}666{,}569}{16{,}777{,}216{,}000{,}000{,}000} = 5\,\Sigma + 2\,f$, which is the *greater* RESIDUAL, ſee that article.

HYPEROCHE *of Henfling*, Travers, Dr. Pepuſch, Overend, Dr. Callcott (Muſical Grammar, art. 23n), &c. is an interval whoſe ratio is $\frac{3072}{3125}$, or $\frac{2^{10}3}{5^5}$, its value in Farey's notation being $15\,\Sigma + f + m$; its common logarithm is .9925711,8968, the reciprocal of which is 74288,1032; its Euler's or binary logarithm is .024679, ſuch being its decimal value of the octave 1: it is equal 1.37696 major commas, and to 15.157524 ſchiſmas. It is equal to the ſum of the following pairs of intervals, *viz.* a diaſchiſma and a medius reſidual, a major comma and a ſemi-comma major of Rameau, a minor comma and a ſemi-comma maxime of Rameau, a dieze minime and a ſchiſma, a priſma and five ſchiſmas, &c. It reſults, as the difference between the following pairs of intervals, *viz.* a ſemitone minor and an enharmonic dieſis, an enharmonic dieſis and a major reſidual, a ſemitone ſubminime and a minor comma, a major ſemitone and two enharmonic dieſes, a chromatic dieſis and a major comma, two ſemitones minor and a ſemitone major, two minor tones and three major ſemitones, three minor ſemitones and a minor tone, &c. The following three intervals alſo compoſe it by addition, *viz.* a ſchiſma, a minor reſidual and a diaſchiſma, a ſchiſma, a medius reſidual, and a major comma, &c.

If three major thirds be turned upwards, and two minor thirds and a fourth downwards, each true and without any beats on an inſtrument having ſufficient ſtrings, this interval will reſult; which, in the additions to the Overend MS. by Dr. Callcott, is deſignated by the Greek ſmall *p* or *pi*.

HYPEROCHE *of Ptolemy*, is an interval whoſe ratio is $\frac{128}{129}$, or $\frac{2^7}{343}$, or $6.88806\,\Sigma + m$, and therefore not in the diatonic ſcale: its common logarithm is .9966202,5935, and its Euler's log = .01122725, and it is equal to .6264543 major commas. It cannot, of courſe, be tuned by any combinations of perfect concords, though it readily may by calculating the BEATS which it makes. See that article.

HYPERO-PHARYNGÆI, in *Anatomy*, a name given by M. Santorini to the peryſtaphylo-pharyngæi muſcles.

HYPEROSTOSIS, from ὑπερ *upon*, and ὀστεον, *a bone*, in *Surgery*, any hard indolent ſwelling upon a bone. See EXOSTOSIS.

HYPER-OXYMURIATES. See the following article.

HYPER-OXYMURIATIC ACID, in *Chemiſtry*. This acid contains a greater proportion of oxygen than the oxymuriatic acid, and on that account has received its name. It may be procured in combination with potaſh in the following proceſs: if a quantity of potaſh, with ſix times its weight of water, be put into one of the bottles of Woulfe's apparatus, and a ſtream of oxymuriatic acid gas be paſſed through it till the potaſh is ſaturated, cryſtals in the form of fine white ſcales fall to the bottom; theſe are cryſtals of hyper-oxymuriatic of potaſh, being a compound of potaſh and hyper-oxymuriatic acid. This acid is chiefly known in its ſaline combinations. Theſe are named *hyper-oxymuriates*, and from the peculiarity of their chemical compoſition—the large quantity of condenſed oxygen exiſting in them, and retained by no very ſtrong attraction, their characters are extremely diſtinctive. The principal are theſe, they afford very pure oxygen when expoſed to a red heat, detonating with great violence with inflammable bodies, either on the application of heat, or by mere percuſſion or trituration, and cauſing thoſe bodies to burn when ſulphuric or nitric acid is added to the mixture of the ſalt and the inflammable matter. Their taſte is cool and penetrating; they are generally ſoluble in water, and cryſtallizable: the greater number of them are alſo ſoluble in alcohol. They do not precipitate any of the metallic ſalts; nor deſtroy the vegetable colours, but in ſmall quantities they heighten them. The hyper-oxymuriatic acid contains

Oxygen - -	65 parts.
Muriatic acid -	35
	100

The order of the affinities of the hyper-oxymuriatic acid is the following:

Potaſh,
Soda,
Barytes,
Strontites,
Lime,
Ammonia,
Magneſia,
Alumine.

From the hyper-oxymuriates of potaſh, oxygen-gas can be obtained in the greateſt purity; but the moſt aſtoniſhing of its properties are thoſe which it exhibits when mixed with combuſtibles. All combuſtible ſubſtances are capable of decompoſing it, and in general the decompoſition is attended with violent detonations. When three parts of this ſalt and one of ſulphur are triturated in a mortar, the mixture detonates violently: the ſame effect is produced when the mixture is placed upon an anvil, and ſtruck ſmartly with a hammer. It ſometimes detonates ſpontaneouſly without any perceptible friction. Charcoal produces the ſame effect, though not ſo violent. This property led Berthollet to propoſe it as a ſubſtitute for nitre in the preparation of gunpowder. The attempt was made in 1788, but as ſoon as the workmen began to triturate the mixture of charcoal, ſulphur, and the hyper-oxymuriate of potaſh, it exploded with violence, and proved fatal to two of the experimenters. Phoſphorus detonates with this ſalt either by trituration or percuſſion, but the quantities uſed ſhould not be more than half a grain each, or there will be danger in the experiment. When this ſalt is triturated in a mortar with a little cotton cloth, ſmall repeated exploſions are heard ſimilar to the crack of a whip, and if the cotton be dry and warm it ſometimes takes fire. When nitric acid is poured upon a mixture of oxymuriate of potaſh and phoſphorus, flakes of fire are emitted at intervals for a conſiderable time. The theory of theſe exploſions is this. The oxygen of the acid combines with the combuſtible, and at the ſame time lets go a quantity of caloric: and trituration or percuſſion acts merely by bringing the particles which combine within the ſphere of each other's attraction. The conſtituents of the oxymuriate of potaſh are

58.3 Acid,
39 2 Potaſh,
2.5 Water.

It is prepared by diſſolving one part of carbonate of potaſh in ſix parts of water, and ſaturating the potaſh with oxymuriatic acid gas. When the ſaturation is nearly completed the oxymuriate falls down in cryſtals. It is purified by ſolution in boiling water: as the water cools, the pure hyper-oxymuriate cryſtallizes. The cryſtals are to be dried between the folds of blotting paper. Hyper-oxymuriate of ſoda may be prepared by the ſame proceſs as hyper-oxymuriate of potaſh; it cryſtallizes in cubes, and it produces a ſenſation of cold in the mouth. The other hyper-oxymuriates that have been examined are thoſe of ammonia, magneſia, lime, barytes, and ſtrontian. See Muriatic *Acid*, in which article an account of Dr. Davy's experiments on it, with a view to its decompoſition, and the reſults will be given.

HYPER PHRYGIAN, in *Ancient Muſic*, called by Euclid hypermixolydian, was the moſt acute of the thirteen modes of Ariſtoxenus.

HYPERSARCOMA, or Hypersarco'sis, from ὑπερ, and σαρξ, *fleſh*, a fleſhy excreſcence; fungous granulations; proud fleſh.

HYPERTHYRON, formed of ὑπερ, *over*, and θυρα, *gate*, in the *Ancient Architecture*, a ſort of table uſed after the manner of a frieze, over the jambs of Doric doors and gates, and the lintels of windows. It lies immediately under the corona; and is, by our workmen, uſually called the *king-piece*.

HYPETHRE, two rows of pillars ſurrounding, and ten at each face of any temple, &c. with a periſtyle within of ſix columns. See Hypæthros.

HYPHASIS, or Huphasis, in *Ancient Geography*, a river of India, called anciently by the natives Beypaſha; now the *Beyah*; which ſee.

HYPHEN, Ὑφεν, in *Grammar*, an accent or character, which implies, that two words are to be joined, or connected into one compound word—As, *male-adminiſtration*, &c.

Hyphens ſerve alſo to connect the ſyllables of ſuch words as are divided by the end of the line.

HYPHIALTES, Ephialtes, in *Mythology*, names given by the Greeks to certain rural divinities anſwering to the Incubi of the Romans.

HYPHYDRA, in *Botany*, derived from ὑπο, *under*, and ὑδωρ, *water*, becauſe, as Aublet informs us, it is always found growing three or four feet under the ſurface.—Schreb. 666. Willd. Sp. Pl. v. 4. 629. Vahl. Symb. v. 3. 99. (Tonina; Aubl. Guian. 856. Juſſ. 443.) Claſs and order, *Monœcia Gynandria*. Nat. Ord. *Plantæ incertæ ſedis*, Juſſ.

Gen. Ch. Male, *Cal.* Perianth of one leaf, deeply divided into three, obovate, concave, ſmooth lobes incurved at the top. *Cor.* none. *Stam.* Filaments ſix, capillary, long, inſerted, at the angles, above the germen; anthers roundiſh. *Piſt.* Germen empty, inflated, membranous, hexagonal, truncated at the top; ſtyle capillary, the length of the ſtamens; ſtigma none.—Female, *Cal. Cor.* and *Stam.* none. *Piſt.* Germen roundiſh, with three furrows; ſtyle triangular; ſtigmas three, acute. *Peric.* Capſule membranous, of one cell, and three valves. *Seed* ſolitary, ovate, ſtreaked.

Eſſ. Ch. Male, Calyx three-cleft. Corolla none. Stamens ſix. Female, Calyx none. Corolla none. Style ſingle. Stigmas three. Capſule of three valves, ſingle-ſeeded.

1. *H. amplexicaulis.* (Tonina fluviatilis; Aubl. Guian. 857. t. 330.—Eriocaulon amplexicaule; Rottb. Surinam. 4. t. 1. f. 1.)—An inhabitant of waters at Guiana and Cayenne, flowering and bearing fruit in February. This herb puts forth many branching, ſcattered, erect or decumbent little *ſtems*, furniſhed with capillary radicles. *Leaves* alternate, ſmooth, narrow, lanceolate, acute, fringed longitudinally with reddiſh briſtles, ſeſſile, embracing the ſtem. *Flowers* capitate, axillary, on ſolitary footſtalks,

HYPNOTIC, Ὑπνωτικος, derived from ὑπνος, *ſleep*, in *Medicine*, a remedy which promotes or induces ſleep; called alſo *ſoporific* and *opiate*. See alſo Narcotics.

HYPNOTICUS Serpens, the *ſleep-ſnake*, in *Zoology*, the name of an Eaſt Indian ſpecies of ſerpent, called by the Ceyloneſe *nintipolong*, a word importing the ſame ſenſe. It is of a deep blackiſh brown, variegated with ſpots of white, and is a very fatal kind in its poiſon, its bite always bringing on a ſleep which ends in death.

HYPNUM, in *Botany*, an ancient name for ſome kind of moſs, formerly uſed in medicine. The word is ſuppoſed by Dillenius, who firſt adopted it for the particular genus to which it is now applied, to originate from ὑπνος, *ſleep*; and he juſtifies its application on the principle of fragrant ſubſtances, like theſe moſſes, producing ſleep. Dill. Muſc. 261. Linn. Gen. 564. Schreb. 762. Hedw. Fund. v. 2. 94. Sm. Fl. Brit. 1276. Juſſ. 11. Lamarck Illuſtr. t. 874. (Leſkia; Schreb. 762. Hedw. Fund. v. 2. 93. t. 10. f. 62—65.)—Claſs and order, *Cryptogamia Muſci*. Nat. Ord. *Muſci*.

Eſſ. Ch. Capſule ovate-oblong, from a lateral ſcaly ſheath. Outer fringe of ſixteen teeth, dilated at the baſe; inner a variouſly-toothed membrane; veil ſmooth.

This vaſt and beautiful genus differs from *Bryum*, (ſee that article), in no other eſſential character than the lateral, not terminal, ſituation of its female flowers. The habit, however, is widely different. *Hypnum* has uſually a lax, ſpreading, repeatedly branched ſtem, whence its Engliſh name of Feather-moſs, cloathing the ground to a wide extent, and being of larger dimenſions than moſt others of this family. The ſpecies in the *Flora Britannica* are 77, and a few others have been found ſince that work came out. The *Species Muſcorum* of Hedwig defines 83 *Hypna*, beſides 35 ſpecies of *Leſkea*, or *Leſkia*, a genus comprehended under *Hypnum* in Flor. Brit. Yet theſe, making together 118, form but an inadequate catalogue of the known ſpecies, and ſome of them are reducible to other genera, *H. Smithii* of Dickſon and Hedwig being a *Pterogonium*; and others belonging to *Hookeria*. The difference on which Hedwig founds the diſtinction between *Hypnum* and *Leſkea* conſiſts in the inner fringe, the teeth of which in the latter are equal and uniform, uſually 16 in number, while in the former there are 16 broad teeth, with ſingle or double intermediate ones. This diſtinction, however, proves not only extremely difficult to diſcern, but totally unnatural as to the ſpecies it brings together or ſeparates, and by no means certain or conſtant in each.—See Fringe *of* Mosses.

Hypnum is diſtributed into ſeveral ſections.

1. Capſules erect. Shoots cylindrical.

Of this H. *pulchellum*, Engl. Bot. t. 2006, and *ſericeum*, t. 1445, the latter very common on walls, roofs, banks, and trees, may ſerve for examples.

2. Capſules erect. Shoots compreſſed, the leaves being diſpoſed in two ranks.

The only two Britiſh ſpecies here are *complanatum*, Engl. Bot. t. 1492, and *trichomanoides*, t. 1493.

3. Capſules drooping or curved. Shoots compreſſed, the leaves in two ranks.

Such are *denticulatum*, t. 1260; *crenulatum*, t. 1261; *ſerrulatum*, t. 1262; and the common *riparium*, t. 2060. But *lucens* no longer remains here, being now called *Hookeria lucens*, (ſee Hookeria;) and there is much reaſon to believe the beautiful *undulatum* ought alſo to make one of a new genus, marked by its furrowed capſule.

4. Capſules drooping or curved. Shoots compreſſed. Leaves imbricated every way.

A handſome tribe, ſee *ſplendens*, Engl. Bot. t. 1424; *proliferum*, t. 1494. Curt. Lond. faſc. 1. t. 72, very common in woods, but rarely in fruit; and *prælongum*, t. 2035, alſo very frequent.

5. Capſules drooping or curved. Shoots cylindrical. Leaves imbricated every way.

A rather numerous ſection, in which we find *Alopecurum*, Engl. Bot. t. 1182, a native of ſhady moiſt rocks; *ſerpens*, t. 1037, very common, known by its white veil; *luteſcens*, t. 1301; and the beautiful though vulgar *purum*, t. 1599.

6. Capſules drooping or curved. Leaves ſquarroſe.

The ſharp prominent leaves, projecting on all ſides of the branches, give the peculiar character of this very diſtinct ſection, as in *fluitans*, t. 1448; *ſtriatum*, t. 1648; *ſtellatum*, t. 1302; and the great well-known *triquetrum*, t. 1622.

7. Capſules drooping or curved. Leaves curled.

In this elegant ſection are *rugoſum*, t. 2250; *ſcorpioides*, t. 1039, the figure done from too young a ſpecimen, but otherwiſe correct; *cupreſſiforme*, t. 1860; *molluſcum*, t. 1327, and a near relation of the laſt, though much finer, the true *H. Chriſta caſtrenſis*, t. 2108, recently diſcovered in Scotland by Mr. G. Don.

HYPO, Ὑπο, a Greek particle retained in the compoſition of divers words borrowed from that language; literally denoting *under*, *beneath*.—In which ſenſe it ſtands oppoſed to *ὑπερ*, *ſupra*, *above*.

HYPO-ÆOLIAN, a mode in the *Ancient Muſic*, called alſo by Euclid the grave hypo-lydian. This mode has its fundamental a fourth below the Æolian.

HYPOBOLE, from ὑπο, and βαλλω, *I caſt*, or *Subjection*, in *Rhetoric*, a figure, ſo called, when ſeveral things are mentioned, that ſeem to make for the contrary ſide, and each of them refuted in order. This figure, when complete, conſiſts of three parts; a propoſition, an enumeration of particulars with their anſwer, and a concluſion. Thus Cicero, upon his return from baniſhment, vindicates his conduct in withdrawing ſo quietly and not oppoſing the faction that ejected him. Pro. Dom. cap. 35.

HYPOCATHARSIS, Ὑποκαθαρσις, compounded of ὑπο, *under*, and καθαιρω, *I purge*, in *Medicine*, a too faint or feeble purgation.

HYPOCAUSTUM, Ὑποκαυστον, formed of the prepoſition ὑπο, *under*, and the verb καιω, *I burn*, among the Greeks and Romans, was a ſubterraneous place, wherein was a furnace that ſerved to heat the baths.—Vitruvius calls it caldarium.

The ancients had properly two ſorts of hypocauſta; the one called by Cicero *vaporarium*, and by others *laconicum*, or *ſudatio*; which was a large ſweating bath, in which were three brazen veſſels called *caldarium*, *tepidarium*, and *frigidarium*, according to the water contained therein.

The other hypocauſtum was a ſort of *fornax*, or oven, to heat their winter parlours, or *cænatiunculæ hybernæ*.

The latter hypocauſtum was called *alveus* and *fornax*; and the man that tended the fire, *fornacator*. See Baths.

The remains of a Roman hypocauſtum, or ſweating-room, were diſcovered under ground at Lincoln, in 1739. We have an account of theſe remains in the Phil. Tranſ. N° 401. ſect. 29. See Abr. vol. ix. p. 455.

Hypocaustum, among the moderns is that part or place where the fire is kept that warms a ſtove, or hot-houſe.

HYPOCHÆRIS, in *Botany*, ὑποχοιρις, an ancient name of uncertain derivation. Linn. Gen. 405. Schreb. 533. Willd. Sp. Pl. v. 3. 1620. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 840. Juſſ. 170. Lamarck Illuſtr. t. 656. Gærtn. t. 160. Claſs and order, *Syngeneſia Polygamia æqualis*. Nat. Ord. *Compoſitæ Semifloſculoſæ*, Linn. *Cichoraceæ*, Juſſ.

Gen. Ch. *Common Calyx* roundiſh, imbricated, ſwelling at the baſe; the ſcales lanceolate, acute. *Cor.* compound, uniform, imbricated, the florets hermaphrodite, equal, numerous, each with one ligulate, linear, abrupt, five-toothed petal. *Stam.* Filaments five, capillary, very ſhort; anthers united into a cylindrical tube. *Piſt.* Germen ovate; ſtyle thread-ſhaped, the length of the ſtamens; ſtigmas two, reflexed. *Peric.* none, except the cloſed calyx, aſſuming a globoſe pointed ſhape. *Seeds* ſolitary, oblong. *Down* feathery, ſtalked. *Recept.* clothed with linear-lanceolate ſcales, the length of the ſeeds.

Eſſ. Ch. Receptacle chaffy. Calyx ſomewhat imbricated. Down feathery.

Obſ. Haller, Reichard, and others have remarked, that in H. *glabra* the ſeeds of the circumference have ſeſſile down. See Fl. Brit. 842.

Five ſpecies of *Hypochæris* are defined by Willdenow, ſome Linnæan ones being removed to *Seriola*. Three are natives of England; the *maculata*, Engl. Bot. t. 225, found in chalky open paſtures, but rarely; *glabra*, t. 575. Curt. Lond. faſc. 3. t. 53, a native of gravelly fields, ſometimes found among turnips in Norfolk, in which caſe it is very luxuriant; and *radicata*, Curt. Lond. faſc. 3. t. 52. Engl. Bot. t. 831, a very common weed.

The firſt is perennial, with a nearly ſolitary, rather large, yellow flower, and toothed, rough leaves ſpotted with black. The ſecond is annual, ſmooth, with ſeveral ſmall, pale, yellow flowers, expanding in the morning only. The third is perennial, with rough runcinate leaves, a ſmooth branching ſtem, and large flowers of a full yellow.

The other two ſpecies in Willdenow are,

1. H. *helvetica*, Jacq. Ic. Rar. t. 165, a large and handſome plant, confounded by Linnæus with his *maculata*, from which its narrower, lanceolate, unſpotted leaves, perfectly ſimple ſtem ſwelling upward, and very large flower diſtinguiſh it. This ſpecies, found on the Alps, is delineated by Haller, Allioni, and Villars, being a favourite with alpine botaniſts.

2. H. *minima*, Desfont. Atlant. v. 2. 238. (H. hiſpida; Roth. Catal. v. 1. 100.) Native of Barbary, reſembling H. *glabra*, but ſcarcely half its ſize, with roughiſh leaves and a briſtly calyx.

HYPOCHEOMENOS, a perſon afflicted with a cataract, or opacity of the cryſtalline lens of the eye. The term is derived from *ὑποχεω*, *to ſuffuſe*.

HYPOCHONDRIA, in *Anatomy*, from ὑπο, *under*, and χονδρος, *cartilage*, thoſe parts of the cavity of the abdomen which are covered by the inferior ribs and their cartilages: they are diſtinguiſhed by the epithets right and left. See ABDOMEN.

HYPOCHONDRIASIS, in *Medicine*, a diſorder principally characterized by an anxious and apprehenſive ſtate of mind in reſpect to the patient's health, and by an imaginary ſuffering of many morbid affections, together with a deranged ſtate of the digeſtive organs.

This complaint has been known from ancient times, and has received a great variety of appellations, many of which have been derived from hypothetical views of its nature. The term *hypochondriaſis*, or *hypochondriac diſeaſe*, is taken from *hypochondrium*, ὑποχόνδριον, which ſignifies literally *under the cartilage*, and is the name given by anatomiſts to the upper and lateral regions of the belly which lie under the cartilages of the falſe ribs. This appellation was probably given to the diſeaſe in queſtion, in conſequence of the general uneaſy ſenſations which are experienced by hypochondriacs in theſe parts of the body, eſpecially on the left ſide; as well as from the opinion of phyſicians, that the ſeat of theſe ſenſations, and of the diſeaſe itſelf, is always in ſome of the organs which lie in the hypochondria, and which are the ſtomach and ſpleen on the left ſide, and the liver on the right. The Arabians denominated the diſeaſe *Mirachia*, the word *Mirach*, in their language, ſignifying the abdomen or belly. The opinion, which was for a long time prevalent, that *the ſpleen* was principally the ſeat of the diſorder, gave occaſion to the uſe of the name of that viſcus to denote the malady. And another ſuppoſition, that the diſordered ſtate of the mind was excited by *vapours*, ariſing from a collection of fæculent and offenſive matter accumulated in the ſpleen and firſt paſſages, gave riſe to the denomination of *vapours*, by which the malady has alſo been deſignated. The French call hypochondriacal perſons, *malades imaginaires*, from the various imaginary evils of which they complain. The term *hyp* and *hypo*, familiarly uſed in this country, are obviouſly contractions of the Greek name.

It would be impoſſible to give a regular hiſtory of all the ſymptoms of a diſeaſe, which is ever varying and irregular in its phenomena, and includes, in different inſtances, almoſt all the painful ſenſations and ſigns of diſordered functions, that are witneſſed in the various complaints incident to the human frame. We muſt content ourſelves, therefore, with delineating the peculiar features of the diſorder, and enumerating ſome of the moſt remarkable circumſtances that have been obſerved to accompany it. We might ſay, in a few words, that, after a ſeries of ſymptoms, evincing a deranged ſtate of the bodily health in general, but eſpecially of the organs of digeſtion, which have continued for an indefinite length of time, a ſtate of mind gradually ſhews itſelf, which is diſtinguiſhed by the following circumſtances; langour, liſtleſſneſs, or want of reſolution and activity with reſpect to all undertakings: a lowneſs of ſpirits, ſadneſs, and timidity; and with reſpect to all future events, a dread and apprehenſion of the worſt, or moſt unhappy occurrences, often upon the ſlighteſt grounds. But this apprehenſion is particularly directed to the ſtate of the patient's health; he attends minutely to every change of ſenſation, and from every unuſual feeling, though of the ſlighteſt kind, anticipates great danger, and even death itſelf. He ſuppoſes himſelf, at different times, as theſe ſenſations vary, afflicted with every diſorder in ſucceſſion that he has either ſeen, heard, or read of: and, in reſpect to all theſe feelings and apprehenſions, he commonly entertains the moſt obſtinate perſuaſion and belief, and is even diſobliged by any perſon, who ſhall intimate that he looks well. He is fond of complaining, and tireſome in deſcribing his maladies: never ſatiated with medicines, yet conſtantly anxious to fly from remedy to remedy; and equally deſirous of medical counſel, yet ſoon diſſatisfied with every phyſician. As the diſeaſe advances, he is afflicted with moſt unaccountable ſenſations and affections, which can be only referred to his imagination.

Such, in brief, is the character of hypochondriaſis. This ſtate of mind, however, as we have juſt ſtated, is uſhered in and accompanied by various ſymptoms of corporeal diſeaſe, which are principally referrable to a diſordered condition of the digeſtive organs, with which other organs alſo ſuffer in ſympathy. Thus the perſon is troubled for a conſiderable time with flatulency, and a ſenſe of heat and pain along the courſe of the œſophagus and the pit of the ſtomach, called heart-burn, ſometimes attended with acidity and ſometimes with a feeling of oilineſs and rancidity, eſpecially when eructation takes place. The air, which is evolved in the ſtomach, produces great diſtention of that organ, and this diſtention is always accompanied with an uneaſy feeling and ſenſe of anxiety: this wind afterwards deſcends into the bowels, producing croaking and rumbling noiſes, called *borborigmi*, and exciting pricking pains, "ſnatchings, thumpings, and pulſations in the belly," as Maudeville deſcribes them, which conſiſt of ſlight convulſive motions of the abdominal muſcles. The appetite is frequently bad, but in ſome caſes craving, and is generally irregular in the beginning, as well as the alvine diſcharge. As the diſorder advances the patient is generally very coſtive, diſcharging black hardened excrement, with much pain and ſtraining. At this time the bowels are moved with difficulty, and require ſtrong cathartics to produce any effect: hæmorrhoids or piles, eſpecially internal ones, accompanied with great pain, and not unfrequently with bleeding, are liable to occur. Sometimes a diarrhœa ſuddenly comes on; but ſo far from giving relief, it rather exhauſts the ſtrength of the patient, and leaves him low and dejected.

While theſe ſymptoms of indigeſtion prevail, others, which appear to be the direct or indirect conſequence of them, are often very troubleſome. There is often a weight, oppreſſion, or tightneſs felt about the præcordia, with palpitations of the heart: the face is frequently fluſhed, and flying heats are felt even over the whole body: the head often aches, and the eyes are dim. The urine is various: it is often of a wheyiſh, or milky white appearance, which always announces a great weakneſs and diſorder in the chylopoëtic viſcera: at other times a pale and limpid urine is paſſed in large quantities, eſpecially after any agitation of mind, or hurry of ſpirits. Cold ſweats, which alternate with fluſhes of heat, fainting, giddineſs, deafneſs, ringing in the ears, and diſturbed and unrefreſhing ſleeps, from which the patient wakes in fright, are common ſymptoms in the advanced ſtages of the diſorder. The whole nervous ſyſtem is deranged. The patient generally feels a much more oppreſſive ſenſation of weakneſs and fatigue than is natural, conſidering the muſcular ſtrength which he is capable of exerting. Slight ſymptoms of debility, which in another perſon would hardly produce any diſagreeable effect, for inſtance, ſudden diſtention of the ſtomach, ſlight palpitation, or colic, inſtantly occaſion all the alarming feelings of fear and apprehenſion, and theſe are accompanied with a degree of anxiety which cannot be deſcribed.

But the hypochondriac has many painful feelings in parts where no diſeaſe apparently exiſts, and many diſeaſed perceptions which command his belief, and greatly add to the ſum of his miſery. A number of thoſe diſtreſſing feelings are often external pains, ſeated immediately under the ſkin, and in parts which, when examined, appear to be in a ſound ſtate. Sometimes the pain is ſeated in the middle of one or two of the ribs; ſometimes in the middle of the leg, thigh, or arm; ſometimes in the back, and in various parts of the ſcalp. That theſe painful feelings are generally tranſmitted from impreſſions in the ſtomach and bowels, appears from this; that they are moſt frequent, when the patient is troubled with indigeſtion, flatulency, coſtiveneſs, or colic: what is very remarkable, the external pain is often increaſed by preſſure. Dr. Crichton mentions the caſe of a gentleman who ſuffered exceedingly from theſe falſe pains. If the finger was preſſed upon the pained part, it generally excited ſpaſms in the organs of reſpiration, and occaſioned ſo much agony, as to make him ſcream aloud; after the preſſure was removed, the pain ceaſed. Theſe pains were conſtantly ſhifting their place, and often wandered over half the patient's body in the courſe of the day. Dr. Whytt, after enumerating many facts, concludes, "that faintings, tremors, palpitations of the heart, convulſive motions, and great fearfulneſs, may be often owing more to the infirm ſtate of the firſt paſſages, than to any fault either in the brain or heart:" and he farther remarks, in regard to himſelf, "When my ſtomach and bowels have been out of order, and affected with an uneaſy ſenſation from wind, I have not only been ſenſible of a general debility and flatneſs of ſpirits, but the unexpected opening of a door, or any ſuch trifling unforeſeen accident, has inſtantly occaſioned an odd ſenſation about my heart, extending itſelf from thence to my head and arms, and, in a leſſer degree, to the inferior parts of my body. At other times, when my ſtomach is in a firmer ſtate, I have no ſuch feelings, or at leaſt in a very ſmall degree, from cauſes which might be thought more apt to produce them." Whytt on Nervous Diſorders, chap. iii.

When the diſagreeable feelings, dejection of ſpirits, and unremitting anxiety and attention to their health and to every new ſenſation, have continued for an indefinite time, which is longer or ſhorter, according to a variety of circumſtances, diſeaſed perceptions ſuddenly ariſe, which claim the belief of hypochondriacs. It would be vain to attempt an enumeration of all the extravagant ideas which enter into the minds of ſuch people, ſince they are infinitely various. Some think that their extremities and poſteriors are made of glaſs: others that their legs are as ſoft as wax; ſome think they have no heart, others that they have no ſoul; others fancy that they are dead, and others that they are changed to monſters, &c. In others, the diſorder verges upon melancholy, and ideal pains of poverty, perſecution of enemies, ſecret vengeance, and calumny, haunt them perpetually: but in this caſe, the diſeaſe may be conſidered as having paſſed the limits of hypochondriaſis, and put on the character of inſanity. When hypochondriaſis ariſes from diſeaſed viſcera, the erroneous ideas, which preſent themſelves to the mind of the patients, generally concern their own frame. It is not very eaſy to trace theſe erroneous perceptions to the original painful, yet obſcure ſenſations in the body, to which they owe their exiſtence. It is only, indeed, by a long continuance of theſe ſenſations, that they become aſſociated with the ſtrange notions of hypochondriaciſm. "Nothing can be more intereſting," Dr. Crichton remarks, "to a phyſician who is endowed with only a moderate ſhare of the ſpirit of obſervation, than the progreſs of this complaint in a number of patients, eſpecially in regard to its effects on the mind. They always ſtruggle more or leſs in the beginning, with the lowneſs and dejection which affect them; and it is not until many a ſevere conteſt has taken place between their natural good ſenſe, and the involuntary ſuggeſtions which ariſe from the obſcure and painful feelings of their diſeaſed nerves, that a firm belief in the reality of ſuch thoughts gains a full conqueſt over their judgment. A firm belief in any perception never takes place until it has acquired a certain degree of force; and as all impreſſions which ariſe from the viſcera of the abdomen are naturally obſcure, we ſee the reaſon why theſe muſt continue for a great length of time, or be often repeated before they can draw a perſon's attention from the ordinary impreſſions of external objects, which are clear and diſtinct, and before they acquire ſuch a degree of vividneſs as to deſtroy the operations of reaſon." An Inquiry into the Nature and Origin of Mental Derangement, &c. vol. i. p. 202.

Dr. Crichton thus attempts to explain the fact, that the ſource of the mental illuſion generally lies in the abdomen. "Moſt of the objects which ſurround us have been examined by ſeveral of our ſenſes; we have compared the various ſenſations they have yielded, and theſe, therefore, become aſſociated in our minds; ſo that if any external body, thus examined, be again preſented to only one of our ſenſes, the idea of all its various qualities is recalled, and we neceſſarily believe in their reality. The ſources of almoſt all our perceptions, while we are in health, lie in external objects: for the nerves of the external ſenſes are the only ones of our whole frame which convey clear impreſſions to the intellectual part. Hence we acquire a natural habit of aſcribing all ſtrong impreſſions to ſome external cauſe. In caſes, therefore, where the cauſe of the ſenſation cannot be examined, a falſe judgment may eaſily ariſe. The languor and pain and various uneaſy ſenſations, which a hypochondriac feels, naturally withdraw his attention from ſurrounding objects; and as the exerciſe of his judgment is weakened by the ſame circumſtances, he does not examine the unreaſonable ideas with accuracy, when they are firſt preſented to his mind. Painful feelings are aſſociated with melancholy thoughts; and new and uncommon feelings, upon the ſame principle, are aſcribed to ſtrange and uncommon cauſes. The weakneſs, therefore, which a hypochondriac feels in his limbs, makes him imagine they are unable to ſupport him; but if they cannot do ſo, he concludes they muſt bend or break; the idea of fragility, or flexibility, however, is often derived from ſuch ſubſtances as wax and glaſs, and he therefore believes that his limbs are made of ſome kind of ſimilar materials." Loc. cit. p. 208.

In a word, theſe ſingular notions of the hypochondriac may be conſidered as ariſing from a long recurrence of novel and diſtreſſing ſenſations, connected with a morbid ſtate of the nervous ſyſtem in general, and of the mind or ſpirits in particular, which abſorb the attention of the individual to the excluſion of common impreſſions: and as the perturbed and agitated mind converts every obſcure impreſſion on the ſight, for inſtance, into viſions of horrible form; of the reality of which, if the impreſſions continue, it conceives a firm belief; ſo theſe unuſual ſenſations in the interior of the body become the ground-work of falſe and extravagant perceptions.

There is no difficulty in accounting for the ordinary ſuppoſitions of hypochondriacs, that they are affected with certain dangerous or loathſome diſeaſes; when it is recollected, that ſcarcely any organ or portion of the body altogether eſcapes being the ſeat of ſome uneaſineſs or irregularity of function, which, in the watchful anxiety of the patient's mind, and his diſpoſition to deſpondency, at once becomes the object of his attention and evil forebodings. Like *hyſteria* in the female, this diſeaſe aſſumes the form, and mimics the ſymptoms, of almoſt all other diſeaſes. When palpitations of the heart occur, with intermiſſions of the pulſe, tightneſs in the cheſt, pulſation in the abdomen, &c. from over-diſtention of the ſtomach by food or flatulency, the hypochondriac immediately ſuppoſes that hydrothorax, dropſy of the pericardium, aneuriſm of the heart or of the great artery, angina pectoris, or ſome ſuch formidable diſeaſe, with which his reading or enquiries have made him acquainted, is already his lot. If, from ſympathy with the ſame organs, the head is affected with giddineſs, or pain, the eyes occaſionally dim, the viſion double, or otherwiſe incorrect, the ears affected with a ringing noiſe, &c. the notion of ſome diſeaſe fixed in the brain immediately occurs, which is at one time ſuppoſed to be hydrocephalus, at another an abſceſs in the brain, or ſome morbid adheſion among the membranes, &c. And in like manner, every other organ of the body is in its turn believed to be the ſeat of ſome fatal and irremediable malady.

While this general diſturbed ſtate of the ſenſations continues, the ſleep is commonly imperfect and interrupted, and every variety of diſtreſſing dreams is excited; ſo that the patients frequently awake ſuddenly, with ſtarting and in great terror, ſuppoſing themſelves haunted by all ſorts of monſters and viſions which imagination can ſuggeſt, and ſuffering much from thoſe oppreſſive feelings, which are comprehended under the denomination of *incubus* or *night-mare*. It is not difficult to conceive, that ſome of the fancies, entertained by hypochondriacs, may have originated in theſe dreams, and become rivetted by repetition, from the recurrence of the peculiar ſenſations which called forth the trains of ideas. See DREAMS.

It would be ſuperfluous to attempt to illuſtrate all the various abſurd notions which hypochondriacs have in different inſtances entertained, and the ſtrange reſolutions which they have formed in conſequence; many examples of them are detailed by writers on mental derangement, of which one or two may ſuffice. Tulpius relates, that a painter of conſiderable reputation imagined that all his bones were become ſo ſoft and pliant, that they muſt neceſſarily bend like wax, if he attempted to walk, or if any hard body was ſtruck againſt them. In conformity with the fears which ſuch a notion inſpired, he kept his bed during the whole winter, imagining that if he aroſe, his legs would be compreſſed by his own weight into a lump like clay or wax. (See his Obſ. Med. lib. i. cap. 18.) Marcus Donatus has ſtated, that a baker of Ferrara believed he was made of butter, and on that account would not approach the oven, leſt he ſhould melt. (Hiſt. Med. Rar. lib. ii. cap. 1.) The ſame author has recorded the caſe of a perſon, of the name of Vincentinus, who believed that he was of ſuch an enormous ſize, that he could not go through the door of his apartment. His phyſician gave orders that he ſhould be forcibly led through it, which was done accordingly, but not without a fatal effect; for Vincentinus cried out, as he was forced along, that the fleſh was torn from his bones, and that his limbs were broken off, of which terrible impreſſion he died in a few days, accuſing thoſe who conducted him of being his murderers. (ibid.) Dr. Darwin had witneſſed twice an imaginary itch, and twice an imaginary diabetes, when there was not the leaſt veſtige of either of thoſe diſeaſes, and once an imaginary deafneſs, where the patient heard perfectly well; and an imaginary venereal diſeaſe, when they have only deſerved it, is a very common hallucination among modeſt young men. See Zoonomia, vol. ii. claſs iii. 1. 2.

Although a great majority of hypochondriacal complaints, eſpecially of the ſlighter kind, even when they have continued for a conſiderable time, do not lead to any ſerious reſult; yet there are many inſtances in which the actual ſtate of corporeal diſeaſe is ultimately demonſtrated, by the termination of the ſymptoms in dangerous and fatal maladies; ſuch as apoplexy, palſy, jaundice, dropſy, tympany, and pulmonary conſumption; not to mention the more complete diſeaſes of the intellect, confirmed mania, melancholy, and fatuity, in which they occaſionally end. For although the morbid condition of the abdominal viſcera may be but ſlight in the firſt inſtance, and will yield to the regimen adopted for its removal; yet diſeaſed vaſcular action, when long continued, whether idiopathic or ſympathic, frequently leads to morbid ſtructure, to great congeſtions, and to ſlow inflammation, with adheſions, effuſions of lymph and ſerum, &c. which are the conſequences of the latter. See Whytt on Nervous Diſorders, chap. vi.

Cauſes of Hypochondriaſis.—Some perſons are obviouſly much more liable to hypochondriacal affections than others; and this *prediſpoſition* to the diſeaſe appears to conſiſt in a peculiarity of conſtitution of the nervous ſyſtem, and of the digeſtive organs. This conſtitution is not always to be diſtinguiſhed by external character; but it belongs more particularly to the male ſex, to the advanced periods of life, and to the melancholic temperament: it is commonly original, or diſtinguiſhes the individual from his birth; and is often hereditary, having exiſted in his progenitors; but it may be brought on by diſeaſe, by improper aliment, and certain modes of life. The diſeaſe, however, occaſionally takes place in perſons of the ſanguineous temperament, as we ſhall ſtate immediately. With reſpect to the conſtitution of the digeſtive organs, it is remarked by Dr. Whytt and Dr. Crichton, that this does not conſiſt ſolely in debility; ſince we ſometimes ſee the appetite good, and digeſtion well performed, on the one hand, and, on the other, we often meet with indigeſtion and diſordered ſtates of the ſtomach and bowels, in perſons who have never ſuffered any hypochondriaſis. It is to be conſidered, therefore, as a peculiar ſenſibility of the nerves of theſe parts, which are readily put into an unnatural or depraved ſtate of feeling.

The *exciting cauſes* are ſuch circumſtances as tend to augment or produce this derangement of the chylopoëtic viſcera, and of the general ſtate of the nervous power. Among theſe we may enumerate great watching; exceſſive fatigue; anxious purſuit of buſineſs; a ſedentary life; intenſe application to ſtudy; exceſs in venery; all the depreſſing paſſions, however produced, as grief, anxiety, and fear; general repletion in reſpect to food, or the uſe of improper diet; intermitting and remitting fevers. To theſe moſt writers on the ſubject have added, the prevalence of a gouty humour, or the exiſtence of atonic, miſplaced or retrocedent gout; the receſſion of certain cutaneous eruptions; and the retention and ſuppreſſion of accuſtomed evacuations, as the catamenia and hæmorrhoids.

The former of theſe cauſes invariably influence the digeſtive organs, deſtroy the appetite for food, and render the ſtomach incapable of converting that which is taken into nutriment; hence the load and oppreſſion after eating, the torpor, ſleepleſsneſs, &c. which enſue. At the ſame time an extreme mobility of the nervous ſyſtem is induced, eſpecially by exhauſtion, from watching, hard ſtudy, or any other continued and anxious purſuit, or where there is any ſevere depreſſing emotion of mind. Theſe cauſes, therefore, at once give riſe to that diſturbed ſtate of the nervous ſyſtem which takes the alarm at every diſagreeable or unuſual ſenſation, and to that derangement of the organs of digeſtion, which, from their peculiar and univerſal ſympathy with every other part of the body, tends to multiply thoſe morbid ſenſations. Hoffmann remarks, that intenſe ſtudy operates in an additional way, in conſequence of the poſture of the ſtudent; who, in leaning forwards immediately after the ſtomach is diſtended with food, neceſſarily occaſions a preſſure upon the viſcera of the abdomen, and eſpecially upon the meſeraic veins; whence the circulation through the liver is impeded, and conſequently congeſtion muſt take place in the various organs of that cavity. (Syſt. Med. Ration. tom. i. lib. ii. cap. 10.) This diſeaſe, therefore, has been obſerved to be particularly frequent in literary men. Theſe congeſtions have, in fact, been found to exiſt in ſuch caſes. Dr. Whytt ſays, "in the bodies of thoſe who have died of the hypochondriac diſeaſe, the meſeraic and other veins which meet to form the *vena portarum* (the great veſſel which ſupplies the liver), have been often found greatly diſtended with blood. But," he adds, "this diſtenſion of thoſe veins, if any thing preternatural, was probably only a conſequence of ſome obſtruction of the liver, and not to be reckoned, as it has been by ſome authors, the cauſe of that diſtemper." (Loc. cit. chap. 5.) Obſtruction by direct preſſure on the *vena portæ* muſt occaſion the ſame effects on the other abdominal viſcera as obſtruction in the liver itſelf; and theſe effects, Dr. Whytt alleges, are occaſioned "by hindering the free circulation of the fluids through theſe parts, by affecting their nerves with an uneaſy ſenſation, and by preventing digeſtion; in the liver and ſpleen, by impeding the ſecretion of bile, and, by their weight, occaſioning a diſagreeable ſenſation, not only in theſe, but in the neighbouring parts by ſympathy; in the meſentery, by preventing the further preparation of the chyle, and its courſe towards the thoracic duct; in the uterus and ovaria, by diſturbing the functions of theſe parts, and by conſent affecting the ſtomach and bowels."

The latter cauſes above-mentioned, eſpecially the previous occurrence of intermitting and remitting fevers, may give riſe to hypochondriaſis, by their well-known influence on the abdominal viſcera, eſpecially the liver and ſpleen, which they often leave in an enlarged, indurated, or ſcirrhous ſtate; from which the reſt of the adjoining organs will be diſordered in the way juſt ſtated. The obſervation, that wandering gout, as it has been called, gives riſe to theſe nervous derangements is as old as Aretæus; and Muſgrave, Whytt, and others among the moderns, have borne teſtimony to the correctneſs of the obſervation. It is, however, only an hypothetical expreſſion of the fact, that when a regular fit of gout has occurred, theſe local and varying complaints have for a time diſappeared; but affords no juſt grounds for the ſuppoſition of a morbid humour afloat in the ſyſtem. (See Gout and Humoral *Pathology*.) And in the ſame manner, the relief of hypochondriacal ſymptoms, on the appearance of certain puſtular, ſcurfy, or other cutaneous eruptions, has been deemed a further proof that complaints of this kind proceed from ſome morbid humour in the blood; a notion which we have endeavoured to refute in the articles juſt referred to. See Whytt, loc. cit. Muſgrave de Arthritide Anomala, cap. 19.

With reſpect to the *proximate cauſe*, or the eſſential conſtituent part of the diſeaſe, almoſt all writers have agreed in referring it to a morbid condition of the chylopoëtic and other abdominal viſcera, as we learn from the following enumeration by Dr. Whytt. "Many authors," he obſerves, "have aſcribed this diſorder in men to obſtructions in the ſpleen, liver, and meſentery. Highmore to a vitiated conſtitution of the ſtomach. (Exercit. de paſſione hyſter. et affect. hypochond.) Willis to an indiſpoſition of the brain and nerves, or to a fault of the ſpirits. Etmüller, who confounds the hypochondriac diſeaſe, when in a higher degree, with the ſcurvy, has written a diſſertation to prove that its ſeat is not in the ſpleen, but in the inteſtines, eſpecially in that part of the *colon* which lies in the left hypochondre, in which the excrements often ſtagnate, and where much wind is pent up. (Opera, p. 1820.) Sydenham aſcribes the ſame diſtemper to an ataxy or confuſion of the ſpirits. (Epiſt. ad. D. Cole.) Mandeville to a diſordered chylification, and a deficiency or paucity of the ſpirits. (Treatiſe on the hypochond. and hyſter. Paſſions, Dial. 1. and 2.) Juncker makes the *cauſa proxima* of the hypochondriac affection to conſiſt in an obſtructed motion of the blood in the *vena portarum* and viſcera connected with it. (Conſpectus Medicinæ, p. 186.) Boerhaave derives it from an atrabiliary humour lodging in the pancreas, ſpleen, ſtomach, and neighbouring organs. (Aphoriſm 1098.) Hoffmann from a perverted periſtaltic motion of the ſtomach and inteſtines. (Syſt. Med. Rat. tom. iii. p. 3. cap. 5.) And, laſtly, Dr. Cheyne is of opinion, that all great nervous diſorders proceed from ſome glandular obſtruction in the ſtomach, bowels, liver, ſpleen, meſentery, or other organs of the lower belly. (Engliſh Malady, part ii. cap. 7.)"

It may be obſerved, then, that the obſervations of phyſicians from early times have nearly coincided, in referring the ſeat of the diſeaſed action, upon which the ſymptoms of hypochondriaſis depend, to the viſcera of the abdomen; that the very appellation of the diſeaſe is deduced from ſuch obſervations; that the uneaſy ſenſations of patients, under this diſeaſe, are principally aſcribed to the ſame part of the body; and that the diſeaſe often terminates in actual morbid ſtructure of the organs there contained. The manner in which diſeaſe in theſe organs may give riſe to the ſingular morbid ſenſations in diſtant organs, has been briefly touched upon above; and thoſe who wiſh for farther illuſtration, in regard to the wonderful and widely extended ſympathy, which obtains between the alimentary canal and almoſt the whole ſyſtem, will be gratified by the peruſal of the firſt chapter of Dr. Whytt's treatiſe, ſo often referred to in this article. (See alſo Sympathy.) A very able and experienced teacher in London infers from theſe facts, which opinion, he alleges, is corroborated by the ſuperior ſucceſs of a particular mode of treatment, "that the proximate cauſe of hypochondriaſis, in a curative view, conſiſts in a ſluggiſh and irregular ſtate of the hepatic function." Dr. Curry's Syllabus of Lectures at Guy's Hoſpital, p. 199.

Diagnoſis.—There is ſome difficulty in drawing a preciſe line of diſtinction between hypochondriaſis, on the one hand, and *dyſpepſia* (indigeſtion), *hyſteria*, and *melancholia*, on the other. This ariſes partly from the circumſtance, that theſe diſeaſes have all ſeveral ſymptoms in common; that hypochondriaſis is often combined with one or other of them; and that they ſometimes reciprocally paſs into each other. There are few caſes of hypochondriaſis in which ſome degree of dyſpepſia is not preſent; but Dr. Cullen has pointed out a ſtriking difference in the diſeaſe, as it occurs in two different temperaments, or ſtates of the conſtitution: firſt, as it occurs in *young* perſons of both ſexes, in men of a *ſanguine* temperament, and of a lax and flaccid habit; and, ſecondly, as it occurs in *elderly* perſons of both ſexes, of a *melancholic* temperament, and of a firm and rigid habit. "Theſe two different caſes of the combination of vapours and dyſpepſia," he ſays, "I conſider as two diſtinct diſeaſes, to be diſtinguiſhed chiefly by the temperament prevailing in the perſons affected. As the dyſpepſia of ſanguine temperaments is often without vapours; and as the vapours, when joined with dyſpepſia in ſuch temperaments, may be conſidered as perhaps always a ſymptom of the affection of the ſtomach, ſo to this combination of dyſpepſia and vapours, I would ſtill apply the appellation of *dyſpepſia*," &c. "But the combination of dyſpepſia and vapours in melancholic temperaments, as the vapours, or the turn of mind peculiar to the temperament, are eſſential circumſtances of the diſeaſe; and as this turn of mind is often with few or only ſlight ſymptoms of dyſpepſia, and even though the latter be attending, as they ſeem to be rather the effects of the general temperament than of any primary or topical affection of the ſtomach, I conſider this combination as a very different diſeaſe from the former, and would apply to it ſtrictly the appellation of hypochondriaſis." Dr. Cullen farther remarks, "I believe the affection of the mind is commonly different in the two diſeaſes; in dyſpepſia it is often languor and timidity only, eaſily diſpelled; while in hypochondriaſis it is generally the gloomy and rivetted apprehenſion of evil. The two diſeaſes are alſo diſtinguiſhed by ſome other circumſtances. Dyſpepſia, as I have ſaid, is often a ſymptomatic affection, while hypochondriaſis is, perhaps, always a primary and idiopathic diſeaſe. As debility may be induced by many different cauſes, dyſpepſia is a frequent diſeaſe, while hypochondriaſis, depending upon a peculiar temperament, is more rare." Cullen, Firſt Lines, par. 1227 and 1231.

Moſt of the older writers conſider *hyſterical* and *hypochondriacal* affections as eſſentially the ſame, differing no more from each other than as the frame of the female ſex, in which *hyſteria* moſt commonly occurs, is more delicate than that of the male, which is moſt liable to hypochondriaſis; or inaſmuch as the *uterus* is ſuppoſed to be the ſeat of the diſeaſe in the one caſe, while the liver, ſpleen, or ſome contiguous viſcus, is believed to be chiefly deranged in the other. The intelligent phyſician, Fred. Hoffmann, ſeems to have been one of the firſt to point out the difference of the two diſeaſes, in reſpect to their ſymptoms, cauſes, and termination. (Med. Rat. Syſt. tom. iii. p. 4. cap. 5. § 5 & 6.) There is this obvious difference between hyſteria and the diſeaſe in queſtion, in regard to the ſtate of the ſpirits, to wit, while in hypochondriaſis theſe are always in ſome degree low, inſpiring the patient with a greater or leſs dread and apprehenſion with reſpect to the ſtate of his bodily health; no perſons, on the contrary, have a greater flow of high ſpirits than hyſterical patients often exhibit; and the ſuddenneſs with which the ſymptoms change from one claſs to an oppoſite one, without any evident cauſe, or on the ſlighteſt imaginable, is one of the moſt remarkable features of the hyſterical diſeaſe, not to mention the peculiar convulſive paroxyſms, the *globus*, &c. which very frequently accompany the latter. See HYSTERIA.

With regard to the diſtinction between hypochondriaſis and *melancholy*, an ambiguity has ariſen, not only from the one occaſionally degenerating into the other, but from the difference of opinion among medical men, as to the uſe of the terms. The generality of writers agree in confining the term hypochondriaſis to thoſe inſtances of dejection of ſpirits and gloomy apprehenſions, which relate excluſively to the perſonal bodily health of the patient, while they appropriate the term melancholy to thoſe caſes in which the deſpondency and anxiety are fixed upon external relations, as the ſuppoſed loſs of friends, the imaginary influence of calumny, perſecution, &c. In the ſtate of melancholy, too, the digeſtion is often not impaired, whereas indigeſtion almoſt invariably accompanies hypochondriaſis; and it may be added, that in hypochondriaſis the indigeſtion precedes this ſorrowful ſtate of the mind; whereas, in melancholia, when idiopathic, the ſtate of the mind precedes, and is in a great meaſure unconnected with the indigeſtion. (Sims, in Memoirs of Med. Society of Lond. vol. v. p. 393.) Dr. Crichton has expreſſed an opinion, that it is of little utility to confine our diagnoſtic obſervations to the nature of the erroneous ideas, and he includes a much wider range in his notion of hypochondriaſis. Nevertheleſs he ſubſcribes in ſome meaſure to the diſtinctions above made, in admitting, that "when hypochondriaſis ariſes *primarily from diſeaſed viſcera*, the erroneous ideas, which preſent themſelves to the mind, generally concern their own frame; but when it has *primarily* ariſen *from melancholia*, then the morbid ideas are for the moſt part unnatural, or at leaſt unreaſonable fancies, either concerning other people, or their own worldly affairs." (Vol. i. p. 201.) Theſe diſtinctions are all that are requiſite with a practical view, and it is immaterial by what name we deſignate them, provided we avoid the confuſion which an undefined acceptation of ordinary terms muſt occaſion.

Cure of Hypochondriaſis.—The method of treatment, required for the removal of hypochondriaſis, muſt neceſſarily vary in different caſes, according to the age, temperament, and particular ſymptoms of different individuals; and the attention of the phyſician muſt be directed more or leſs to the bodily or to the mental indiſpoſition, accordingly as the one or the other is found to predominate. In all caſes, indeed, theſe two indications muſt principally be kept in view; 1. To correct the particular dyſpeptic or other morbid ſtate of the alimentary canal, and of the organs more immediately connected with it; and 2. To occupy the mind with a variety of intereſting impreſſions, connected by a natural aſſociation, and thus gradually to weaken and deſtroy the morbid concatenation of ideas which had taken place.

So far as the bodily health is concerned, and eſpecially that of the ſtomach, it might ſeem neceſſary only to have recourſe to the uſual remedies for *indigeſtion*; and that practice has generally been carried on with little diſtinction; but Dr. Cullen has juſtly pointed out ſome diſtinction which is to be made. Where the ſymptoms of indigeſtion are particularly urgent, then the ſame means muſt be reſorted to for their relief, as in caſes of ſimple dyſpepſia. Thus, where exceſs of acidity, which, from the ſlow evacuation of the ſtomach in melancholic temperaments, often ariſes to a high degree in hypochondriaſis, occurs, it muſt be obviated and corrected with the utmoſt care, by the uſe of the ſeveral antacids, and other means adapted to that purpoſe. (See INDIGESTION.) In like manner, the diſtreſs ariſing from flatulency, heartburn, coſtiveneſs, &c., may be alleviated by the appropriate means. (See the ſame article; alſo CARDIALGIA, FLATULENCE, and CONSTIPATION.) The point in regard to which Dr. Cullen ſuggeſts an important diſtinction in the treatment of hypochondriaſis and ſimple dyſpepſia in ſanguine habits, relates to the uſe of corroborant medicines, to reſtore the tone of the ſtomach. "In dyſpepſia," he ſays, "the chief remedies are the tonic medicines, which to me ſeem neither neceſſary nor ſafe in hypochondriaſis; for in this there is not a loſs of tone, but a want of activity that is to be remedied." (Firſt Lines, 1239.) And he ſuggeſts, that a practice directly oppoſite to that employed in the caſe of dyſpepſia is often to be followed. Cold bathing, he obſerves, is often highly uſeful to the dyſpeptic, and as a general ſtimulant, may ſometimes ſeem uſeful to the hypochondriac; but it is not commonly ſo to the latter; while, on the other hand, warm bathing, hurtful to the dyſpeptic, is often extremely uſeful to the hypochondriac. Another inſtance, he ſays, of a contrary practice neceſſary in the two diſeaſes, and illuſtrating their reſpective natures, is, that the drinking tea and coffee is always hurtful to the dyſpeptic, but is commonly extremely uſeful to the hypochondriac. Theſe obſervations, however, admit of many exceptions. Chalybeate mineral waters have commonly been employed in hypochondriaſis, and ſeemingly with ſucceſs. But this, Dr. Cullen juſtly ſuppoſes, is probably to be imputed to the amuſement and exerciſe uſually accompanying the uſe of theſe waters, rather than to the tonic power of the ſmall quantity of iron which they contain; and that perhaps the elementary water, by favouring the excretions, may have a ſhare in relieving the diſeaſe.

One of the moſt important parts of the medical treatment of hypochondriaſis, however, regards the diminution of that torpor and ſluggiſhneſs, with which the hepatic functions are performed; if this is not accompliſhed, the other remedies, calculated to obviate the ſymptoms of dyſpepſia, will afford but a brief and temporary alleviation of the diſorder. This degree of morbid action in the liver, may be known by attending to the ſtate of the bowels, and of the fæcal evacuations from them; by the various colour and odour of which the deficiency or morbid condition of the bilious ſecretion may be eſtimated. The moſt uſeful treatment conſiſts in maintaining a gentle ſtimulant operation upon the bowels by means of mild mercurial preparations, varying them in point of ſtrength as the torpor of the alimentary canal is greater or leſs.

Exerciſe, as it ſtrengthens the ſyſtem in general, and the chylopoetic viſcera in particular, as it obviates the preſſure upon thoſe viſcera, which a ſedentary and ſtudious habit occaſions, and as it contributes to maintain a free and active circulation through the moſt minute portions of the arterial ſyſtem, and thus ſupports the proper performance of all the functions of ſecretion, (ſee Exercise,) proves a particularly advantageous remedy in hypochondriaſis. But it is not leſs uſeful, perhaps, by its operation on the mind, than by that upon the body, as we ſhall immediately explain.

The management of the mind, in hypochondriacs, has been conſidered by Dr. Cullen as the moſt important part of the treatment, and as often a nice and difficult point. But as it muſt be admitted, that the morbid perceptions, which characterize the diſeaſe, originate actually in corporeal diſturbance; ſo the ſtate of mind muſt be conſidered as a ſymptomatic and ſecondary part of the complaint. Nevertheleſs, as the morbid aſſociations will be ſtrengthened, if not in any way oppoſed, after they have once gained admittance, independently of any increaſe of the corporeal diſeaſe, they ſhould not be treated with neglect. It muſt be conceded, therefore, to Dr. Cullen, that "the firm perſuaſion which generally prevails in ſuch patients, does not allow their feelings to be treated as imaginary, nor their apprehenſion of danger to be conſidered as groundleſs;"—"ſuch patients therefore are not to be treated either by raillery or by reaſoning. It is ſaid to be the manner of hypochondriacs to change often their phyſician, and indeed they often do it conſiſtently; for a phyſician who does not admit the reality of the diſeaſe, cannot be ſuppoſed to take much pains to cure it, or to avert the danger of which he entertains no apprehenſion." Hence Dr. Cullen allows, that if the pious fraud of a placebo be admiſſible at any time, it ſeems to be in treating hypochondriacs, even with the beſt view to their own ſecurity and advantage; for they, ever anxious for relief and fond of medicines, will apply to every ſource where theſe are offered, and, though frequently diſappointed, will ſtill take every new drug that can be propoſed to them; and thus often become the victims of empiriciſm and ignorance. The following obſervations from the able profeſſor above quoted, ſeem to comprehend all that is rational in regard to the mode of occupying the minds of hypochondriacs.

"As it is the nature of man to indulge every preſent emotion, ſo the hypochondriac cheriſhes his fears, and, attentive to every feeling, finds in trifles light as air a ſtrong confirmation of his apprehenſions. His cure therefore depends eſpecially upon the interruption of his attention, or upon its being diverted to other objects than his own feelings. Whatever averſion to application of any kind may appear in hypochondriacs, there is nothing more pernicious to them than abſolute idleneſs, or a vacancy from all earneſt purſuit. It is owing to wealth admitting of indolence, and leading to the purſuit of tranſitory and unſatisfying amuſements, or to that of exhauſting pleaſures only, that the preſent times exhibit to us ſo many inſtances of hypochondriaciſm. The occupations of *buſineſs* ſuitable to their circumſtances and ſituation in life, if attended with neither emotion, anxiety, nor fatigue, are always to be admitted, and perſiſted in by hypochondriacs. But occupations upon which a man's fortune depends, and which are always, therefore, objects of anxiety to melancholic men; and more particularly where ſuch occupations are expoſed to accidental interruptions, diſappointments, and failures, it is from theſe that the hypochondriac is certainly to be withdrawn.

"The hypochondriac who is not neceſſarily, by circumſtances or habits, engaged in buſineſs, is to be withdrawn from his attention to his own feelings by ſome *amuſement*. The various kinds of ſport and hunting, as purſued with ſome ardour, and attended with exerciſe, if not too violent, are amongſt the moſt uſeful. All thoſe amuſements which are in the open air, joined with moderate exerciſe, and requiring ſome dexterity, are generally of uſe. Within doors, company which engages attention, which is willingly yielded to, and is, at the ſame time, of a cheerful kind, will be always found of great ſervice. Play, in which ſome ſkill is required, and where the ſtake is not an object of much anxiety, if not too long protracted, may be often admitted. In dyſpeptics, however, gaming, liable to ſudden and conſiderable emotions, is dangerous; and the long continuance of it, with night-watching, is violently debilitating. But in melancholics, who commonly excel in ſkill, and are leſs ſuſceptible of violent emotions, it is more admiſſible, and is often the only amuſement that can engage them. Muſic, to a nice ear, is a hazardous amuſement, as long attention to it is very fatiguing.

"It frequently happens, that amuſements of every kind are rejected by hypochondriacs; and in that caſe, *mechanical means* of interrupting thought are the remedies to be ſought for. Such is to be found in briſk exerciſe, which requires ſome attention in the conduct of it. Walking is ſeldom of this kind, though, as gratifying to the reſtleſſneſs of hypochondriacs, it has ſometimes been found uſeful. The required interruption of thought is beſt obtained by riding on horſeback, or in driving a carriage of any kind. The exerciſe of ſailing, except it be in an open boat, engaging ſome attention, does very little ſervice. Exerciſe in an eaſy carriage, in the direction of which the traveller takes no part, unleſs it be upon rough roads, or driven pretty quickly, and with long continuance, is of little advantage.

"Whatever exerciſe may be employed, it will be moſt effectual when employed in the purſuit of a journey; firſt, becauſe it withdraws a perſon from many objects of uneaſineſs and care, which might preſent themſelves at home; ſecondly, as it engages in more conſtant exerciſe, and in a greater degree of it than is commonly taken in airings about home; and, laſtly, as it is conſtantly preſenting new objects which call forth a perſon's attention." Cullen, loc. cit.

We muſt obſerve, however, in concluſion, that the exerciſes, thus recommended, operate perhaps equally by reſtoring the corporeal health, as by abſtracting the attention of the mind from its erroneous perceptions. Upon the ſame principle, *reaſoning* with hypochondriacs is commonly uſeleſs; for, as Dr. Crichton remarks, although the ſingular notions which they entertain may now and then be eradicated from their minds by means of a little art, there is ſeldom any real good to be derived from this, except the diſeaſe be at the ſame time cured; for if diſeaſed impreſſions continue to ariſe in the mind from the diſordered viſcera, other illuſive notions will ſpring up as one ſet is deſtroyed. And we have already alluded to a fatal inſtance of a forcible attempt to convince a hypochondriac of his error by a mechanical proof.

HYPOCHOPHOSIS, a ſlight degree of deafneſs.

HYPOCHYMA, or Hypochysis, from ὑπο, *under*, and χυω, *to pour*, in *Surgery*, the diſeaſe uſually denominated a cataract, which was ſuppoſed to proceed from a humour running under the cryſtalline lens. See Cataract.

HYPOCISTIS, in *Botany*, Tournef. t. 477. See Cytinus.

Hypocistis, Ὑποκιστις, formed of ὑπο, *under*, and κιστος, *ciſtus*, in *Medicine*, a juice uſed in the compoſition of theriaca, &c.

The hypociſtis is the juice of a ſhoot or excreſcence of the ſame name, ſprouting out from the foot of a kind of ciſtus, or rock-roſe, which is called *ledon* or *ladanifera*; common enough in the hot countries.

The ſhoot grows about three or four inches high; and one, two, or three inches thick; and is ſomewhat bigger at top than at bottom; and is ſoft, ſucculent, of a yellowiſh colour, and ſurrounded from ſpace to ſpace with a ſort of rings, or browniſh knots. It bears a number of little bell-ſhaped flowers, but no leaves.

When gathered, they pound it in a mortar, and expreſs the juice: that done, they evaporate it on the fire till it come to the conſiſtence of a hard blackiſh extract, much like Spaniſh liquorice: then they make it up into little maſſes for carriage. It is a mild aſtringent, of no particular ſmell or flavour, and recommended for ſtopping fluxes of the belly, vomitings, and hæmorrhages; though anciently much more than at preſent. It is alſo an ingredient in ſome unguents.

It is ſometimes uſed as a ſubſtitute to acacia.—Dr. Quincy ſays, it is the more powerful aſtringent of the two.

HYPOCRANIUM, in *Surgery*, ſignifies an abſceſs under the cranium, between the bone and dura mater. The term is derived from ὑπο, *under*, and κρανιον, *the ſkull*.

HYPOCRAS. See Hippocras.

HYPOCRATERIFORMIS, *Saucer-ſhaped*, in *Botany*, the name given by Mr. Tournefort to a peculiar ſort of flowers of plants, of the general order of the infundibuliform, but not ſo deep and narrow at the mouth as thoſe ſimply ſo called, but expanded into the figure of a ſaucer.

HYPOCRINE, or Hippocrene. See Helicon.

HYPOCRISY, ὑποκρισις, in *Ethics*, denotes diſſimulation with regard to the moral or religious character.

HYPODIACONORUM Festum. See Calendarium *feſtum*.

HYPO-DIEZEUXIS, in *Muſic*, according to Bacchius, ſen. is the interval of a fifth between two tetrachords ſeparated by a disjunction, and further by a third intermediate tetrachord. Thus there is a hypo-diezeuxis between the tetrachords hypaton and diezeumenon, and between the tetrachords ſynnemenon and hyperbolæon. See Tetrachord.

HYPO-DORIAN, the loweſt of all the modes of *Ancient Muſic*. It has its fundamental a fourth below that of the Dorian mode. It is ſaid to have been invented by Philoxenus. This mode is grand, but cheerful: uniting ſweetneſs with majeſty.

HYPODROME. See Hippodrome.

HYPOESTES, in *Botany*, a name given by Dr. Solander, who meant to write it *Hypoeſthes*, from ὑποεσθης, *an inner veſtment or covering*, expreſſive of the minute membranous internal calyx. Brown. Prodr. Nov. Holl. v. 1. 474. Claſs and order, *Diandria Monogynia*. Nat. Ord. *Perſonatæ*, Linn. *Acanthi*, Juſſ.

Eſſ. Ch. Calyx in five equal ſegments, contained in a four-cleft three-flowered involucrum. Corolla two-lipped. Seeds two in each cell, with an appendage at their baſe. Partition attached to the valves. Anthers of one cell.

A genus ſeparated from *Juſticia* by Solander and Brown, conſiſting of cauleſcent herbs or ſhrubs. The involucrums, naturally three-flowered, though ſometimes, by abortion, ſingle-flowered, grow oppoſite, in axillary or terminal ſpikes, accompanied by leafy bracteas. The flowers are either purple or white. Within the proper calyx is a ſmall white membranous integument.

Examples of this genus are found in the firſt ſection of Willdenow's *Juſticiæ*, as *J. faſtuoſa*, Linn. Mant. 172. Vahl. Symb. v. 1. t. 1. ſent by Koenig from Tranquebar. To this is nearly allied *J. Forſkalei* of Vahl.

Mr. Brown found a new ſpecies in the tropical part of New Holland, which he denominates *H. floribunda*.

HYPOGÆUM, ὑπογειον, formed of ὑπο, *under*, and γαια, *earth*, in the *Ancient Architecture*, is a name common to all the parts of a building that are under ground; as the cellar, butteries, and the like places.

The term hypogæum was uſed by the Greeks and Romans for ſubterraneous tombs in which they buried their dead.

Hypogæum, Ὑπογαιον, in *Aſtrology*, is a name given to the celeſtial houſes which are below the horizon; and eſpecially the *imum cœli*, or bottom of heaven.

HYPOGASTRIC Artery, in *Anatomy*, a name under which the internal iliac is often deſcribed, as the correſponding vein is alſo called the hypogaſtric. More commonly, however, the name is given to thoſe continuations of the trunks of the internal iliacs, which aſcend along the ſides of the bladder to the umbilicus, where they take the name of umbilical. They go to the placenta. See Embryo for their deſcription.

Hypogastric *Region*, is the lower portion of the abdominal cavity. See Abdomen.

HYPOGASTRIUM is the ſame with the Hypogastric *region*; which ſee.

HYPOGASTROCELE, from ὑπογαστριον, and κηλη, *a tumour*, in *Surgery*, a ventral hernia. See Hernia.

HYPOGLOSSUM, in *Botany*. See Ruscus.

HYPOGLOSSUS, in *Anatomy*, from ὑπο, *under*, and γλωσσα, the *tongue*, the nerve of the ninth pair, ſo called from its ſituation under the tongue.

HYPOGLOTTIS, or Hypoglossis, compoſed of ὑπο, *under*, and γλωττα, *tongue*, is a name given to two glands of the tongue.

There are four large glands of the tongue; two of them called hypoglottides, ſituated under it, near the venæ ranulares; one on each ſide of the tongue. They ſerve to filtrate a kind of ſerous matter, of the nature of ſaliva, which they diſcharge into the mouth by little ducts near the gums.

Hypoglottis, or *Hypogloſſis*, in *Medicine*, denotes an inflammation or ulceration under the tongue; called alſo *ranula*.

HYPO-IASTIAN, in *Muſic*. See Hypo-ionian.

HYPO-IONIAN, the ſecond of the modes of *Ancient Muſic* from the loweſt: Euclid calls it hypo-iaſtian, and grave Phrygian. Its fundamental is a fourth below the Ionian mode.

HYPOLÆNA, in *Botany*, from ὑπο, *under*, and χλαινα, *a cloak*, or *covering*, alluding to the ſhort integument which inveſts the baſe of the fruit. Brown. Prodr. Nov. Holl.

v. 1. 251. Claſs and order, *Diœcia Triandria.* Nat. Ord. *Calamariæ*, Linn. *Reſtiaceæ*, Brown.

Eſſ. Ch. Male, Cal. ſcales of a catkin. Perianth a huſk of ſix leaves. Stamens three. Anthers ſimple, peltate.

Female, Cal. ſcales numerous, imbricated. Perianth a huſk of ſix leaves, terminal, ſolitary. Style in two or three diviſions, deciduous. Nut bony, naked, ſingle-ſeeded, longer than the perianth.

A genus eſtabliſhed by Mr. Brown, who obſerves, that it has the habit as well as the male flowers, of *Reſtio*, for which reaſons, as well as on account of the want of a lobed external appendage to the perianth, he has ſeparated it from the *Willdenovia* of Thunberg, whoſe fruit is ſimilar, but its male infloreſcence (not well deſcribed by Thunberg), and its habit are different.

The ſpecies are,

1. H. *faſtigiata.* Stems branched, round, ſtriated, aſh-coloured; their branches ſomewhat level-topped. Glumes of the perianth at length oval.

2. H. *exſulca.* Stems branched, round, ſmooth; their branches alternate, quite ſimple. Glumes of the perianth roundiſh.

Both grow in various of the cooler parts of New Holland.

HYPOLEPIS, from ὑπο, *under*, and λεπις, *a ſcale.* Perſoon Syn. v. 2. 598. The ſame plant as *Phelypæa ſanguinea* of Thunberg and Willdenow. See Phelypæa.

HYPO-LYDIAN, the fifth mode of the *Ancient Muſic*, beginning from the loweſt. Euclid calls it hypo-iaſtian and hypo-phrygian. Its fundamental is a fourth below the Lydian. Euclid diſtinguiſhes two hypo-lydian modes; the acute, which is that of this article, and the grave, which is the ſame as the hypo-æolian.

The hypo-lydian mode was proper for funeral chants, ſublime and divine meditations: its invention is attributed by ſome to Polymneſtes of Colophon, by others to Damon of Athens.

HYPOLYTRUM, in *Botany*, from ὑπο, *under*, and ἐλυτρον, *a cover*, or *ſcale*, on account, as we preſume, of the internal ſcaly covering of the ſeeds. Perſoon Syn. v. 1. 70. Claſs and order, *Triandria Monogynia.* Nat. Ord. *Calamariæ*, Linn. *Cyperoideæ*, Juſſ.

Eſſ. Ch. "Scales imbricated every way. Seeds with an internal cover, reſembling a glume of three or four valves. Stamens two or three. Stigmas one or two." *Perſoon.*

This is ſuſpected to be the ſame genus with *Hypælyptum*, (ſee that article,) and even their names are perhaps originally the ſame. Perſoon defines three ſpecies, H. *latifolium. ſenegalenſe*, and *gracile*, all communicated by M. Richard. Their definitions, however, do not accord with our above-mentioned ſpecies of *Hypælyptum.*

HYPO-MIXO-LYDIAN, a mode added by Guido d'Arezzo to the *Ancient Muſic* of the church: it is properly the plagal of the mixo-lydian mode, and its fundamental is the ſame as that of the Dorian mode.

HYPOMNEMATOGRAPHUS, Ὑπομνηματογραφος, derived from ὑπο, μνημη, *regiſter*, and γραφω, *I write*, in the *Primitive Church*, an officer who attended on the biſhop, and kept a regiſter of his conſecrations.

HYPOMOCHLION, Ὑπομοχλιον, formed of ὑπο, *under*, and μοχλος, *lever*, in *Mechanics*, the fulcrum of a lever, or the point which ſuſtains its preſſure, when employed either in raiſing or lowering bodies.

The hypomochlion is frequently a roller ſet under the lever; or under ſtones, pieces of timber, &c. that they may be the more eaſily lifted up, or removed.

HYPONITIS, in *Botany*, a name given by Dillenius to a genus of plants, called by Tournefort orobanchoides. See Monotropa.

HYPONOMOS, in *Surgery*, from ὑπο, *under*, and νομη, *a phagedenic ulcer*, a deep phagedenic ulcer.

HYPOPHORA, Ὑποφορα, in *Rhetoric*, the firſt part of the prolepſis: thus, in the following inſtance: "but ſome men will ſay, how are the dead raiſed, or with what body do they come?" is the *hypophora*; and, *thou fool, that which thou ſoweſt*, &c. is the *anthypophora*, or ſolution of the objection.

Hypophora, in *Surgery*, a deep, fiſtulous ulcer, from ὑποφερομαι, to be carried underneath.

HYPO-PHRYGIAN, one of the modes of *Ancient Muſic*, derived from the Phrygian. Its fundamental was a fourth higher. Euclid ſpeaks ſtill of another hypo-phrygian mode below it; which was called with more accuracy the hypo-ionian mode.

The character of the hypo-phrygian mode was calm, tranquil, and proper to appeaſe the vehemence of the Phrygian. It was ſaid to have been invented by Damon, the friend of Pythias, and the muſic-maſter of Socrates.

HYPOPHTHALMION, from ὑπο, *under*, and ὀφθαλμος, *the eye*, in *Surgery*, denotes a ſwelling, which ſometimes takes place under the eye in caſes of dropſy and cachexy.

HYPOPHTHALMUM, in *Botany*, a name uſed by ſome authors for the *aſter atticus.*

HYPOPHYLLOCARPODENDRON, in *Botany*, Boerhaave. See Leucadendron and Protea.

HYPOPHYLLOSPERMOUS Plants, formed of ὑπο, *under*, φυλλον, *leaf*, and σπερμα, *ſeed*, are ſuch plants as bear their ſeeds on the back-ſides of their leaves.

HYPOPHYSIS, from ὑπο, *under*, and φυω, *to produce*, an inflammation of the eye, ariſing from a turning of the eye-lid inwards. See Trichiasis.

HYPOPIA, from ὑπο, and ωψ, *the eye*, an ecchymoſis juſt under the eye; a black eye.

HYPOPITYS, in *Botany*, Dill. Gen. 7. See Monotropa.

HYPOPODIUM, in *Antiquity*, a piece of furniture belonging to the baths; its uſe was to ſet or reſt the feet on, as the name imports.

HYPO-PROSLAMBANOMENOS, in *Muſic*, the name of an additional ſtring or ſound, which Guido is ſaid to have added to the ſcale of the Greeks, a note below proſlambanomenos, anſwering to gammut or G on the firſt line in the baſe. The author of this new ſound expreſſed it by the letter Γ, gamma, of the Greek alphabet, whence the name of gammut was derived. See Diagram.

HYPOPYON, or Hypopium, is a term in *Surgery*, uſually ſignifying an abſceſs under the cornea, in the interior or poſterior chamber of the aqueous humour. The word is compounded of ὑπο, *under*, and πυον, *pus.*

A diſtinction has been drawn by ſome writers between the caſe, where the matter is ſituated in the anterior chamber, and that where it lies in the poſterior one, the latter inſtance being ſometimes named *empyeſis oculi.* But ſince both chambers always have a free communication with each other through the pupil; ſince one chamber can never have much matter in it, without a part gliding into the other; and laſtly, as the matter in either example may be diſcharged through the ſame opening; Richter contends, that the difference in the caſes is not of much importance. Hypopium is generally a conſequence of a violent inflammation of the eye; yet unuſual inſtances do preſent themſelves, in which the diſeaſe comes on quite unpreceded by any degree of ophthalmy. This is ſaid to happen particularly in venereal and ſcrophulous patients. A woman, in the Royal Infirmary of Edinburgh, had a very conſiderable collection of matter in the anterior chamber, accompanied with very little, or no inflammation. The matter altered its form and place according to the poſition of the head, and, during the day, the agitation of the body, produced by walking, mixed the matter with the aqueous humour, and rendered the whole anterior chamber turbid. Wardrop's Eſſays on the Morbid Anatomy of the Human Eye, p. 51.

Hypopium, when it is a conſequence of inflammation, can only proceed from a violent degree of it, and it commonly makes its appearance under the following ſymptoms. The pain is throbbing and acute, and inſtead of being confined to the eye-ball and upper part of the forehead extends as far as the back of the head. All on a ſudden, however, upon the attack of a ſhivering fit, it undergoes a diminution, and it is at this period that the firſt drop of matter generally makes its appearance at the bottom of the anterior chamber, in the form of a ſemilunar whitiſh ſpeck, which, in proportion as the quantity increaſes, gradually becomes larger, ſpreads upwards, covers the pupil, and at length occupies the whole of the anterior chamber. In this ſtate, the cornea exhibits every where a white appearance. The progreſs of the diſeaſe is various. When the caſe is left to take its own courſe, the pain often becomes again exceſſively ſevere, and no alleviation is experienced, till the matter makes its way through the cornea, and eſcapes, together with the aqueous humour, and, in general, a conſiderable portion of the vitreous. The pain immediately abates; but the eye is irrecoverably deſtroyed. In favourable caſes, the matter, with the aid of proper means, is entirely diſperſed. Sometimes it is only partly abſorbed, and a portion continues, either upon the inſide of the cornea, upon the ſurface of the cryſtalline lens, or in the pupil, ſo as to produce either total blindneſs, or a material impairment of viſion.

The matter of hypopium is commonly repreſented to be pus; but Scarpa, the celebrated ſurgeon at Pavia, adopts the opinion, that it is only coagulating lymph, which is effuſed from the highly inflamed choroides and uvea in ſevere ophthalmies affecting the interior of the eye.

While the violence of the inflammation of the eye laſts, the hypopium never fails to enlarge; but as ſoon as this ſtage ceaſes, and the ophthalmy falls into its ſecond period, or that attended with local weakneſs, the matter in the anterior chamber receives no longer any addition, and, from that moment, is diſpoſed to diminiſh. See Scarpa Sulle Malattie degli Occhi.

Surgical writers have recorded curious examples of a periodical ſpecies of hypopium. A man, of a bad habit of body, became blind the firſt fortnight of every month. A yellowiſh matter, which was ſo thick and opaque as to conceal the iris, could always at this time be remarked in the anterior chamber. The conjunctiva was alſo inflamed; but not painful. On the fourteenth day of each month theſe complaints uſed to diſappear, and the ſight to return. (Janin Mémoires ſur l'Œil, p. 412.) Another perſon was deprived of his eye-ſight every morning, and, during the attack, the aqueous humour was always very turbid. The patient at the ſame time regularly ſuffered pain under the ſhort ribs, on the right ſide. The paroxyſm conſtantly terminated on a copious diſcharge of air being made from the alimentary canal. See Richter's Anfangſgründe Band 3. p. 97.

The treatment of hypopium conſiſts either in attempting to diſperſe the matter collected in the anterior or poſterior chamber, or elſe in making an inciſion for its evacuation. Againſt the latter proceeding, as a general one, Scarpa has urged ſeveral weighty conſiderations, as we ſhall preſently notice.

The tendency of an hypopium to diminiſh, as ſoon as the firſt violence of the ophthalmy is over, ſhews, according to Scarpa's judgment, how important it is, in order to check the progreſs of hypopium, to employ the moſt powerful means for ſubduing the firſt ſeverity of the inflammation of the eye. With this view, copious evacuations of blood, both generally and topically, are recommended. When chemoſis prevails, the conjunctiva is to be divided. Mild aperients, bliſters to the nape of the neck, little bags of emollient herbs applied to the eye, and other meaſures for the relief of the firſt ſtage of ſevere ophthalmy, are highly neceſſary. Theſe will be known to have fulfilled the deſired end, by the abatement of the lancinating pains in the eye, the ceſſation of the febrile ſymptoms, the reſtoration of the free motion of the eye, and the hypopium no longer continuing to increaſe. The firſt meaſures have now anſwered every expectation, notwithſtanding the eye-lids and conjunctiva may ſtill be affected with a degree of redneſs. The lower orders of people are frequently ſeen in the ſecond ſtage of acute ophthalmy, going about with an hypopium, and making no complaint whatever of any of the ſerious ſufferings always attendant on the firſt ſtage of acute ophthalmy. It is only at this criſis, or at the termination of the acute ſtage of violent inflammation of the eye, that the hypopium ceaſes to enlarge, and begins to be abſorbed, provided this ſalutary proceſs be not impeded by any wrong plans.

Scarpa remonſtrates againſt making an inciſion in the cornea to let out the matter; a plan which has been commonly taught by ſurgical authors, and which has been extenſively adopted, but which moſt frequently gives riſe to evils worſe than hypopium itſelf, and this, notwithſtanding Richter's advice be followed, not to let out all the matter at once, and not to promote its exit by preſſure or injections. Scarpa aſſures us, that a wound in the lower part of the cornea, how ſmall ſoever it may be, moſt commonly re-produces the ſevere acute ophthalmy, and occaſions a large extravaſation of lymph, or matter in the chambers of the aqueous humour. Beſides, after opening the cornea, the matter, if left to itſelf, would be ſeveral days in becoming entirely diſcharged, during all which time it would keep the edges of the wound aſunder, and make them ſuppurate. In this manner the cut would be changed into an ulcer, through which the aqueous humour would eſcape, and in all probability a fold of the iris be protruded. Even the cryſtalline lens itſelf might fall out. No arguments in favour of the practice can juſtly be drawn from the ſucceſsful reſult of certain caſes, in which the hypopium ſpontaneouſly burſts. Scarpa reminds us that there is a wide difference between the effects of a ſpontaneous opening into a natural or preternatural cavity of the animal body, or of one made with cauſtic, and the conſequences of an opening made with a cutting inſtrument. In the two firſt methods the ſubſequent ſymptoms are conſtantly milder than in the laſt. Beſides, the fact is, that when an hypopium diſcharges itſelf through an ulcerated opening, it not unfrequently happens that not only the aqueous humour eſcapes, but a prolapſus of the iris alſo happens.

Scarpa only admits the utility and neceſſity of dividing the cornea, when the coagulating lymph, or matter of an hypopium, exiſts in very large quantity, and produces ſuch diſtention of the eye, and ſuch urgent ſymptoms, as put the patient's life into danger, beſides menacing a total deſtruction of the affected organ.

It is maintained by this diſtinguiſhed anatomiſt and ſurgeon, that as the fragments of cataracts, when puſhed through the pupil into the anterior chamber of the aqueous humour, are in time abſorbed, there cannot be a doubt that the coagulating lymph, in the example of hypopium, alſo admits of being taken away by the abſorbents, as ſoon as a further extravaſation no longer goes on, and the lymphatics begin to recover their activity. Scarpa, therefore, inculcates that the reſolution of an hypopium is the firſt thing which the ſurgeon ought to aim at in the treatment of the common form of the diſeaſe, and that the beſt method of doing this is to ſubdue the firſt vehemence of the acute ophthalmy by antiphlogiſtic remedies, and mild, emollient, topical applications.

When ſucceſs attends this plan, as it does in the generality of caſes, the hypopium not only ceaſes to enlarge, but even begins to diminiſh, in proportion as the violence of the inflammation abates.

Various remedies have been recommended for the purpoſe of diſperſing the matter collected in the chambers of the aqueous humour. Monſieur Janin was of opinion, that when the matter diſappeared, it was not abſorbed, but exuded through the pores of the cornea. His advice, conſequently, was to endeavour to make the pores of this membrane as pervious as poſſible, by the topical employment of emollient applications, ſo as to promote the eſcape of the matter. For this object he recommends the decoctum malvæ, as exceedingly efficacious. He uſed to bathe the eye ſeveral times a day with this remedy, and in the intervals apply compreſſes wet with the ſame. Janin aſſures us, that even when both the chambers of the eye were full of matter, and the cornea ſeemed likely to burſt, this method proved ſucceſsful, the diſperſion being generally effected in about twelve or fourteen days. There can be no doubt that benefit has been derived from uſing the decoctum malvæ, eſpecially as Pellier and other eminent oculiſts confirm the accounts of the good effects of the application. But we believe with Scarpa, that it is by no means ſuperior to ſeveral other remedies, and that every topical emollient application, if conjoined with ſuch internal antiphlogiſtic treatment as is the moſt proper for repelling the acute ſtage of the ſevere ophthalmy, would be equally beneficial. Mere warm water is productive of quite as much good.

With reſpect to Janin's notion of the matter of the hypopium exuding through the pores of the cornea, the opinion is altogether deſtitute of foundation. Richter rightly maintains, that when an hypopium is diſperſed, there are no appearances in ſupport of ſuch a ſentiment. When blood is extravaſated in the anterior chamber, and afterwards diſappears, it muſt be by abſorption, for if it exuded out of the cornea, it would be viſible upon the ſurface or in the ſubſtance of this tranſparent membrane.

Woolhouſe recommends, for the diſperſion of an hypopium, the application of a poultice, made of the pulp of a roaſted apple, and containing a ſmall proportion of camphor. Guerin adviſes the uſe of a collyrium, compoſed of roſe-water, muriate of ammonia, aloes, and myrrh. Mauchart ſpeaks in favour of warm collyria, and of fomenting the eye.

We decidedly join Richter in thinking, that, as the eye is in general violently inflamed, all irritating applications muſt be hurtful and improper. Little benefit can be expected from any remedies which only come into contact with the eye-lids, as, for inſtance, Woolhouſe's poultice. But, ſuppoſing the applications to act more extenſively, they can hardly operate effectually upon the ſurfaces, by which the matter of the hypopium is ſecreted. Some good, however, will reſult from emollients, and much more may reaſonably be expected from ſuch means as tend to excite and quicken the action of the abſorbents, as, for example, antimonials, aperients, bleeding, bliſters on the nape of the neck, or behind the ears, &c. Theſe remedies not only promote the abſorption of the matter, they likewiſe have a powerful effect in putting a ſtop to the inflammation.

When the firſt ſtage of ſevere ophthalmy has reſiſted the beſt modes of treatment, or when theſe have been practiſed too late, the matter in the chambers of the eye is occaſionally ſo abundant, after the firſt ſtage of the ophthalmy is over, that it continues for a long while to obſtruct viſion. Scarpa has often ſeen patients, eſpecially paupers, who, from negligence or wrong treatment, have remained a great while after the ceſſation of the acute ſtage of an ophthalmy, with the anterior chamber almoſt entirely filled with the glutinous matter of hypopium. When the inflammation ceaſes, theſe perſons are deſcribed as wandering about the ſtreets with great unconcern, and having no affliction but the impairment of their ſight. In this ſecond ſtage of ophthalmy, the hypopium cannot be diſperſed, either ſo ſpeedily, or by exactly the ſame treatment as in the firſt ſtage. In a caſe of this deſcription, Scarpa recommends ſuch remedies as are moſt calculated to invigorate the debilitated tone of the vaſcular ſyſtem of the eye, particularly the lymphatics. The time neceſſary for the completion of this object will vary according to the patient's age and the nature of his conſtitution. The ſurgeon ought carefully to try the degree of irritability in the eye, by introducing, between the globe and the eyelids, a few drops of a collyrium, containing ſome ſulphate of zinc, and mucilage of quince-ſeeds. Should the eye ſeem too ſtrongly ſtimulated by this application, it muſt not be uſed, and little bags, filled with warm mallows and a few grains of camphor, are to be ſubſtituted for it. In the intervals the vapour of the ſpiritus ammoniæ comp. may be applied to the eye. A bliſter is alſo to be put on the nape of the neck. As ſoon as the eye will eaſily bear the vitriolic collyrium, this is to be employed, and its ſtrength may afterwards be gradually increaſed by the addition of a few drops of camphorated ſpirit.

Under ſuch treatment, the hypopium may often be obſerved to diſappear regularly as the chronic ophthalmy is removed.

We are not, however, always to expect to be thus ſucceſsful with regard to hypopium, attended either with the firſt or ſecond ſtage of ophthalmy. When the extravaſated matter ſtrongly diſtends the chambers of the aqueous humour, and the cornea in particular, the moſt ſkilful treatment will ſometimes not avail in preventing ulceration, opacity, and the burſting of the central part of the cornea.

When the ulcerated opening is formed, ſome of the matter of the hypopium eſcapes, and a degree of amendment follows; but the relief is only of ſhort continuance, as a portion of the iris is ſoon protruded through the aperture. If, in an urgent caſe of this kind, the burſting of the cornea were not ſpeedily to happen, the violent ſymptoms depending on the diſtention of the eye-ball would compel the ſurgeon to make an opening in that membrane. This form of the diſeaſe is deſcribed as being exceſſively ſevere, and even attended with danger. The head-ache, and pain in the eye, are frequently ſo grievous as to occaſion delirious ſymptoms. According to Scarpa, the ſurgeon may the more readily make up his mind to practiſe an inciſion, as there is hardly any hope of ſaving the eye.

Should there be any reaſonable chance of reſtoring the tranſparency of the cornea, and of preſerving the eye, Scarpa approves of opening this membrane at its lower part, juſt as is done in the operation of extracting the cataract. But when no ſuch pleaſing proſpect occurs, he thinks the beſt and quickeſt way of relieving the ſevere pain of the hypopium, is to introduce acroſs the central point of the cornea a ſmall biſtoury, ſo as to make a cut about one line and a half broad. The little flap is then to be raiſed with forceps, and removed with one ſtroke of a pair of ſciſſors.

The opening, thus made, will not be liable to cloſe like a ſimple inciſion. The fluid part of the matter immediately eſcapes, and reſt ſome time afterwards, followed, ſooner or later, by the cryſtalline lens and vitreous humour.

As ſoon as the operation is done, a bread and milk poultice is to be applied, and care taken to change it every two hours. At the ſame time ſuch means are indicated as are moſt calculated to avert and diminiſh inflammation, and ſooth nervous irritation. The eye gradually ſuppurates and heals, after which it is generally in a ſtate to admit of the application of an artificial eye. See Eye, *Artificial*.

Although Scarpa ſanctions the performance of an inciſion in the foregoing caſe of hypopium, which is attended with urgent, diſtreſſing, and perilous ſymptoms, he maintains that the practice is highly improper in common inſtances, for reaſons already explained.

With reſpect to cutting out a piece of the centre of the cornea, as is adviſed by Scarpa, we feel perſuaded that nothing can juſtify this proceeding unleſs it is decidedly certain that the eye and eye-ſight are beyond recovery. In any other circumſtance, the inciſion ſhould undoubtedly be executed, as in the extraction of the cataract. See Cataract.

HYPORCHEMA, formed of ὑπορχεομαι, *I accommodate my dancing to a ſinging chorus*, of ὑπο and ορχεομαι, *I dance*, in the *Greek Poetry*, a poem compoſed of divers kinds of verſes, and of different lengths; but always very ſhort, and full of Pyrrhic feet. This poem was compoſed either to be ſung or played with the flute or cithara, but to regulate a dance according to the ſound of voices and inſtruments. Proclus ſays, it was a dance accompanied with a ſong. Theſe were, probably, the origin of the Italian *Ballata*; which ſee.

HYPORISMA, in *Surgery*, an aneuriſm.

HYPOSCENIUM, Ὑποσκηνιον, in *Antiquity*, a partition under the pulpit or logeum of the Greek theatre, appointed for the muſic.

HYPOSCHESIS, Ὑποσχεσις, in *Rhetoric*, the ſame with diviſion.

HYPOSPADIAS, in *Surgery*, from ὑπο, *under*, and σπαω, *I draw*, a Greek name anciently given to a perſon, who had the orifice of the canal of the ureter not directly at the extremity of the gland. Galen applies the ſame name to thoſe, the frenum of whoſe penis is too ſhort, on which account it is bent in erection; this is eaſily remedied by cutting the ligament, and waſhing the wound with warm wine.

HYPOSPATHISMUS, in the *Ancient Surgery*, an operation practiſed, by making three inciſions in the forehead, to the very bone, about two inches long; in order to cut or divide all the veſſels between thoſe inciſions. The deſign of the operation was to prevent defluxions on the eyes.

The word is ὑποσπαθισμος, formed of ὑπο, *under*, and σπαθη, *ſpatula*; by reaſon after inciſions were made they thruſt a ſpatula all along between the pericranium and the fleſh.

HYPOSPHAGMA, in *Surgery*, a contuſion of the eye, attended with ecchymoſis; a black eye.

HYPOSTAPHYLE, from ὑπο, *under*, and σταφυλη, *the uvula*, a relaxation, or elongation of the uvula.

HYPOSTASIS, Ὑποςασις, compounded of ὑπο, *under*, and ιςημι, *I ſtand, I exiſt*, q. d. *ſubſiſtentia*, a Greek term, literally ſignifying *ſubſtance*, or *ſubſiſtence*; it is uſed in theology for *perſon*.

Thus ſome have held that there is but one nature or eſſence in God, but three hypoſtaſes, or perſons.

The term hypoſtaſis is of a very ancient ſtanding in the church. St. Cyril repeats it divers times, as alſo the phraſe, *union according to hypoſtaſis*. The firſt time it occurs in all Chriſtian antiquity, is in a letter of that father to Neſtorius, where he uſes it inſtead of προσωπον, the word we commonly render *perſon*, which did not ſeem expreſſive enough. "The philoſophers, ſays St. Cyril, have allowed three hypoſtaſes: they have extended the divinity to three hypoſtaſes: they have even ſometimes uſed the word Trinity: and nothing was wanting but to have admitted the conſubſtantiality of the three hypoſtaſes, to ſhew the unity of the divine nature, excluſive of all triplicity in reſpect of diſtinction of nature, and not to hold it neceſſary to conceive any reſpective inferiority of hypoſtaſes."

This term has occaſioned great diſſentions in the ancient church; firſt among the Greeks, and afterwards alſo among the Latins.

In the council of Nice, hypoſtaſis was defined to denote the ſame with *eſſence*, or *ſubſtance*; ſo that it was hereſy to ſay, that Jeſus Chriſt was of a different hypoſtaſis from the Father; but cuſtom altered its meaning. See Trinity.

Hypostasis, in *Medicine*, the ſediment of the urine, or that thick heavy part of the urine which ſubſides and ſettles at bottom.

HYPOSTATICAL, in *Theology*, is a term uſed in ſpeaking of the myſtery of the incarnation.

Hypoſtatical union, is a phraſe uſed by ſome divines for the union of the human nature with the divine in the perſon of Jeſus Chriſt.

Hypostatical *Principles*, among the *Chemiſts*, and particularly the *Paracelſiſts*, are the three chemical elements, *ſalt*, *ſulphur*, and *mercury*; called alſo the *tria prima*. See Principle and Element.

HYPO-SYNAPHE, in the *Greek Muſic*, the disjunction of two tetrachords ſeparated by the interpoſition of a third tetrachord conjoint with both; ſo that the homologous or relative ſtrings of the two tetrachords, disjoined by the hypoſynaphe, have the interval of five tones, or a minor ſeventh between them. Such are the two hypaton and ſynnemenon tetrachords.

HYPOTHECA, in the *Civil Law*, an obligation, whereby the effects of a debtor are made over to his creditor, to ſecure his debt.

The word comes from the Greek, ὑποθηκη, *a thing ſubject to ſome obligation*; of the verb ὑποτιθημαι, *ſupponor, I am ſubjected*; of ὑπο, *under*, and τιθημι, *pono, I put*.

As the hypotheca is an engagement procured on purpoſe for the ſecurity of the creditor, various means have been made uſe of to ſecure him the benefit of the convention. The uſe of the pawn or pledge is the moſt ancient, which is almoſt the ſame thing with the hypotheca; all the difference conſiſting in this, that the pledge is put into the creditor's hands; whereas, in a ſimple hypotheca, the thing remained in the poſſeſſion of the debtor. It was found more eaſy and commodious to engage an eſtate by a civil covenant than by an actual delivery: accordingly, the expedient was firſt practiſed among the Greeks; and from them the Romans borrowed both the name and the thing: only the Greeks, the better to prevent frauds, uſed to fix ſome viſible mark on the thing, that the public might know it was hypothecate, or mortgaged by the proprietor; but the Romans, looking on ſuch advertiſements as injurious to the debtor, forbad the uſe of them.

The Roman lawyers diſtinguiſhed four kinds of hypothecas: the *conventional*, which was with the will and conſent of both parties: the *legal*, which was appointed by law, and for that reaſon called *tacit*; the *prætor's pledge*, when by the flight or non-appearing of the debtor, the creditor was put in poſſeſſion of his effects; and the *judiciary*, when the creditor was put in poſſeſſion by virtue of the ſentence of the court.

The *conventional* hypotheca is ſubdivided into *general* and *ſpecial*. The hypotheca is *general*, when all the debtor's effects, both preſent and future, are engaged to the creditor. It is *ſpecial*, when limited to one or more particular things.

For the *tacit* hypotheca, the civilians reckon no leſs than twenty-ſix different ſpecies thereof.

HYPOTHECATE, from the Latin *hypotheca*, *a pledge;* to hypothecate a ſhip, is to pawn the ſame for neceſſaries: and a maſter may hypothecate either ſhip or goods, for relief, when in diſtreſs at ſea. For he repreſents the traders as well as the owners; and in whoſe hands ſoever a ſhip or goods hypothecated come, they are liable. 1 Salk. 34. 2 Litt. Abr. 95.

HYPOTHENAR, in *Anatomy*, a name given by Winſlow to two muſcles of the little finger. The abductor minimi digiti is his hypothenar minor; and the adductor oſſis metacarpi minimi digiti is the hypothenar metacarpi.

HYPOTHENUSE, or rather HYPOTENUSE, ὑποτεινουσα, *ſubtendens*, formed of ὑποτεινω, *ſubtendo*, *I ſubtend*, in *Geometry*, is the longeſt ſide of a right-angled triangle; or that ſide which ſubtends, or is oppoſite to the right angle.

Thus in the triangle ABC (*Plate* VIII. *Geometry*, *fig.* 100.) the ſide A C, oppoſite to the right angle A B C, is called the hypothenuſe.

It is a celebrated theorem in geometry, that in every rectilinear right-angled triangle, as A B C, the ſquare of the hypothenuſe, A C, is equal to the ſquares of both the other ſides, A B and B C. This is particularly called the Pythagorean theorem, from its inventor Pythagoras, who is ſaid to have ſacrificed a whole hecatomb to the Muſes, in gratitude for the diſcovery. For proof of this theorem, let A D be the ſquare on the hypothenuſe A C, and B G, B I, the two ſquares on the ſides A B and B C: let M B H be parallel to A E, meeting G F, produced, in H; and let E A be produced to meet G H in N, and D C to meet I K in O. If from the equal right angles G A B, C A N, the angle N A B, common to both, be taken away, there will remain N A G = B A C; whence, as the angle G is alſo = A B C, and the ſide A G = A B, the ſides A N and A C (= A E) are likewiſe equal; and therefore the parallelogram A M = the parallelogram A H (being both on equal baſes and between the ſame parallels); which laſt, and conſequently the former, is equal to the ſquare B G, ſtanding on the ſame baſe A B, and between the ſame parallels. By the ſame mode of reaſoning, the parallelogram C M is = the ſquare B I; and, conſequently, the ſquare A D (= A M + C M) = both the ſquares B G and B I. The ſame reaſoning is applicable to circles or any other ſimilar figures; *viz.* that any figure deſcribed on the hypothenuſe is equal to the ſum of the two ſimilar figures deſcribed on both the other two ſides.

HYPOTHESIS, ὑποθεσις, formed of ὑπο, *under*, and θεσις, *poſitio*, *of* τιθημι, *pono; I put*, in *Logic*, is a propoſition or principle which we ſuppoſe, or take for granted, in order to draw concluſions for the proof of a point in queſtion.

In diſputation, they frequently make falſe hypotheſes, in order to draw their antagoniſts into abſurdities; and even in geometry, truths are often deducible from ſuch falſe hypotheſes.

Every conditional or hypothetical propoſition may be diſtinguiſhed into hypotheſis and theſis: the firſt rehearſes the conditions under which any thing is affirmed or denied; and the latter is the thing itſelf affirmed or denied.

Thus in the propoſition, a triangle is half of a parallelogram, if the baſes and altitudes of the two be equal; the latter part is the hypotheſis, if the baſes, &c. and the former the theſis, a triangle is half a parallelogram.

In ſtrict logic, we are never to paſs from the hypotheſis to the theſis; that is, the principle ſuppoſed muſt be proved to be true, before we require the conſequence to be allowed. Dr. Barrow ſays, that hypotheſes, or poſtulatums, are propoſitions aſſuming or affirming ſome evidently poſſible mode, action, or motion of a thing, and that there is the ſame affinity between hypotheſes and problems, as between axioms and theorems; a problem ſhewing the manner, and demonſtrating the poſſibility of ſome ſtructure, and an hypotheſis aſſuming ſome conſtruction which is manifeſtly poſſible.

HYPOTHESIS, in *Phyſics*, &c. denotes a kind of ſyſtem laid down from our own imagination, by which to account for ſome phenomenon or appearance of nature.

Thus we have hypotheſes to account for the tides, for gravity, for magnetiſm, for the deluge, &c.

The real and ſcientific cauſes of natural things generally lie very deep: obſervation and experiment, the proper means of arriving at them, are in moſt caſes extremely ſlow; and the human mind is very impatient: hence we are frequently driven to feign or invent ſomething that may ſeem like the cauſe, and which is calculated to anſwer the ſeveral phenomena, ſo that it may poſſibly be the true cauſe.

Philoſophers are divided as to the uſe of ſuch fictions or hypotheſes, which are much leſs current now than they were formerly. The lateſt and beſt writers are for excluding hypotheſes, and ſtanding wholly on obſervation and experiment.

Whatever is not deduced from phenomena, ſays ſir Iſaac Newton, is an hypotheſis; and hypotheſes, whether metaphyſical or phyſical, or mechanical, or of occult qualities, have no place in experimental philoſophy. Phil. Nat. Prin. Math. in calce.

The Carteſians take upon them to ſuppoſe what affections in the primary particles of matter they pleaſe; juſt what figures, what magnitudes, what motions, and what ſituations, they find for their purpoſe. They alſo feign certain unſeen, unknown fluids, and endue them with the moſt arbitrary properties; give them a ſubtlety which enables them to pervade the pores of all bodies, and make them agitated with the moſt unaccountable motions. But is not this to ſet aſide the real conſtitution of things, and to ſubſtitute dreams in their place? Truth is ſcarcely attainable even by the ſureſt obſervations; and will fanciful conjectures ever come at it? They who found their ſpeculations on hypotheſes, even though they argue from them regularly, according to the ſtricteſt laws of mechanics, may be ſaid to compoſe an elegant and artful fable; but it is ſtill only a fable. Cotes in Præfat. ad Newton. Princip.

HYPOTHESIS is more particularly applied, in *Aſtronomy*, to the ſeveral ſyſtems of the heavens; or the divers manners wherein different aſtronomers have ſuppoſed the heavenly bodies to be ranged, moved, &c.

The principal hypotheſes are the Ptolemaic, Copernican, and Tychonic.

The Copernican is now become ſo current, and is ſo well warranted by obſervation, that the advocates of it hold it injurious to call it an hypotheſis.

HYPOTHETICAL *Propoſition* and *Syllogiſm*. See CONDITIONAL.

HYPOTRACHELION, from ὑπο, *under*, and τραχηλος, *neck*, in *Anatomy*, denotes the lower part of the neck.

HYPOTRACHELION, in *Architecture*, is uſed for a little frieze in the Tuſcan and Doric capital, between the aſtragal and annulets; called alſo the *colerin* and *gorgerin*.

The word is alſo applied by ſome authors, in a more general ſenſe, to the neck of any column; or that part of the capital thereof below the aſtragal.

HYPOTYPOSIS, or *Imagery*, Ὑποτύπωσις, formed of the verb ὑποτυπόω, *per figuram demonſtro, I ſhow, repreſent, or make any thing to be ſeen*; of ὑπό, *under*, and τύπος, *type, image, reſemblance*, in *Rhetoric*, a figure whereby a thing is deſcribed or painted in ſuch ſtrong and bright colours, that it does not ſeem to be read, or heard, but actually ſeen, or preſented before the eye.

Such is that elegant one of Cicero, wherein he paints the barbarity of Verres: "Ipſe inflammatus ſcelere et furore, in forum venit. Ardebant oculi; toto ex ore crudelitas emanabat. Expectabant omnes quo tandem progreſſurus, aut quidnam acturus eſſet; cum repente hominem corripit, atque in foro medio nudari ac deligari, et virgas expedire jubet. Clamabat ille miſer ſe civem eſſe Romanum, &c." Such is alſo the picture which he has drawn of Catiline, conſiſting of an unaccountable mixture of contrary qualities. Pro. Cœl. c. 5.

The hypotypoſis is frequently uſed by the poets, and particularly Virgil, who abounds in paintings.

This figure is peculiarly ſuited for drawing characters, and often affords the fineſt ornaments in poetry and hiſtory, as well as oratory. It is alſo adapted to move and intereſt different paſſions, according to the nature of the ſubject, and the artful management of the ſpeaker.

HYPOXIS, in *Botany*, from ὑπο, *underneath*, and ὀξυς, *ſharp*, alluding, as it ſhould ſeem from the generic deſcription, to the tapering and pointed baſe of the capſule. Linn. Gen. 166. Schreb. 221. Willd. Sp. Pl. v. 2. 106. Mart. Mill. Dict. v. 2. Brown. Prodr. Nov. Holl. v. 1. 288. Juſſ. 55. Lamarck. Illuſtr. t. 229. Gærtn. t. 11.—Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Coronariæ*, Linn. *Narciſſi*, Juſſ.

Gen. Ch. *Cal.* none. *Cor.* of one petal, ſuperior, in ſix deep, equal, ovate-oblong, ſpreading ſegments, permanent. *Stam.* Filaments ſix, very ſhort, capillary; anthers oblong, ſhorter than the petals. *Piſt.* Germen inferior, turbinate; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma three-cleft, bluntiſh. *Peric.* Capſule rather oblong, tapering at the baſe, crowned with the permanent corolla, and compoſed of three cells, not burſting. *Seeds* numerous, roundiſh, "with a lateral beak-like projection." *Brown.*

Eſſ. Ch. Corolla ſuperior, permanent, in ſix deep equal ſegments. Capſule tapering at the baſe, without valves. Seeds numerous, with a lateral beak.

Obſ. Mr. Brown, like Gærtner, deſcribes the capſule as not ſeparating into valves, which is true of ſome ſpecies, but the whole have not yet, in his opinion, been ſufficiently examined.

Undoubted ſpecies of *Hypoxis* are,

1. H. *erecta.* Linn. Sp. Pl. 439. Curt. Mag. t. 710. A native of dry paſtures in North America.

2. H. *ſobolifera.* Jacq. Ic. Rar. t. 372. Curt. Mag. t. 711. Found at the Cape of Good Hope.

3. H. *ſerrata.* Linn. Suppl. 197. Jacq. Ic. Rar. t. 369. Curt. Mag. t. 709. Found alſo at the Cape.

Theſe are bulbous herbs, with numerous radical leaves of a lanceolate form, channelled, hairy or ſmooth. Stalks radical, more or leſs corymboſe. Flowers reſembling thoſe of the Engliſh *Ornithogalum luteum*, yellow within, green underneath.

Willdenow enumerates 15 ſpecies in all, ſome of which are ſuſpected to be varieties.

H. *juncea.* Sm. Spicil. 15. t. 16. brought by the late Mr. Fraſer from Carolina, is ſuppoſed to be a ſtarved narrow-leaved variety of the *erecta*, the ſtalks of which are ſingle-flowered.

HYPOZOMA, in *Anatomy*, a name given to ſuch membranes as ſeparate two cavities.

In this ſenſe the mediaſtinum is an hypozoma.

HYPPASUS of Metapontus, or Crotonia, in *Biography*, is enumerated among the diſciples of Pythagoras, late in his life. Theon of Smyrna informs us, that Laſus and Hyppaſus ſeeking celebrity, and in order to avoid the tedioufneſs of calculation by the ratio of numbers, as Pythagoras found the proportions of intervals by means of hammers and ſtrings, his two diſciples diſcovered by means of different portions of water in two vaſes or glaſſes of equal ſize, and in uniſon with each other; that when one of them was half filled with water, leaving the other empty, the reſult was the octave 2 to 1. Then filling one vaſe or glaſs three parts full of water, and the other half full, they produced the proportion or conſonance of the 5th or 3 to 2; and, laſtly, four portions of water in one glaſs, and three in the other, produced the fourth or 4 to 3. The ſame proportions of conſonances were ſtill produced as in the Syrinx from reeds of different lengths, or by holes in the flute, or tibia.

This article has been inſerted by Padre Martini without telling us that he had proved it to be true by experiment.

HYPPIAS, according to Lucian, was an excellent muſician, and the firſt man of his time for geometry, perſpective, and aſtronomy. He was alſo a great architect. A deſcription of the magnificent baths of his conſtruction may be read in Lucian.

HYPPOPHORBION, in the *Ancient Muſical Inſtruments.* The Lybians, according to Pollux, invented a kind of flute called hyppophorbion, becauſe its ſound reſembled the acute neighing of a horſe.

The hyppophorbion was made of a ſtick of laurel ſtript of its bark and pith, and ſerved thoſe who had the care of horſes at paſture as a kind of lure or horſe-call.

HYPPOMACHUS, in the *Ancient Greek Muſic.* An eminent performer on the flute, perceiving one day at a public exhibition, that one of his diſciples of ordinary talents was violently applauded by the common people, ſilenced him by a blow of his cane; telling him that the greateſt proof of his ignorance was the being applauded by the mob.

HYPPONAX was the inventor of Iambic verſe, according to Athenæus, lib. 14.

HYPSA, in *Ancient Geography*, a river of Sicily, placed by Ptolemy between Heraclea and Agrigentum, and according to this geographer, diſcharging itſelf into the ſea to the ſouth of the latter city. It is now called *Belici*; which ſee.

HYPSELE, an epiſcopal town of Egypt, W. of the Nile, in a nome of which it was the chief place, called the Hypſelites nomos.

HYPSICLES, in *Biography*, an ancient mathematician who flouriſhed in the ſecond century, under the reigns of Marcus Aurelius and Lucius Verus, was a native of Alexandria, and a diſciple of Iſidorus. He was author of a work entitled "Ἀναφορικός, ſive de Aſcenſionibus," which was publiſhed at Paris by Mentelius, with the Optics of Heliodorus in 1657. He is ſuppoſed to be author of the 14th and 15th books of the "Elements of Geometry," which are commonly attributed to Euclid. Gen. Biog.

HYPSICRYMNOS, in *Ancient Geography*, a town in the vicinity of Caucaſus, ſaid by Æſchylus, in his Prometheus, to have been peopled by Arabs.

HYPSILOGLOSSUS, in *Anatomy*, the ſame with baſioglosſus. See HYOGLOSSUS.

HYPSILOIDES, from ὑψιλον, and ειδος, *form*, the ſame with *hyoides;* which ſee.

HYPSISTARII, HYPSISTARIANS, ὑψιςαριοι, formed from ὑψιςος, *higheſt*, in *Eccleſiaſtical Hiſtory*, a ſect of heretics in the fourth century; thus called from the profeſſion they made of worſhipping the moſt High God.

The doctrine of the Hypſiſtarians was an aſſemblage of Paganiſm, Judaiſm, and Chriſtianity. They adored the moſt High God with the Chriſtians; but they alſo revered fire and lamps with the Heathens; and obſerved the ſabbath, and the diſtinction of clean and unclean things, with the Jews.

The Hypſiſtarii bore a near reſemblance to the Euchites or Maſſalians.

HYPSOPHYLLUM, in *Surgery*, an ulcer under a cicatrix or ſcab.

HYPSUS, in *Ancient Geography*, a town of the Peloponneſus, in Arcadia, N. of Megalopolis.

HYPTIS, in *Botany*, a genus named by Jacquin from ὑπτιος, *reſupinate*, becauſe the limb of the corolla is turned, as it were, upon its back.—Schreb. 388. Willd. Sp. Pl. v. 3. 84. Mart. Mill. Dict. v. 2. Jacq. Collect. v. 1. 101. Juſſ. 449. Lamarck. Dict. v. 3. 184. Illuſtr. t. 507.—Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Gen. Ch. *Cal.* Perianth turbinate, permanent, divided half way down into five, lanceolate, acute, generally equal, erect ſegments. *Cor.* of one petal, ringent; tube funnel-ſhaped; throat dilated; limb ſpreading widely, reſupinate; the upper lip (which is reverſed as to its ſituation) cut into three, lateral, ovate, acute ſegments, the middle one roundiſh, concave, obtuſe; the lower lip (turned uppermoſt) is divided half way down into two half-ovate, flat, acute ſegments. *Stam.* Filaments four, awl-ſhaped, two ſhorter; anthers twin, dependent. *Piſt.* Germen four-cleft; ſtyle thread-ſhaped; ſtigma bifid or ſimple. *Peric.* none, the calyx protecting the four *ſeeds*.

Eſſ. Ch. Calyx five-toothed. Corolla ringent, reverſed, its upper lip bifid, lower one trifid, the middle ſegment formed like a little pouch. Stamens declined.

1. *H. verticillata*. Willd. n. 1. Jacq. Ic. Rar. v. 1. t. 113.—"Flowers in whorls. Leaves lanceolate, toothed."—A native of Hiſpaniola. It flowers in the ſtoves of Europe about November or December.—This *ſhrub* is about ten feet high, with one or two upright *ſtems*, which are ſmooth, browniſh-aſh-coloured, round and woody; the younger branches ſquare and herbaceous. *Leaves* oppoſite, on footſtalks, lanceolate, acute, unequally ſerrated, ſmoothiſh, from three to ſix inches long, ſlightly odorous. *Whorls* on the younger branches, at each pair of leaves, ſeſſile, ſix-flowered. *Corolla* white, with the ſegments of the upper lip purpliſh. *Calyx* a little hiſpid at the back and at the edges of the ſegments. *Anthers* pale yellow.

2. *H. capitata*. Willd. n. 2. Jacq. Ic. Rar. v. 1. t. 114.—"Flowers in little ſtalked heads. Leaves ovate, toothed."—This is alſo found in Hiſpaniola, flowering in December.—*Stem* rather ſhrubby, about a yard in height, ſquare, brown. *Branches* annual, ſubdivided, roughiſh. *Leaves* oppoſite, on footſtalks, veined, unequally ſerrated, rather hairy on both ſides, dark green; the lower ones wrinkled, about ſeven inches long. *Flower-ſtalks* bearing numerous white or bluſh-coloured *flowers* collected together into a ſemi-globular head. The *tube* of the corolla is a little hairy on its outſide, eſpecially on the back of the helmet. Whole plant inodorous.

Willdenow refers *Clinopodium rugoſum*, Linn. Sp. Pl. 882. to this genus, as well as *Clinopodium chamædrys*, Vahl. Symb. p. 3. 77; the former, under the name of *Hyptis radiata*, and the latter of *H. Chamædrys*.

HYPULUS, in *Surgery*, an ulcer under a cicatrix.

HYRAX, in *Zoology*, a genus of mammalia in the order Glires. The eſſential character conſiſts in having two broad and diſtant fore-teeth in the upper jaw, in the lower jaw four, of a flattened form, broad, notched, and placed contiguous; grinders large, tuberculated, and ten in number (or ſometimes eight); fore-feet four-toed; hind-feet three-toed; tail and clavicle none.

In the general aſpect this animal bears ſome reſemblance to the guinea-pig; the length from the muzzle to the end of the rump is about fifteen inches. The head is ſhort, the ſnout blunt, blackiſh, and without hair; the ears oval, open, brown, and woolly; the body thick and ſhort, and the belly prominent; the hair of the fur woolly, above or on the back browniſh, mixed with longer black and a few briſtles; the colour becoming grey in deſcending on the ſides, and being towards the abdomen whitiſh. The limbs appear very ſhort, the ſhoulders and thighs being concealed under the fur. The anterior feet are four-lobed, and each lobe is armed with a flat rounded nail; the poſterior feet are only two-lobed, but have beſides a toe which is furniſhed with a long ſharp claw.

According to Schreber there are two ſpecies of the hyrax genus, one of which is found at the Cape, the other an inhabitant of Syria. In this opinion he is followed by Gmelin, who thus deſcribes the two preſumed ſpecies under the names of Capenſis and Syriacus, "*Capenſis;* palmarum unguibus planis plantarum unico ſubulato,"—and "*Syriacus;* pedibus unguiculatis." Schreber. The ſpecies capenſis is that above deſcribed, and is the ſame as the Cavia capenſis of Erxleben, Marmotte du Cap of Buffon, and Cape cavy of Pennant. That called Syriacus is the animal mentioned by Bruce under the name of the "Lamb of Iſrael," and which that author concludes to be the Saphan of holy writ; it ſeems to differ principally from the former in being about two inches longer, the body more elongated in proportion, the muzzle longer, and the fur reddiſh-grey. The difference between theſe two animals is confeſſedly inconſiderable, inſomuch, perhaps, as to juſtify an idea that they may not be ſpecifically diſtinct; Sonnini is convinced they are the ſame, and confidently aſſerts it to be the only ſpecies of this genus known.

At the Cape this animal is called by the natives *klip-daas*, or rock badger, but as its haunts are the more retired, and inacceſſible parts of the mountains, its habits in a natural ſtate are little known; it is ſaid to form its retreat in the hollows of rocks and caverns, where it makes a litter compoſed of moſs and leaves that occaſionally ſerves to afford it reſt or nouriſhment, as herbage conſtitutes its natural food. Some writers, and among the number Dr. Pallas, ſeem to believe this animal forms burrows in the earth like the marmot and the badger, but this appears improbable when we conſider the flat and rounded form, as well as weakneſs of the toe-nails, the ſtructure of which is very different from thoſe of animals which we well know are deſtined by nature to ſcratch and burrow in the earth, the ſolitary toe nail on each of the poſterior feet excepted, and this, it is ſuppoſed, is principally uſeful to the animal in aſſiſting it to remove from the ſkin ſome portion of thoſe numerous pediculi with which it is infeſted and tormented. The fleſh of the hyrax is eſteemed by the inhabitants of the Cape good eating; the Hottentots endeavour alſo to diſcover its haunts for another reaſon as well as that of its capture, for they collect in the places

laces of its retreat a particular ſubſtance ſuppoſed by them to be depoſited from the urine of this animal after long expoſure to the air; and which they maintain to be a ſovereign remedy in many diſorders; the colour of this ſubſtance when dry is blackiſh, and the ſmell offenſive in the extreme.

When domeſticated the Cape hyrax becomes a familiar and intereſting animal, and one ſuſceptible of attachment. If called by any name by which it is accuſtomed to be diſtinguiſhed, it replies in a ſhort but ſharp and piercing cry, and approaches thoſe it knows in confidence. It dreads cold, and places itſelf cloſe to the fire when it can conveniently. The diſpoſition of this animal is remarkably timid. Thoſe tranſported from the Cape into European climates have been known to ſubſiſt on bread, potatoes, fruits, and various other vegetables.

HYRCAN I., John, in *Biography*, high-prieſt and prince of the Jews, was the ſon of Simon Maccabeus. On the invaſion of Judea by the Syrian governor in the year B.C. 139, he and his brother Judas led a body of troops, who entirely defeated the invaders. After his father's murder by his ſon-in-law, Ptolemy, he went to Jeruſalem, where he was declared Simon's ſucceſſor in the prieſthood and ſovereignty. This was in the year 135. Antiochus Sidetes laid ſiege to Jeruſalem, but was induced to grant a peace to the Jews upon condition of their diſmantling the city, and the payment of a large ſum of money. Hyrcan afterwards made an alliance of friendſhip with Antiochus, and accompanied him in his war againſt Phraates, king of Parthia, in which he did much ſervice, and after the death of Antiochus, he took advantage of the civil diſſentions prevailing in Syria, made himſelf maſter of ſeveral neighbouring towns, and entirely ſhook off all dependance on that crown. He afterwards became the aggreſſor, and made conſiderable conqueſts for his country, till at length he extended his dominion not only over Paleſtine, but alſo over the provinces of Samaria and Galilee, and the Jewiſh ſtate appeared with greater luſtre than under any of his predeceſſors ſince the captivity. He was zealous for his religion, and attached to the ſect of Phariſees, but a quarrel with that haughty and powerful body embittered the latter part of his life. He died in the year 107, and was ſucceeded by Ariſtobulus.

Hyrcan II., high-prieſt and king of the Jews, was eldeſt ſon of Alexander Jannæus; but at the death of his father, his mother Alexandra took the reins of government, and allotted to him the ſucceſſion of the prieſthood. On her deceaſe Hyrcan was declared king, but being of a quiet and unenterpriſing diſpoſition, he was quickly diſpoſſeſſed of his dignities, and reduced to a private ſtation. He was afterwards perſuaded by Antipater to accompany him to Arabia, in the vain hope of obtaining the aſſiſtance of king Aretas to reſtore him. The Romans, gained over by Ariſtobulus, the brother of Hyrcan, defeated Aretas, and the two brothers at length pleaded their cauſe in perſon before Pompey. In the year 63 B.C. Hyrcan was reſtored to his pontifical office with the title of prince, but he was diveſted of royalty, and made tributary to Pompey. He lived ſeveral years under the protection of the Romans; and was very much favoured by Cæſar, but at length he fell into the hand of his nephew Antigonus, who cut off his ears, in order to incapacitate him for the prieſthood. He was then carried into Parthia, where he was well treated, till he complied with an invitation from Herod to return to Jeruſalem, and reſume the pontificate. His honours were of ſhort duration, being beheaded by the tyrant when he was in the eightieth year of his age. Joſephus. Univer. Hiſt.

HYRCANIA, in *Ancient Geography*, a large country of Aſia, ſituated to the ſouth of the eaſtern part of the Caſpian ſea, hence called the Hyrcanian ſea. It had on the W. Media, on the S. Parthia, and on the E. Margiana. This country was mountainous, covered with foreſts, and inacceſſible to cavalry. It was ſeparated from Parthia by mount Corone. According to Ptolemy the Maxaræ, and S. of them the Chrindi, and alſo the Aſtabeni, were ſituated towards the ſea. Its towns were Barange, Adrapſa, Caſape, Aberbina, Amaruſa, Sinica, Hyrcania the metropolis, Sale or Sacæ, Aſmura or Aſmurna, and Mauſoca.

It is now well known that Timotheus, the Neſtorian pontiff, who had been raiſed to that dignity A.D. 778, converted to the Chriſtian faith by the miniſtry of Subchal Jeſu, whom he had conſecrated biſhop, firſt the Gelæ and Dailamites, by whom a part of Hyrcania was inhabited; and afterwards, by the labours of other miſſionaries, the reſt of the nations, which had formed ſettlements in Hyrcania, Bactria, Margiana, and Sogdia. It is alſo certain, that Chriſtanity enjoyed in theſe vaſt regions, notwithſtanding the violent attacks of the Mahometans, to which it was ſometimes expoſed, the advantages of a firm and ſolid eſtabliſhment for a long courſe of ages; while the biſhops, by whoſe miniſtry it was propagated and ſupported, were all conſecrated by the ſole authority of the Neſtorian pontiff.

Hyrcania, or *Hyrcanus Campus*, a country of Aſia Minor.

Hyrcania, a country of Aſia, S. of Babylonia; inhabited by the Hyrcanii, who, as well as the Sacs and Caduſians, occupied that diſtrict which lay between the Tigris and the Euphrates. Theſe people were powerful enemies of the king of Aſſyria; and an alliance with them was ſought for by Cyrus in his war againſt this prince. He formed of theſe people 2000 cavalry, and a very conſiderable body of infantry; and having diſpoſſeſſed the Aſſyrians of their garriſons on the frontier of the country, Cyrus aſſigned them to his new allies. The Hyrcanians, who inhabited Hyrcania, on the coaſt of the Caſpian ſea, were a ferocious people.

HYRGALE, a town of Aſia, in Phrygia Salutaris; ſituated on a river towards the northern part of this province. The chief magiſtrate bore the title of Archon. The worſhip of Cybele was eſtabliſhed in this city; but abandoned on the introduction of Chriſtianity. Its biſhop aſſiſted at the council of Chalcedon, in 451.

HYRIA, a town built by the Cretans, who aſſumed the name of Japyges Meſſapii. It was ſituated in the interior of the country between Tarentum and Brunduſium. Strabo calls it Ouria, and the Latins Uria. It is now Dria.

HYRYNSELMI, in *Geography*, a town of Sweden, in the government of Ulea; 34 miles N.E. of Ulea.

HYS, a town of the Arabian Irak, on the Euphrates; 120 miles S. of Bagdad.

HYSSOP, in *Botany* and *Gardening*. See Hyssopus.

Hyssop, *Common*, *Hyſſopus officinalis*, in the *Materia Medica*, is a native of Siberia, and the mountainous parts of Auſtria, and flowers from June till September. The hyſſop mentioned in the Old Teſtament is not ſuppoſed to be this plant, which is neither the *eſof* of the Hebrews, nor the ὑσσωπος of the Greeks. It was firſt cultivated in England by Gerarde in 1596, and is now extremely common in our gardens. The leaves of hyſſop have an aromatic ſmell, and a bitteriſh, moderately warm taſte. They give out their active matter both to water and rectified ſpirit; the watery infuſions are of a browniſh or greeniſh yellow, and the ſpirituous tinctures of a blackiſh green colour. On inſpiſſating the latter, the remaining extract retains its flavour, is bitteriſh, and very warm, and diſcovers a penetrating pungency, reſembling that of camphor. Water, diſtilled from the freſh herb, is found pretty ſtrongly impregnated with its flavour.

An eſſential oil is obtained from the diſtillation, which riſes to the ſurface, to the quantity of about an ounce from ſix pounds of the leaves: this oil is very pungent, and in ſmell exactly reſembles the hyſſop.

The ſtimulating quality of hyſſop is aſcribed to the quantity of eſſential oil which it contains; and with a view to its aromatic and ſtimulant effects, Bergius recommends it as an emmenagogue and antihyſteric; but it is chiefly employed as a pectoral, and has been long thought an uſeful medicine in humoral aſthmas, coughs, and catarrhal affections: for this purpoſe, an infuſion of the leaves, ſweetened with honey or ſugar, and drank as tea, is recommended by Lewis.

Hyſſop is greatly commended in caſes of bruiſes from falls, blows, &c. uſed externally by way of fomentations or cataplaſms, or only a little bundle of the plant ſewed up in a linen rag, and applied to the part. Ray gives an account from Mr. Boyle, of a violent contuſion of the thigh, from a kick of a horſe, which was happily cured by this herb, boiled and applied as a cataplaſm. He tells us, the violent pain was almoſt inſtantly removed, and the very mark and blackneſs taken off in a few hours. It is alſo recommended as a vermifuge by Roſenſtein. Woodv. Mat. Med.

Hyſſop was commonly made uſe of, as we learn from the ſcriptures, in purification. Thus God commanded the Hebrews when they came out of Egypt, to take a bunch of hyſſop, to dip it in the blood of the paſchal-lamb, and ſprinkle the lintel and two ſide-poſts with it. (Exod. xii. v. 22.) Sometimes a little wool was added to it of a ſcarlet colour. So in the purification of lepers, a bunch, compoſed of hyſſop, the branches of cedar, and red wood, was dipped in water, mingled with the blood of a bird, and with this the leper was ſprinkled. (Levit. xiv. v. 4.) David alſo alludes to theſe ceremonial cleanſings in his 51ſt Pſalm, v. 7th. "Purge me with hyſſop, and I ſhall be clean."—Cruden obſerves it is very probable that this plant grows to a great height in Judea, ſince it is ſaid in the Goſpel, that the ſoldiers having filled a ſponge with vinegar, they put it upon a ſtick of hyſſop and preſented it to our Saviour's mouth, who was then upon the croſs.

Hyssop, *Hedge*, in *Botany* and the *Materia Medica*. See Gratiola.

Hyssop, *Mountain*. See Thymbra.

HYSSOPIC Art, a name which Paracelſus gave to chemiſtry, conſidered as the art which purifies metals, minerals, &c. in alluſion to that text in the Pſalms, "Purge me with hyſſop, and I ſhall be clean."

HYSSOPUS, in *Botany*, generally taken for ὑσσωπος of Dioſcorides, derived by ſome from ὕω, *to rain*, or *to be ſhowered on*, and ὤψ, *the countenance*, becauſe the duſt of this plant, when dried and pulverized, was uſed in the Grecian ſacrifices for ſprinkling the head and eyes, as the Catholics now uſe holy water for the purpoſe of *croſſing* themſelves, and this operation was ſuppoſed to cleanſe the impurities of thoſe over whom hyſſop was ſprinkled. Profeſſor Martyn more juſtly deduces the word from the Hebrew, *Eſob*. Linn. Gen. 289. Schreb. 385. Willd. Sp. Pl. v. 3. 47. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 283. Juſſ. 113. Tournef. t. 95. Lamarck Dict. v. 3. 185. Illuſtr. t. 502.—Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, cylindrical, oblong, ſtriated, acutely five-toothed, permanent. *Cor.* of one petal, ringent; tube cylindrical, ſlender, as long as the calyx; throat inclined; upper lip ſtraight, flat, ſhort, roundiſh, emarginate; lower lip divided into three ſegments, the lateral ones ſhorter and obtuſe; the middle one crenate, obcordate, acute, with diſtant lobes. *Stam.* Filaments four, erect, longer than the corolla, diſtant; the two upper ones ſhorter, but the two longer ones nearer to the lower lip; anthers ſimple. *Piſt.* Germen four-cleft; ſtyle thread-ſhaped, under the upper lip, and of the ſame length; ſtigma bifid. *Peric.* none; the calyx containing the *ſeeds*, which are four in number, and ſubovate.

Eſſ. Ch. Corolla with a ſmall middle crenate ſegment in its lower lip. Stamens ſtraight, diſtant.

1. *H. officinalis*. Common Hyſſop. Linn. Sp. Pl. 796. Jacq. Auſtr. t. 254.—"Spikes all leaning in the ſame direction. Leaves lanceolate."—A native of the ſouth of Europe, flowering from June to September. *Root* woody, half an inch thick. *Stem* about 18 inches high, at firſt ſquare, then round. Leaves ſeſſile, the lower ones in pairs, narrow, ſmooth, entire, like thoſe of lavender, but ſhorter. *Flowers* in whorls, from the boſoms of the leaves, continued into a ſpike, of a blue colour, but varying to red and white. The whole plant has a ſtrong aromatic ſcent, and was cultivated in this country by Gerarde in the year 1596.

2. *H. Lophanthus*. Mint-leaved Hyſſop. Linn. Sp. Pl. 796. Jacq. Hort. Vind. v. 2. t. 182.—"Flowers reſupinate, lower ſtamens ſhorter than the corolla. Leaves cordate."—Native of Siberia, flowering in Auguſt and September. *Root* perennial, fibrous, ſending out many ſquare ſtalks, which divide into branches. *Leaves* heart-ſhaped, rough, pale on the under ſide. *Cluſters* of four or five purple flowers are produced at each joint of the ſtem. The tube of the corolla is longer than the calyx.

3. *H. nepetoides*. Square-ſtalked Hyſſop. Linn. Sp. Pl. 796. Jacq. Hort. Vind. v. 1. t. 69.—Stem ſharply quadrangular. Flowers in cloſe whorls. Leaves ovate.—Native of Virginia and Canada, flowering from Auguſt to October.—*Root* perennial. *Stem* erect, about four feet high. *Leaves* obliquely cordate, or ovate, ſerrated, acute, on ſhort footſtalks. *Flowers* yellow, in thick cloſe ſpikes four or five inches long; upper lip of the corolla divided into two roundiſh ſegments. *Seeds* brown.

There is a variety of this ſpecies with purple ſtalks and flowers, the leaves on longer footſtalks, and the ſpikes of flowers denſer, but Willdenow has made a new ſpecies of it, we preſume, under the name of *H. ſcrophularifolius*. Vide Willd. Sp. Pl. v. 3. 48.

Hyssopus, in *Gardening*, affords a plant of the low under-ſhrubby kind; of which the ſpecies cultivated is the common hyſſop (H. officinalis).

There are ſeveral varieties, as the blue-flowered, the white-flowered, the red-flowered, the long-ſpiked, with deep blue flowers, the curled-leaved, and the ſtriped-leaved.

Method of Culture.—This is a kind of plant which is capable of being raiſed by means of ſeeds, cuttings, and ſlips.

The ſeeds ſhould be ſown in a bed or border of light mould, prepared for the purpoſe, in the ſpring ſeaſon, being well raked in. When the plants appear, they ſhould be thinned where they ſtand too cloſe, and as ſoon as they are three or four inches in height, be planted out in the places where they are to grow. In the forming of edgings of this plant, the ſeeds may be depoſited in drills run along the edges of the borders, &c. where they are to grow, being covered in about half an inch in depth.

In the two latter modes, ſome of the more robuſt ſide-ſhoots ſhould be cut or ſlipped off, and planted in a ſhady border, or other place, in the latter part of the ſummer, at the diſtance of five or ſix inches from each other, water being immediately given, and occaſionally repeated. The plants ſoon take root, when in the autumn they may be ſet out where they are to grow.

It is the common blue-flowered hyſſop that is the kind moſtly made uſe of, and which is commonly cultivated either in cloſe rows, or by way of edging to beds and other parts, in which latter caſe the plants are kept regular and in order, by annual clippings. The rows ſhould be about fifteen or eighteen inches apart where that method is employed, and nearly at an equal diſtance between the plants in the rows.

They are the young leafy ſhoots and flower-ſpikes which are uſually employed, being cut as they are wanted. And the flower ſtems may be cut over during the ſummer, and be tied up in bunches for uſe.

Plants of the ſeveral different varieties may likewiſe be planted out ſeparately, in the borders, clumps, and other parts of the pleaſure grounds, in order to form ſmall buſhy plants for the purpoſe of ornament.

HYSTERA, a term uſed by ſome of the old writers in medicine to expreſs the fecundines.

HYSTERALGIA, in *Medicine*, from the Greek ὑστέρα, ſignifying the *womb* or *uterus*, and ἄλγος, *pain*, a term uſed by the noſologiſts to denote all the ſlow painful diſorders of that organ.

Sauvages deſcribes ſixteen ſpecies of hyſteralgia, diſtinguiſhing them by the various circumſtances by which the pain is excited. Thus he includes, under this genus, the pains ariſing from *prolapſus* of the uterus (Spec. 1. H. *ab hyſteroptoſi*); from *hernia* of the ſame viſcus (2. H. *ab hyſterocele*); from *dyſmenorrhœa*, or painful menſtruation (3. H. *à menoſtaſia*); from cancer of the uterus (4. H. *canceroſa*); from ulceration and ſcirrhus (5 and 6. H. *ulceroſa*, *ſcirrhoſa*); from pruritus in the uterus (7. H. *pruriginoſa*); from a bony ſubſtance in it (8. H. *ab oſſe*. See Hody, in Philoſ. Tranſact. vol. ix. p. 191.); from intermitting fever (9. H. *febricoſa*, Morton, Pyretologia, p. 92.); from hyſterical affections (10. H. *vaporoſa*); from abſceſs ſucceeding to inflammation of the uterus (11. H. *ex abſceſſu*. See Hysteritis); from the gradual diſtention of the uterus in pregnancy (12. H. *impregnatarum*); from ſuppreſſion of the milk (13. H. *lactea*); from the natural contractions of the uterus after delivery, during the diſcharge of the *lochiæ*, commonly called *after-pains* (14. H. *lochialis*); from a ſuppoſed tranſlation of the milk to the hypogaſtric region (15. H. *ab ſparganoſi*); and, laſtly, from calculous concretions formed in the uterus (16. H. *calculoſa*). See his Noſol. Meth. Claſs vii. Ord. 4. It will be obſerved, that ſome of theſe varieties of hyſteralgia, ſuch as thoſe connected with the enlargement of the gravid uterus (ſp. 12.) and the after-pains (ſp. 14.), can ſcarcely be conſidered as diſeaſes, unleſs they occur in an unuſual degree of ſeverity: while, on the other hand, ſome of them are extremely rare; ſuch as the caſe deſcribed by Hody (ſp. 8.), and the variety occaſioned by the preſence of calculi. The firſt and ſecond ſpecies, depending upon prolapſus of the vagina and hernia, can only be relieved by mechanical means, by which the uterus may be replaced in its natural ſituation. (See Prolapsus *Uteri*, and Hysterocele.) Ulceration and cancer of the womb conſtitute the moſt painful and diſtreſſing diſeaſes to which the female frame is ſubject, and will be treated of under their proper heads. See Womb.

But, in addition to theſe inſtances of hyſteralgia, there are caſes in which pain, referred to the uterus and its appendages, is a leading ſymptom, and cannot be aſcribed exactly to any of the cauſes above-mentioned. Such pains ſometimes come on a few weeks after delivery in married women, and are often dated from the laſt child-birth. They are moſt commonly accompanied by ſome irregularity in the menſtrual diſcharge, generally by an increaſe of it, or by alternations of a bloody, with a thinner, leſs coloured, and offenſive evacuation. The ſymptoms vary a little in different caſes, apparently according as the uterus itſelf, or its particular appendages are diſordered. In general the patient complains of pains in the loins, extending round the margin of the pelvis to the groin, on one or both ſides, and ſhooting down the thigh to the knee, or, in more ſevere caſes, even to the foot. Sometimes the pain is more ſtrictly referred to the uterus itſelf, or its neck, and the loins are ſcarcely affected; and ſometimes it is fixed, in one ſide, above the ilium, as if ſeated in the ovarium. In one caſe we have ſeen the diſeaſe confined apparently to the ovarium and ligaments of one ſide, in which there was great ſoreneſs of the part, where the round ligament paſſes to the pubes. The ſtomach is frequently diſordered by ſympathy, and the patient complains of nauſea, flatulence, and other ſymptoms of indigeſtion; and occaſionally ſome degree of febrile action attends theſe complaints.

Theſe forms of hyſteralgia are by no means unfrequent, eſpecially among the poor; and ſeem to originate often in ſome degree of chronic inflammation, and diſeaſed ſecretion in the uterus, conſequent on the irritations of child-birth, or produced by cauſes ſuddenly interrupting or deranging the lochial and menſtrual diſcharges. Sometimes it is probable that they are merely the ſigns of incipient ſcirrhus.

There are no medicines which operate ſpecifically upon the uterus. When there is clearly a feveriſhneſs connected with hyſteralgia, laxatives and diaphoretics are the moſt uſeful medicines, the pain being at the ſame time ſoothed by conium, opium, humulus, or other anodynes. The tincture of the hop, or humulus lupulus of Linnæus, has ſometimes appeared to afford eaſe in theſe caſes, when the other narcotics had failed; but perhaps this obſervation is applicable to any medicine of this claſs. When the hyſteralgia is connected with great weakneſs and lowneſs of ſpirits, and a conſiderable leucorrhœa, cordials and tonics, combined with the anodynes juſt mentioned, muſt be adminiſtered. In the caſe attended with pain and ſoreneſs in the courſe of the round ligament, the application of leeches to the groin, and the uſe of ſaline laxatives, afforded relief. In all theſe caſes reſt, or abſtinence from all motion, eſpecially from walking, ſeem to be beneficial; although perhaps negatively, by allowing the veſſels of the part to recover their natural actions, which the erect poſture and the irritation of walking tend to prevent. See Edin. Med. and Surg. Journal, vol. iv. p. 241.

In the volume of the Journal, juſt quoted, a caſe of hyſteralgia is related, which continued, without one day's ceſſation, for twenty-ſix years, yet no derangement in the ſtructure of the uterus, ſufficient to account for it, was diſcovered after death. See p. 168.

HYSTERIA, Hysterics, or *Hyſterical Affection*, from ὑστέρα, the *uterus*, or *womb*, implies literally the *uterine diſeaſe*; it denotes a ſtate of conſtitution, in which a variety of ſpaſmodic, convulſive, and painful affections occur, together with extreme variability of the ſpirits, and a frequent ſenſe of ſuffocation, from a ball riſing from the abdomen to the throat, which has been called the *globus hyſtericus*, and conſidered by ſome as the eſſential characteriſtic of the diſeaſe.

Other appellations have been given to the diſeaſe, with reference to its origin from the womb, eſpecially to the convulſive paroxyſms, or *hyſteric fits*, which have been called *ſuffocation of the womb*, *ſuffocatio uteri*, *fits of the mother*, &c. The appellation of *vapours* has alſo been applied to this diſeaſe in females, as well as to the hypochondriaſis in men; and from a ſimilar notion, that it is occaſioned by vapours, aſcending from the *uterus*, and affecting the brain, lungs, &c.;

&c. ; as vapours ariſing from the ſtomach, liver and ſpleen, were ſuppoſed to give riſe to hypochondriaſis.

All medical writers have admitted the difficulty of deſcribing, in a conciſe manner, the various forms of this diſorder, which exhibits ſuch a number of phenomena, which rapidly appear and change, that it imitates almoſt every diſeaſe of the nervous claſs, and even ſeveral of the more fixed and organic diſeaſes. "Dies me deficeret," ſays Sydenham, "ſi omnia, quæ adfectus hyſtericos gravant, ſymptomata enumerare velim ; tam diverſa atque ad invicem contraria ſpecie variantia, quam nec Proteus luſit unquam, nec coloratus ſpectatur chamæleon." (Diſſertatio Epiſtolaris ad Gul. Cole.) The moſt complete form of *hyſteria*, however, is ſeen in the paroxyſms, or *fits*, which occur at various periods, without any regularity. Theſe are commonly preceded by a ſenſe of laſſitude, coldneſs of the feet, and a copious diſcharge of pale limpid urine : often by pain in the head, loins, or ſtomach ; which latter organ, as the fits commence, is ſometimes affected with vomiting. The paroxyſms commonly begin by ſome pain and fulneſs felt in the left ſide of the belly. From this a ball ſeems to move, with a grumbling noiſe into the other parts of the belly ; and, making as it were various convolutions there, ſeems to move into the ſtomach, and more diſtinctly ſtill riſes up to the top of the gullet, where it remains for ſome time, and by its preſſure upon the larynx gives a ſenſe of ſuffocation. There is occaſionally much difficulty of breathing, and a palpitation of the heart at the onſet. By the time the diſeaſe has proceeded thus far, the patient is affected with a ſtupor and inſenſibility, while at the ſame time the body is agitated with various convulſions : the trunk of the body is writhed to and fro, and the limbs are variouſly agitated ; commonly the convulſive motion of one arm and hand, is that of beating with the cloſed fiſt upon the breaſt very violently and repeatedly. The whole of the belly, and particularly the navel, is often drawn ſtrongly inwards ; ſometimes there is a violent working, or alternate riſing and falling of the belly, attended with conſiderable noiſe. The *ſphincter ani*, during the fit, is ſometimes ſo firmly conſtricted as not to admit a ſmall glyſter-pipe, and there is at the ſame time an entire ſuppreſſion of urine. This ſtate continues for ſome time, with ſome remiſſions and renewals of the convulſive motions ; but they at length ceaſe, leaving the patient in a ſtupid and ſeemingly ſleeping ſtate. More or leſs ſuddenly, and frequently with repeated ſighing and ſobbing, together with a murmuring noiſe in the belly, the patient returns to the exerciſe of ſenſe and motion, but generally without any recollection of the ſeveral circumſtances that had taken place during the fit.

Such fits are very liable to recur from time to time, and during the intervals the patients are ſubject to involuntary motions, to fits of laughing and crying, with ſudden tranſitions from one to the other ; while ſometimes falſe perceptions and ſome degree of delirium alſo occur, as well as all the various incongruities of the diſeaſe to which we alluded above. The preceding account is that of the moſt common form of the *hyſteric paroxyſm* ; but this is conſiderably varied in different perſons, and even in the ſame perſon at different times. It differs chiefly by having more or fewer of the circumſtances above-mentioned, by the greater or leſs degree of violence of theſe, and by the different duration of the whole fit. See Cullen, Firſt Lines, par. 1514. *et ſeq.*

Sydenham has enumerated the principal varieties of form, which the *irregular hyſteria*, as it has been termed, aſſumes ; or, to uſe perhaps a more correct expreſſion, the principal diſorders of the functions, which take place in the intervals of the paroxyſms, or occur where the paroxyſms do not appear. "The diſeaſe," he ſays, "is not more remarkable for its frequency, than for the numerous forms under which it appears, reſembling moſt of the diſtempers wherewith mankind are afflicted. For in whatever part of the body it be ſeated, it immediately produces ſuch ſymptoms as are peculiar to that part ; ſo that unleſs the phyſician be a perſon of judgment and penetration, he will be miſtaken, and ſuppoſe ſuch ſymptoms to ariſe from ſome eſſential diſeaſe of this or that particular organ, and not from the *hyſteric paſſion*." (Loc. cit.) Dr. Ferriar, in his chapter on the "converſion of diſeaſes," has remarked that the converſions of hyſteria are very common ſources of error to young practitioners, and ſometimes deceive even the moſt experienced. "Whoever would preſent us with a good book," he ſays, on the *fallacy of ſymptoms*, which is greatly wanted, muſt be completely maſter of this unaccountable diſeaſe." Ferriar, Med. Hiſtories and Reflections, vol. ii. See alſo CONVERSION *of Diſeaſes*, where the ſubſtance of that ingenious diſſertation will be found.

"When the hyſteric diſpoſition is ſet in motion, the ſame author obſerves, it is not uncommon to find many of the different viſcera attacked by it in turns, and the diſeaſes peculiar to each counterfeited with much exactneſs. I have ſeen ſymptoms of paralyſis, jaundice, palpitation, and nephritis, ſucceed each other rapidly in the ſame patient, while ſome of the characteriſtic marks of hyſteria have been diſcernible, and where the unity of the diſeaſe was proved, by the diſappearance of all menacing affections, on the approach of regular fits. In one caſe, the bowels were attacked, and the ſymptoms of *enteritis* were ſo preciſely imitated, as to give much alarm for the patient's ſafety. I ſuſpected the real nature of the diſeaſe, from obſerving that the pulſe was ſoft and full, that the evacuations were natural, and that her ſpirits were agitated, even to involuntary emotions, by ſlight cauſes. This caſe terminated ſucceſsfully, on the acceſſion of clear hyſteric ſymptoms. Several years ago, I attended an elderly lady, for a complaint which ſeemed to vibrate between apoplexy and palſy : after lying for ſeveral weeks in a ſtate which afforded little hope of amendment, ſhe was affected with involuntary ſobbing and weeping ; the complaints in her head and limbs were converted into hyſterical convulſions, and ſhe recovered completely.

"It is very common to meet with ſyncope, or palpitations of the heart and great veſſels, accompanied with a ſoporific depreſſion, or extreme dejection of ſtrength and ſpirits, and converted, after deep ſighing or diſcharge of tears, into the hyſterical paroxyſm. In theſe caſes, the pulſe is ſometimes full and regular during the moſt alarming appearance of ſinking, and ſometimes variable to ſuch a degree, as to exclude all conjecture, excepting that of an hyſteric origin.

"I have met with ſeveral caſes of hyſterical hæmoptoë, in which the quantity of blood evacuated was very conſiderable ; ſix or eight ounces were ſometimes ſpit up daily, for a fortnight or three weeks ſucceſſively. Moſt of the uſual ſymptoms attended, which denote danger in this complaint, when it ariſes from other cauſes ; but the equal moderate ſtate of the pulſe, and the appearance of ſome degree of *globus hyſtericus*, ſeemed to determine the nature of the complaint ; a converſion accordingly ſoon took place to the ordinary hyſteric paroxyſm, and no bad conſequence followed the hæmorrhage from the lungs.

"In all ſimilar inſtances, the ſupervening hyſterical paroxyſm puts a favourable termination to the irregular appearances." Loc. cit.

Sydenham's account of theſe irregularities differs, in ſome reſpects, from the one juſt detailed ; eſpecially inaſmuch as he does not generally notice the ſolution of the local complaint by the occurrence of the regular hyſteric paroxyſm, which he mentions only as one of the forms which the diſeaſe aſſumes. He ſeems to conſider the copious diſcharge of limpid urine, as the chief characteriſtic of the hyſteric attacks, which counterfeit other diſeaſes; (Opera Univerſa, Edit. Lugd. Bat. 1726, p. 392. 394. 570. Wallis's Tranſlat. p. 111. 114. and 399, vol. ii.) but he looks upon this ſymptom as belonging in common to hyſteria in women, and to hypochondriaſis in men.

Among the diſeaſes which he has obſerved to be counterfeited by hyſteria, are *apoplexy*, when it attacks the head, which terminates in *hemiplegia*, and is chiefly ſeen in lying-in-women, after difficult parturition, attended with great hæmorrhage: the *clavus hyſtericus*, or acute pain in one ſmall ſpot in the head, which is often accompanied by vomiting, and *palpitation* of the heart; theſe are moſt frequent in delicate and chlorotic girls: pain in the ſtomach, colic, with porraceous vomiting, reſembling the *iliac paſſion*, terminating in *jaundice*, and always accompanied by great deſpondency; chiefly attacking women of lax fibre, who have ſuffered ſevere labours from large children: pains in the kidneys and bladder, like *fits of the ſtone*, with *ſuppreſſion of urine*; occurring in women much debilitated by previous hyſteric fits, and in a bad ſtate of health; who are alſo liable to long-continued *vomiting* and *diarrhœa*, without pain, diſcharging green bile. He likewiſe remarks, that the diſeaſe is liable to attack the external parts and muſcular fleſh, ſometimes cauſing pain, ſometimes ſwelling, in the throat, ſhoulders, hands, thighs, and legs, more eſpecially in the laſt; which ſwelling, however, is to be diſtinguiſhed from œdema, by being greateſt in a morning, by leaving no pit after preſſure with the finger, and by commonly affecting only one leg; though its external appearance much reſembles that of œdema. But the moſt ſevere of thoſe pains, is that which affects the back. He adds, that theſe pains have this circumſtance in common, that they all leave the parts extremely ſore and tender, as if they had been ſeverely beaten, ſo that they cannot bear the touch for ſome time; and that theſe pains and other ſymptoms are all preceded by a death-like coldneſs of the external parts. Diſſ. Epiſtolaris.

To conclude, the regular hyſteric paroxyſm ſometimes alternates with the *cataleptic* ſtate, in which the patient remains fixed in one inſenſible poſition (ſee CATALEPSY); ſometimes with a loſs of voice; with *carus*; and with various ſtates of mental derangement, as *nymphomania*, fatuity, &c.

Cauſes of Hyſteria.—The *prediſpoſing* cauſe of this diſeaſe appears to conſiſt chiefly in a certain mobility of the nervous ſyſtem, which is almoſt peculiar to the female conſtitution, the "varium et mutabile, fœmina," more eſpecially to females of a ſanguine temperament, and of a plethoric and irritable habit. The diſeaſe, therefore, is very rarely ſeen in the male ſex, and never in the ſame exquiſite degree in which it occurs in women. In the latter, it appears moſt generally from the age of puberty to that of thirty-five or forty years; very ſeldom before the firſt or after the laſt of thoſe periods; but at all ages, the time at which it moſt readily occurs is that of the menſtrual period, and it is often obviouſly connected with ſome irregularity or deficiency in the uterine functions; as with ſuppreſſed or difficult menſtruation, pain in the uterus, &c. It affects barren women, more than thoſe who are breeding, and therefore frequently young widows. It occurs eſpecially in thoſe females who are liable to nymphomania; and the noſologiſts have properly enough marked one of the varieties of this diſeaſe by the title of *hyſteria libidinoſa*. It is more frequent in cold than in hot climates.

The *exciting* cauſes of hyſteria, which readily operate on a conſtitution pre-diſpoſed to the complaint, are eſpecially all violent paſſions, and every conſiderable emotion of the mind, particularly thoſe brought on by ſurpriſe. Some females, liable to this diſeaſe, acquire ſuch a degree of ſenſibility, as to be ſtrongly affected by every impreſſion, however ſlight, that comes upon them ſuddenly and by ſurpriſe; even by diſagreeable odours, ſights, &c. An indolent life and a luxurious manner of living tend both to augment the pre-diſpoſition to the diſeaſe, and to call it into action. Any irritation, eſpecially in the alimentary canal or in the uterus, will excite hyſteria; whence it often accompanies a ſtate of inanition, or emptineſs of the ſtomach from long faſting (Sydenham, *loc. cit.*); the uſe of a ſtrong emetic or purgative (*idem.*); painful menſtruation; and an immoderate diſcharge of the menſes, either in child-bed, or at other times. It is alſo occaſionally excited by a prolapſus of the uterus, though more rarely; and it has been ſaid to follow the repreſſion or metaſtaſis of chronic cutaneous eruptions, intermittent fevers, and other acute diſeaſes.

As to the *proximate* cauſe of the diſeaſe, it may be remarked, that its paroxyſms appear to begin by a convulſive and ſpaſmodic affection of the alimentary canal, which afterwards influences the brain and a great part of the nervous ſyſtem. But, as Dr. Cullen obſerves, "although the diſeaſe appears to begin in the alimentary canal, yet the connection which the paroxyſms ſo often have with the menſtrual flux, and with the diſeaſes that depend on the ſtate of the genitals, ſhews that phyſicians have at all times judged rightly in conſidering this diſeaſe as an affection of the uterus and other parts of the genital ſyſtem." Par. 1520.

He confeſſes himſelf, however, unable to explain in what manner the uterus and the ovaria are affected in the diſeaſe; how the affection of theſe is communicated with particular circumſtances to the alimentary canal; or how the affection of this part, riſing upwards, affects the brain, ſo as to occaſion the particular convulſions which take place. To ſay that there is a great ſympathy between the uterine and digeſtive organs, is but to expreſs the fact in other terms; and with this general expreſſion we muſt be content at preſent.

Sydenham refers all the phenomena to the irregular motions of the animal ſpirits; which is a ſtill more hypothetical expreſſion of the fact, becauſe the very exiſtence of ſuch ſpirits is a mere aſſumption, which a better inveſtigation has rejected as altogether unfounded. He denies that the diſeaſe is to be aſcribed "to the aſcent of malignant vapours from the corrupted ſemen or menſtruous blood in the uterus to the parts affected, as ſome authors have aſſerted; or, as others affirm, to a latent depravity of the juices, or a collection of acrid humours." And his reaſon is very concluſive againſt the humoral pathology: "for," he ſays, "that the cauſe of the diſeaſe does not lie concealed in any morbific matter, appears evident from this ſingle inſtance. If a ſlender weak woman, otherwiſe uſually healthy, happens, by miſtake, to be debilitated and exhauſted by a ſtrong vomit or purgative, ſhe will be infallibly ſeized with ſome one of the concomitant ſymptoms of this diſeaſe; which would, by theſe means, rather have been carried off, than occaſioned, if the cauſe of it had been any preſent humour. The ſame may be ſaid of too great loſs of blood, whether it be taken away by bleeding, flows immoderately after delivery, or be diminiſhed by inanition and too long abſtinence from fleſh; all which would rather be preventive than productive of hyſteric diſeaſes, if the cauſe of theſe conſiſted in ſome kind of morbid matter; whereas, on the contrary, they are never more certainly occaſioned than by theſe evacuations." Nevertheleſs, Sydenham was unable to baniſh completely his prejudices in favour of the humoral pathology, although refuting it thus ſatisfactorily; and therefore, he maintains that "the irregular motion of the ſpirits generates putrid humours in the body;" and that theſe corrupt juices, collected in the blood, are ſent to various organs, producing chloroſis, and other cachectic diſeaſes. Loc. cit.

It would be quite ſuperfluous to enter into any diſcuſſion reſpecting the abſurd notions of the ancients, who attributed the diſeaſe either to the aſcent of vapours from the uterus, producing the ſenſe of ſuffocation and convulſions, or to the aſcent of the uterus itſelf, which was ſuppoſed to roam about the abdomen at times, and, by preſſing the diaphragm upwards, to give riſe to the ſymptoms. The latter opinion ſeems to have been held both by the philoſophers and phyſicians; for Hippocrates (de Natura Mulierum) and Plato (Timæus) have expreſſed the ſame notion; the latter comparing the uterus to an animal, deſirous of impregnation, and wandering through the whole body. Galen's knowledge of anatomy enabled him to refute theſe abſurdities (de locis affect. cap. 5.); and therefore the notion of riſing vapours was adopted, and it continued to be eſpouſed for a conſiderable period after the reſtoration of learning. For a ſtatement of the arguments, the reader may conſult Sennert. Pract. lib. i. ſect. 1. cap. 14. and lib. iv. part 2. ſect. 3. cap. 4. the works of Fernel, &c.

Of the Diagnoſis.—The hyſteric paroxyſm ſcarcely reſembles any other affection of the body, except occaſionally the paroxyſm of *epilepſy*; but in epilepſy, the convulſive motions are generally much more violent, and the inſenſibility more complete; there is foaming at the mouth, and a ſtate of coma or profound ſleep follows the fit; on the contrary, there is no *globus* riſing into the throat, no agitation of the abdomen, no ſcreaming, laughing, or crying, nor any copious diſcharge of limpid urine, as is common in the commencement of the hyſteric fit.

The diſeaſe in general has been conſidered by many phyſicians as the ſame with hypochondriaſis, the latter term being appropriated to it, when occurring in the male ſex, and hyſteria when it is found in the female. But this ſeems to be improper, if the ſymptoms of the two diſeaſes be accurately examined. They may have, indeed, ſome ſymptoms in common; but for the moſt part they differ widely. Spaſmodic affections occur in both; but they are generally local, confined to particular parts, and much leſs ſevere in hypochondriaſis, as well as much leſs frequent than in hyſteria. Indigeſtion occaſionally affects hyſteric patients; but they are often entirely free from it, which never happens in hypochondriacs. But the diſeaſes are ſtill more certainly diſtinguiſhed by the temperament which they uſually attack, and by the time of life at which they appear to be moſt exquiſitely formed: youth and a ſanguine temperament being moſt liable to hyſteria, while the middle or advanced periods of life, and a melancholic temperament, are peculiarly favourable to hypochondriaſis. Nor are they limited to the reſpective ſexes; for the male ſex, when youth and the ſanguine temperament, exquiſitely marked, concur, is not abſolutely free from the attacks of hyſteria; and inſtances of hypochondriaſis in the female ſex, of the oppoſite age and temperament, are very common.

With reſpect to the irregular forms of hyſteria, under which it reſembles many other diſeaſes, we have already anticipated the means of forming a diagnoſis. Dr. Ferriar conſiders the ſupervention of the regular paroxyſm as the principal ſource of diſcrimination: but as the diſeaſe is generally removed by this occurrence, it is deſirable to detect the nature of thoſe irregular affections at an earlier period. Beſides the copious diſcharge of limpid urine, which Sydenham conſidered as the pathognomonic ſymptom of hyſteric complaints, the ſame accurate obſerver deemed the ſtate of the mind a valuable index of their preſence; and it is obvious, from the obſervations above quoted from Dr. Ferriar, that he alſo attended to this point, and to the ſtate of the pulſe. As the moſt frequent exciting cauſes of hyſteric fits are ſome ſudden and ſtrong emotions of the mind, whenever Sydenham was conſulted by women concerning any particular diſorder, which could not be accounted for on the ordinary principles of inveſtigating diſeaſes, he always inquired whether they were not chiefly attacked with it after fretting or any diſturbance of mind; and if they acknowledged this, he concluded that the diſorder was of the hyſterical claſs, eſpecially when the other diagnoſtic, copious pale urine, at the ſame time occurred. Epiſt. ad Dom. Cole.

Although the paroxyſm of hyſteria is extremely alarming to the inexperienced obſerver, it is ſcarcely ever fatal in its own form, unleſs when it is induced by ſome very violent cauſe; and the diſorder generally diſappears in the decline of life. Inſtances have occurred, indeed, in which it has continued to harraſs a patient from the commencement to the ceſſation of the catamenial diſcharge, and then ceaſed.

Of the Cure.—In the treatment of hyſteria, as in many other diſeaſes, conſiderable diſcrimination will be required in the application of remedies, which muſt be varied according to the form or degree of the complaint, to the temperament, habit of body, and condition in life, of the patient, and to the nature of the cauſes exciting it. Although that peculiar mobility of the nervous ſyſtem, on which the diſorder chiefly depends, is moſt frequently connected with a plethoric habit, and a purely ſanguine temperament; yet this is by no means univerſal: for it is often obſerved in habits the reverſe of plethoric, in which a conſiderable degree of debility, and a pale and phlegmatic temperament prevail. In aſcribing the convulſive paroxyſms of hyſteria to a local plethora or turgeſcence of blood in the uterus, from the analogy of epilepſy and aſthma, which he refers to a turgeſcence of blood in the veſſels of the brain and of the lungs reſpectively, Dr. Cullen has obviouſly hit upon a falſe analogy, which will not bear him out in the explanation. For in the epilepſy and aſthma, the peculiar functions of the brain and of the lungs are diſordered by plethora of theſe organs; the functions of ſenſe and motion, in the one caſe, and of reſpiration in the other, are almoſt excluſively deranged. But in hyſteria, if the analogy were correct, the uterine functions ſhould be alone or principally diſeaſed: whereas the functions of the brain, the lungs, and the alimentary canal, are chiefly deranged, to which the ſuppoſed plethora does not extend. See Cullen, Firſt Lines, par. 1523.

Whatever notion be adopted as to the pathology of the diſeaſe, the curative indications ſeem to reſolve themſelves into two; namely, *firſt*, in the paroxyſm, to check its violence; and, *ſecondly*, in the interval, to endeavour to leſſen or remove the prediſpoſing and exciting cauſes.

The firſt indication will be fulfilled by different means, according to the ſtate of the patient's habit. If ſhe is of a robuſt and plethoric conſtitution, *blood-letting* is the moſt effectual antiſpaſmodic that can be employed; and when the convulſions are ſevere, or long continued, with a fluſhing or fulneſs of the veſſels of the face and external parts, it is the only antiſpaſmodic that can be adminiſtered with ſafety.

At the ſame time, the turgeſcence and activity of the blood-veſſels, and the conſequent over-irritation of the nervous ſyſtem, may be diminiſhed by the application of cold to the head and abdomen, or to the body in general. The uſe of nauſeating emetics has alſo been recommended for this purpoſe. Where the plethora is not ſo conſiderable as to warrant general blood-letting, cupping from the neck, or from any part in pain, may be ſubſtituted.

But in thoſe habits, which exhibit no marks of plethora or of conſiderable ſtrength, evacuations of blood, ſo far from being beneficial, are extremely detrimental, and are abſolutely enumerated among the cauſes which induce the diſeaſe. In ſuch conſtitutions, the hyſteric paroxyſm is to be diminiſhed or cut ſhort by ſtimulant and antiſpaſmodic medicines. Of theſe, opium, in its various preparations, is one of the moſt effectual; and its efficacy is conſiderably aided by a combination with the more diffuſible ſtimulants, eſpecially with æther and ammonia, or the volatile alkali. It is moſt commonly not difficult to force the patient to ſwallow twenty or thirty drops of ſulphuric æther and of tincture of opium, in any liquid, at the commencement or during the continuance of the fit; and this is frequently followed by a ſpeedy ceſſation of the ſpaſmodic motions. Various other ſtimulant medicines, eſpecially thoſe of ſtrong and pungent odour, may be adminiſtered with good effect under the ſame circumſtances; ſuch are the preparations of valerian, muſk, caſtor, camphor, aſſa-fœtida, oil of amber, oleum animale, &c. At the ſame time, any ſtrong impreſſion made upon the nervous ſyſtem will frequently arreſt the progreſs of the paroxyſm; as the application of any ſtrong-ſmelling ſubſtance to the noſtrils, ſuch as burning feathers, and volatile ſalts. The ſtimulus of heat may likewiſe be reſorted to for the relief of the paroxyſm, when it is obſtinate; and it may be applied to the whole body, by means of the warm bath; or to the lower extremities, in the way of pediluvium.

After the paroxyſm is over, the means for fulfilling the *ſecond* indication muſt be adopted, in order to prevent relapſes: and as the principal prediſpoſing cauſe and the leading feature of the hyſterical habit, (the great mobility of the nervous ſyſtem,) is connected with the oppoſite conditions of plethora and of inanition or debility, the firſt object will be to correct this prediſpoſition, by the means adapted to the removal of the one or the other of theſe conditions reſpectively. In robuſt and plethoric habits, the adherence to a moderate ſyſtem of living, to a light and ſpare diet, chiefly of vegetable matters, or weak animal broths, which may be taken in ſufficient quantity to diſtend the ſtomach, and relieve the ſenſation of inanition, without affording a copious nutriment, muſt be ſtrongly recommended. The uſe of ſtrong cathartics for this purpoſe is deprecated by Sydenham; becauſe the irritation of theſe medicines, and the ſudden depletion which they occaſion, when draſtic, are liable to excite the paroxyſms, in the mobile conſtitution of hyſterical perſons, and thus to produce the evil which it is the object of medicine to prevent. With a view to reduce the ſtrength and fulneſs of the habit, the conſtant repetition of hydragogue purgatives is ſurely not adviſable; but for other purpoſes they are requiſite, and ſhall be mentioned preſently. The gradual abſtraction of nutriment is the ſafeſt method of reducing the plethoric condition, eſpecially when combined with regular exerciſe. In the oppoſite ſtate of conſtitution, in thin ſpare habits, the oppoſite method of repleniſhing the ſyſtem by nutritious and full diet will neceſſarily be reſorted to, attending at the ſame time to the uſe of exerciſe. Sydenham obſerves that thin and bilious habits often derive the moſt eſſential benefit from a *diet of milk*, and that "ſome women have been cured of long and obſtinate hyſteric diſorders, which had baffled all the endeavours of the phyſicians, by living on milk only for ſome time." The hyſteric *colic*, he ſays, has eſpecially been removed by this diet, which, being much eaſier of digeſtion than a more heterogeneous mixture of food and drink, affords leſs irritation to the alimentary canal. On the whole, indeed, milk, as it partakes of a middle nature between that of the animal and vegetable aliments, and being in its qualities nearly aſſimilated to the chyle, affords the beſt means of reſtoring ſtrength to valetudinarians, and thoſe of weak digeſtive powers, where it agrees with the individual conſtitution. But where the debility is not ſo great, a moderate quantity of animal food, with ſome wine or fermented liquors, will be requiſite.

When the ſtate of plethora has been corrected, or pretty free evacuations have been made, and ſtill more particularly when the habit is ſpare and feeble, various tonic remedies are to be reſorted to, with a view to leſſen the irritability and to improve the general ſtrength of the conſtitution. Among tonic remedies, the metallic medicines have been found very ſerviceable, and eſpecially the various preparations of *iron*. After evacuations, and in debilitated habits without any previous evacuation, Sydenham preſcribed ſome chalybeate medicine to be taken for thirty days, conſidering it one of the moſt effectual ſtrengtheners. He preferred, as Baglivi, Hoffmann, and other able phyſicians have alſo done, to give the iron in ſubſtance; and as he affirms, he had never found or heard that it injured any one, who uſed it in this manner, ſo much experience had convinced him that it cures with more expedition and certainty than any of the common preparations. Dr. Cullen, however, gave the preference to the ſalts of iron, ſuch as the ſulphate and tartrite, and the ammoniated iron. The oxyd, which is precipitated by adding an alkali to a ſolution of the ſulphate of iron, and is in a ſtate of impalpable powder, is a very convenient form for exhibition. The *chalybeate waters* have been alſo drank with great benefit in hyſterical caſes; but, as has been before obſerved, the very minute portion of iron, contained in theſe waters, ſeems ſcarcely ſufficient to produce thoſe beneficial effects; and much of the advantage, gained during a courſe of the waters, is to be aſcribed to the other concomitant circumſtances, which tend to re-eſtabliſh the general health; namely, the conſtant exerciſe, the early and regular hours, the cheerful ſociety, and the various amuſements, which divert the attention of the patient from brooding over her feelings. See HYPOCHONDRIASIS.

Many other tonic and corroborant medicines, both of the metallic and vegetable claſſes, have been employed with benefit to reſtore the general ſtrength of hyſteric patients. Such are the oxyd and ſaline combinations of zinc, the ammoniated copper, and even the nitrate of ſilver, which have been adminiſtered in the intervals between the paroxyſms of *epilepſy* (which ſee). But the vegetable tonics, as being on the whole more ſafe, have generally had the preference; among theſe the *cinchona*, or Peruvian bark, ſtands moſt eminent for its ſtrengthening qualities. Where the ſtomach is particularly affected, the bark may be advantageouſly combined with ſome of the more aromatic bitters, all of which poſſeſs more or leſs of a tonic power; ſuch as the bark of the *caſcarilla*, the roots of gentian, and colombo, a powder or extract of the flowers of chamomile, &c. Sydenham conſiders the Peruvian bark as next to ſteel in its beneficial operation upon hyſterical females, and eſpecially in that form of it in which violent convulſions take place, and the patients beat their breaſts; or, in other words, where the regular paroxyſms occur with conſiderable violence. He likewiſe recommends an infuſion of gentian, angelica, wormwood, centaury, orange-peel, and other bitters, in *canary*, to be taken in the quantity of a few ſpoonfuls three times a day.

"But," the ſame intelligent phyſician remarks, "the beſt thing I have ever found for ſtrengthening and cheering the ſpirits, is riding on horſe-back ſome hours almoſt every day." This exerciſe, indeed, appears to have been conſidered by Sydenham as a *panacea* in almoſt all chronic diſorders; and, although confirmed conſumption may not yield to it ſo readily as his obſervations might lead us to expect, we are perſuaded, that in all diſeaſes, in which the alimentary and chylopoëtic viſcera are chiefly diſordered, this mode of exerciſe, ſteadily perſevered in, affords the moſt certain relief.

In attempting to reſtore the general ſtrength, and to leſſen the irritability of the nervous ſyſtem, all thoſe expedients, which are now well underſtood as being conducive to health, ſhould be employed with regularity and perſeverance. The forms of exerciſe, as well as the quantity of it, ſhould be proportioned to the ſtrength of the patient, and increaſed as the increaſing ſtrength renders it capable of being taken with ſlight fatigue. The clothing ſhould alſo be regulated, with attention to the varying conditions of the atmoſphere; and eſpecially with care, that in chilly weather, the deviations from the mean may be always on the ſide of warmth; the attempts to harden the conſtitution, in habits extremely delicate and irritable, being as pernicious as they are abſurd in principle. All anxieties and conſiderable emotions of the mind ſhould be avoided, as far as poſſible, and the cauſes of them removed. And there are circumſtances at times, which render it adviſable to change the ſexual condition of the patient, by marriage; by which the mental ſtate in ſome caſes may be probably relieved, and the uterus, being called upon to perform its natural functions, may likewiſe be reſtored to a more healthy condition.

From what has been ſaid above, in regard to the deceptive forms of the irregular hyſteria, when it mimics, as it were, the various organic diſeaſes, according to the organ in which it takes its ſeat, we by no means wiſh to miſlead the inexperienced into a belief, that theſe organs are not often ſeriouſly affected, and that active remedies are not often to be applied to them under ſuch diſorders. On the contrary, Sydenham has mentioned the hyſteric apoplexy as being ſometimes fatal. All that is to be underſtood by calling theſe local organic attacks *hyſterical*, is, that where they occur in a conſtitution, in which either imperfect paroxyſms of hyſteria, or the great nervous mobility and variable ſpirit of the hyſteric habit appear, in ſuch caſes the ſymptoms are to be conſidered as much leſs formidable than thoſe of ordinary organic diſeaſe, and as likely to yield more readily to remedies, which therefore require to be uſed with leſs activity and vigour, and to be repeated with more caution. Whenever the individual organs and their functions are greatly diſordered, it is the duty of the phyſician not to omit the remedies which experience has ſhewn to be effectual in reſtoring them to health in other caſes; watching, at the ſame time, the various concomitant appearances which may indicate the peculiar ſtate of the habit, and may lead him to diſcriminate the counter-indications. Such diſcrimination, however, is not peculiar to the treatment of hyſteria; it is in all diſeaſes requiſite, and the poſſeſſion and exerciſe of it conſtitute the principal characteriſtic of an experienced phyſician.

Before we conclude, we muſt obſerve, that the apprehenſions which Sydenham and many other phyſicians have entertained, relative to the danger of uſing purgatives freely in hyſteria, appear to have been carried to a degree far beyond what unprejudiced obſervation would lead us. In this, as in many other diſeaſes in which the alimentary canal is much deranged, a free purgation is not only ſafe, but moſt beneficial; and a conſiderable diſcharge of dark, offenſive, and unnatural fæces is often thus procured. Dr. Hamilton affirms, that he has adopted this practice with great ſucceſs, calling in at the ſame time the aid of fœtid and tonic medicines, which, however, he conſiders as merely ſubſidiary. At all events, though Dr. Hamilton may have kept one indication too excluſively in view, yet the leſſon which he has taught us, to unload the bowels in all theſe nervous caſes, is doubtleſs extremely important. See his Obſ. on the Utility of Purgative Med. 2d edit. chap. vii.

Hystericus *Lapis*, in *Natural Hiſtory*, a name given to an American ſtone, called alſo *lapis uterinus*, ſuppoſed to be famous for its virtues againſt diſorders of the womb, externally applied. It is black, and capable of a fine poliſh.

Hystericus *Clavus*. See Clavus.

HYSTERITIS, in *Medicine*, from ὑστερα, the *womb*, with the termination *itis*, uſed to denote inflammation, ſignifies inflammation of the womb. Sauvages, and ſome other writers, have employed the term *Metritis*, from μητρα, alſo ſignifying the *womb* or *uterus*, to denote the ſame diſeaſe. Noſol. Method. Claſs iii. Gen. 15.

The uterus is obviouſly liable to ſuffer inflammation, like the other viſcera of the body, from the common cauſes of inflammatory diſeaſe. In the unimpregnated ſtate, however, it is leſs frequently attacked by this diſorder than moſt of the neighbouring organs; and ſeldom, if ever, is thus affected, except about the periods when its veſſels are in a ſtate of increaſed action, in conſequence of the occurrence of the menſtrual diſcharge. At theſe periods, when not only the uterine ſyſtem, but the conſtitution in general, undergoes a ſlight erethiſm, or tendency to febrile excitement, ſudden expoſure to cold, violent exerciſe, great heats, or very high feeding, occaſionally bring on inflammation in the womb; more eſpecially in females of plethoric habit, and ſtrong fibre, who are accuſtomed to a ſyſtem of diet above the rules of juſt temperance. Where the uterus has become ſubject to inflammation in this way, it appears often to become unfit for the office of conception, and leaves the patient childleſs.

The moſt frequent cauſe of inflammation of the womb, however, is the irritation or injury which it is liable to ſuffer during the proceſs of parturition or abortion. When it is conſidered, indeed, how much preſſure different parts of this organ neceſſarily undergo, during theſe proceſſes, even by the long continued actions of the uterus itſelf upon the body of the child; and that, in the early part of labour, it not unfrequently occurs, that the lower ſegment of the uterus is protruded into the cavity of the pelvis, along with the head of the child, and in this ſituation is ſqueezed between the head and the ſides of the pelvis; (not to mention the occaſional neceſſity of uſing inſtruments;) it muſt be obvious that many cauſes of violence will be applied in a natural labour, and more in difficult and preternatural caſes. Perhaps the free diſcharge of the *lochia*, which is a neceſſary conſequence of the ſeparation of the *placenta*, anſwers the ſecondary purpoſe of local depletion, and thus, like a copious blood-letting inſtituted by art, prevents the evils which would otherwiſe be very likely to enſue. This ſuppoſition is rendered farther probable, from the circumſtance that inflammation of the uterus, when it comes on a few days after child-birth, commonly ariſes where the patient has been expoſed to cold, by being taken out of bed too early, (a practice deſervedly reprobated by Sydenham,) and is connected with a ſuppreſſion of the lochial diſcharge. See

Clarke's Eſſays on the Management of Pregnancy and Labour, &c. p. 59.

Inflammation of the ſubſtance of the uterus, when it exiſts ſimply, is tolerably well marked by its ſymptoms. It uſually begins about the ſecond or third day after delivery, and is firſt known to exiſt by a ſenſation of pain felt at the lower part of the abdomen, which gradually increaſes in violence, and is diſtinguiſhable from *after-pains* by its conſtancy. After-pains are intermittent, like the pains of labour, depending, like them, upon contractions of the uterus; but the pain of inflammation, ariſing from the uninterrupted action of the veſſels, is neceſſarily unremitting. The patient complains much of any preſſure applied externally to the region of the uterus; and this organ feels larger than common under the hand, as well as much harder, reſembling almoſt a ſtone in firmneſs. Marks of conſtitutional affection ſoon appear in the increaſe of heat over the whole body, a white and dry tongue, thirſt, head-ache, a hard, full, and ſtrong pulſe, (when the diſeaſe occurs in full habits,) and in all caſes a frequency of pulſe, from 100 to 120 ſtrokes in a minute. Very ſoon after the attack, the ſtomach is uſually affected with ſickneſs and vomiting; but this ſymptom is not invariably preſent. There is commonly a conſiderable degree of pain in the back, ſhooting round the pelvis to the groins, and down the thighs. Not only the lochial diſcharge, but alſo the ſecretion of milk is for the moſt part interrupted. The bowels are variouſly affected; often coſtive in the commencement of the diſeaſe, but frequently very looſe as it advances. The urine is commonly high-coloured, depoſiting ſometimes a pink-coloured ſediment, when it can be ſeen unmixed with the uterine diſcharges. It will ſometimes be found, when the diſeaſe has communicated with the neck of the bladder, or when the uterus and bladder have ſuffered, that ſuppreſſion of urine will take place, ſo that the catheter muſt be employed two or three times a day to draw it off. On the other hand, we have ſeen the inflammation apparently extend to the kidnies, in which caſe no urine was ſecreted for two or three days; yet the patient experienced the ſenſation of an urgent deſire to make water, probably from the inflammation being likewiſe communicated to the neck of the bladder. If the inflammation is very great, it may ſpread to the peritoneum, covering the fundus of the uterus, and lining the cavity of the belly; in which caſe there is great ſwelling, tenſion, and ſoreneſs of the belly, and other new ſymptoms ariſe, ſuch as characterize the child-bed fever, deſcribed in another place. See PERITONITIS *Puerperarum*.

In the progreſs of the diſeaſe, ſlight ſhiverings frequently take place at different times in the day, while the acuteneſs of the pain is diminiſhed, and the face of the patient becomes occaſionally fluſhed. Theſe ſymptoms, together with the increaſed frequency and weakneſs of the pulſe, mark the tendency of the diſeaſe either to ſuppuration, or to a dangerous failure of the vital powers. The tongue puts on a fiery red or ſcarlet appearance, which is often followed by aphthæ: ſymptoms of great general irritation ſucceed; and the patient is often cut off in a ſhort time. Now and then, however, a flow of fœtid lochia relieves theſe ſymptoms, the pulſe becomes leſs frequent; the fluſhings more rarely appear; the tongue grows paler, and the ſkin, which before had been hot and dry, now relaxes and is cooler; a ſpontaneous diarrhœa comes on, and the patient recovers. (Clarke, loc. cit.) The caſe is more favourable, and the proſpect of recovery greater, where theſe ſhiverings and fluſhings have never occurred; but where the uterus gradually becomes ſofter, and leſs tender on preſſure, the lochial diſcharge returns in its uſual quality and quantity, and the ſecretion of milk begins again.

Of all the acute diſeaſes, to which women are liable in the puerperal ſtate, inflammation of the womb appears, on the whole, to be the leaſt fatal; partly, perhaps, becauſe the pain and fever accompanying it, at a time when the patient is neceſſarily under the care of her medical attendant, ſpeedily call for the application of remedies. When the diſeaſe deſtroys life, it is uſually by ſymptoms of exceſſive irritation: ſometimes it goes on to ſuppuration; but rarely, it would ſeem, to mortification. It is true, as Dr. Clarke obſerves, that mortification has been often deſcribed as occurring in the uterus; but he is ſatisfied from experience that this has been chiefly ſaid to happen by perſons not habituated to the examination of the bodies of women who have died in child-bed, and who have miſtaken the appearance of that part of the uterus, to which the placenta had adhered, for gangrene: whereas, it is commonly only the remainder of the maternal portion of the placenta, and of the coagula of blood formed at the extremities of the large veſſels of the uterus, upon the ſeparation of the placenta; and a very little attention, by gently ſcraping off this ſubſtance, will detect the ſound internal ſurface of the uterus beneath.

On diſſection, after death produced by *hyſteritis* in puerperal women, the uterus is commonly found very firm in its ſubſtance, but larger than when naturally contracted. Upon cutting into it, *pus* is often found, which is ſituated in the large veins, and not in any circumſcribed cavity, like that of an abſceſs. Inflammation is often obſerved running along the Fallopian tubes, and into the ovaria, which when cut open are found loaded with blood. Pus is alſo ſometimes found in the cavity of the Fallopian tube, as well as in the ſubſtance of the ovaria, which are in ſome caſes diſtended by inflammation and matter, ſo as to equal in bulk a pigeon's egg. When the inflammation has exiſted in the uterus ſimply, little or no extravaſated or ſecreted fluids have been found in the cavity of the abdomen: the peritoneal ſurfaces have alſo been diſcovered free from diſeaſe in ſome caſes. In others, however, the peritoneum which covers the uterus has been obſerved to be partially inflamed, as well as that covering the poſterior part of the bladder. Clarke, loc. cit. Baillie, Morbid Anatom. p. 364, 2d edit.

When the ſymptoms of inflammation of the uterus concur with the puerperal ſtate, or ſevere abortion, little doubt will ariſe as to the ſeat of the diſeaſe. But when it occurs in the unimpregnated ſtate, the ſymptoms may be miſtaken for thoſe of inflamed bowels, kidnies, or bladder, if not very attentively inveſtigated. When, however, we obſerve a woman complaining of a burning pain, with a ſenſe of weight and diſtention in the lower part of the belly, the pain being conſtant, fixed, and throbbing; when there is alſo a pain in the loins, frequently ſhooting round the pelvis to the groins, and down the thighs, and in addition to theſe, an acute fever, with ſickneſs at the ſtomach, and extreme reſtleſſneſs, little doubt can remain reſpecting the exiſtence of inflammation in the uterus. An examination *per vaginam*, when the *os uteri* will be found extremely tender and painful to the touch, will more completely decide the matter, where it is permitted. The inflammation, however, is liable to become complicated, in this caſe too, by extending to the kidnies, bladder, and other contiguous parts; and a degree of ſtrangury and *teneſmus* (or fruitleſs deſire to go to ſtool) is liable to occur from the mere vicinity of the uterine irritation.

Cure of Hyſteritis.—As the diſeaſe, therefore, is often extended to different organs at the ſame time, and the ſymptoms muſt neceſſarily be rather complicated, the functions of all the ſuffering organs being in ſome meaſure deranged, an accurate diſtinction of the ſeat of the diſorder is often difficult. This, however, is the leſs important, as the ſame remedies will remove the inflammation, in whichſoever viſcus it may occur. Of theſe, *blood-letting* is the moſt efficacious; and, even in the puerperal ſtate, in ſtrong conſtitutions, it ſhould be early and liberally employed. In the diſeaſe happening independent of parturition, it cannot be omitted with ſafety, perhaps, under any circumſtances; but the repetition of it muſt be determined by the conſtitution of the patient, the violence of the ſymptoms, and the effect of the previous bleeding on the diſeaſe. It may frequently be found neceſſary a ſecond and a third time. But in leſs robuſt habits, it will be expedient, if the ſymptoms, although diminiſhed, have not been entirely removed by the firſt bleeding, to take away more blood by applying ſix or more leeches, incloſed in a baſin, to the belly, or by cupping the ſkin of the abdomen. *A bliſter* may be alſo applied to the belly, as near the ſeat of the pain as may be. Dr. Clarke, however, is of opinion that theſe applications are not ſo beneficial in this affection, as in ſome other inflammatory diſorders; and thinks that he has often obſerved them to increaſe the frequency of the pulſe, and the irritation in the ſyſtem at large. At the ſame time, the decided advantages obtained from bliſters, in peripneumonies and other internal inflammations, lead him to ſpeak heſitatingly againſt the general employment of them. Gentle *cathartics*, eſpecially of the ſaline claſs, are evidently uſeful in the caſe of hyſteritis, unconnected with child-birth; but in that which follows delivery, a courſe of purging is not to be recommended. It is always right, indeed, in the firſt inſtance, to procure two or three evacuations from the inteſtines; but, afterwards, it will generally be enough to preſerve the regular motions of the bowels, by giving, from time to time, ſmall quantities of caſtor oil, or a little rhubarb mixed with ſome ſaline purgative. Dr. Clarke ſtates this objection to long continued purging, that it has the effect of preventing that gentle perſpiration, which, if it can be produced and kept up, does more towards curing the diſeaſe than any internal remedy can effect. With a view of producing this ſalutary determination to the ſkin, ſmall doſes of antimony and opium, or the compound powder of ipecacuanha, which bears the name of Dr. Dover, with the addition of a little rhubarb, and an occaſional ſaline draught, may be uſefully adminiſtered. In caſe a ſpontaneous diarrhœa ſhould come on, it ſhould not be interfered with, farther than taking care that the ſtrength of the patient be not too much reduced by it. Except where there is reaſon to ſuſpect the exiſtence of undigeſted or indigeſtible aliment in the ſtomach, the action of vomiting ſhould always be avoided; inaſmuch as it conſtantly increaſes the pain by the agitation which it occaſions, and the preſſure made by the muſcles of the abdomen on the inflamed uterus.

It is ſcarcely neceſſary to add, that, during the whole courſe of the diſeaſe, every thing heating and ſtimulating ſhould be cautiouſly avoided; that the food of the patient ſhould be of a mild and digeſtible nature, conſiſting of liquid and vegetable ſubſtances, and her drink watery and diluent, every ſort of animal food, and of fermented and ſpirituous liquors, being abſtained from.

As hyſteritis occurs, both connected with and independent of parturition, particularly in thoſe who indulge in full diet, and in the uſe of heating food and liquors; ſo the prevention of the diſeaſe muſt depend principally upon temperance and regularity in this reſpect. In the former caſe, this end may be obtained by attention to the proper management of the woman both before and during labour.

If the diminution of pain, and the acceſſion of ſhiverings, announce the commencement of ſuppuration, little, it is to be feared, can be done by medicine. Under ſuch circumſtances, a great proportion of patients will be carried off. The moſt favourable tendency of the ſuppuration will be, when the pus is in the veins of the uterus, or in the Fallopian tube, that it may eſcape into the cavity of the uterus. The only means within the power of the phyſician, in this caſe, are to recommend a milk-diet, or ſome other light and nutritious aliment, and to ſoothe the irritation and pain by moderate doſes of narcotic medicines.

HYSTERIUM, in *Botany*, a name given by Perſoon and others to a ſpecies of Fungi, compoſed of various ſpecies, amongſt which is the *Lichen pulicaris* of preceding authors, but this name will probably not be retained.

HYSTEROCELE, in *Surgery*, a rupture, or hernia, containing the uterus. The term is derived from ὑστερα, *the womb*, and κηλη, *a tumour*. See Hernia.

HYSTEROCYSTICA Ischuria, a retention of urine, ariſing from the preſſure of the uterus upon the bladder.

HYSTEROLITHUS, formed of ὑστερα, *womb*, and λιθος, *ſtone*, or *Cunnolithus*, in *Natural Hiſtory*, a ſtone thus called, from its reſemblance to the external parts of generation of the female ſex. This is a ſpecies of helmintholithus in the Linnæan ſyſtem. Theſe ſtones are found in great abundance near the caſtle of Braubach, upon the Rhine, on the confines of the landgravate of Heſſe.

Hysterolithus is alſo a name given by Ol. Wormius (Muſeum, p. 83.) to the caſt or inſide impreſſion of a ſort of Anomia ſhell, as Dr. Woodward ſtates in his Letters on the Method of Foſſils (p. 10.), and thus ſhews the abſurdities of the tales which had been related of this ſtone. This ſpecies of anomia occur with mytilites, in argillaceous rubble-ſtone, or ſlate. Kirwan's Geo. Eſſays, p. 244.

HYSTEROLOGY, Ὑστερολογια, ſignifying a *diſcourſe inverted*, in *Rhetoric*, a ſpecies of hyperbaton, or a vicious manner of ſpeaking, wherein the natural order of things is inverted; called alſo by the Greeks ὑστερον προτερον; *q. d.* putting the firſt thing where the laſt ſhould be.

Thus Terence uſes *valet & vivit*, for *vivit & valet.* And Virgil *moriamur & in media arma ruamus*, for *in media arma ruamus & moriamur.* Quintilian expoſes this fault, lib. xi. cap. 2. where he ſays, *quædam——turpiter convertuntur, ut ſi* peperiſſe *narres, deinde* concepiſſe; *in quibus, ſi id quod poſterius eſt dixeris de priore tacere* optimum *eſt.*

HYSTEROPHORUS, in *Botany*. See Parthenium.

HYSTEROPOTMI, Ὑστεροποτμοι, in *Antiquity*, the ſame with deuteropotmi.

HYSTEROPTOSIS, in *Surgery*, a bearing down of the uterus.

HYSTEROTOMIA, from ὑστερα, *the womb*, and τομος, *a ſection*, the operation of cutting through the parietes of the abdomen into the uterus, for the purpoſe of extracting the fœtus, a proceeding ſometimes neceſſary: the Cæſarian ſection.

HYSTEROTOMOTOCY, Ὑστεροτομοτοκια, an operation more uſually called the Cæſarian ſection.

HYSTRIX, in *Zoology*, a genus of mammalia, in the order Glires, the fore-teeth in which are two in number, and cut off obliquely; the grinders eight; toes either four or five; and the body covered with ſpines and hair. Theſe conſtitute the porcupine genus of Engliſh writers.

Species.

Cristata. Anterior feet four-toed; poſterior pair five-toed; head creſted; tail ſhort. S. G. Gmelin. *Hyſtrix capite criſtato*, Briſſ. *Hyſtrix*, Geſner, &c. *Stachelſchwein*, Ridinger. *Porc-epic*, Buff. *Creſted porcupine.*

The length of this ſpecies is about two feet; the head long and compreſſed; the ſnout ſhort and obtuſe; the upper lip cleft to the noſtrils; eyes ſmall, and black; ears oval, broad, and ſhort; tail conic and ſpinous; feet ſhort; hair between the ſpines cinereous; the ſpines long, ſtout, ſmooth, and annulated with black and white. The longeſt of theſe ſpines, and alſo the briſtles of the neck, it is able to erect at pleaſure. This animal is found in Aſia, Africa, and the ſouth of Europe, as Italy and Spain; it burrows in the earth, where it forms a number of convenient apartments, with a ſingle entrance. During the day time the porcupine remains in its burrows; which it leaves at night in ſearch of fruits, roots, herbs, and other vegetables of which its food conſiſts. When frightened it rolls itſelf up like the hedgehog, and preſents its formidable armament of ſpines, for it has no other means of defence, but this is alone ſufficient to repel the temerity of moſt animals that venture to attack it. The porcupine brings from two to four young at a litter, is eaſily tamed, and the fleſh is reputed excellent for the table. There appear to be ſeveral varieties of the common porcupine.

Prehensilis. Feet four-toed; tail long, prehenſile, naked at the end beneath. Schreber. *Hyſtrix Americanus*, Briſſ. *Cuandu Braſilienſibus, Luſitanis Ourico cachieno*, Marcg. *Braſilian porcupine.*

A native of the woods of Brazil, New Guinea, and New Spain. This ſpecies climbs trees, feeds on fruits and ſmall birds; grunts like the ſwine, rolls itſelf up, ſleeps in the day, is eaſily tamed, and is taken for the ſake of its fleſh, which is eſteemed an article of food. The length of the body is about fifteen inches; the tail ſeven inches; the whiſkers are long and white; feet cinereous; claws ſtrong and black. A ſuppoſed variety, with the tail longer and ſpines ſhorter, (Hyſtrix longius caudatus, brevioribus aculeis,) is deſcribed by Barrer. Fr. équin. The animal called Hoitztlacuatzin, ſeu Tlacuatzin, by Hernandez and Nieremberg, is preſumed by Gmelin to be another variety of this kind; it has the tail ſhort and thick; a third kind is ſaid to be ſmaller than the common Braſilian porcupine, and has the head white.

Mexicana. Tail long, prehenſile; hind feet four-toed; ſpines nearly concealed among the long hair. *Mexican porcupine.*

Length eighteen inches; tail nine inches; body duſky. This kind inhabits Mexico.

Dorsata. Interior feet four-toed; hind feet five-toed; back ſpinous. Schreber. *Hyſtrix piloſus Americanus*, Cateſby. *Cavia Hudſonis*, Klein. *Urſon*, Buffon. *Hudſon's-bay or Canadian porcupine.*

Inhabits North America; the body is ruſty brown above; tail beneath white at the tip; and the ſpines nearly concealed among the hair. This animal is nearly the ſize of the hare; it digs holes under trees, and feeds on fruits and the bark of the juniper. The Canadian porcupine is ſometimes found entirely white.

Macroura. Feet five-toed; tail very long; ſpines clubbed or jointed. Schreber.—*Porcus aculeis ſylveſtris*, Seba.

The ears in this ſpecies are ſhort and naked; the tail the length of the body, the tip crowned with a tuft of long, knotted, ſilvery hairs; body ſhort and thick; ears ſhort and naked; and the eyes large and bright. Inhabits the woods of the iſlands in the Indian ocean.

HYTH, or Hith, a port, wharf, or little haven, to embark or land wares at. Such is *Queen-hith*, &c.

HYTHE, or Hithe, in *Geography*, a market town and one of the principal Cinque Ports, is ſituated in the pariſh of Saltwood, hundred of Heane, and county of Kent, England. Its name ſignifies, in Saxon, a port or haven; and it was anciently of far greater importance, as a maritime town, than at preſent. Leland ſays, "it hath bene a vere great towne yn length, and conteyned iiii paroches, that now be clene deſtroied; that is to ſay, St. Nicolas paroche, Our Lady paroche, St. Michael's paroche, and our Lady of Weſthithe."—And again—"to cownt from Weſthive to the place wher the ſubſtans of the towne ys now, ys ii good myles yn length al along on the ſhore." He mentions a fire in the reign of Edward II, which deſtroyed nearly four hundred houſes, and was followed by a peſtilence; ſo that the town was greatly diminiſhed. In the beginning of the next century, it again ſuffered much by ſimilar viſitations. At the time of the maritime ſurvey, in the reign of Elizabeth, there were 122 inhabited houſes in Hythe, and perſons "lacking habitation" ten: its ſhipping conſiſted of "ſeventeen traivellers, at five tuns; ſeven ſhoters, of fifteen tuns; three crayers, of thirty tuns; and four crayers, of forty tuns." Since this ſurvey, the haven has been wholly loſt, and the ſea beach is now nearly three quarters of a mile from the town. According to the returns under the act of 1801, the number of houſes in Hythe was 217; that of inhabitants 1365. The houſes are chiefly compriſed in one long ſtreet, running parallel with the ſea; but having two or three leſſer ones branching off at right angles. The civil government of the town is veſted in a mayor, twelve jurats, and twenty-four common-council-men; by whom, together with the freemen, the repreſentatives are elected; the number of voters being about 180. The firſt return of barons to parliament from this port, was in the forty-ſecond year of Edward III. The church occupies a very elevated ſituation on the acclivity of the hill above the town. It is built in the form of a croſs, with a tower at the weſt end, and appears to have had originally another tower, riſing above the roof, from the interſection of the nave and tranſept. The weſt tower, with the ſouth end of the tranſept, was rebuilt between the years 1748 and 1751, at which time the whole church underwent a general repair. Near the altar, on the ſouth ſide, but partly concealed by the wainſcotting, are four beautiful ſtone ſeats, with trefoil heads, and a range of circles and quatrefoils above them. The church-yard commands a fine view of the ſea, and coaſt of France. Near the middle of the principal ſtreet are the court-hall and market-place; and in one of the ſtreets leading towards the beach, on the oppoſite ſide, is a ſmall theatre. In this pariſh are two hoſpitals, or alms-houſes, of ancient foundation; the one called St. John's, the other St. Bartholomew's. The former was founded for lepers previouſly to the year 1336, but at what particular era is uncertain; the other was built by biſhop Hamo Noble, ſurnamed De Hythe, from his having been born in the town; and his deed of foundation, which is printed in the Regiſtrum Roffenſe, deſcribes it as "erected on the ſpot where he and his anceſtors firſt had their origin" Beſides the Martello towers that have been recently erected along this coaſt, there are ſeveral ſmall forts on the beach in this vicinity, which were built ſhortly after the commencement of the laſt war. On the heights immediately above Hythe are extenſive ranges of barracks for infantry, erected ſince the beginning of the preſent century; and near theſe are numerous mud-wall cottages for the wives and families of the ſoldiers. Other barracks, of a temporary kind, are within the town. Hythe is diſtant from London 67 miles; and has a weekly market on Thurſday.

About one mile north-weſt from Hythe ſtands Saltwood caſtle, the original foundation of which has been attributed to the Romans, though probably on inſufficient authority. Kilburne ſays, that it was erected by Oeſc, ſon of Hengiſt: and Groſe ſtates that "on examining theſe ruins, every ſtone of them evidently appears to have been laid by the Normans." This laſt aſſertion is not only diſproved by hiſtorical authorities, but is demonſtratively erroneous; as the principal buildings now ſtanding are of a much later date, and in a different ſtyle of architecture. Haſted ſtates that it was rebuilt by Henry de Eſſex, baron of Ralegh, and ſtandard-bearer to Henry II. Archbiſhop Courtenay, who was promoted to the ſee of Canterbury in the fifth year of Richard II., expended great ſums in rebuilding this caſtle, to which he annexed a park, and made it his uſual place of reſidence. The ſcite of this caſtle was well choſen; the walls encircle an extenſive area, of an elliptical form, ſurrounded by a very broad and deep moat, partly natural, and partly artificial. The entrance into the firſt court was by a gateway, now in ruins, defended by a portcullis: the outer walls were ſtrengthened by ſeveral circular and ſquare towers, all of which are dilapidated.

About half a mile from Saltwood, weſtward, is Sandling, the new ſeat of William Deedes, eſq. who has built here a large manſion, under the direction of Bonomi, on a hill which commands fine views of the ſea, and yet looks down on its own demeſne, conſiſting of wooded vallies, and recluſe rural ſcenery, poſſeſſing many beauties. Haſted's Kent, vol. iii. Beauties of England and Wales, vol. viii.

I and J.

I, The ninth letter of the Engliſh alphabet, may be conſidered both as a vowel and a conſonant; agreeably to which two different powers, it has two different forms; though, ſince the vowel and conſonant differ in their form as well as ſound, they may, as Dr. Johnſon obſerves, be more properly accounted two letters.

The Hebrews call the *j* conſonant *jod*, יוד, from יד, *hand* and *ſpace;* becauſe it is ſuppoſed to repreſent the hand clenched; ſo as to leave the ſpace underneath void. With them it was pronounced as the conſonant *y*, as it ſtill is among the Germans, and ſome other people. The Greeks had no *j* conſonant, and for that reaſon uſed their vowel *i* inſtead of it, as coming the neareſt in ſound. The letter *i* was uſed as a conſonant among the Latins. In Engliſh *j* conſonant has invariably the ſame ſound with that of *g* in *giant;* and ſerves to mollify that of the vowels; as in *Jew, juſt, jovial. I* vowel varies in its ſound: in ſome words it is long, as *fine, thine*, &c. In others ſhort, as *fin, thin*. Prefixed to *e*, it makes a diphthong of the ſame ſound with the ſoft *i*, or double *ee*, in *field, yield*, except in *friend*, which is pronounced *frend*. Subjoined to *a* or *e*, it makes them long, as *fail, neigh;* and to *o* makes a mingled ſound, which approaches more nearly to the true notion of a diphthong, or ſound compoſed of the ſounds of two vowels, than any other combination of vowels in the Engliſh language, as *oil, coin*. The ſound of *i* before another *i*, and at the end of a word, is always expreſſed by *y*. Johnſon.

The vowel *i*, according to Plato, is proper for expreſſing fine and delicate, but humble things; on which account that verſe in Virgil,

> "Accipiunt inimicum imbrem, remiſque fatiſcunt,"

which abounds in *i*'s, is generally admired.

The vowel *i* was the only vowel which the Romans did not mark with the daſh of a pen, to ſhew when it was long; inſtead of which, to denote it long, they uſed to make it bigger than ordinary, as in *PIſo, VIvus*, &c. According to Lipſius, they often repeated it when it was to be long, as in *dii*. They ſometimes alſo denoted the length of this letter by adding *e* to it, and turning it into a diphthong, as *divei* for *divi*, *omneis* for *omnis*, &c.

I, in *Grammar, ik*, Gothic, ic, Saxon, *ich*, Dutch, is a pronoun perſonal. By Shakſpeare I is more than once written for *ay*, or *yes: e. g.*

> "Did your letters pierce the queen?"
> —I, ſir; ſhe took 'em and read 'em in my preſence,
> And now and then an ample tear trill'd down."

I, in *Logic*, denotes a particular affirmative propoſition.

I was anciently a numeral letter, and ſignified a hundred, according to the verſe.

> "I. C. compar erit, et centum ſignificabit."

I, in the ordinary way of numbering, ſignifies one; and when repeated, it ſignifies as many units as it is repeated times. When put before a higher numeral, it ſubtracts itſelf, as IV, IX, &c. but when ſet after it, it is added as often as it is repeated; as VI, XI, VIII, XIII, &c.

In abbreviatures and ciphers, I frequently repreſents the whole word Jeſus, whereof it is the firſt letter.

Neither the long nor the ſhort I, the conſonant *ja*, nor the vowel I, is the initial of any technical term in *Muſic*.

I, in the *French Coinage*, characterizes the money of Limoges.

JA, in *Geography*, a town of Sweden, in Eaſt Bothnia; at the mouth of the river Jaſari; 12 miles N. of Ulea.

JA, *St.*, *St. Ya*, or *St. Agatha*, a town of France, in the department of the Seſia, ſituated on the Naviglio, containing five churches. N. lat. 43° 22′. E. long. 8° 8′. See *St.* AGATHA.

JAATSURO, a town of Japan, in the iſland of Niphon; 65 miles N.W. of Jedo.

JAB, a town of Africa, in the kingdom of Woolli, ſituated on the river Gambia.

JABA, a town of Africa, in Bambarra, on the Niger. N. lat. 13° 15′. W. long. 4° 45′.

JABADII INSULA, an ancient name given to Sumatra, according to M. D'Anville, though others have ſuppoſed it to be Java. Ptolemy ſpeaks of this iſland and ſays, that it abounded with gold. He calls the capital Argentea, the poſition of which ſeems to correſpond with that of Achen.

JABAJAHITES, a ſect among the Muſſulmen, who, according to Ricaut, teach, that God is not perfectly wiſe; that his knowledge does not extend to every thing; and that time and experience have furniſhed him with the knowledge of many things whereof he was before ignorant. Thus, ſay they, not being appriſed from all eternity of every event that ſhall happen in the world, he is now obliged to govern it according to the chance and occurrence of thoſe events.

JABARABA, in *Geography*, a town of Brazil, in the government of Minas Geraes; 32 miles S. of Villa Rica.

JABARIANS, a ſect of Mahometans, in direct oppoſition to the *Kadarians*, diſtinguiſhed by denying free agency in man, and aſcribing his actions wholly to God. They take their denomination from Al Jabr, which ſignifies neceſſity or compulſion, becauſe they maintain that man is neceſſarily and inevitably conſtrained to act as he does, by force of God's eternal and immutable decree. Some of theſe, who are more rigid in their opinion, are called *pure* Jabarians, and others, who are more moderate, are called *middle* Jabarians. The former will not allow men to have any power at all; aſſerting that man can do nothing, and that he is deſtitute of power, will, or choice, as much as an inanimate agent. They aſſert alſo, that rewarding and puniſhing are the effects of neceſſity, and they alſo ſay the ſame of the impoſing of commands. This was the doctrine of the "Jahmians," the followers of Jahm Ebn Safwan, who likewiſe held that paradiſe and hell will vaniſh, or be annihilated, after thoſe who are deſtined to theſe habitations ſhall have entered them, ſo that at laſt there will be no exiſting being beſides God. The moderate Jabarians aſcribe ſome power to man, but ſuch as has no influence on the action. As to thoſe who grant the power of man to have ſome influence on the action, which influence is called "acquiſition," ſome will not allow their being denominated Jabarians; whereas others reckon them in the number of middle Jabarians, and contend for the middle opinion between abſolute neceſſity and abſolute liberty, attributing to man acquiſition or concurrence in producing the action, or in conſequence of which he gains commendation or incurs blame; and they make the "Aſharians" a branch of this ſect. To the middle or moderate Jabarians, belong the "Najarians," whoſe founder Al Haſan Ebn Mohammed al Najar taught, that God created the actions of men, both good and bad, and that man acquired them, and that man's power had an influence on the action, or a certain co-operation, which he called "acquiſition," agreeing in this reſpect with Al Aſhari; and the "Derârians," the diſciples of Derâr Ebn Amra, who alſo held that men's actions are really created by God, but that man really acquired them. The Jabarians alſo ſay, that God is abſolute Lord of his creatures, and may deal with them according to his own pleaſure; ſo that if he ſhould admit all men without diſtinction into paradiſe, it would be no partiality, or if he ſhould caſt them all into hell, it would be no injuſtice, concurring in this reſpect with the Aſharians. Sale's Prel. Diſc.

JABBEE, in *Geography*, a large town of Africa, in the kingdom of Bambarra, having in it a Mooriſh moſque, and ſituated on the Niger; 55 miles S.W. of Sego. N. lat. 13° 59'. W. long. 3° 21'.

JABBUAH, a town of Hindooſtan, in the circar of Banſwaleh; 25 miles S.S.E. of Tandla.

JABEZ, or JABESH-GILEAD, in *Scripture Geography*, a city in the half-tribe of Manaſſeh beyond Jordan, ſituated in Gilead, at the foot of the mountain ſo called. Euſebius places it ſix miles from Pella towards Geraſa.

JABI, or YABBAH, a diſtrict of Africa, on the Gold Coaſt, ſituated to the eaſt of Anta, the ſoil of which is rich and fertile; but the gold obtained here is adulterated.

JABIRU, or JABIRU-GUACU, in *Ornithology*, the MYCTEREA *Americana*; which ſee.

JABLONOW, in *Geography*, a town of Poland, in the palatinate of Braclaw; 64 miles N.W. of Braclaw.

JABLONOWSKY, JOSEPH ALEXANDER VON, in *Biography*, a Poliſh prince, who devoted himſelf chiefly to the ſciences, and, for the ſake of improvement, made ſeveral tours through Germany and France. When the troubles broke out in Poland he reſigned his ſenatorial dignity, left the country, and took up his reſidence at Leipſic, where he diſtinguiſhed himſelf not only as a friend and protector of ſcience, but as a man of great literary acquirements. He founded a ſociety which was named after himſelf, and aſſigned a liberal ſum for the purpoſe of diſtributing premiums to the authors of the beſt anſwers to queſtions propoſed on various literary ſubjects. This ſociety ſtill exiſts, holds its meetings at Leipſic, and occaſionally preſents the world with the fruit of its labours. The prince died in 1777, at the age of ſixty-five. His works are, "The Lives of twelve Generals:" written in the Poliſh language: "A Treatiſe on the Sclavonic Poetry," and ſome pieces of a ſimilar nature. Gen. Biog.

JABLONSKI, DANIEL ERNEST, was born at Dantzic in the year 1660: he was educated partly at Liſſa and partly at Frankfort on the Oder. He ſpent ſome time in his maturer ſtudies at Holland, and from thence he went to England, and took all the advantages which the univerſity of Oxford could afford him. On his return to his native country in 1683, he was admitted to the miniſtry, and appointed paſtor of the reformed church at Magdeburg. After ſome ſucceſſive changes he was at length appointed to be miniſter to the court of Berlin. He was extremely anxious to promote an union between the Calviniſts and Lutherans, and to introduce into Pruſſia a conſtitution of church government reſembling that of the Engliſh eſtabliſhment: but his well-meant efforts proved ineffectual. He was not however diſheartened by want of ſucceſs, but directed all his attention to the ſame ſubject twelve years afterwards. Some account of the meaſures taken in this buſineſs will be found at the end of Dr. Maclaine's tranſlation of Moſheim's Eccleſiaſtical Hiſtory. To this account is annexed "A Plan of Eccleſiaſtical Diſcipline and Public Worſhip," drawn up by Jablonſki, and ſeveral original papers. In 1706, M. Jablonſki received the diploma of doctor of divinity from the univerſity of Oxford. In 1718 the king of Pruſſia nominated him counſellor of the Conſiſtory, in 1729 member of the Directory of the reformed churches, and in 1733 preſident of the Academy of Sciences at Berlin. He died at the age of eighty, in 1741. He was author of a great number of works, chiefly theological, but his moſt important were, 1. "Biblia Hebraica, cum Notis Hebraicis et Lemmatibus Latinis ex recenſione, et cum Præfatione Latina, D. E. I." 2. "Jura et Libertates Diſſidentium in Religione Chriſtiana in Regno Poloniæ et Magno Ducatu Lithuaniæ, ex legibus Regni, et aliis Monumentis authenticis excerpta." Moreri. Moſheim.

JABLONSKY, CHARLES GUSTAVUS, private ſecretary to the queen of Pruſſia, and a conſiderable naturaliſt, began his career, as an author, by the publication of "A Syſtem of all known indigenous and foreign Inſects," arranged according to the Linnæan ſyſtem, and intended as a continuation of Buffon's Natural Hiſtory. The ſhare which Jablonſky had in this work extends only to the ſeventh ſheet of the third part, relating to butterflies. His illneſs prevented him from continuing a work that demanded much labour and attention. It was carried on by Mr. Herbſt, a clergyman at Berlin; who alſo continued another work on the deſcription of the Scarabæi, begun by Jablonſky. Our author died in the year 1787, at the age of thirty-one, to the regret of his friends, who had high expectations from his talents and great aſſiduity. Gen. Biog.

Jablonsky, John Theodore, brother of D. Erneſt, was born at Dantzic in 1654. He was educated partly at Amſterdam, and partly at Berlin, from whence he was ſent to the Gymnaſium of Konigſberg, and then to Frankfort on the Oder. In 1680 he made a tour through Germany, Holland, and England, and in 1687 he accompanied the princeſs of Deſſau to Poland, where he remained till the death of the prince Radzivil, the huſband of his patroneſs. He was now appointed ſecretary at the court of the duke of Saxe-Barby, and in 1700 was elected ſecretary to the Academy of Sciences at Berlin, then newly eſtabliſhed. In 1715 he accompanied on his travels, in the capacity of tutor, Frederic William, hereditary prince of Pruſſia, and upon his return was appointed a counſellor of ſtate. He died in 1731, leaving behind him a great number of very learned works, among which was "A General Dictionary of Arts and Sciences;" which was afterwards augmented and improved by J. J. Schwabe, profeſſor of philoſophy at Leipſic. Gen. Biog.

Jablonsky, Paul Ernest, ſon of Daniel Erneſt, was born at Berlin in 1693. His great talents were diſcovered at an early period, and having ſtudied at Frankfort, and acquired a deep knowledge of theology and the Coptic language, he was admitted among the royal candidates; and at the king's expence made a literary tour through Germany, Holland, England, and France. In the courſe of his travels he had an opportunity of improving himſelf in the Coptic, particularly by conſulting the different works in that language at Leyden, Oxford, and Paris. In 1720 he was appointed profeſſor of philoſophy, and preacher to the reformed congregation of Frankfort on the Oder: in 1722, public profeſſor of theology, and afterwards member of the Academy of Sciences at Berlin. He died in the month of September, 1757. He was author of many learned and theological works; and was by his labours of much ſervice to biblical literature. Two of his principal pieces were "Rhempha Ægyptiorum Deus ab Iſraelitis in Deſerto cultus," and "Pantheon Ægyptiorum, ſive de Diis eorum Commentarius."

JABLUNKAU, in *Geography*, a town of Sileſia, in the principality of Teſchen, on the river Elſe, with an adjoining fort; 11 miles S.S.E. of Teſchen. N. lat. 49° 32′. E. long. 18° 48′.

JABOK, or Jabbok, in *Scripture Geography*, a brook on the other ſide of Jordan, whoſe ſpring was in the mountains of Gilead. It fell into Jordan, near the ſea of Tiberias, ſouth; and ſeparated the land of the Ammonites from Gaulonitis, and that of Og king of Baſhan. Gen. xxxii. 42 to 43.

JABOLPOUR Gurrah, a town of Hindooſtan, in Gurry Mundella; 28 miles E.N.E. of Gurrah.

JABOROSA, in *Botany*, a name given by Juſſieu from the Arabic appellation of the Mandrake, *Jaboroſe*, with which the plants in queſtion agree in habit, and almoſt, as Juſſieu himſelf hints, in genus. Juſſ. 125. Willd. Sp. Pl. v. 2. 1016. Lamarck. Illuſtr. v. 2. 11. t. 114. Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Luridæ*, Linn. *Solaneæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-ſhaped, in five nearly equal ſegments, permanent. *Cor.* of one petal, tubular, much longer than the calyx; tube nearly cylindrical; limb in five acute, ſomewhat ſpreading, ſegments. *Stam.* Filaments five, ſhort, flat, inſerted into the upper part of the tube, and ſcarcely extending beyond its orifice; anthers erect, heart-ſhaped. *Piſt.* Germen ſuperior, roundiſh; ſtyle thread-ſhaped, the length of the tube, erect; ſtigma capitate, with a ſmall point. *Peric.* and *Seeds* unknown.

Eſſ. Ch. Corolla tubular. Stamens inſerted into the top of the tube. Stigma capitate. Berry?

1. *J. integrifolia.* Lamarck. Illuſtr. t. 114.—Leaves elliptic-oblong, ſlightly toothed.—Native of Buenos Ayres, where it was gathered by Commerſon, from whoſe ſpecimens alone, of this and the following ſpecies, any thing is known concerning them in Europe. They appear to be perennial herbaceous plants, of the ſize of a primroſe, with ſeveral radical rather downy *leaves*, without any *ſtem*. *Flowers* on ſimple radical ſtalks, ſhorter than the leaves, the tube an inch and a half long, rather ſlender.

2. *J. runcinata.* Lamarck. n. 2.—Leaves lyrate. Tube of the corolla ſomewhat bell-ſhaped.—Gathered by Commerſon near Monte Video. Its lyrate, deeply toothed *leaves*, and ſhorter bell-ſhaped *flower*, much like that of *Atropa Belladonna*, ſufficiently diſtinguiſh it from the preceding.

JABOTAPITA. See Ochna.

JABOTI, in *Zoology*, the name of a remarkable ſpecies of tortoiſe found in America. The ſhell of this ſpecies is black, and has many hexangular figures marked upon it; the head and legs are brown, variegated with ſpots of a duſky greeniſh hue. The liver of this ſpecies is accounted a very delicate food.

JABOU, in *Geography*, a country of Africa, W. of Benin.

JABRIN, a diſtrict of Arabia, S.W. of Hadsjar, abounding with ſalt.

JACA, a town of Spain, in Aragon, at the foot of the Pyrenées, on the river Aragon; the ſee of a biſhop ſuffragan of Saragoſſa. This ancient town, which has a citadel built in 1592, was formerly the capital of Aragon, as it is now of a diſtrict, comprehending nearly 200 towns and villages; 45 miles N. of Saragoſſa. N. lat. 42° 29′. W. long. 0° 41′.

Jaca, in *Natural Hiſtory*, the name of a kind of nut, very common in China, which is reckoned the largeſt of all yet known. It is produced from the trunk of the tree, as if the branches, however large and ſtrong, were not able to bear it; its ſhell is ſo ſtrong, that there is occaſion for an ax or hatchet to open it; and within are innumerable cells or veſicles, containing a pulp of a yellow colour, which ſurrounds a kernel like the cheſnut, that is exceedingly ſweet when ripe.

JACAMACIRI and Jacamar, in *Ornithology*. See Alcedo *Galbula*.

JACANA. See Parra *Jacana*.

JACAPA, or Jacapu. See Tanagra *Jacapa*.

JACARAY, in *Geography*, a town of Brazil, in the government of St. Paul; 50 miles N.E. of St. Paul.

JACARE, in *Zoology*. See Lacerta *Alligator*.

JACARINI, in *Ornithology*. See Tanagra *Jacarina*.

JACCA, in *Ancient Geography*, a town of Spain, in the interior of the country of the Vaſconi. Ptol.

JACCATRA, in *Geography*, one of the empires of the iſland of Java, bounded on the E. by that of Cheribon, and to the W. by the kingdom of Bantam. It was formerly governed by its own kings; but the laſt of theſe, having been ſubdued by the arms of the Dutch Eaſt India Company in the year 1619, they have ever ſince poſſeſſed it by the right of conqueſt, as ſovereigns. It is under the immediate government of the governor-general and the council of India, and all the Javaneſe of Jaccatra are therefore born the company's ſubjects. Before this revolution, Jaccatra was the capital of the empire, but Batavia, which is built near the former, is now the chief place. The Preanger lands are diſtricts which did not formerly belong to the kingdom of Jaccatra, but which have been united to the company's poſſeſſions ſince the year 1677; and the adminiſtration of them is divided between Batavia and the reſidency of Cheribon. The whole country of Jaccatra, with the Preanger lands, is 110 Dutch miles in circumference, and comprizes 30 diſtricts, containing together 33,914 families, or 203,384 inhabitants; of which the diſtrict of Batavia alone includes 19,469 families, or 116,814 inhabitants. Hence it appears, that the other diſtricts are much leſs populous, ſo that a great extent of excellent land remains uncultivated and neglected, and that which is tilled is owing to the induſtry and perſeverance of the Chineſe, who are ſettled here. The depopulation of Jaccatra has been chiefly owing to the conqueſts of the company, which having taken the capital and defeated the army of Bantam, carried away the inhabitants into the latter kingdom; in conſequence of which Jaccatra remained for a conſiderable time nearly in an uninhabited ſtate. Since the year 1753, however, the population has here been conſiderably augmented. Jaccatra is watered and fertilized by ſeveral rivers, of which the largeſt are the Sadani, or the river of Tangerang, and that of Crawang, which deſcend from the inland mountains, and flow into the ſea in a northerly direction. The river of Tangerang runs into the ſea, not far from the point of Ontong Java, and near its mouth the company have a ſmall port called the "Kwal." This river gives part of its water to a canal that ſupplies the canals and moats of the city of Batavia; but the greater part is furniſhed by other rivers. The productions of Jaccatra are principally coffee, ſugar, and rice; likewiſe indigo, cotton, yarn, turmeric, and cadjung, or lentiles, from which laſt oil is preſſed. In 1778 there were ſold in Holland the following articles, being productions of the colony of Jaccatra; *viz.* 2,000,000lbs. of ſugar, at 4 ſtivers; 2,000,000lbs. of coffee, at 11 ditto; 500,000lbs. of pepper, at 17 ditto; 100 leagers of arrack; 10,000lbs. of candied ginger; cotton-yarn to the amount of 200,000 florins, and indigo to the amount of 1000 florins. This may be taken as the annual quantity of what Jaccatra is able to furniſh for Europe, and the gain upon theſe articles is conſiderable, as none of them coſt much; the pepper and coffee nearly 2½, and the ſugar 1½ ſtivers per pound. Of ſugar, the company farther diſpoſe every year full four millions of pounds weight in Japan, Surat, Malabar, and other eſtabliſhments, from which they likewiſe make conſiderable profits; and about the ſame quantity, 400,000lbs. is exported in private trade, together with immenſe quantities of arrack, rice, and other articles. Stavorinus's Voyage to the Eaſt Indies, &c. vol. iii.

JACCHAGOGI, Ιακχαγωγοι, in *Antiquity*, thoſe who carried the ſtatue of the hero Jacchus in proceſſion, at the celebration of the Athenian feſtival called *Eleuſinia*. They had their heads crowned with myrtle.

JACCHUS, in *Zoology*. See Simia.

JACEA, in *Botany*. See Centaurea.

JACI, in *Geography*, a ſmall well built and populous town of Sicily, in the valley of Demona, where a great quantity of ſilk is manufactured. It was formerly called Acis. (See Acis.) The modern town is ſituated far higher than the ancient city, if we judge from its actual elevation above the level of the ſea, and the number of ſtrata of lava which are diſcovered in deſcending the flight of ſteps, leading from this town to the Caricatore, which is below it; 12 miles N.N.E. of Catania. N. lat. 37° 40′. E. long. 15° 15′.

JACINA, a river of Naples, which runs into the gulf of Squillace, N. lat. 38° 57′. E. long. 17°.

JACINTH, in *Botany*. See Hyacinthus.

JACK, in *Falconry*, ſignifies the male of birds of ſport. See Falcon and Hawk.

Jack, or *Pike*, in *Ichthyology*. See Esox *Lucius*.

Jack, in *Mechanics*, is an inſtrument in common uſe for raiſing heavy timber, or very great weights of any kind. See *Plate* XXX. *Mechanics*, *fig.* 1.

But as the wheel-work of this engine is incloſed in the ſtrong piece of timber C B, the inſide of it is repreſented in *fig.* 2, where the rack A B muſt be ſuppoſed at leaſt four times as long in proportion to the wheel Q, as the figure repreſents it; and the teeth, which will be then four times more in number, to be contained about three in an inch. Then if the handle H P be ſeven inches long, five turns of it; *i. e.* five times 22 inches, or 110 inches, will be the velocity of the power, whilſt the weight raiſed by the claw A, or depreſſed by the claw B, moves one inch: for as the pinion of the handle has but four leaves, and the wheel Q twenty teeth, there muſt be five revolutions of the handle to turn the wheel once round, whoſe three-leaved pinion R will, in that revolution, juſt move the rack three teeth, or one inch. This might have been alſo known without ſeeing, or even knowing the number of the teeth of the wheel and pinions, by meaſuring a revolution of the handle in *fig.* 1; and comparing the ſpace gone through by it with the ſpace gone through by the end A or B. This machine is ſometimes open behind from the bottom almoſt up to the wheel Q, to let the lower claw, which in that caſe is turned up as at B, draw up any weight. When the weight is drawn, or puſhed ſufficiently high, it is kept from going back by hanging the end of the hook S, fixed to a ſtaple, over the curved part of the handle at *h*.

Jack is alſo the name of a well known engine uſed for turning a ſpit: the weight is the power applied; the friction of the parts, and the weight with which the ſpit is charged, are the force to be overcome; and a ſteady uniform motion is maintained by means of the fly. See the conſtruction of this engine more particularly explained and illuſtrated by a figure, under the article Mechanical *powers*.

Jack, *Smoke*, is an engine uſed for the ſame purpoſe with the common jack, and is ſo called from its being moved by means of the ſmoke or rarefied air; aſcending the chimney, and ſtriking againſt the tail of the horizontal wheel A B, (*fig.* 3.) which being inclined to the horizon, is moved about the axis of the wheel, together with the pinion C, which carries the wheels D and E; and E carries the chain F, which turns the ſpit. The wheel A B ſhould be placed in the narrow part of the chimney, where the motion of the ſmoke is ſwifteſt, and then the greateſt part of it muſt ſtrike upon the ſails. The force of this machine depends on the draught of the chimney, and the vehemence of the fire.

Jack, in a *Ship*, is a ſort of flag or colours, diſplayed from a maſt erected on the outer end of a ſhip's bowſprit. In the Britiſh navy the jack is nothing more than a ſmall union flag, compoſed of the interſection of the red and white croſſes; but in merchant-ſhips this union is bordered with a red field. See Flag.

Jack is uſed alſo for a horſe or wooden frame to ſaw timber upon; for an inſtrument to pull off a pair of boots; for a great leathern pitcher to carry drink in; for a ſmall bowl that ſerves as a mark, at the exerciſe of bowling; and for a young pike.

Jack, a *Muſical* implement in a virginal, ſpinnet, and harpſichord;

harpſichord ; it is a ſmall machine, uſually made of pear-tree wood, in which is a tongue, armed with a quill. This tongue moves on a ſwivel, and when the quill has ſtruck the ſtring, by the jack being thrown up with the key, on the end of which it reſts, if the finger is taken off, it returns to its place under the ſtring, and the tongue, thrown back by paſſing the ſtring, is forced into its perpendicular ſituation by the ſpring of a briſtle behind it.

JACK-*Arch*, in *Architecture*, is an arch of one brick thickneſs.

JACK-*Head*, in *Hydraulics*, a part ſometimes annexed to the forcing-pump. See PUMP.

JACK-*in-a-Box*, in *Botany*. See HERNANDIA.

JACK *by the Hedge*. See ERYSIMUM.

JACK-*Daw*. (See CORVUS *Monedula*.) This bird is very miſchievous to the farmer and gardener, and is of ſuch a thieviſh diſpoſition, that he will carry away much more than he can make any uſe of. There is a method of deſtroying this bird by a particular ſort of ſpringe, which is much practiſed in ſome parts of England, and is ſo uſeful, that it ought to be made univerſal. The method is this : a ſtake of about five feet long is to be driven firmly into the ground, and made ſo faſt that it cannot move, and ſo ſharp pointed at the top, that the jack-daw cannot reſt upon it. Within a foot of the top there muſt be a hole bored through it, of three quarters of an inch in diameter ; through this hole is to be put a ſtick of about eight inches long, then a horſe-hair ſpringe or nooſe is to be faſtened to a thin hazel-wand, and this brought up to the place where the ſhort ſtick is placed, and carried with it through the hole ; the remainder being left open under that ſtick. The other end of the hazel-rod is to be put through a hole in the ſtake near the ground, and faſtened there ; the ſtake is to be planted among the jack-daw's food, and he will naturally be led to ſettle on it ; but finding the point too ſharp, he will deſcend to the little croſs ſtick ; this will ſink with his weight, and the ſpringe will receive his leg, and hold him faſt.

JACK-*Daw, Purple*. See GRACULA *Quiſcala*.

JACK-*Ketch*, is a name given by the populace to the common hangman.

JACK-*in-a-Lantern*. See IGNIS *Fatuus*.

JACK-*Snipe*, in *Ornithology*. See SCOLOPAX *Gallinula*.

JACK *Wambaſium*, in our *Old Writers*, a kind of defenſive coat-armour, worn by horſemen in war, not made of ſolid iron, but of many plates faſtened together ; which ſome perſons by tenure were bound to find upon any invaſion.

JACK, *Wood*, a ſort of ſtool made uſe of for ſawing or cutting wood upon.

JACKALL, in *Zoology*, the name of a creature of the dog-kind, the canis aureus of Linnæus, called by authors *lupus aureus*, the gold-coloured wolf, and by the modern Greeks *ſquilachi*. See AUREUS.

JACKSON, JOHN, in *Biography*, was born at Senſey, near Thirſk, in Yorkſhire, in 1686. He was educated at Doncaſter, under Dr. Henry Bland, afterwards head-maſter of Eton ſchool. From Doncaſter he went to Cambridge, and was entered, in 1702, of Jeſus college. Here he took his degree of B. A. and quitted the univerſity in 1707, and engaged himſelf as private tutor in the family of a gentleman of Derbyſhire. In the following year he was ordained, and ſoon after obtained the rectory of Roſſington, which had been reſerved for him, by the corporation of Doncaſter, after the death of his father. In 1714 he commenced his career as author, by publiſhing three letters in defence of Dr. Samuel Clarke's "Scripture Doctrine of the Trinity," under the name of a country clergyman. This work was the means of introducing him to the notice of Dr. Clarke, who was anxious to procure for him ſome preferment in the church. In 1714, Mr. Jackſon engaged in the Bangorian controverſy, and proved an able defender of biſhop Hoadly, in the cauſe of liberty. In 1716 he engaged in a controverſy with Dr. Waterland, in defence of the ſentiments maintained by Dr. Clarke. He purſued the ſubject ſtill farther in a correſpondence with Mr. Whiſton, by which he was led to determine never more to ſubſcribe to the thirty-nine articles. In conſequence of this reſolution, he loſt, about the year 1724, the hopes which he had been led to entertain of a prebendary of Saliſbury, which biſhop Hoadly refuſed to give him without ſubſcription. This refuſal was ſo extraordinary, eſpecially as it came from Hoadly, and as the law did not make ſubſcription neceſſary, that the prelate was cenſured for it by his beſt friends. Whiſton exclaimed, "how conſiſtent this was with his own notion of liberty of conſcience, or with that Chriſtian freedom, of which he was always an advocate, I do not well underſtand." Upon the death of his friend Dr. Clarke, in 1729, Mr. Jackſon was preſented to the maſterſhip of Wigſton's hoſpital, in Leiceſter, by the duke of Rutland, which place he filled, till his death, with much reputation and credit, candidly admitting into the houſe perſons of different religious perſuaſions, even ſome who had been violent partizans againſt him. Mr. Jackſon next appeared as an author in defence of human liberty, or the liberty of the will, in oppoſition to Anthony Collins, who had publiſhed a pamphlet in behalf of the doctrine of neceſſity : he alſo wrote in juſtification of human reaſon ; and in defence of the Chriſtian religion, in oppoſition to Tindal's work, entitled "Chriſtianity as Old as the Creation." His other ſmaller treatiſes we ſhall paſs over, though very uſeful and important in the controverſies and diſcuſſions of the period in which the author flouriſhed. In 1752 he ſent his great work into the world, entitled "Chronological Antiquities, or the Antiquities and Chronology of the moſt ancient Kingdoms from the Creation of the World, for the Space of Five thouſand Years." This work, the reſult of much ſtudious application, and very extenſive reading, conſiſted of three volumes 4to., was well received by the literati of our own country, and was tranſlated into the German language. He had other works in view, particularly an edition of the New Teſtament in Greek, with ſcholia in the ſame language ; this he meant to have accompanied with all the various readings which he had collected, but the infirmities of age prevented him from accompliſhing his deſigns. He died in 1763, in the 78th year of his age. He was a man of deep and very extenſive learning, particularly in Greek and Roman literature, and his induſtry was indefatigable. He was the avowed friend of civil and religious liberty, and was never afraid of avowing the truth on any ſubject, although he was fully ſenſible of the obloquy and temporal loſſes to which ſuch conduct would expoſe him. Biog. Brit.

JACKSON, THOMAS, was born at Witton, in the county of Durham, in the year 1579. Having obtained a good claſſical education, he was entered of Queen's college in the year 1595, and in the following year he was, on account of his great merit, unanimouſly elected a ſcholar of Corpus Chriſti college, notwithſtanding the utmoſt intereſt was made for another candidate. He took his degrees in regular courſe, and was at length choſen vice-preſident of his college ſeveral years ſucceſſively. He firſt obtained a benefice in his native country, which, in a ſhort time, he relinquiſhed for the vicarage of St. Nicholas, in Newcaſtle-upon-Tyne. He was in ſentiment a rigid Calviniſt, and was much admired and followed as a preacher. Being afterwards appointed chaplain to Dr. Neile, biſhop of Durham, that prelate was the means of making him a convert to Arminianiſm. In 1650 he was elected preſident of Corpus Chriſti college, on which occaſion he reſigned the vicarage in Newcaſtle, and ſoon afterwards was nominated chaplain in ordinary to his majeſty, and collated to the vicarage of Witney in Oxfordſhire. In 1635 he was made a prebend of Wincheſter, and in 1638 he was promoted to the deanery of Peterborough. He died in 1640, leaving behind him a character for a ſolid and penetrating judgment, and for extenſive and ſound learning. His works are numerous, but wholly theological; the principal of them conſiſt of "Commentaries on the Apoſtle's Creed," in twelve books, His works, thirty years after his deceaſe, were collected and publiſhed in three volumes folio, to which is prefixed the life of the author. Biog. Brit.

Jackson, William, an eminent muſical compoſer, was a native of Exeter, in Devonſhire. He was pupil of the celebrated Travers, and may be ſaid to have imbibed no ſmall portion of that compoſer's ſpirit. It muſt be allowed that Jackſon poſſeſſed a conſiderable ſhare of intellectual ability, and evinced on many occaſions a very diſtinguiſhed taſte for the fine arts. His judgment in general was ſound; genius will not be denied him, and when genius, judgment, and taſte are united in the ſame perſon, we are entitled to expect an approximation to human excellence. At the ſame time it muſt be confeſſed, that theſe qualities were ſtrongly alloyed by a mixture of ſelfiſhneſs, arrogance, and an inſatiable rage for ſuperiority.

In many of his muſical compoſitions he has diſplayed traits of novelty, but theſe are not the moſt eſtimable of his productions. The "Elegies," the beſt of his works, poſſeſs ſuperior melody, for which we may allow him credit; but the harmony of theſe is in ſome meaſure derived from his old maſter; that is, they are conſtructed upon the model of that compoſer's canzonets. Indeed, many of Jackſon's early compoſitions favour much of the ſpirit and contrivance of Travers.

Jackſon's fame, in a great meaſure, may be ſaid to be founded in his judgment of ſelection with regard to poetry; though he ſometimes took unwarrantable liberties with his author, in order to accommodate the lines to his muſic.

Perhaps no compoſer copied leſs from others than Jackſon, yet at the ſame time it muſt be admitted that he was a palpable manneriſt. His moſt intereſting and novel melodies are too frequently aſſociated with common paſſages that have exiſted almoſt from the origin of muſic; the deſcent of four notes in the diatonic order is ſufficient to illuſtrate our meaning. Jackſon's peculiar fort exiſted in giving an elegant and plaintive melody to elegiac poetry. In conſtituting harmony, without rendering the middle part or parts of a compoſition deſtitute of melody, Jackſon ſtands unrivalled.

This is no trivial praiſe, when it is known that, before his time, compoſers were, and are at preſent, very defective in this part of their art.

It was a defect in Jackſon's muſic, that his melody would ſuit any ſpecies of plaintive lines: few of his compoſitions diſplayed the art of mingling expreſſion with melody, and preſerving the latter in its purity. His "Fairy Fantaſies," not yet publiſhed, evince more congruity than any others of his works.

Jackſon paid his court to the graphic muſe, but never looked at nature, believing, that by copying other maſters, he might at laſt arrive at excellence. His great model was his friend Gainſborough, whoſe colouring and compoſition he conſtantly endeavoured to imitate, ſometimes with a degree of ſucceſs which induced him to lay a falſe claim to the merit of originality. But had he ſucceeded in even equalling that great artiſt, his pictures would not have ſpoken the language of nature; the man who merely copies another, either in muſic or painting, can never be conſidered a great artiſt; he can only be a faint echo, and ranked among the ſervum pecus imitatorum.

Jackſon's literary works, though not of the higheſt order, poſſeſs genius. He wrote "Thirty Letters on various Subjects," 8vo. "The Four Ages, and other Eſſays," 8vo. "Treatiſe on the preſent State of Muſic." Alſo ſome papers in the eſſays of the Exeter Society. He produced eighteen muſical publications, conſiſting of "Hymns, Songs, Canzonets, Elegies," and an "Ode to Fancy," &c.

Jackſon was elected organiſt of St. Peter's cathedral, Exeter, in 1777, and continued in that ſituation till his death, in 1803.

Though his general mode of living was temperate, yet he thought that a ſtill greater abſtinence would prolong his exiſtence. He latterly dined on milk-porridge, and drank water. This experiment was fatal. His habit neceſſarily became impoveriſhed, and his exiſtence terminated in a dropſy, at the age of 73.

Jackson, in *Geography*, a county of America, in Georgia, containing 7736 inhabitants, of whom 1400 are ſlaves.—Alſo, a county of Teneſſee, in Mero diſtrict.

Jackson, *Port*, a bay or harbour on the E. coaſt of New Holland, ſo called by lieutenant (afterward captain) Cook, who diſcovered it in May 1770, and found that it had good anchorage. This is one of the nobleſt harbours in the world, extending about 14 miles in length, with numerous creeks and coves. On the ſouth of this, at a ſpot called Sidney cove, a ſettlement for tranſported criminals was fixed. Jackſon lies three leagues N. of *Botany-bay*; which ſee. See alſo *New* Holland.

Jackson's *River*, a head-water of James's river, in Virginia, which riſes in the warm ſpring mountains, and runs S.W. through the valley, until it is joined by Carpenter's creek, when the river aſſumes the name of Fluvanna, and flows S.E. About ¾ of a mile from its ſource, it falls over a rock 200 feet into the valley below. It is near half as high as Niagara, but only 12 or 15 wide.

JACKSONBORO, a poſt-town of America, in Scriven county, Georgia; 670 miles from Waſhington.

JACKSONIA, in *Botany*, ſo named by Mr. Robert Brown, in memory of the late Mr. George Jackſon, F.L.S. a man of the moſt excellent and amiable character, devoted to the ſcience of botany, to which, under the auſpices of his patron and friend, A.B. Lambert, eſq. he has rendered ſeveral important ſervices. The improved ſtyle of the Botanical Repoſitory, for ſome time paſt, though far ſhort of what he wiſhed, is owing to his care, and he has furniſhed a paper in the tenth volume of the Linnæan Society's Tranſactions, on a new genus of Decandrous Leguminous plants, named *Ormoſia.* Many manuſcripts evincing his learning and ſcientific ſkill remain in the hands of Mr. Lambert. Mr. Jackſon died of a rapid decline Jan. 12, 1811, aged 31, and was interred on the 16th in St. George's burying-ground, Mary-le-bone. He was a native of Aberdeen.—Brown in Ait. Hort. Kew. v 3. 12.—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, nearly equal, acute ſegments. *Cor.* papilionaceous, of five petals. Standard inverſely heart-ſhaped, about equal to the calyx. Wings rather longer, obtuſe, with a tooth on their upper ſide near the baſe. Keel of two petals, of the ſize and ſhape of the wings. *Stam.* Filaments ten, awl-ſhaped, diſtinct, equal, aſcending, deciduous; anthers roundiſh. *Piſt.* Germen nearly ſeſſile, oval; ſtyle awl-ſhaped, ſlender; ſtigma ſimple, obtuſe. *Peric.* Legume ovate or oblong, ſomewhat ſwelling, of one cell and two valves, downy on their inſide. *Seeds* two, roundiſh, without any appendage.

Eſſ. Ch. Calyx in five deep, nearly equal, ſegments. Corolla papilionaceous. Style awl-ſhaped. Stigma ſimple. Legume of one cell, downy within. Seeds two, without any appendage.

Of this genus, whoſe habit is ſlender and reſembling that of Broom, two ſpecies are defined in an unpubliſhed ſheet of the third volume of the *Hortus Kewenſis*, kindly communicated to us by Mr. Brown, that the memory of his friend might as ſoon and as widely as poſſible be commemorated. Theſe are,

1. J. *ſcoparia.* Brown MSS.—"Stem arboreſcent, without thorns. Branches angular. Cluſters terminal."—Native of New South Wales, from whence it was ſent to Kew garden by Mr. George Caley, in 1803. This is the plant mentioned in Sims and Kœnig's Annals of Botany, v. 1. 511, which the author of the eſſay there printed, and of the preſent article, for want of the fruit, could not then venture to determine. Its *branches* have the aſpect of a *Spartium*, and are ſomewhat ſilky, leafleſs, much branched, and angular. *Flowers* yellow, in ſcattered ſhort cluſters. Specimens were long ago ſent from Port Jackſon, by Dr. White.—This ſpecies is kept in the green-houſe, and flowers from June to Auguſt.

2. J. *ſpinoſa.* Brown MSS. (Gompholobium ſpinoſum; Billard. Nov. Holl. v. 1. 107. t. 136.)—"Stem ſhrubby. Branches ſpinous, ſpreading, twice or thrice forked, angular. Bracteas very ſhort, cloſely preſſed to the top of the flower-ſtalk."—Native of the ſouth-weſt coaſt of New Holland, from whence it was ſent to Kew, by Mr. Peter Good in 1803, and is kept in the green-houſe, flowering moſt part of the ſummer. The *ſtem* is much branched, rigid and ſpinous, without leaves. *Flowers* ſtalked, uſually in pairs. Billardiere ſays the ſeeds are from two to four, and kidney-ſhaped.

Several more ſpecies of *Jackſonia* are deſtined to appear in Mr. Brown's *Prodromus Fl. Novæ Hollandiæ*, with which, we preſume, the above ſpecific characters are contraſted. S.

JACKSONSBOROUGH, in *Geography*, a ſmall poſt-town of South Carolina, on the W. ſide of Ediſto river, about 35 miles W. of Charleſton.

JACKTALL, a town of Hindooſtan, in Dowlatabad; 12 miles N.W. of Ramgur.

JACMEL, a juriſdiction and ſea-port town on the S. ſide of the iſland of St. Domingo. This juriſdiction, in the French part of the iſland, contains three pariſhes, remarkable for the goodneſs of its ſoil, and the abundant crops of coffee. The town is ſituated on the S. ſide of the neck of the ſouth peninſula; 6 leagues weſtward of Cayes de Jacmel, or 13 S.W. of Port-au-Prince, and 53 E. of cape Tiburon. N. lat. 18° 21′. W. long. from Paris 75° 2′.

JACMEL, *Cayes de*, a town and pariſh on the E. ſide of the ſtream of its name; the pariſh is bounded E. by the plain on the Spaniſh part, at the foot of the mountains of Bahoruco, 80 leagues ſquare, fit for any kind of cultivation.

JACO, a river of Brazil, which runs into the Atlantic. S. lat. 17° 25′.

JACO, in *Ornithology.* See PSITTACUS *Erithacus.*

JACOB, in *Scripture Hiſtory*, the ſon of Iſaac and Rebecca, was born in the year B. C. 1836. He was twin-brother of Eſau (ſee Gen. xxv. 25.), of a meek peaceable diſpoſition, domeſtic in his habits, inclined to a paſtoral life, and the favourite of his mother; whereas, Eſau was of a more fierce and turbulent temper, fond of hunting, and, in conſequence of his maſculine active ſpirit, the object of his father's partial affection. Jacob derived his name from the manner of his birth, as he came into the world holding his brother's heel, which, in Hebrew, is expreſſed by עקב, whence עקב, *he ſupplanted*, a term indicating ſome events that occurred in the progreſs of his years, and of which we have already given a brief account under the article Eſau. It is needleſs minutely to detail the particulars of his future hiſtory, as they are recited in the book of Geneſis, to which the reader is referred. Here we find, that in order to avoid the threatened effects of his brother's diſpleaſure, incurred as we have already related under the article ESAU, Jacob was ſent by his mother to her brother Laban. In his journey he had a viſion of a peculiar nature, which brightened his proſpects, and induced him to form pious and laudable reſolutions. On his arrival at Padan-Aram, he was hoſpitably received by his uncle Laban; and in a little while he conceived an affection for Rachael, his youngeſt daughter. In order to obtain Laban's conſent to their marriage, he agreed to ſerve him ſeven years; but at the cloſe of this period of ſervice, Leah, the eldeſt ſiſter, was ſubſtituted for Rachael; and he contracted to ſerve Laban for a ſecond term of years, upon condition of obtaining the firſt object of his affection. Upon the expiration of this term he married Rachael; and during his abode with Laban, he was ſingularly proſperous. At length his ſituation became intolerably grievous, and he determined to return with his wives and children, and the property he had acquired, to his own country. Availing himſelf of an opportunity which Laban's abſence afforded, he prepared for his journey; and he had proceeded ſo far before his departure was known, that Laban was ſeven days in purſuing him before he could overtake him. Upon their interview on mount Gilead, Laban remonſtrated and Jacob juſtified the meaſure which he had adopted. Rachael, however, before her departure, had contrived to purloin her father's *teraphim* (which ſee); and Laban, in his remonſtrance with Jacob, complained of the robbery. Jacob, unapprized of the fact, conſented to an examination of every tent, and declared that the individual, who was guilty of the robbery, ſhould be put to death. Rachael contrived to elude the ſearch; and Laban, apprehending that his charge was unjuſt, inclined to meaſures of conciliation. Accordingly, he propoſed to Jacob terms of alliance, and that a monument ſhould be erected as a teſtimony of it to future ages. Jacob acquieſced: a pile of ſtones was reared, called by Laban, in the Syriac tongue, Jagar-Sahadutha, and by Jacob, in Hebrew, Gilead; both ſignifying the heap of witneſs. The treaty was concluded with a ſacrifice and a feaſt; and Laban, having embraced and bleſſed Jacob and his family, ſet out on his return to Padan-Aram. Jacob, as he purſued his journey, began to entertain apprehenſions of the unappeaſed reſentment of his brother Eſau; and notwithſtanding the conciliatory meaſures he had adopted, he ſoon found that his brother was advancing to meet him with an armed force, and with ſeeming purpoſes of hoſtility. Having recommended himſelf by an act of devotion to the divine protection, he prepared a coſtly preſent for his brother. At this time he was favoured with a prophetic viſion, which ſerved to allay his fears and to animate his reſolution; and from a circumſtance that occurred on this occaſion, he obtained the name of "Iſrael," ſignifying a man who has prevailed with God; and this became afterwards the name of his poſterity. Having joined his family after this viſion, he advanced to meet his brother, who received him in the moſt kind and affectionate manner, and invited him to ſettle in his neighbourhood. Jacob, however, could not eaſily diſmiſs his apprehenſions of danger, and choſe rather to take up his abode near Schechem, where he purchaſed ground, on which he built an altar to the Lord. A circumſtance of a very diſtreſſing kind occurred, for an account of which we refer to the hiſtory, which made it neceſſary for Jacob to remove from the vicinity of Schechem; and whilſt he was deliberating whither to direct his courſe, he was inſtructed to erect an altar to God at Bethel, a place where he had received early aſſurances of the divine protection and favour. Having erected an altar at this place, he ſet out on his journey to his father; but in the way he was ſeverely afflicted by the loſs of his beloved wife Rachael, who died in childbirth of her ſon Benjamin. Soon afterwards he arrived at Mamre, and continued there till his father's death. At this time Joſeph, being about 17 years of age, became the object of jealouſy to his brethren; who, meditating his deſtruction, determined at length to ſell him to a troop of Iſhmaelites, and to feign a ſtory, with which they impoſed upon the afflicted father, of his having been torn to pieces by ſome wild beaſt. After the lapſe of ſome years, Jacob received the conſolatory news of Joſeph's being ſtill alive, and in a ſtation of high honour and power at the court of Pharaoh. (See Joseph.) The news, we may well imagine, tranſported him beyond meaſure, and he fainted in the arms of his ſons who communicated it. As ſoon as he could be perſuaded that the report was true, and found himſelf ſurrounded by the preſents of his ſon, and by the chariots of Egypt, which were to convey him and his family thither, he prepared for his journey, and in his way ſtopped at Beerſheba, to offer ſacrifices to God, thus expreſſing his gratitude and his deſires of continued protection and bleſſing. Having received aſſurances of divine favour, he purſued his journey with pleaſure; and, as he approached the borders of Egypt, he received a meſſage from Joſeph, requeſting him to meet him in the land of Goſhen, ſituated between the Red ſea and the Nile, which was a fruitful territory, and adapted to his paſtoral life. The interview between the patriarch and his ſon Joſeph is beſt conceived by a mind of virtuous ſenſibility. Having obtained leave of Pharaoh to ſettle in the land of Goſhen, Joſeph conducted his father and family thither; and here they proſpered and multiplied. Jacob lived 17 years in Egypt; and when he apprehended that his life was drawing to a cloſe, he obtained a promiſe from Joſeph that his remains ſhould be carried to Canaan, and depoſited with thoſe of his progenitors, Abraham and Iſaac, in the cave of the field of Machpelah, which Abraham had purchaſed. When he was dying, he adopted the two ſons of Joſeph, Manaſſeh and Ephraim, as his own; declaring, that in the diviſion of the promiſed land they were to receive a double lot, and to be conſidered as the heads of two diſtinct tribes. Having delivered to his ſons, who were collected round him, his dying predictions of the events that ſhould happen to their ſeveral deſcendants in future times, and which exactly correſponded to the patriarch's declarations, Jacob expired, at the age of 147 years, in the year B. C. 1689. Joſeph faithfully fulfilled his promiſes with reſpect to the burial of his father; and Pharaoh teſtified his reſpect for Joſeph by contributing in various ways to the pomp of the funeral proceſſion. After having depoſited the remains of their father in the cave of Machpelah, Jacob's ſons returned to Egypt, where they and their poſterity remained till the time of the *Exodus*. See Exodus. Geneſis, ch. xxv.—4. Anc. Un. Hiſt. vol. ii. p. 248. &c. &c. Calmet's Dict. Bib. art. *Jacob*.

Jacob, John, in *Biography*, was a native of Zulpha, and in the year 1641 he filled the poſt of principal joiner to the king of Perſia. He was celebrated for his ſkill in mechaniſm, and was author of many uſeful inventions. Having an opportunity of viſiting Europe, he formed a complete idea of the art of printing, and upon his return to Iſpahan he ſucceeded in erecting a preſs, and cut for himſelf matrices for the neceſſary types. The firſt ſpecimens of his typographical art were in the Armenian language, and conſiſted of the epiſtles of St. Paul, and the ſeven penitentiary pſalms. He would have proceeded with the other parts of the bible, but his progreſs alarmed the copyiſts, who excited ſuch a clamour againſt him that he was obliged to lay aſide the undertaking. He was a Chriſtian in religion; but on account of his very extraordinary talents he was permitted to hold a poſt which was never before occupied but by a Mahometan. His ſovereign would gladly have enrolled him among the followers of the prophet, but no offers of preferment, however tempting, could prevail on him to renounce Chriſtianity. Moreri.

Jacob, Henry, celebrated as the founder of the firſt independent or congregational church in England, was a native of Kent, and received his academical education at St. Mary's hall, Oxford. Having entered into holy orders, he was made precentor of Corpus Chriſti college, and afterwards obtained the benefice of Cheriton in Kent. In the year 1604 he publiſhed "Reaſons taken out of God's Word, and the beſt of human Teſtimonies, proving the Neceſſity of reforming our Churches of England." The publication of this, and of another work, againſt what was falſely called "learned preaching," drew down upon him the perſecution of biſhop Bancroft, and to avoid his wrath he fled to Holland. At Leyden he met with Mr. Robinſon, with whom he had frequent conferences, and became a convert to the Browniſt principles, ſince known by the name of independency. In Holland he publiſhed ſeveral treatiſes, and upon his return he avowed a deſign of ſetting up a ſeparate congregation upon the model of thoſe in Holland. This, in a ſhort time, he carried into effect, and thus laid the foundation of the firſt independent congregational church in England. He was elected paſtor of the church, and continued with his people till the year 1624, when, being deſirous of entering on a more enlarged ſphere of uſefulneſs, he went to Virginia, where he ſoon afterwards died. He was author of many publications which were highly eſteemed in his day. Neal's Hiſt. Puritans.

Jacob, Henry, ſon of the preceding, was born in the year 1609. He received the greater part of his education at Leyden, and made a wonderful progreſs in philological and oriental learning. He was patronized firſt by the earl of Pembroke, and then by archbiſhop Laud. By the influence of the latter he was appointed "ſocius grammaticalis" in Merton college, a poſt which had not been occupied for more than a century, and the duties of which required him to be reader of philology to the juniors. He became fellow of his college, and acted ſome time as amanuenſis to Mr. Selden. In 1648 he was expelled from his fellowſhip and college by the parliamentary viſitors; and being deſtitute of the means of ſubſiſtence he came to London, where his friend Mr. Selden contributed to his ſupport. He was never an economiſt either with regard to his little property or his health, and by intenſe application to his ſtudies he died, at Canterbury, at the early age of 44. He left behind him many very learned pieces, particularly "Græca et Latina Poemata." Gen. Biog.

Jacob, a performer on the eſtabliſhment of the Royal Academy at Paris, a ſcholar, on the violin, of Gavigné, who likewiſe taught that inſtrument, according to the principles of his maſter, by which he acquired reputation. He publiſhed, in 1769, a new muſical grammar, in which he wrote down the doctrine of the Abbé la Caſſagne, concerning the reduction of all clefs to one; calling his book l'Uncleſier, a plan which he had ſtolen from our countryman, Salmon, as Dumas had done before, and others of his countrymen ſince. Salmon's "Eſſay for the Advancement of Muſic, by reducing all Clefs to one," was publiſhed in 1672, to which there was no valid objection but the rendering all previous compoſitions obſolete. See Salmon and Clef.

Jacob, *St.* in *Geography*, a town of the duchy of Stiria; ſeven miles W. of Fridburg.—Alſo, a town of Stiria; ſix miles N.E. of Marburg.—Alſo, a town of Tyrol; eight miles S. of Landeck.—Alſo, a town of Sweden, in the government of Abo; 10 miles E. of Abo.

Jacob's *Creek*, an eaſtern water of Youghiogany river, in Weſtmoreland county, Pennſylvania. Six miles W. to Monongahela river there is a carrying place from the Youghiogany, oppoſite to the mouth of this creek.

Jacob's *Ladder*, in *Botany*. See Polemonium.

Jacob's *Staff*, a mathematical inſtrument for taking heights and diſtances; the ſame with the croſs-ſtaff.

JACOBÆA, in *Botany*. See Senecio.

JACOBÆAN Lily. See Amaryllis *Formoſiſſima*. The name was given by the Spaniards, becauſe this flower reſembles, in ſize, colour, and ſhape, the red croſs worn by the knights of the order of St. James, embroidered on their habits, as may be ſeen by ſome of their portraits brought into this country.

JACOBÆASTRUM. See Othonna.

JACOBÆOIDES. See Othonna.

JACOBAZZI, Dominic, in *Biography*, an Italian cardinal, was born at Rome in the year 1443. Having fixed upon the eccleſiaſtical life, he applied himſelf to the ſtudy of the canon law and theology, and became ſo eminent for his proficiency in theſe ſciences, and for his talents as a man of buſineſs, that he was employed by pope Sixtus IV., and five of his ſucceſſors, in the management of ſeveral important affairs. He roſe rapidly in the church; by pope Julius II. he was made vicar of Rome, and preſident of the univerſity in that city; he was likewiſe put in poſſeſſion of ſeveral biſhoprics, and at length, in the year 1517, he was elevated to the rank of cardinal by pope Leo X. He died about the year 1527, when he was 84 years of age. He was author of "A Treatiſe concerning the Councils," which was originally publiſhed at Rome in 1538, in folio. It forms the 18th volume of father Labbe's "Collectio Maxima Conciliorum," and renders that collection extremely valuable.

JACOBIN, in *Ornithology*. See Loxia *Molucca*.

JACOBINE, the name of a particular ſpecies of pigeon, called by Moore the *columba cypria cucullata*. (See Columba *Cucullata*.) It is generally called the jack, for ſhortneſs. It is, when genuine and of the true breed, the ſmalleſt of all pigeons. It has a range of feathers inverted quite over the hinder part of its head, and reaching down on each ſide of the neck to the ſhoulders of the wings, which forms a kind of friar's hood, from whence the bird has its name. This ſpecies has alſo a ſhort bill, and a pearly eye. The colour is various in the feathers; there are reds, yellows, blues, blacks, and mottles; but whatever is the general colour, the head, tail, and flight, are white. Some pigeons of this ſpecies are feather-legged, others are not.

JACOBINS, a name given in France to the religious who follow the rule of St. Dominic, on account of their principal convent, which is near the gate of St. James, in Latin Jacobus, at Paris; and which, before they came poſſeſſed of it in the year 1218, was an hoſpital of pilgrims, dedicated to the ſaid ſaint. (See Dominicans.) Others maintain, that they have have been called Jacobins ever ſince they were eſtabliſhed in Italy, becauſe they pretended to imitate the lives of the apoſtles.

They are alſo called *friars predicants*, or *preaching friars*.

Jacobins, a term of reproach applied ſoon after the French Revolution to thoſe who actually were, or who were ſuſpected to be attached to the French intereſt.

JACOBITES, in *Eccleſiaſtical Hiſtory*, a ſect of heretics, who were anciently a branch of the Eutychians, and are ſtill ſubſiſting in the Levant.

They were ſo called from Jacobus, James, of Syria, called Albardai, or Baradæus, who was one of the heads of the Monophyſites, or ſectaries who owned but one nature in Jeſus Chriſt.

This poor monk revived the cauſe of the Monophyſites by his activity and diligence; and when he died biſhop of Edeſſa, A.D. 588, he left this ſect in a moſt flouriſhing ſtate in Syria, Meſopotamia, Armenia, Egypt, Nubia, Abyſſinia, and other countries. The laborious efforts of Jacob were ſeconded in Egypt, and the adjacent countries, by Theodoſius, biſhop of Alexandria.

The Monophyſites were a ſect of vaſt extent, comprehending the Armenians, Copts, and Abyſſinians: and the denomination of Jacobites is commonly uſed in an extenſive ſenſe, as comprehending all of them, except the Armenians; but it more ſtrictly and properly belongs only to thoſe Aſiatic Monophyſites, of which Jacob Albardai was the reſtorer and chief. All the patriarchs of the Jacobites aſſume the denomination of Ignatius.

As to their faith, all the Monophyſites, both Jacobites and others, follow the doctrine of Dioſcorus touching the unity of nature and perſon in Jeſus Chriſt. See Monophysites.

Jacobites, in England, is a term of reproach beſtowed on ſuch perſons as diſallow of the revolution by king William, and ſtill aſſert the rights, and adhere to the intereſts of the abdicated king James, and his line.

JACOBS, Lucas, in *Biography*, a painter, born at Leyden, and therefore commonly known by the name of Lucas Van Leyden. In the year 1494 he made the entrè of life, and as he grew up was inſtructed by his father, Hugh Jacobs, in the art of painting. Afterwards he became the pupil of Cornelius Engelbrecht, and had acquired conſiderable reputation as a painter, and alſo as an engraver, when he arrived at the age of manhood.

His ſtyle is of the dry Gothic ſchool of Germany, of which Albert Durer is the leader; cloſe upon whom followed Jacobs, with nearly as much merit as a painter, though not his equal by far in invention. The attempt to copy the model cloſely is in the works of the latter as evident as in thoſe of the former, and his draperies have the ſame character. Both are imperfect and meagre in lines; but ſometimes, where they copied the large flowing dreſſes of the church, they are broad and have much majeſty. His feeling of expreſſion is of a low and vulgar caſt, and oftentimes mere grimace; but it muſt be acknowledged that he and Albert were far above their contemporaries in Germany.

The works of this maſter are numerous; but he is perhaps better known by his prints, engraved by himſelf with great ingenuity, from a great number of his pictures in Leyden, Amſterdam, Vienna, &c. &c. He died in 1533, at the age of 39.

JACOBSHAGEN, in *Geography*, a town of Pomerania; 16 miles E. of Stargard. N. lat. 53° 25′. E. long. 15° 30′.

JACOBSON, John Charles Gottfried, in *Biography*, was born at Elbingen in 1726. He ſtudied at Leipſic, but in conſequence of an unfortunate duel he was obliged to leave that place, and entered into the ſervice of the elector of Saxony. He afterwards enliſted in a regiment of infantry at Berlin, and during a two years' reſidence in that city he diligently frequented the different manufactories and workſhops, and between the years 1773 and 1776 publiſhed his “Deſcription of all the Cloth Manufactories in Germany,” in four volumes octavo. He was indefatigable in his purſuits, and beſides his own publications he aſſiſted Sprengel in his “Collection of the Arts and Handicrafts,” and Nicolai in his “Deſcription of Berlin.” In 1778 he was actively engaged in military affairs, but after the campaign of this year he obtained a diſcharge, and began his “Technological Dictionary of all uſeful Trades, Arts, Manufactures, &c.” which was publiſhed in parts between the years 1781 and 1784. In the latter year he was appointed inſpector of all the royal manufactories in the kingdom of Pruſſia; he died in 1789. He was author of “A Deſcription of all the Linen, Cotton, and Woollen Manufactures in the Pruſſian States,” in 4 vols. and he had begun a “Compendium of Technology,” when death put an end to his labours. Gen. Biog.

JACOBSTADT, in *Geography*, a ſea-port town of Sweden, in the government of Waſa, with a convenient port. N. lat. 56° 41′. E. long. 22° 36′.

JACOBUS, a gold coin, worth twenty-five ſhillings; ſo called from king James the Firſt of England, in whoſe reign it was ſtruck. We uſually diſtinguiſh two kinds of Jacobus, the *old* and the *new*; the former valued at twenty-five ſhillings, weighing ſix penny-weights ten grains; the latter, called alſo Carolus, valued at twenty-three ſhillings; in weight five penny-weights twenty grains.

JACOPONE DA TODI, in *Biography*, an Italian poet of the 13th century, was born at Todi, of the noble family of Benedetti, or Benedettoni. He was brought up to the profeſſion of the law, in which he practiſed, obtained a fortune, and lived in every reſpect as a man of the world. A ſerious accident which befel his wife, and occaſioned her death, led him to reflection, and he immediately devoted himſelf to religion. He entered the order of the Franciſcans: to receive the humiliation of contempt he counterfeited folly, and ſucceeded ſo well, that his baptiſmal name of Jacopo was changed into the nick-name of Jacopone. The rigour of his ſuperiors ſurpaſſed his own voluntary mortifications, and for a ſlight offence he was thruſt into a noiſome dungeon, where he is ſaid to have compoſed one of his moſt rapturous canticles of divine love. He underwent greater ſufferings from the reſentment of pope Boniface VIII., on account of ſome reflections thrown out reſpecting the evils brought on the church by that pontiff. He was cloſely impriſoned, and allowed no other ſuſtenance than bread and water. He ſurvived his liberation but three years, and died in 1306. His “Spiritual Canticles” have given him a place among the Italian poets. Of this work the beſt edition is that of Venice, in 1617. Moreri.

JACPOE, in *Geography*, a town on the W. coaſt of the iſland of Borneo. S. lat. 0° 14′. E. long. 109° 21′.

JACQUELOT, ISAAC, in *Biography*, was born at Vaſſy, in Champagne, in the year 1647. He was educated for the miniſtry and as ſoon as he had arrived at man's eſtate he was appointed his father's colleague in the church of his native place. After the revocation of the edict of Nantz he retired to Heidelberg, and from thence he removed to the Hague. His talents as a preacher acquired for him a high reputation, and he was ſolicited by the king of Pruſſia to become his miniſter at Berlin; to which he readily acceded, and enjoyed a handſome penſion from his majeſty till his death in 1708. He was author of many works, among which are “Diſſertations on the Exiſtence of God;” “Diſſertations on the Meſſiah;” and “A Treatiſe on the Inſpiration of the Sacred Books.” He wrote and publiſhed “A Criticiſm on the Picture of Socinianiſm,” written by Jurieu, which expoſed M. Jacquelot to a bitter perſecution.

JACQUES, FRERE (*Friar* JAMES), whoſe ſurname was BAULOT, or BEAULIEU, a celebrated lithotomiſt, and a man of ſingular character, was born, in 1651, at a village in Franche-Comté, where his father was a poor labourer. At the age of ſixteen he was ſeized with an inclination to travel. The education, which he had received, did not extend beyond writing and reading; but he had an ardent deſire for other knowledge, and a propenſity, which he felt for the practice of ſurgery, was put in the way of gratification, by himſelf becoming a patient in the hoſpital of his province. During his convaleſcence, he applied himſelf with great aſſiduity to aſſiſting the ſick, and learned to bleed. He ſoon afterwards enliſted in a regiment of cavalry, in which he ſerved ſome years, and became acquainted with an Italian empirical ſurgeon, named Pauloni, who had become famous for cutting for the ſtone, and curing ruptures. Having procured his diſcharge, at the age of twenty-one, Jacques attached himſelf to this empiric, and travelled with him five or ſix years, in various countries, as an aſſiſtant. At length feeling himſelf equal to undertake the practice without a director, he quitted Pauloni, and began to act for himſelf in the villages and country towns of Provence, taking no more recompence for his ſervices, than juſt ſufficed for his humble maintenance After having practiſed his art eight or ten years, he put on a monaſtic habit, in 1690, or 1691, but not of any particular religious order, and took the name of *frere* Jacques, by which he was ever afterwards diſtinguiſhed. He now viſited the larger towns; eſpecially Marſeilles, and went alſo into other provinces, where he chiefly operated upon the poor; but, among the perſons of rank whom he cut, was a canon of Paris, who recommended him to viſit the metropolis, and gave him letters of introduction. He arrived at Paris in Auguſt 1697, and was ordered to perform his operation on the dead body in the preſence of the phyſicians and ſurgeons of the Hôtel-Dieu. But although one or two of theſe officers gave a preference to his operation, prejudice and envy prevailed, and he was not allowed to practiſe it on the living body. He, therefore, quitted Paris in October of the ſame year, and went to Fontainebleau, the reſidence of the court, where the ſucceſs of his operation, in the preſence of the principal medical men, obtained him a reputation, which led to a ſecond viſit to Paris; where he is ſaid to have been unſucceſsful in a large proportion of his operations, and was taxed with extreme ignorance of anatomy, as well as of the art of ſurgery in general, ſo that he refuſed, it was alleged, to pay much attention to the wound, ſaying, that “it was ſufficient that he had removed the ſtone; God would heal the patient.” Time and experience, however, taught him better; and he employed proper dreſſings and treatment. His name ſpread throughout Europe as the moſt ſucceſsful lithotomiſt of his time; and between the years 1688 and 1714, he viſited Holland, Geneva, Flanders, and the principal cities, performing an immenſe number of operations with various ſucceſs. When at Paris, in 1703, he performed his operation on the marſhal de Lorges, who died on the following day, and he quitted that city in ſome diſgrace, reſolved never to return. He was much honoured by the magiſtrates of Amſterdam, who cauſed his portrait to be engraved, with the inſcription, “Frater Jacobus de Beaulieu, Anachoreta Burgundus, Lithotomus omnium Europæorum peritiſſimus;” and above it, this motto, as a juſtification of ſome of his failures,—"Quia non omnes convaleſcunt, non idcirco nulla medicina eſt"—The celebrated ſurgeon and anatomiſt, Rau, oppoſed him, however, with acrimony; but did not refuſe to borrow from him his method, which, with ſome improvements, conſtituted the *lateral operation*, afterwards brought to perfection in England by Cheſelden. In the courſe of his travels, Frere Jacques was called to Vienna to be conſulted for the emperor Joſeph; and at Rome, he was received with great honour by the pope. But tired at length with wandering about, he ſought his native village: his parents were dead; and, having diſtributed ſome money among his nephews, he choſe a quiet retreat near Beſançon, with a view of finiſhing his days in retirement and tranquillity. And after a ſojourn of a few weeks, he died, in December 1714, at the age of ſixty-nine, with all the tokens of ſincere piety. Frere Jacques, though in ſome meaſure chargeable with the temerity of ignorance, was a man of genius and of an elevated mind, and deſerves to rank among the improvers of an uſeful art. He publiſhed an account of his method of operating, in 1702, in a pamphlet of eight pages; and it was reprinted by M. Morand in the ſecond part of his "Opuſcules." Eloy. Dict. Hiſt.—Gen. Biog.

JACQUIER, Francis, a very learned eccleſiaſtic and mathematician, was born at Vitry, near Paris, in 1711, and died at Rome in 1788. He was one of the editors of what is generally known in this country as "The Jeſuits' edition of Sir Iſaac Newton's Principia." This edition, which was publiſhed in four thin volumes in 4to. in the year 1760, is illuſtrated with a perpetual commentary, for the benefit, as the editors avow, neither of the very learned, nor of thoſe who are wholly unſkilled in mathematical ſcience. Jacquier was author of ſeveral works written in the Italian language.

JACQUINIA, in *Botany*, ſo named by Linnæus, in honour of the celebrated Nicholas Joſeph Von Jacquin, profeſſor of botany at Vienna, born at Leyden in 1727, who was early diſtinguiſhed by the publication of his hiſtory of American plants, as he has ſince been by numerous very ſplendid works. This venerable author is, as far as we know, ſtill living at Vienna, and has an only ſon, Joſeph Von Jacquin, who reſided for ſome time in England about twenty years ago, and treads in his father's ſteps.—Linn. Gen. 101. Schreb. 137. Willd. Sp. Pl. v. 2. 1064. Mart. Mill. Dict. v. 2. Jacq. Amer. 53. Ait. Hort. Kew. ed. 2. v. 2. 5. Juſſ 151. Lamarck. Illuſtr. v. 2. 45 t. 121.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Sapotæ*, Juſſ. *Myrſineæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of five roundiſh, concave, permanent leaves. *Cor.* of one petal; tube bell-ſhaped, inflated, longer than the calyx; limb in ten roundiſh ſegments, of which the five inner ones are ſhorteſt. *Stam.* Filaments five, awl-ſhaped, inſerted into the receptacle; anthers arrow-ſhaped. *Piſt.* Germen ſuperior, ovate; ſtyle the length of the ſtamens; ſtigma capitate. *Peric.* Berry roundiſh, pointed, of one cell. *Seed* ſolitary, roundiſh, cartilaginous.

Eſſ. Ch. Corolla in ten ſegments. Stamens inſerted into the receptacle. Berry with one ſeed.

Obſ. The germen contains the rudiments of ſeveral ſeeds, one of which only, for the moſt part, comes to perfection. Hence the embryo, naturally erect, becomes tranſverſe from the altered poſition of the ſeed in ripening. See Brown's Prodr. v. 1. 533.

Five ſuppoſed ſpecies of *Jacquinia* are defined by Willdenow, but of theſe one is indicated by Mr. Brown as a new genus, belonging to a very different order, the *Rubiaceæ*. This is *J. venoſa* of Swartz's *Prodromus*, omitted either by accident or deſign, in his *Flora Ind. Occid.* The place of this, however, is ſupplied by a new ſpecies from the ſecond edition of the *Hortus Kewenſis*. They are all ſhrubby or arboreſcent, with rigid, ſmooth, entire, ſcattered *leaves* on ſhort *ſtalks*, each with a pair of minute, awl-ſhaped, intrafoliaceous, deciduous *ſtipulas*, not always diſcernible. *Flowers* terminal, racemoſe or ſolitary, white, yellow, or orange-coloured, on ſmooth ſtalks.

1. J. *arborea*. Vahl. Eclog. Amer. faſc. 1. 26. Willd. n. 1.—Leaves obovate, ſomewhat wedge-ſhaped. Branches even; the lowermoſt quaternate; upper ones forked.—Found by Mr. Ryan in the iſland of Montſerrat, on the ſea coaſt in one place only, near the road called New Windward. A *tree* from four to 20 or 30 feet high, the trunk from ſix to eight inches thick, the branches ſcarcely ſwelling under their ſubdiviſions, in which character and its greater ſize only it differs from the following, and they ought ſurely to be conſidered as mere varieties.

2. J. *armillaris*. Linn. Sp. Pl. 272. Jacq. Amer. 53. t. 39.—Leaves obovate, ſomewhat wedge-ſhaped. Branches ſwelling under their ſubdiviſions; whorled below; forked above. Cluſters many-flowered.—Native of the Weſt Indies. A handſome *ſhrub*, ſeldom more than four or five feet high. *Leaves* two inches long, emarginate, ſometimes with a minute point. *Flowers* about 20 in a cluſter, the ſize of lily of the valley, white, ſmelling like jaſmine. *Berry* as big as a pea, reddiſh orange. The Indians are ſaid by Jacquin to make bracelets of the ſeeds, whence the ſpecific name, and the leaves to intoxicate fiſh if thrown into the water.

3. J. *aurantiaca*. Ait. Hort. Kew. ed. 2. v. 2. 6.—Leaves obovate or lanceolate, with ſpinous points. Cluſters of few flowers.—Diſcovered in the Sandwich iſlands by Mr. Archibald Menzies, by whom it was introduced into the Kew garden in 1796. It is kept in the ſtove and flowers moſt part of the ſummer. The upper *leaves* of each branch reſemble thoſe of the two foregoing, but the lower ones are ſmaller and almoſt lanceolate; every one of them is tipped with a rigid ſpine. The *branches* and *ſtalks* are ſlightly downy. *Flowers* orange-coloured, only three in the cluſter of the only ſpecimen we have ſeen, which is preſerved in the Bankſian herbarium.

4. J. *ruſcifolia*. Linn. Sp. Pl. 271. Jacq. Amer. 54. Ait. Hor. Kew. ed. 2. v. 2. 6. (Fruticulus foliis ruſci ſtellatis; Dill. Elth. v. 1. 148. t. 123. f. 149.)—Leaves all lanceolate, with ſpinous points. Flower-ſtalks ſimple.—Native of South America. Found by Jacquin in mountainous woods at the Havannah, flowering in January and February.—A rigid *ſhrub*, three feet high, with narrow, coriaceous, ſpinous-pointed *leaves*, whoſe form is like the lower leaves of the ſpecies laſt mentioned. The *ſtalks* are ſingle-flowered, recurved as the fruit ripens.

A large variety, as it appears to be, of this ſpecies, received by Miller from Carthagena, and called by that author in his Dictionary *Ruſcus fruteſcens*, is preſerved in the Bankſian herbarium. Its larger *leaves* ſomewhat approach thoſe of the *aurantiaca*, but the *flower-ſtalks* are ſimple.

5. J. *linearis*. Linn. Sp. Pl. 272. Jacq. Amer. 54. t. 40. f. 1.—Leaves linear, with ſpinous points. Flower-ſtalks ſimple, reflexed.—Native of the ſea-ſhore near Port-au-Prince in Hiſpaniola, bearing flowers and fruit in January. *Jacquin*. Much ſmaller than any of the foregoing, with leaves ſcarcely more than an inch long. *Flowers* ſmall, white, inodorous, on ſlender reflexed ſtalks.

JACRAH, in *Geography*, a town of Bengal; 35 miles S. of Burdwan.

JACTITATION *of* Marriage. See Marriage.

JACULATOR, or Shooting-fish, in *Ichthyology*, is a ſpecies of the *chætodon* in the Linnæan ſyſtem, or the CHÆTODON *Roſtratus*; which ſee.

JACULGONG, in *Geography*, a town of Hindooſtan, in Dowlatabad; 18 miles S. of Oudighir.

JACULUM, or JACULUS, in *Zoology*, the name of a ſpecies of ſerpent, (the ANGUIS *Jaculus*,) found in Rhodes, and ſome other places, and more uſually called *Acontias*; which ſee. It is found in Egypt, with the abdominal ſcales ſomewhat broader.

JACULUS. See DIPUS *Jaculus*.

JACUPEMA, in *Ornithology*, the name of a Braſilian bird of the pheaſant kind, nearly as large as the common European hens. Its feet are of a fine red; it is a very well taſted fowl, and is eaſily kept tame. It has its name from the noiſe it makes, which is, *jacu, jacu, jacu*. Margrave. See PENELOPE *criſtata*.

JACURSO, in *Geography*, a town of Naples, in Calabria Ultra; 8 miles W. of Squillace.

JACURUTU, in *Ornithology*, the *Bubo Magellanicus*. See STRIX *Bubo*.

JACUSI, in *Geography*, a town of Japan, in the iſland of Niphon; 25 miles N. E. of Achila.

JACUT, in the *Natural Hiſtory of the Arabians*, is generally ſuppoſed to be the name of the ruby only; and it is owing to this, that among the gems uſed by the Arabian phyſicians in medicine, the ruby is ſuppoſed to have been moſt of all in eſteem, as the name jacut oftener occurs in their writings than that of any other of the gems.

JACUT-AGA, is the name of an officer in the court of the grand ſeignior. He is one of two eunuchs who have the care of the treaſure.

JACZIN, in *Geography*, a town of Poland, in Galicia; 34 miles S.W. of Halicz.

JACZINOW, a town of Galicia; 52 miles S. of Halicz.

JADDESSES, is the name of an inferior order of prieſts in Ceylon, who have the care of the chapels appropriated to the genii, who form a third order of gods among theſe idolaters. Theſe prieſts are applied to by the people in a time of diſeaſe or calamity, who offer a cock on their behalf to appeaſe the anger of the dæmons.

JADE, in *Natural Hiſtory*. See NEPHRITIC *Stone*.

JADEL, in *Geography*, a town of Aſiatic Turkey, in the province of Diarbekir; 20 miles N.W. of Rabba.

JADERA, in *Ancient Geography*, a town and colony of Liburnia, placed by Pliny 160 miles from Pola. We find references to it in the medals of Claudius and Juſtinian.

JADEVAR, in *Geography*, a town of Hindooſtan, in Viſiapour; 15 miles S.E. of Raibaug.

JADGEREM, or JAGEROM, a town of Perſia, in the province of Choraſan. N. lat. 36° 23'. E. long. 55° 42'.

JADJAPOUR, a town of Bengal; 33 miles S.S.E. of Moorſhedabad.

JADISPOUR, a town of Hindooſtan, in Bahar; 21 miles W. of Arrah.

JADO, a town of Japan, in the iſland of Niphon; 5 miles S.E. of Meaco.

JADREKA, in *Ornithology*. See SCOLOPAX *Limoſa*.

JADUNATPOUR, in *Geography*, a town of Hindooſtan, in Bahar, on the Soane; 20 miles W.S.W. of Rotaſgur.

JAEGERSPREIS, a town of Denmark, in the iſland of Zealand; 22 miles N.W. of Copenhagen.

JAEL, a town of Hindooſtan, in the circar of Nagore; 16 miles N.E. of Nagore.

JAEN, a province of Spain, from which the king of Spain takes the title of king of Jaen, whence it is called a kingdom, and having been a kingdom in the time of the Moors, till it was annexed to the crown of Caſtile: it is now comprehended under the government of Andaluſia, and forms one of its diviſions. It is about 60 miles from N. to S. and about as much from E. to W., itſelf mountainous and ſurrounded with mountains, which afford mines of lead, copper, and ſilver, and which ſeparate it from the kingdoms of Cordova, Toledo, Murcia, and Granada The river Guadalquivir divides it from the kingdom of Seville. The valleys of this province are merely ſuch as have been formed by torrents of water; and the decompoſition of the hills, not contiguous or connected, have at different periods produced thoſe gaps and paſſes, which now form the roads in this petty kingdom, once the domain of a Mooriſh chieftain, and for a long period the theatre of chivalry, honour, and love. In the centre of this rugged kingdom, about ¾ of a league from the town of Linares, is a ſmall plain ſituated in the moſt elevated part of the country, which affords an extenſive proſpect, comprehending Jaen the capital, as well as Andujar, Baeça and Ubeda. The hills at the extremity of this place are pierced like a ſieve, with innumerable ſhafts and excavations, ſuppoſed to be the work of the Moors, from which they ſupplied the neighbouring ſtates with ſilver, copper, and lead. The common or wild camomile is ſo common here, that the whole kingdom might be ſtocked with it; here is alſo plenty of game. The principal towns of this ſmall kingdom are Jaen, Baeça, Ubeda, Caçorla, and Caſſona.

JAEN, the capital of the above kingdom, is ſaid by ſome to have been the Oningi of Pliny, and the Oringi of Livy, and, according to others, the Menteſſa of the Romans. It is ſituated at the foot of a mountain of mixed marble, at the top of which the ruins of its antique caſtle are viſible, a league from the river Guadilbeva, and two from the Guadalquivir. It is ſurrounded by walls, flanked with towers; contains ſome ſquares, one of which is ſpacious, and is formed by pleaſant houſes. It is well ſupplied with water, which is diſtributed by fountains in the ſquares, ſtreets and houſes. This city is the ſee of a biſhop, ſuffragan of the archbiſhop of Toledo: its dioceſe contains two cathedral chapters, two collegiate chapters, ſeven arch-prieſts, and 438 pariſh churches. Beſides the cathedral, which is a noble ſtructure, and pariſh churches, Jaen has a great number of monaſteries and nunneries, and two hoſpitals. The chapter of the cathedral is compoſed of eight dignitaries, 21 canons, 21 prebendaries, and 30 prieſts who ſerve the church. This city is the reſidence of the intendant of the province: it has a criminal judge, and a lord mayor for the adminiſtration of juſtice, a municipality compoſed of a determinate number of regidors, a board of economy, and a population of about 30,000 perſons. Jaen was taken from the Moors by Ferdinand II. king of Caſtile, in 1243. It was formerly rich and commercial, and had a great number of ſilk manufactories; but theſe became almoſt extinct at the end of the 16th and beginning of the 17th century. An attempt was made to revive them about the middle of the 18th century; but few of them are now remaining. The environs of Jaen are extremely agreeable, abounding with delightful fertile valleys, and furniſhing great quantities of corn, hemp, flax, paſture, and exquiſite fruits. The lands belonging to the town yield the ſame productions, in ſtill greater plenty: they are particularly planted with trees of every kind, and as there is no deficiency of mulberry trees, the ſilk-worm is raiſed; but it is an object very much neglected; 45 miles E. of Cordova. N. lat. 37° 53'. W. long. 3° 51'.

JAEN *de Bracamoros*, a province of South America, in the viceroyalty of New Granada. It is the moſt ſouthern of the viceroyalty, and was ſubdued by Pizarro about the year 1540. In the mountains is found ſome gold; and the plains produce cotton, excellent chocolate, and tobacco.

Jaen de Bracamoros is alſo the name of a town, the capital of the above province, which was founded in the year 1549 by Diego Palomino. It is ſituated in the juriſdiction of Chaca-Inga, on the N. ſhore of the river Chinchipe, at its conflux with the Maranon, and is the reſidence of the governor. It lies in about 5° 25′ S. lat. and its longitude is nearly that of Quito. It contains between 3 and 4000 inhabitants, who are for the moſt part Meſtizos, with ſome Indians, but very few Spaniards.

JAEPOUR. See Jyenagur.

JAERSBORG, a town of Denmark, in the iſland of Zealand; 5 miles N.N.W. of Copenhagen.

JAFA, a territory of Arabia, ſurrounded by Aden, ſome part of the Imam's dominions, and the extenſive province of Hadramaut. It is fertile, and abounds particularly in coffee and cattle. It was formerly under the dominion of the Imam; but in the end of the 17th century the inhabitants revolted, and became independent. They are governed at preſent by three ſovereign princes, who have conquered alſo a part of Hadramaut. Theſe princes are, the ſultan of Reſſes, who reſides at Medsjeba, the ſultan of Moſaka, who takes his title from the place of his reſidence, and the ſultan of Kara, who reſides in a caſtle upon the mountain of Kara. One of theſe ſultans of Jafa likewiſe poſſeſſes Schæhr, a ſea-port town, from which incenſe, inferior in quality to that of India, is exported. Niebuhr.

JAFATIN Islands, a cluſter of ſmall iſlands in the Red ſea, near the coaſt of Egypt. N. lat. 27° 10′. E. long. 33° 50′.

JAFERI, a town of Perſia, in Choraſan; 75 miles N.N.W. of Badkis.

JAFFA, Yaffa, Yafa, or Yaffé, the ancient *Joppa*, was formerly a conſiderable ſea-port on the Mediterranean, and the only port which the Jews had on that ſea. It was ſeated on a high hill, which commanded a full proſpect of the ſea on one ſide, and of a fertile country on the other. On the S. it had the town of Jamnia, on the N. Cæſarea Paleſtina, and on the E. Rama or Ramula. During the holy war, this city, ſo often mentioned both in the Old and New Teſtament, was ſo entirely ruined, that it had ſcarcely any buildings left beſides the old caſtle, ſituated on an eminence above it, and another near the ſea. The preſent town has been neatly rebuilt with ſtone, but on account of the inequality of its ſituation the ſtreets are paved in ſteps. It is walled, and has two principal gates and a ſmaller one; the latter and one of the former yet remain; the other is ſhut up. It is commanded by an eminence on the N. within muſket ſhot, where Ali Bey, when he beſieged it, pitched his camp. Although it has a good wharf, ſhips cannot come up to it; nor has it any port or ſecure place of anchorage. This port, which is formed by a pier, and at preſent choaked up, might be cleared out, and made to contain veſſels of 300 tons burden each. At preſent ſhips are obliged to caſt anchor out at ſea, at nearly a league's diſtance from the ſhore; where they are by no means ſafe, the bottom being a bank of rock and coral, which extends as far as Gaza. Yafa is the port at which the rice ſent from Damietta to Jeruſalem, the merchandiſe for a ſmall factory at Ramla, and the commodities from the various ports on the coaſt of Syria, are landed. Here alſo the pilgrims from the Morea and Conſtantinople arrive; and here the ſpun cottons of Paleſtine, and other articles of trade, conveyed by ſea, along the coaſt, are ſhipped. Although in its preſent ſtate it does not deſerve mention as a ſea-port, or place of ſtrength, it is capable of being made one of the moſt important on the coaſt, on account of two ſprings of freſh water which are within its walls, on the ſea-ſhore, and which enabled it to make an obſtinate reſiſtance during the late wars. The air, formerly deemed inſalubrious, has, by the draining of ſome adjacent marſhes, been rendered perfectly healthy; and before the two late ſieges, it was one of the moſt agreeable towns on the coaſt. Its environs were a continued foreſt of orange and lemon trees, citrons and palms, which here firſt begin to bear good fruit. The country at a greater diſtance abounded with olive trees as large as walnut trees: but in the ſieges undertaken by Ali Bey and his ſucceſſor Mahomed Abu-dhahal, the Mamlouks cut them down and uſed them for fire wood. It has thus loſt its greateſt convenience and ornament: but it was impoſſible to deprive it of the rivulets that water its gardens, and nouriſh the young ſuckers, which have already begun to ſhoot. This town has three ſmall convents of Chriſtians, Armenian, Greek, and Roman Catholic, and a few Jews. Yafa is one of the three appanages, or "Melkana," into which Paleſtine is divided, the other two being Loudd and Gaza. The former belongs to the Walda, or Sultana-Mother; and is held by an Aga, who pays to her 120 purſes. For this he receives the whole miri and poll-tax of the town, and ſome adjacent villages. But the chief part of his revenue ariſes from the cuſtom-houſe, as he receives all the duties on imports and exports. The government is now mild; and the population, gradually increaſing, may be eſtimated at 6 or 7000 ſouls. Jaffa, in the year 1799, was taken by the French, though not without conſiderable difficulty and bloodſhed, but they held poſſeſſion only 40 days. According to ſir R. Wilſon the conqueſt was followed by a maſſacre of 3800 priſoners, four days after the ſurrender of the town; and he informs us that 580 French ſoldiers, ſick in the hoſpital, were poiſoned with opium by command of the French general Bonaparte; 40 miles S. of Acre, and 40 miles N. of Gaza. N. lat. 32° 2′. E. long. 34° 53′. Volney's Travels, vol. ii. Browne's Travels, p. 359.

JAFFIERABAD, a town of Hindooſtan, in the country of Berar, and circar of Aurungabad, 40 miles N.N.E. of Aurungabad. N. lat. 20° 22′. E. long. 76° 25′.—Alſo, a town of Hindooſtan, on the coaſt of Guzerat, and next to Diu, a place of the greateſt trade on this coaſt. The town is ſurrounded by a wall for its defence. In a river near this town are found very large oyſters. N. lat. 20° 56′. E. long. 70° 36′.—Alſo, a town of Bengal; 6 miles N.W. of Iſlamabad.—Alſo, a town of Oude; 7 miles S.E. of Hajypour.

JAFFIERGUNGE, a town of Bengal; 40 miles E.S.E. of Dacca.

JAFFNA, the capital of the diſtrict of Jafnapatam in the iſland of Ceylon, ſtands at the diſtance of ſome miles from the ſea, but communicates with it by means of a river navigable with boats. The river falls into the ſea near Point Pedro, where are a fort and harbour. The fort of Jaffna was given up by the Dutch to the Britiſh troops, as ſoon as they appeared before it. It is ſmall, but exceedingly neat and well built. The Pettah, or Black Town, without the walls, which is of a quadrangular figure, is large and more populous than that of Trincomalee. Since Columbo was taken poſſeſſion of by the Engliſh, ſeveral Dutch families have quitted it, and taken up their reſidence in the vicinity of Jaffna; as this latter place is much cheaper and better ſupplied with all the neceſſaries of life, ſeveral of which are ſcarcely to be procured in the other parts of the iſland. The inhabitants of Jaffna conſiſt of a collection of various races. The greateſt number conſiſts of Malabars of Mooriſh extraction, who are divided into ſeveral tribes, known by the names of Lubbahs, Belalas, Mopleys, Chittys, Choliars, and a few Brahmins;

they are diſtinguiſhed by wearing a little round cap on their cloſe ſhaven heads. There is alſo a race of Malabars found here ſomewhat differing in their appearance from thoſe on the continent. Theſe different tribes of foreign ſettlers greatly exceed in number the native Ceyloneſe in the diſtrict of Jaffna. The Malabars are employed in manufacturing cotton, cloths, &c. The Chittys and Lubbahs trade in cloths, calicoes, handkerchiefs, &c. and go backwards and forwards to the continent to carry on this trade. The Lubbahs are Moors and Mahometans. The Belaias are numerous; they are chiefly huſbandmen and attend to tillage and rearing cattle. Theſe are extremely litigious and quarrelſome; and, although profeſſed Chriſtians, they obſerve ſcarcely any of the ordinances of our religion. They are in ſome meaſure Pythagoreans; and ſay when a child is born lame, blind, or dumb, that it was formerly the ſoul of a perſon, who muſt have deſerved this puniſhment by his actions in a former ſtate. They are extremely ſuperſtitious, and attached to many of the rites of Paganiſm.

The Choliars and Chivias do the hard work; are porters, palankeen bearers, and water carriers; though ſome are deſcended from the higher order, and will only carry the great men. The Panias and Pariars are the fiſhermen, as alſo the Mokkouas. The Nalloaus are the blackeſt of all the tribes. They gather the toddy from the cocoa-trees, make arrack, tend the cattle, and are labourers and Coolies. The Pariars are accounted the loweſt and moſt deſpicable. All theſe in ſome meaſure partake of the Ceyloneſe cuſtoms and habits of life, mingled with their own. They inhabit various parts of the north-weſt coaſts of Ceylon.

At Jaffna there is alſo a number of handicraftſmen, ſuch as goldſmiths, jewellers, joiners, and makers of all different parts of houſehold furniture. They are very expert in their reſpective operations; particularly that race known in this iſland by the name of Portugueſe, who ſurpaſs all the reſt in the beauty and dexterity of their workmanſhip.

JAFFNOO, a kingdom of Africa, bounded on the N. by Sahara or the great deſert, on the E. by Ludamar, on the S. by Kaſſon, and on the W. by Geduma. N. lat. 15° to 15° 40'. W. long. 7° 40' to 9°.

JAFFRAY, a poſt-town of America, in Cheſhire county, New Hampſhire, on the S. ſide of the great Monadnock mountain, ſix miles N. of the Maſſachuſetts line; incorporated in 1773, and containing 1341 inhabitants. Here are found red and yellow ochre, alum, vitriol, and black lead in great quantities: and alſo buck-bean or menyanthes, reckoned uſeful in Medicine.

JAFFRYGUNGE, a town of Bengal; 43 miles N.E. of Purneah.

JAFNA. See Jamnia.

JAFNAPATAM, a diſtrict of Ceylon, comprehending an oblong peninſula in the northern extremity of the iſland, almoſt cut off from the reſt by a branch of the ſea, which penetrates acroſs the iſland, except that a ſmall ſtrip of land remains, which is nearly inundated at high water. This diſtrict looks directly towards Negapatam on the Coromandel coaſt, and is conſidered as the moſt healthy in the iſland: a circumſtance which is aſcribed to its being ſurrounded almoſt on all ſides by the ſea, by which means the violent hot winds from the continent of India are cooled in their paſſage. The fields, clothed with verdant paſture, exhibit a convincing proof of the temperate nature of the climate. Fruits, vegetables, game, and poultry abound every where in this diſtrict; and it ſeems that the atmoſphere differs in ſome reſpect or other from that contiguous to other parts of the iſland; as it is only in the tract which lies between Point Pedro and Jaffna that ſheep have been ever reared with ſucceſs. The articles of commerce produced here are of no great value; the cinnamon and pepper being of an inferior kind to that which grows in the S.W. of the iſland. Jafnapatam was once a kingdom by itſelf, but was divided into ſeveral provinces. It is very populous, and has a great number of villages and churches, for all the various denominations of its inhabitants. The four leſſer provinces contained in it are Beligame, Tennermarche, Waddermarche, and Patchiapalle. The Dutch built a church in 1658 at Telipoli, near a ſhady and pleaſant grove. Several very good villages lie along this diſtrict, with churches and ſchool-houſes for educating the native children. The paſſage from Point Pedro to Negapatam on the oppoſite coaſt is uſually made by boats in a few hours. The king of Jafuapatam built a ſmall fort here againſt the incurſions of the Moors and Malabars. It was taken by the Portugueſe in 1620, and loſt by them in 1658. This was the laſt ſtation retained by them in the iſland.

Dependent upon the diſtrict of Jaffna, and at a ſmall diſtance in the ſea to the north-weſt of Point Pedro, are ſeveral ſmall iſlands, which the Dutch named from their own native cities, Delft, Haarlem, Leyden, and Amſterdam. Theſe iſlands they employed in breeding horſes and cattle, as from their excellent paſturage they are better adapted to this purpoſe than any part of Ceylon. The Engliſh government continues the ſame ſyſtem. The horſes are bred under the ſuperintendance of officers appointed for the purpoſe, and, when at proper age, are diſpoſed of on account of government. Percival's Ceylon.

JAFRABAD, a town of Perſia, in the province of Irak; 20 miles E.S.E. of Sava.

JAG, in *Mining*, ſignified formerly a drove or number of pack-horſes, uſed for carrying ore, lead, &c.; and hence the carriers of ore for hire in Derbyſhire are ſtill called *jaggers*, although carts and waggons have long been ſubſtituted for pack-horſes in this diſtrict. Jag or join of ale, is alſo a term among the miners here for a quantity of ale ſent for by a party of them at their work.

JAGA, in *Geography*, a town of Africa, in the country of Kaſſon, on the ſouth ſide of the Senegal. N. lat. 14°.

Jaga *Calanda*, a town of Africa, in the kingdom of Matamba; 70 miles N.W. Sta. Marin de Matamba.

Jaga *Coconda*, a country of Africa, S. of Benguela.

JAGAMI, a town of Japan in the iſland of Niphon, 80 miles N.W. of Meaco.

JAGANABATTA, a town of Bengal, 42 miles S.W. of Burdwan. N. lat. 22° 35'. E. long. 87° 50'.

JAGANATH, in *Hindoo Mythology*, a name of Viſhnu and of Kriſhna; more generally applied to the latter, who, under the deſignation of Jaganatha, or lord of the univerſe, has a very celebrated temple dedicated to him in the territories of the raja of Berar. It is ſituated in the province of Cuttack, near the ſea-ſhore in the bay of Bengal, and is annually viſited by an immenſe concourſe of pilgrims. It is ſaid that all ſects of Hindoos venerate the ſanctity of this ſacred temple, and reſort thither in expiation, by ablutions, prayers, alms, and auſterities, of ſin, or in the hope of ſpiritual or temporal advantage; it may, however, be concluded that the pilgrims are chiefly of the ſect who excluſively worſhip Kriſhna as the deity; which ſect is called Gokalaſtha; Gokal being another of Kriſhna's names. The extreme care with which Hindoos avoid eating with an individual of an inferior tribe, or partaking of food ſo prepared, is a well known fact; but an exception from its generality is ſaid to obtain at Jaganath, where the high and low, the Brahman and the

Pariar, aſſociate and eat together. In the late war between the Engliſh and the Mahratta confederates, this temple, with the greater part of the province in which it is ſituated, fell into the hands of the former; but of courſe ſuffered no profanation: on the contrary, its ſanctity was guarded with more than native vigilance; immunities were extended to pilgrims, and their approach to its holy precincts greatly facilitated. A ſimilar policy at the ſacred city of Benares has now for many years operated very favourably on the Engliſh character. While under Hindoo government, a heavy toll was impoſed on the entrance of individuals, and this toll or tax was arbitrary, in reference to the ſuppoſed wealth of the viſitor. This, as may be ſuppoſed, gave riſe to much vexation and injuſtice. Its abolition was a very popular meaſure, and has contributed, among other cauſes, to render Benares one of the moſt populous and wealthieſt cities in the world. See Benares.

JAGARESTE, in *Geography*, a town of Thibet; 180 miles N. of Fyzabad. N. lat. 29° 38′. E. long. 81° 30′.

JAGARNAUT, a town of Hindooſtan, in the province of Cuttack, famous for a grand pagoda, which lies a few miles E. of Chilka lake, and cloſe on the ſea-ſhore. (See Jaganath.) It is an excellent ſea-mark, on a coaſt that is perfectly flat and uniform. It has no claim to great antiquity; but major Rennell ſuppoſes, that it ſucceeded the temple of Sumnaut in Guzerat, which was deſtroyed by Mahmood in the 11th century.

JAGAS, or Giagas, ſavages of Africa, in the kingdom of *Congo*, (which ſee,) of whoſe cruel practices Cavazzi has given an account, that would be hardly credible, if it were not well authenticated. The women often expoſe their own children to wild beaſts. Some of the Jaga princes take pleaſure in eating young women, and their favourite diſh is a fœtus cut from the womb; and a princeſs is ſaid to have been ſo fond of her gallants that ſhe ate them ſucceſſively. The laws of the Jagas, called "quixillas," preſent a horrible code of vice and cruelty, being certainly the only national code ever enacted for theſe brutal purpoſes. Their moſt delicious beverage is warm human blood. Indeed, the cruelty of the Jagas ſurpaſſes all deſcription. Queen Zinga tore her own ſon from her breaſt, and bruiſing him in a mortar, formed a horrible banquet, which continued to be made in the ſame manner of the bodies of babes. Being regarded as a ſovereign charm, the Jaga chieftain, Caſſangi, uſed to have a young woman killed every day for his table; and ſhe was often ſelected, who had paſſed the night in his bed. Zinga ordered that all her officers, before they proceeded on an expedition, ſhould exerciſe the conjugal myſteries in public, in the midſt of a ſolemn aſſembly with the wife or concubine, who was the moſt favourite object of their love. The ſlaves among the Jagas die in a certain expectation of a ſimilar but happier exiſtence in another world; and it is eſteemed an act of generoſity to kill a beautiful female at the tomb of a friend: the Singhillas, or prieſts and magicians, are ſingularly deſpotic, and while they enforce the laws on others, eſteem themſelves free from their obſervance. As after a battle the bodies are claimed, each warrior is underſtood to wound in a particular part that he may ſelect his prey. The women, by the account of the author above cited, are as ferocious as the men, and delight to cleave the ſkull and ſuck the warm brains of the ſlain. Five or ſix ſtrong men will at once deſtroy and ſhare a captive, by cutting where their portions begin, and tearing him in pieces. But the above relation affords a ſufficient ſpecimen of their ſavage manners and conduct.

JAGERNDORF, in *Geography*, a principality of Sileſia, originally part of Troppau, and firſt eſtabliſhed as a diſtinct principality in favour of duke Nicholas V: but ceded, at the peace of Berlin in 1742, by Maria Thereſa, queen of Hungary and Bohemia, to Frederick II. of Pruſſia.—Alſo, the capital of the above principality, ſituated on the Oppa, containing two churches and a convent; 12 miles N.W. of Troppau. N. lat. 50°. E. long. 17° 40′.

JAGERSBURG, a town of Brandenburg, in the New Mark; 15 miles E. of Arenſwald.—Alſo, a town of Heſſe-Darmſtadt; 13 miles S.S.W. of Darmſtadt.

JAGHAUS, a town of Germany, in the Tyroleſe; 14 miles N.W. of Schwas.

JAGHIRE, a term in India, which denotes a grant of land from a ſovereign to a ſubject, revocable at pleaſure; but generally, or almoſt always for a life rent. Hence are derived "jaghiredars," or holders of jaghires: their titles to their poſſeſſions being nominally during their life-time only, though ſome of them in the Mahratta ſtate have long ſince become hereditary. This term "Jaghire" is applied to the Eaſt India company's lands in the Carnatic, extending from Madras to the Pullicate lake, northward; and to Alemparvé, ſouthwards; and weſtward, beyond Conjeveram: that is, about 108 Britiſh miles along ſhore, and 47 inland, in the wideſt part. This Jaghire is underſtood to be held in perpetuity. It contains about 2440 ſquare miles; and its revenue is reckoned at about 150,000*l.* per annum.

JAGIPOUR, a town of Hindooſtan, in Bahar, on the left bank of the Ganges; 48 miles E.S.E. of Hajypour.

JAGNEVO, a town of European Turkey, in Servia; 8 miles S. of Priſtina.

JAGNIDE, *Ital.* See Hyagnis.

JAGO, in *Geography*, a town of Africa, in Guinea, on the river Formoſa; 70 miles from the ſea.

Jago, *St.* the capital of the kingdom of Chili. See Santiago.

Jago, *St.* a town of the iſland of Cuba, which was formerly its capital, but of late much reduced from its former ſplendour, is ſituated at the diſtance of 269 leagues from Havannah, in a hilly country, ſubject to ſlight earthquakes. It lies near the ſouth coaſt, on a bay, about ſix miles from the ſea: the haven is ſpacious and ſecure, the entrance being by a channel two leagues in length, defended by a caſtle at the extremity. The women are regarded as the moſt handſome in the iſland. It is the ſee of a biſhop, ſuffragan of St. Domingo. N. lat. 20° 15′. W. long. 75° 32′. See Cuba.—Alſo, a town of Mexico, in the province of Guaxaca; 45 miles E.S.E. of *Guaxaca;* which ſee.—Alſo, a river of Mexico, which runs into the Pacific ocean, N. lat. 22° 30′. W. long. 106°.—Alſo, a town of New Mexico, in the province of New Leon.—Alſo, a town of California; 120 miles W. of Loretto.—Alſo, a town of Paraguay; 154 miles S. of Aſſumption.—Alſo, a river of Peru, whice runs into the Pacific ocean, N. lat. 1° 20′.

Jago, *St.* or *Santiago*, the chief of the Cape Verd iſlands; it is one of the moſt fertile and beſt cultivated, about 40 Britiſh miles in length, by 20 in breadth. Although it has many mountains, it has been reckoned the moſt unhealthy of theſe iſlands. The people are generally black, or of a mixed colour; a few of the better rank excepted. The principal production of this iſland is cotton; and the chief fruits are grapes, plantains, citrons, lemons, oranges, muſk and water melons, limes, guavas, pomegranates, quinces, cuſtard-apples, papas, and other tropical fruits. Its animals are cows, horſes, aſſes, mules, deer, hogs, goats, and black-faced monkies with long tails. Of the feathered birds there are cocks, hens, ducks, Guinea hens, parroquets, parrots, pigeons, turtle-doves, crab-catchers, curlews, and many of them valuable for their plumage. The population of this iſland is eſtimated at about 12,000 perſons. When it was viſited by ſir George Staunton in November, 1792, in his voyage to China, the iſland was in a ſtate of abſolute famine. Little or no rain had fallen there for three years before, the rivers were almoſt entirely dry: the ſurface of the earth was in general deſtitute of any herbage; the greateſt part of the cattle had already periſhed, not leſs through drought than want of food. Of the inhabitants many had emigrated, and many were famiſhed to death. The plains and fields, formerly productive of corn, ſugar-canes, or plantains, nouriſhed by regular falls of rain, now bore little ſemblance of vegetation. Of the iſland of St. Jago, the ſouth-weſt ſide only had any appearance of volcanic formation. About two miles from Praya bay is a very high hill, altogether compoſed of clay and ſand, on which appeared not the leaſt marks of the action of fire. About ſix miles, near the road, from the town of Praya to that of St. Jago, is another hill, almoſt entirely compoſed of rich iron ſtone, of a deep blue or purple colour, formed of clay, calx of iron, and ſiliceous earth. In the rocks oppoſite the governor's houſe, near Praya, are ſeveral narrow perpendicular veins of white ſpar. The beach is covered with a fine ſiliceous ſand. The Portugueſe maintain no force at St. Jago, capable of inſuring a proper reſpect to their flag there; and ſo far are they from drawing any revenue from the place, that ſupplies are ſent to it from Portugal. A trade for ſlaves from Africa is eſtabliſhed at St. Jago; and that trade is a monopoly to the crown. The governor derives his chief profit from the ſales of cattle to the ſhips which call there; and of the amount of theſe ſales he claims a moiety. Such is the ſtate of the inhabitants, that they altogether depend for a ſupply of whatever their own iſland cannot afford, upon veſſels caſually ſtopping there. They ſet little value upon money, which might long lie uſeleſs in their hands; preferring to barter whatever they have to ſell, for a return, principally of corn or clothing, rather than any quantity of ſpecie that would be offered to them. The water obtained here is neither good nor eaſy to be had. The chief towns are St. Jago and Praya. N. lat. 15° 4'. W. long. 23° 40'.

Jago, *St.*, *Ribera*, or *Riveira*, a town of the above-mentioned iſland, and formerly its capital, is ſituated in the bottom of a vale, between an elevated plain, on the boundary of which is a fort in ruins, which was originally deſigned to defend the ſteep deſcent towards the town, and a high hill oppoſite to it. This vale ſeemed to have been ſcooped out by the force of a violent torrent, rolling along with it great rocks which ſtood in its paſſage, and emptying itſelf with them into the ſea. There a ſmall, irregular, and unſafe harbour was formed by theſe rocks, while the current itſelf is diminiſhed into a ſtream, ſo ſmall and ſluggiſh, that it cannot clear its mouth from the ſands which the tide throws in, and by which it is almoſt choaked up. On each ſide of this little ſtream are remains of dwellings of conſiderable ſolidity and ſize; and the fragments of glaſs luſtres, ſtill hanging from the ceilings of the principal apartments, denote the elegance or riches that were once diſplayed in this now deſerted place. It had formerly 300 houſes built of rough ſtone, a church, and a convent. But ſir George Staunton, who viſited it in his "Embaſſy to China" ſays, that not above half a dozen families remained in it; the reſt had abandoned it, or periſhed. He adds (vol. i. p. 135.) here was ſtill, however, an attempt at a ſlight manufactory of ſtriped cotton ſlips, the ſame as are made in other parts of the iſland, for the uſe of the Africans on the Main, who pay for them in ſlaves, elephants' teeth, and Arabic gum. The governor now reſides at Porto Praya, which is frequented by the ſhips that, for commercial or other purpoſes, touch at this iſland. See Porto Praya.

Jago *de los Cavalleros, St.*, a town of the iſland of Hiſpaniola; 90 miles N. of St. Domingo. N. lat. 19° 36'. W. long. 70° 52'.

Jago *de Compoſtella, St.* See Compostella.

Jago *del Eſtero, St.*, a town of South America, capital of the country of Tucuman, and ſee of a biſhop; ſituated on the banks of the Dolce, which is here large and navigable for veſſels of burthen, and which affords great plenty and variety of fiſh. The town contains about 300 houſes, or 500 families, and is deſtitute of walls, ditch, or other fence. The inhabitants are moſtly meſtizos and mulattoes, of a dark yellow complexion, indolent and ſickly from the heat of the climate, and more addicted to pleaſure than labour. Surrounded with foreſts, and ſituated on a plain, the town ſuffers from a ſtagnation of air. It has hardly 300 men fit for bearing arms. The women, who are generally handſome, are troubled with ſwellings or wens in the throat. The adjacent country produces plenty of wheat, rice, barley, and all ſorts of fruits, particularly figs and raiſins. The foreſts, which yield abundance of game, are infeſted with tygers and other beaſts of prey; 650 miles N.N.W of Buenos Ayres. N. lat. 27° 46'. W. long. 65° 12'.

Jago *de Gutagayta, St.*, a town of Peru, in the dioceſe of La Plata, and chief town of the juriſdiction of Chicas, under the government of Buenos Ayres; 80 miles S. of Potoſi.

Jago *de Leon, St.*, See Caraccas.

Jago *de los Montanas, St.*, a town of South America, in Quito; 10 miles N.W. of St. Franciſco de Borja.

Jago *Sanahez, St.*, a town of South America, in the province of Buenos Ayres, on the Parana; 25 miles S. of Corrientes.

Jago *de los Valles, St.*, a town of Mexico, in the province of Guaſteca, on the river Panuco; 60 miles S. of Panuco. N. lat. 22° 40'. W. long. 100° 36'.

Jago *de la Vega, St.* See Spanish *Town.*

Jago *de Veragua, St.*, a town of Mexico, and capital of Veragua, ſituated in a fertile country, abounding with maize, plantains, &c. and plenty of cattle. It contains an elegant hoſpital, and is the ſeat of a governor, whoſe authority extends over 14 towns and villages; 110 miles S.W. of Porto-Bello. Nat. lat. 8° 40'. W. long. 81° 46'.

Jago, *St. Military Order of.* See *St.* James *of the Sword.*

JAGODINA, in *Geography*, a town of European Turkey, in Servia, on a ſmall river, which runs into the Morava; 60 miles S.S.E. of Belgrade. N. lat. 45° 15'. E. long. 20° 56'.

JAGOLEEAH, town of Bengal; 21 miles N.N.E. of Calcutta.

JAGOTPOUR, a town of Hindooſtan, in Oude; 16 miles N. of Manickpour.

JAGOVAT, a town of Perſian Armenia; 12 miles N. of Erivan.

JAGRA, or **Jaggery**, a name given to a peculiar ſpecies of ſugar, prepared from the cocoa-nut. This is prepared in Ceylon from a liquor called "toddy," procured, by inciſion, from the top of the tree where the leaves ſhoot up; a ſlit is made in this part of the tree with a knife over night, and a "chatty," or earthen pot, ſuſpended from the branches ſo as to receive the juice, which immediately begins to diſtil, and continues to do ſo till next morning, when the pot is removed. This liquor, when drank before the heat of the riſing ſun has cauſed it to ferment, is very wholeſome and cooling, and operates as a gentle purgative. But upon being fermented it becomes intoxicating; and in this ſtate is well known to the European ſoldiers, who uſe it in large quantities when they cannot procure the arrack diſtilled from it. Arrack in Ceylon is wholly made from toddy, and whole woods of the cocoa-tree are employed for the purpoſe of procuring it. A barm or yeaſt ariſes from this proceſs, equal to that which is procured from our malt liquor employed in the preparation of whiſky. The toddy is likewiſe made into vinegar, and yields a ſpecies of coarſe black ſugar known by the above name.

JAGRA, or *Giarra*, in *Geography*, a country of Africa, producing plenty of rice, cotton, and corn, a little S. of the river Gambia ; about 50 miles from the ſea.

JAGRAH, a town of Hindooſtan, in the circar of Nagore ; 15 miles N. of Nagore.

JAGRENATPOUR, a town of Bengal ; 10 miles N.W. of Purneah.—Alſo, a town of Bengal ; 20 miles W. of Iſlamabad.—Alſo, a town of Hindooſtan, in Bahar ; 65 miles S.S.E. of Hajypour.

JAGUA, a town of the iſland of Cuba ; 85 miles W.S.W. of Havannah.

JAGUACAH-GUACU, in *Ornithology*, the name of a Braſilian bird of the king-fiſher kind, called by the Portugueſe *papa peéxe*. See ALCEDO *Alcyon*.

JAGUARA, in *Zoology*. See FELIS *Onca*.

JAGUARACA, in *Ichthyology*, the name of a Braſilian fiſh, in many things reſembling the ſcorpius of the Mediterranean. It is of the ſize of the freſh-water perch, and its mouth is very large, but without teeth. It is caught among the rocks, and is a very well taſted fiſh. Margrave.

JAGUARETE, in *Zoology*. See FELIS *Diſcolor*.

JAGUILMA, in *Ornithology*, a ſpecies of *Pſittacus ;* which ſee.

JAIL. See GAOL.

JAIL-*Fever*, in *Medicine*. See FEVER and TYPHUS.

JAHANABAD, in *Geography*, a town of Bengal ; 20 miles S. of Burdwan. N. lat. 22° 55′. E. long. 87° 55′.

JAHANAGUR, a town of Bengal ; 10 miles W. of Kiſhenagur.

JAHEDHIANS, a ſect of Mahometans, the followers of Amru Ebn Bahr, ſurnamed Al Jahedh, a great doctor of the Mótazalites, and much admired for the elegance of his compoſitions, who differed from his brethren in imagining that the damned would not be eternally tormented in hell, but would be changed into the nature of fire, and that the fire would of itſelf attract them, without any neceſſity of their going into it. He alſo taught that if man believed God to be his Lord, and Mohammed the apoſtle of God, he became one of the faithful, and was obliged to nothing further. Of the Koran, he uſed to ſay it was a body, which might ſometimes be turned into a man, and ſometimes into a beaſt ; ſeeming to agree with the notion of thoſe who aſſert the Koran to have two faces, one of a man, the other of a beaſt ; thus probably intimating the double interpretation which it will admit of, according to the letter, or the ſpirit.

JAHI, in *Geography*, a town of Aſiatic Turkey, in Natolia ; 16 miles N.N.E. of Angura.

JAHNU, in *Hindoo Mythology*, is called the father of the Ganges, from an extravagant ſtory of an auſtere ſage, named Jahnu, having been diſturbed at his devotions by the intruſion of the river. In anger he ſwallowed the whole ſtream, but, relenting, poured it forth again from an inciſion in his thigh, or, according to others, from his ear. Ridiculous as this wild ſtory may ſeem, it has probably ſome hiſtorical alluſion, for it is generally admitted that both the hiſtory and ſcience of the Hindoos are veiled in mythological fables, taken literally by the people, the Brahmans only poſſeſſing a knowledge of their real import. This fable of Jahnu is frequently alluded to in Hindoo writings, and affords conſiderable ſcope for poetical exuberance. Moor's Hindoo Pantheon.

JAHNUVI, a name of the river Ganges, or Ganga, as it would be more properly written. The river obtained this appellation, which means the offspring of *Jahnu*, from the circumſtance above mentioned.

JAHUPICE, in *Geography*, a town of Poland, in the palatinate of Braclaw ; 48 miles S.E. of Braclaw.

JAICZA, a town, with a caſtle, of European Turkey, in Boſnia, near the river Pliva ; 26 miles S. of Banjaluka.

JAICZI, a town of Great Bucharia, on the Jihon ; 36 miles S. of Bokhara.

JAIMINI, in *Philoſophy*, the founder of a ſchool in India, profeſſing tenets ſimilar in many parts to thoſe taught by Socrates. Jaimini inculcated the unity of the deity, rejecting the ſtories, ſo generally received by many ſects of Hindoos, of the incarnations of deities. He maintains that the great powers and attributes of the deity Brahma, Viſhnu, and Siva (perſonifications, of creation, preſervation, and deſtruction), were men, who, through righteouſneſs, attained a high degree of perfection, and were endowed by the deity with qualities approaching to his own attributes. His followers call this doctrine Purva Mimanſa, diſtinguiſhing it from another branch of Jaimini's philoſophy called Vedanta, between which diſcrimination is not eaſy. (See VEDANTA.) Mimanſa is the general name for the philoſophy of Jaimini, which is upheld by many learned Hindoos. It teaches the eternity of the elements, and of the univerſe ; that bodies are only a compound of atoms, and not produced from one ſubſtance ; that man is a free agent ; that rewards and puniſhments hereafter differ in degrees, according to virtue or ſin. The tranſmigration of the ſoul is alſo a tenet in the Mimanſa philoſophy. See MIMANSA.

JAINA, the founder of a ſect, whoſe tenets have ſpread very extenſively over India. By ſome authors the ſect of Jaina, or Jina, as it is ſometimes written, is ſuppoſed to be a ſubdiviſion of that of Budha, or Boodha (ſee BOODHA), while others contend for its originality and antiquity over moſt other of the ſects into which the Hindoos are theologically ſubdivided. Between the Jainas and the Brahmans, a degree of malignity appears to have exiſted formerly, greater than is now any way diſcernible. Abu'l Fazel, in the Ayin Acbaree, a work written about the year 1600, A.D. has the following paſſage : “ From the moſt ancient times down to the preſent, the learning and wiſdom of Hindooſtan have been confined to the Brahmans and the followers of Jaina ; but ignorant of each other's merits they have a mutual averſion. Kriſhna, whom the Brahmans” (of his own ſect, he ſhould have added, for it is not true of them univerſally) “ worſhip as God, the Jainas conſider as an infernal ſlave ; and the Brahmans carry their averſion ſo far as to ſay, that it is better to encounter a mad elephant than to meet a man of this perſuaſion.” This mutual malignity led to the horrible exceſſes of religious perſecution, inflamed by the jealouſy of rivalſhip, and the baſer feelings of hatred and revenge.

In theſe conflicts the Jainas are related to have ſuffered moſt diſaſtrouſly from the ſuperior proweſs and addreſs of the Brahmans and their adherents, who deſtroyed the temples, books, &c. of their ill-fated opponents, expelling the remains of the ſect to the confines of India. Such, however, is the tenacity of hereſy, cemented, as it were, by perſecution, that the followers of Jaina are now found to have re-eſtabliſhed themſelves in the more central parts of the peninſula of India, where the mildneſs of their manners and tenets appears to gain them proſelytes and reſpect. It is, however, on the weſtern coaſts of the hither peninſula that this intereſting people have of late been moſt noticed by travellers. In the provinces of Kanara and Myore, particularly in the former, Jainas in conſiderable numbers now freely practiſe the ceremonies of their religion, and unmoleſted indulge in their whimſical, and extravagantly inoffenſive propenſities. Their leading tenet is "the ſin of depriving any animal of life," and in obedience to this humane precept, they not only abſtain wholly from animal food, but ſome among the ſtricter individuals will not drink water until it hath been boiled; it being deemed leſs criminal ſo to kill the animalculæ than to deſtroy them in their ſtomachs. Others carry a broom to ſweep the ground on which they tread or ſit, leſt they inadvertently cruſh an inſect. The Jainas are the ſect who endow the hoſpitals for animals and reptiles, that have attracted the attention of ſeveral travellers. Theſe hoſpitals are called Pinjri-pala, meaning an encloſure of protection, and afford it to almoſt every deſcription of animal, monkies more eſpecially; weevils and other diminutive reptiles are nurſed in theſe receptacles of ill-directed charity. The Jainas are deiſts in doctrine; they worſhip one ſupreme being under the denomination of Arhang Paramatma, which in the Sanſcrit language means the ſupreme ſoul; they reject the polytheiſm and incarnations of the orthodox Hindoos, but they honour, almoſt to deification, twenty-four holy perſons whom they call Aryhuntas, of whom images are made and placed in their temples. Of theſe Aryhuntas, or Tirthunkaras, as they are otherwiſe denominated, Riſhaba Deva is the firſt in point of time and veneration. To him are aſcribed the exiſting books of their laws, religion, and morals: of theſe ſacred perſons and books liſts are given, with many curious particulars reſpecting the Jainas of Guzerat, in Moor's Hindoo Infanticide. All the Aryhuntas have the common denomination of Deva, meaning divine, or God-like, appended to their names. Among the Jainas the diviſion into tribes or *caſtes* is not obſervable as among other Hindoos; Yati and Sravaka being their only diſtinctions. The former are a ſort of prieſt, or rather ſpiritual preceptor, who read and expound to the Sravakas or laity, the Saſtras or ſcriptures of the Jaina faith. The Yatis are devoted to religion from their infancy, and are admitted to this diſtinction after a due courſe of ſtudy and piety. They profeſs celibacy and abſtinence, reciting a verſe ſaid to comprize their duties: "that perſon who keeps his five ſenſes under ſubjection is a Yati:" this denotes the Yati with the Jainas to be equivalent to a Saniaſſy among the orthodox Hindoos. (See SANIASSY.) The Yati lives by charity; he may not dreſs his food himſelf, nor eat while the ſun is below the horizon; roots of all ſorts, honey and butter unclarified, are prohibited; all kinds of grain, vegetables, and fruit, produced above ground, with milk and ghee, or butter clarified, are lawful food. The Yati is ſuppoſed to have renounced the world and all ſenſual gratifications; he affects a contemplative indifference, performing no offices of mourning or rejoicing. The Yati performs no religious rites; he is merely an aſcetic and ſpiritual guide. The Sravakas reſort to ſome ſects of orthodox Brahmans for the performance of marriage, funeral, and other ceremonies. See SRAVAKA and YATI.

The Jainas, like the other Baudhas, or adherents of Budha, are addicted to gigantic ſculpture. In the province of Kanara is a coloſſal figure of Jaina-deva, of a magnitude unequalled perhaps by any now in exiſtence. Of this ſtatue major Moor has given a deſcription and a plate in his Hindoo Pantheon. It is upwards of ſeventy feet in height, and being ſituated on an eminence, called Indra-giri, or the hill of Indra, is ſeen in all directions from a diſtance of twelve or fifteen miles. Major Moor's print is taken from a ſketch in the collection of lord Wellington, who has viſited the ſtatue, and judged that the hill on which it now ſeems to ſtand, was once conſiderably higher, and that it has been cut away, leaving only the figure; a mode of ſculpture ſimilar, although under different circumſtances, to the ſubterranean excavations of Elephanta, Kenereh, and other temples. It is, major Moor obſerves, difficult to conceive how in any other mode ſuch a maſs of ſtone could have been ſo ſituated, its magnitude precluding the ſuppoſition of conveyance and erection. Other coloſſal figures of the Jainas of Kanara are deſcribed and repreſented in the Hindoo Pantheon; alſo a very beautiful obeliſk, 52 feet in height, the ſhaft of one ſtone, in front of one of their temples, indicating a degree of taſte and refinement in architectural ſcience, that could ſcarcely be expected under the political and theological diſcouragements to which the perſecuted Jainas are believed to have been ſubjected. One ſingularity is ſtrikingly obſervable in all the images, coloſſal or diminutive, of the Baudhas and Jainas; they have woolly frizzled heads, and many of them thick lips; ſuch as might be expected in Africa, but altogether diſſimilar to the features and lank hair of the Hindoos. See on the ſubject of this article Aſiatic Reſearches, vol. ix. Moor's Hindoo Pantheon. Moor's Hindoo Infanticide.

JAINAD, in *Geography*, a town of Hindooſtan, in the circar of Mahur; 38 miles N. of Neermul.

JAIRE, ST. a town of France, in the department of the Leman; 15 miles S.E. of Geneva.

JAK *in Jakko*, a town of Africa, on the Ivory coaſt.

JAKA, a kingdom of Africa, 500 miles from the ſea, with a capital of the ſame name, on the S. ſide of the Senegal.—Alſo, a town and diſtrict of Africa, on the Ivory coaſt.

JAKAI, a town of Circaſſia; 45 miles W. of Eſkikeſek.

JAKIN, a town of Africa, in the kingdom of Ardra, on the Slave coaſt, where the Engliſh and Dutch had factories, till they were driven away by the king of Dahomy.—Alſo, a river which ſeparates the country of Ardra from Benin, and runs into the ſea at Grand Popo.

JAKIRA, a town of Africa, on the Slave coaſt; 10 miles S. of Aſſom.

JAKOBSHAVN, a Daniſh ſettlement in Greenland.

JAKOWIZINA, a town of Ruſſian Poland, in the palatinate of Braclaw; 36 miles W.N.W. of Braclaw.

JAL, a town of Perſia, in the province of Mecran; 210 miles N. of Kidge.

JALA, a ſmall iſland in the Atlantic, near the coaſt of Africa. N. lat. 11° 45′.

JALAC, a town of Nubia, at the conflux of the Tacazé and Nile; 240 miles S. of Sennaar. N. lat. 17° 50′. E. long. 34° 10′.

JALALABAD, a town of Candahar, in the country of Cabul, on the river Kameh; 60 miles E.S.E. of Cabul. N. lat. 34° 6′. E. long. 69° 45′.—Alſo, a town of Hindooſtan, in the circar of Schaurunpour; 26 miles from Schaurunpour.

JALALGUNGE, a town of Bengal, and principal place of the province of Bajoohow; 25 miles N.N.E. of Goragot. N. lat. 25° 28′. E. long. 82° 30′.

JALALPORUM, a town of Hindooſtan, in the circar of Schaurunpour; 20 miles N.N.W. of Merat.

JALAMLAM, a town of Arabia; 35 miles S. of Mecca.

JALANGHI-LIMAN, a town of Aſiatic Turkey, in Natolia; 12 miles S. of Smyrna.

JALAP, in the *Materia Medica*, ſo called from the name of the country, *viz.* Chalapa, or Xalapa, a province in New Spain, between La Vera Cruz and Mexico, whence it is brought, the root of a ſpecies of the convolvulus, or the convolvulus with variable leaves, foot-ſtalks with ſingle flowers, and a tuberous root. Botaniſts have differed much with reſpect to the officinal jalap plant; Linnæus, following Cluſius, Plumier, Tournefort, and others, firſt referred it to the Mirabilis; but in the ſecond edition of his Materia Medica, he adopts the opinions of Ray and Miller, in conſidering it a convolvulus; and, indeed, after the account given of this plant by Dr. Houſton, no reaſonable doubt can remain on this ſubject.

The mechoacan and this are reckoned of a ſpecies; and therefore as this is ſometimes called *mechoacana nigra*, that goes as often by the name of *jalapium album*.

As jalap does not appear to have been known to the ancients, it has its place in medicine only ſince thoſe parts of America, which produce it, have been traded to by the Europeans. It is ſaid to have been firſt brought to Europe about the year 1610.

The jalap roots are brought over in thin tranſverſe ſlices, and alſo whole, of an oval ſhape, ſolid, hard, and heavy; of a blackiſh colour on the outſide or cortical part, and internally of a dark greyiſh, with ſeveral black circular ſtriæ; the hardeſt, darkeſt coloured, and thoſe which have the moſt of theſe reſinous veins, are the beſt. This root has ſcarcely any ſmell or taſte; but to the tongue and the throat it manifeſts a ſlight degree of pungency.

The medicinal activity of jalap reſides principally, if not wholly, in the reſin, which, though given in ſmall doſes, occaſions violent tormina. The gummy part bears an inconſiderable proportion to the reſinous, and is found to have little or no cathartic power, but as a diuretic it is extremely active.

In doſes of a ſcruple, or half a dram, it is an effectual and ſafe purgative, very rarely occaſioning any ſevere gripes or nauſea. Jalap is an excellent purgative in dropſical and other caſes, in which ſerous humours are to be evacuated. Jalap, in large doſes, or when joined with calomel, is recommended as an anthelmintic and a hydragogue; and from its general efficacy in dropſies was called "Panacea Hydropicorum." Hoffman thought it particularly improper and unſafe to adminiſter this medicine to children; but Dr. Cullen obſerves, that if jalap be well triturated before exhibition with a hard powder, and the cryſtals of tartar are the fitteſt for the purpoſe, it will operate in leſſer doſes than when taken by itſelf, and at the ſame time very moderately, and without griping. Except, he ſays, when given in very large doſes, I have not found it to be heating to the ſyſtem; and if it be triturated with a hard ſugar, it becomes, in moderate doſes, a ſafe medicine for children, which in this form they will readily receive, as the jalap itſelf has very little taſte. But it ſhould not be adminiſtered, ſays Geoffroy, in acute fevers, nor to perſons of dry and hot conſtitutions; for in ſuch caſes, it is liable to the ſame miſchiefs as other acrid purgatives, and will ſometimes bring on heat and inflammations in the viſcera.

The preparations of jalap in uſe with us are a tincture, an extract, and a reſin. The tincture is made by macerating eight ounces of jalap root powdered in two pints of proof ſpirit for 14 days, and ſtraining. The extract is prepared by firſt drawing a tincture from the powdered root with rectified ſpirit, in the proportion of a pound of the root and four pints of the ſpirit, macerating the root in the ſpirit for four days, and pouring off the tincture; then boiling the reſiduum in ten pints of water, until it be reduced to two pints; then ſtrain the tincture and decoction ſeparately, and let the former be diſtilled, and the latter evaporated until each begins to grow thick. Laſtly, mix the extract with the reſin, and reduce it to a proper conſiſtence. Let the extract be kept in a *ſoft* ſtate fit for forming pills, and in a *hard* ſtate ſo that it may be reduced to powder. This extract may be taken by itſelf in doſes of twelve grains, or more. Jalap root, digeſted in as much rectified ſpirit as will cover it to the height of about four fingers, gives out the greateſt part of the reſinous matter in which its activity reſides, and tinges the menſtruum of a yellowiſh brown colour. On inſpiſſating the filtered tincture to about one-half, and adding to the remainder a proper quantity of water, the liquor becomes milky, and on ſtanding depoſits the pure reſin. This preparation, by itſelf, irritates and gripes much, without proving conſiderably purgative; but thoroughly triturated with teſtaceous or other powders, or with ſoap, or ground with almonds, or powdered gum arabic, and made into an emulſion with water, or diſſolved in rectified ſpirit, and mixed with a proper quantity of ſyrup, that the ſolution may bear being diluted with watery liquors without precipitation, it purges, in doſes of eight or ten grains, as effectually, and, for the moſt part, as mildly as the jalap in ſubſtance.' Lewis's Mat. Med.

The Edinburgh college directs the exhibition of jalap in powder, with twice its weight of cryſtals of tartar. The doſe of the ſimple powder is commonly from one ſcruple to two; of the compound powder it may be double this quantity, which is nearly equal to 10 or 15 grains of the extract, or about two drams of the tincture. Woodv. Med. Bot.

After all the preparations the chemiſts have invented for this root, the beſt way of giving it is in ſubſtance. Mr. Bolduc, in his analyſis of it, found, that when he ſeparated its ſaline and its reſinous parts, by making extracts of it, firſt with ſpirits of wine, and then with water, that the ſaline or watery extract was much larger in quantity than the other, but that it purged weakly; and that the reſinous extract, though it operated in a ſmall doſe, was yet a very rough medicine; ſo that the beſt way of uſing them was together, and that nature gave us the medicine ready prepared. Mem. Acad. Par. 1701.

However, others have obſerved, that the extracts of jalap appear preferable to the root in ſubſtance, not only on account of the doſe being rendered ſmaller by the rejection of the woody parts, but likewiſe as being more uniform and certain in ſtrength. Lewis.

Many fraudulent chemiſts, when jalap is dear, have a trick of putting ſcammony, which is of itſelf almoſt all reſin, among it, and ſometimes gamboge; by which means they can afford to ſell it cheaper than the price it can be honeſtly made for. But their moſt curious cheat is in mixing it with the common black reſin; two parts of the latter to one of the former. But this may be known by putting it into rectified ſpirit, which will again diſſolve the reſin of jalap, but not touch the other. The virtues are the ſame with thoſe of the root, but it works rougher, becauſe all ſubſtances ſtick to the coats of the inteſtines, ſo as to occaſion much pain and uneaſineſs; for which reaſon this is corrected with ſugar, cream of tartar, or the like; by which means it is brought into the ſame ſtate as nature preſents it in the root. For ſome purpoſes, indeed, where the form is required to be ſmall, as often in adminiſtration to children, this is moſt convenient. Its doſe is from three grains to one ſcruple.

Jalap poſſeſſes a fermenting power in a conſiderable degree, and is ſaid to be uſed with this intention by brewers and diſtillers.

JALAPA, in *Botany*. See CONVOLVULUS and MIRABILIS.

JALASJARVI, in *Geography*, a town of Sweden, in the government of Waſa; 40 miles E.N.E. of Chriſtineſtadt.

JALEA, a town of Aſiatic Turkey, in Natolia; 12 miles S.W. of Adramitti.

JALEH, a kind of raft of a particular conſtruction, uſed in navigating ſome of the rivers in India, particularly the Cabul or Kameh, on which ſome of the emperors have made voyages down this river from the neighbourhood of Jalalabad, 60 or 70 miles below Cabul, to Paiſhawur. As no embarkations of the hollow kind are in uſe, it ſeems to prove that the navigation is interrupted by rapids; for there can be no doubt but that the body of water in the Kameh is ſufficient to carry boats.

JALEMGORY, in *Geography*, a town of Hindooſtan, in the circar of Sollapour; 18 miles E. of Sollapour.

JALEMUS, Ιαλεμος, or JALEMIA, in *Antiquity*, a kind of mournful ſong uſed upon occaſion of death, or any other affecting accident; ſuch as the Linos was among the Greeks, and the Maneros among the Egyptians. (See SONG.) Hence the Greek proverbs had their original, ιαλεμου οικτροτερος, or ψυχροτερος, *i. e. more ſad or colder than a jalemus*, εις τους ιαλεμους εγγραπτεος, *worthy to be ranked among jalemuſes.* Mem. Acad. Inſcript. tom. xiii. p. 554.

JALI, in *Geography*, an iſland in the Grecian Archipelago, about five miles in circuit; four miles S.E. of Stanchio.—Alſo, a town in the iſland of Borneo; 70 miles N. of Negara.

JALIGNY, a town of France, in the department of the Allier, and diſtrict of La Paliſſe; 15 miles S.E. of Moulins. The place contains 482, and the canton 8114 inhabitants, on a territory of 280 kiliometres, in 12 communes.

JALLA, a town of Hindooſtan, in Bahar; 18 miles N.N.W. of Durbungah.

JALLACOTTA, a town of Africa, in the country of Tenda; 10 miles W. of Tenda. N. lat. 13°. W. long. 12° 9′.

JALLAIS, a town of France, in the department of the Mayne and Loire; 7 miles N. of Chollet.

JALLAS, a river of Spain, which runs into the Atlantic, N. lat. 42° 59′. W. long. 9° 12′.

JALLINDAR, a circar of Hindooſtan, in the country of Lahore, of conſiderable extent, between the rivers Setledge and Beyah.—Alſo, the capital of this diſtrict; 30 miles E. of Lahore. N. lat. 31° 16′. E. long. 75° 25′.

JALLOFFS, or YALLOFFS, a people inhabiting an extenſive interior territory of Africa, between the rivers Gambia to the ſouth, and the Senegal to the north and eaſt; or between about 14° and 16° N. lat. and 13° and 15° W. long. Of theſe people little certain is known; but they are repreſented as of an exceeding black, and more beautiful complexion and more regular features than the inhabitants of the neighbouring countries.

JALLONKADOO, an extenſive country of Africa, lying between Guinea on the S.W. and Manding on the N.E. and containing either the ſprings or firſt courſes of the rivers Niger and Senegal, and alſo of ſeveral other ſtreams which form the Boki, Furkoomah, Wonda, Kokoro, &c. It is between the parallels of 11° and 12° N. lat. and 6° and 9° E. long.

JALLYNE, a town of Bengal; 20 miles W. of Nagore.

JALOAN, a town of Hindooſtan, in the circar of Gohud; 10 miles N.N.E. of Kooch.

JALOAR, a town of the Carnatic; ſeven miles N. of Ootatore.

JALONITZA, a town of European Turkey, in Walachia, on a river of the ſame name; 95 miles S.W. of Iſmail.

JALOUR, a large town of Hindooſtan, ſituated on a mountain difficult of acceſs, in the country of Agimere, and circar of Sirowy; 63 miles W.N.W. of Oudipour. N. lat. 25° 15′. E. long. 73° 40′.

JALOWKA, a town of Lithuania, in the palatinate of Troki; 24 miles S. of Grodno.

JALPUG, a lake of European Turkey, in Beſſarabia, 30 miles long, and from three to five broad, communicating with the Danube, and receiving water from a river called by the ſame name at Tabak; 15 miles W. of Iſmail.

JALYSUS, or JALISSUM, in *Ancient Geography*, a town ſituated on the N.W. coaſt of the iſland of Rhodes; founded, according to Herodotus, by the Danaides, and fortified on occaſion of the Peloponneſian war.

JAM, a town of Greater Bucharia; 10 miles S. of Samarcand.

JAM, or *Jamb*, in the language of our lead-miners in Mendip, a thick bed of ſtone, which hinders their work when they are purſuing the veins of ore.

JAMA, in *Geography*, a river of Peru, which runs into the Pacific ocean, S. lat. 9° 10′.

JAMACAII, in *Ornithology*. See ORIOLUS *Jamacaii*.

JAMADA, in *Geography*, a town of Japan, in the iſland of Xicoco; 20 miles W. of Ovutli.

JAMADAGNI, in *Hindoo Mythology*, is the father of Paraſu Rama, by his wife Runeka. (See RUNEKA.) He was a pious Brahman, who, in his retirement, was entruſted by Indra with the charge of Surabhi, the wonderful cow, which granted every deſire, hence named alſo Kam-denu. (See SURABHI.) On a particular occaſion he entertained the raja Diruj in ſo magnificent a ſtile as to excite his aſtoniſhment, until he learned the ſecret of the ineſtimable animal poſſeſſed by his hoſt. Impelled by covetouſneſs, or rather heart-hardened by the gods, who willed the raja's puniſhment ſhould appear to be the immediate reſult of that baſe paſſion, the raja demanded the cow from the holy Brahman; and on refuſal reſorted to ſtratagem and force, which ended in the death of Jamadagni, but not in ſucceſs with reſpect to the cow, which diſappeared. Jamadagni is ſtated to be deſcended from Bhrigu the ſon of Brahma, and is one of the ſeven Riſhis, the immediate offspring of the creative power. Moor's Hindoo Pantheon. See RISHIS and MENUS.

JAMADSUKURI, in *Geography*, a town of Japan, in the iſland of Niphon; 50 miles S.W. of Nambu.

JAMAGA, a town of Japan, in the iſland of Ximo; 22 miles E. of Udo.

JAMAICA, an iſland of the Weſt Indies, diſcovered by Chriſtopher Columbus in his ſecond expedition to the New World, May 3, A. D. 1494, retaining its original name. The early Spaniſh hiſtorians for Jamaica wrote Xaymaca, which in the language of the nation is ſaid to have ſignified "a country abounding in ſprings." Columbus having at firſt named the iſland "St. Jago," Oldmixon, and ſome other writers, erroneouſly ſuppoſe that Jamaica was the augmentative of James. It was not, however, till about nine years after its firſt diſcovery that he had an opportunity of acquainting himſelf further with the iſland; in conſequence of a ſtorm which compelled him, on the 24th of June 1503, on his return to Hiſpaniola from Veragua, to ſeek refuge in a ſmall harbour on the N. ſide, called to this day "Don Chriſtopher's Cove." About ſeventeen years elapſed after the Spaniards had firſt fixed themſelves in Hiſpaniola before they ſeem to have entertained any ſerious deſign of ſending forth a colony to take poſſeſſion of Jamaica; and the neglect of it was probably owing to its producing neither gold nor ſilver. At length, however, Diego, the ſon of the much injured Columbus, and the heir of his fortunes, inſtituted a memorable proceſs againſt his ſovereign before the council of the Indies at Seville, and obtained from this court a deciſion in favour of his pretenſions. The council pronounced him hereditary viceroy and high admiral of all the countries and iſlands diſcovered by his father. Diego, thus ſanctioned in his proceedings by the high authority of this court, embarked, with a ſplendid retinue, for his government of Hiſpaniola, to which the king had reluctantly appointed him; determined at the ſame time to enforce his pretenſions. In July 1508 he arrived at Hiſpaniola, where he found two perſons actually inveſted by the king with two ſeparate governments, that comprehended the whole continent diſcovered by Chriſtopher Columbus, including alſo the iſland of Jamaica. Diego, thus deprived of his rights, ſtrenuouſly contended for the excluſive privilege of nominating, in particular to the governments of Veragua and Jamaica, the prior diſcovery of both theſe countries being a circumſtance of univerſal notoriety. For ſecuring his claim to Jamaica he ſent thither, in November 1509, Juan de Eſquivel with about 70 men. Under this gallant and equally humane commander, the natives were induced to ſubmit without effuſion of blood, and proſecuted their labours in planting cotton, and raiſing other commodities which yielded great profit. After a few years he died, and was ſucceeded by governors of a very different character, who contributed to deſtroy the inhabitants and to deſolate the iſland. Sixty thouſand of the wretched natives, on the moſt moderate eſtimate, were exterminated by the Spaniards; ſo that not a ſingle deſcendant of either ſex appeared to be alive when the Engliſh took the iſland in 1655, nor perhaps for a century before that period. It is ſaid, indeed, that a ſmall remnant of the ancient Indians exiſts on the S. ſide of the iſland of Cuba, in a little town called St. Jago de Cuba, or Iwanee, and that theſe have adopted the manners and language of the Spaniards. Diego Columbus, who died in his native country in 1525 or 1526, left iſſue three ſons and two daughters; his eldeſt ſon Don Lewis ſucceeded to his father's honours and extenſive claims; and in 1545, upon a compromiſe of a conteſt with the emperor, obtained a grant of the province of Veragua and the iſland of Jamaica. As he and his brothers died without iſſue, his ſiſter Iſabella, who was married to the Count de Gelvez, a Portugueſe nobleman of the houſe of Braganza, became ſole heireſs of the Columbus family, and by her marriage conveyed all her rights to the houſe of Braganza, in whoſe poſſeſſion they remained till the year 1640, when they reverted by forfeiture to the crown of Spain, in conſequence of the revolution, which placed John, duke of Braganza, on the throne of Portugal. From circumſtances recited in minute detail by Mr. Boyan Edwards, it appears that during the protectorate of Cromwell, the Spaniards had been guilty of ſeveral aggreſſions in the Weſt Indies, and that the protector, in ſeeking redreſs, manifeſted a regard to juſtice by his moderation and temper. An appeal was at length made to force; and a powerful armament was equipped, which miſcarried at Hiſpaniola, but ſucceeded at Jamaica, which was captured by the Engliſh forces in May 1655. At this time the whole number of white inhabitants on the iſland, including women and children, did not exceed 1500: and not one hundredth part of the plantable land was in a ſtate of cultivation. The number of negroes, who had been firſt introduced from Africa by the Spaniſh ſettlers after they had exterminated the original proprietors, nearly equalled that of the whites, at the time of its capture. The principal exports of the Spaniſh planters, notorious for their ſloth and penury, conſiſted, beſides cacao, of hog's lard and hides, which ſupplied the few ſhips that touched at their ports with proviſions, in barter for European manufactures; and this conſtituted the whole of their commerce. After the capture of the iſland, until the reſtoration of Charles II., the Engliſh in Jamaica remained under military juriſdiction, although it appears to have been the intention of Cromwell to have eſtabliſhed a civil government in the iſland on very liberal principles. After the reſtoration of Charles II., the Bucaniers, who reſorted to this iſland, and who contributed by their wealth and induſtry to its ſettlement and opulence, received from the king every kind of encouragement and protection; and people of all profeſſions, and from all parts of the Britiſh empire, now reſorted to Jamaica. In 1661 the king appointed D'Oyley chief governor of the iſland; and he was ordered to releaſe the army from military ſubordination, to erect courts of judicature, and, with the advice of a council, to be elected by the inhabitants, to paſs laws ſuitable to the exigencies of the colony. Theſe events may be conſidered as the firſt eſtabliſhment of a regular civil government in Jamaica after the Engliſh had become maſters of it. Soon after D'Oyley deſired to be recalled, and lord Windſor was appointed in his room with inſtructions to publiſh, on his arrival, a royal proclamation, in which, for the ſettlement of the country, allotments of land were offered under ſuch terms as were uſual in other plantations, with ſuch further privileges and immunities as the grantees ſhould reaſonably require. The proclamation contained other declarations, which have been always conſidered, by the inhabitants of Jamaica, as a ſolemn recognition and confirmation by the crown of thoſe rights which are unalienable from a ſubject of England, and of which, ſo long as he maintains his allegiance, emigration for the benefit of the ſtate cannot, and ought not to divert him. Theſe rights and privileges were further ſecured by the American treaty, concluded and ſigned at Madrid in the month of June 1670. Such, however, were the want of integrity and ſteadineſs, characteriſtic in too great a degree of Charles II., that in the beginning of 1678, Jamaica was involved in the troubles of this reign. A new ſyſtem of legiſlation was adopted for this iſland ſimilar to that of the Iriſh conſtitution under Poyning's act; and the earl of Carliſle was appointed chief governor for the purpoſe of enforcing it. A body of laws was prepared by the privy council of England; and a bill was offered to the aſſembly for ſettling a perpetual revenue on the crown. In future the heads of all bills (money bills excepted) were to be ſuggeſted in the firſt inſtance by the governor and council, and tranſmitted to his majeſty to be approved or rejected at home; they were then to be returned under the great ſeal in the form of laws, and paſſed by the general aſſembly, which was to be convened for no other purpoſe than that and the buſineſs of voting the uſual ſupplies; unleſs in conſequence of ſpecial orders from England. The aſſembly rejected the new conſtitution with indignation. No threats would frighten, no bribes could corrupt, nor arts nor arguments perſuade them to conſent to laws that would enſlave their poſterity. In conſequence of this oppoſition, the aſſembly had their deliberative powers reſtored to them, and ſir Thomas Lynch was appointed captain-general and chief governor in the room of lord Carliſle. The Engliſh government claimed a return from the people of Jamaica for having relinquiſhed an oppreſſive and pernicious project; but the aſſembly, averſe from ſubjecting their country to a permanent and irrevocable tax, determined to paſs their ſupply bills from year to year, according to their uſual cuſtom. The miniſtry, influenced by a kind of vindictive policy, adviſed the ſovereign to wave the confirmation of the laws, and to ſuffer the adminiſtration of juſtice in the iſland to remain on a very precarious foundation. In 1728 a compromiſe was happily effected. The aſſembly conſented to ſettle on the crown a ſtanding irrevocable revenue of 8000*l.* per annum on certain conditions, to which the crown agreed. The principal of theſe conditions are as follow: *viz.* that the quit-rents ariſing within the iſland, then eſtimated at 1460*l.* per annum, ſhould conſtitute a part of ſuch revenue; that the body of their laws ſhould receive the royal aſſent; and that all ſuch laws and ſtatutes of England, as had been at any time eſteemed, introduced, uſed, accepted, or received, as laws in the iſland, ſhould be and continue laws of Jamaica for ever.

Jamaica is ſituated in the Atlantic ocean, about 4000 miles S.W. of England; having Hiſpaniola, at the diſtance of 30 leagues, to the E.; the iſland of Cuba, about the ſame diſtance, N.; the gulf of Honduras, W.; and Carthagena, on the great continent of South America, S. at the diſtance of 145 leagues. The centre of Jamaica lies in about 18° 12′ N. lat., and about 76° 45′ W. long. The climate, though much mitigated by various cauſes, is extremely hot, with little variation from January to December; the days and nights are nearly equal, the longeſt and ſhorteſt day differing no more than about two hours with little twilight; and it is twelve at noon in London, when it is about ſeven in the morning in Jamaica. The north and ſouth ſides of the iſland, which are ſeparated by a vaſt chain of mountains, extending from E. to W., differ greatly from each other. Columbus, when he firſt diſcovered Jamaica, on the northern ſide, and perceived that part which now conſtitutes the pariſh of St. Anne, was ſtruck with admiration at the novelty, variety, and beauty of the proſpect. At a ſmall diſtance from the ſhore, the country riſes into hills with gentle acclivity, which are ſeparated from each other by ſpacious vales and romantic inequalities; and is beautifully covered with groves of pimentos, forming by their deeper tints a charming contraſt to the verdure of the ſubjacent turf. The ſoil is in general a chalky marl, which produces a cloſe turf, as ſmooth and even as the fineſt Engliſh lawn, and in colour much brighter. No part of the Weſt Indies abounds with ſo many delicious ſtreams; every valley having its rivulet, and every hill its caſcade. On the ſouthern ſide of the iſland the ſcenery is of a different nature; its predominant feature being grandeur and ſublimity, whilſt the other ſide preſents variety and beauty. Amidſt precipices and inacceſſible cliffs, however, there are vaſt plains, clothed chiefly with extenſive cane-fields. To the inequalities of ſurface that diſtinguiſh this iſland, it is owing that, although the ſoil in many parts of the iſland is deep and very fertile, yet the productive land is but of ſmall extent, in proportion to the whole. That which is actually cultivated is of a middling quality, and requires labour and manure to make it yield liberally.

Jamaica is 150 miles in length, and at a medium about forty miles in breadth. Calculating from theſe data, the iſland, if it were a level country, would contain 3,840,000 acres; but allowing for that great part of it which conſiſts of high mountains, and ſuppoſing, at a moderate eſtimate, the increaſe on that account to be $\frac{1}{16}$th more, or 240,000 acres, the total is 4,080,000 acres. Of theſe no more than 1,907,589 were, in November 1789, located, or taken up, by grants from the crown; and conſequently, upwards of one-half of the lands is conſidered as of no kind of value, the expence of taking out a patent being of no great account; and of the located lands, Mr. Edwards ſuppoſes that little more than one million is at preſent in cultivation. In ſugar plantations, including the land reſerved in woods, for the purpoſe of ſupplying ſtaves, timber, and fire-wood, or appropriated for common paſturage, all which is commonly two-thirds of each plantation, the number of acres may be ſtated at 639,000. Of breeding farms, called "pens," the number is about 400, and allowing to each 700 acres, the whole amount is 280,000; and the ſpace allowed to the minor productions, as cotton, coffee, pimento and ginger, &c. including even the proviſion plantations, may be eſtimated at no more than one-half of the extent aſſigned to the pens. The reſult of the whole is 1,059,000 acres, leaving upwards of three millions an unimproved, unproductive wilderneſs. The mountains, however, are generally covered with extenſive woods, containing excellent timber; ſuch as the lignum vitæ, log-wood, iron-wood, pigeon-wood, green-heart braziletto, and bully-trees, all of which are to a great degree heavy, as well as compact and impenetrable. Some of theſe are neceſſary in mill-work, and would be highly valuable in the Windward iſlands. Of ſofter kinds, for boards and ſhingles, the ſpecies are innumerable; and there are many beautiful varieties for cabinet-work; and among theſe we may enumerate the bread-nut, the wild-lemon, and the well-known mahogany. Jamaica is not only abundantly wooded, but well watered; the number of its rivers being reckoned at above 100. It has alſo a variety of medicinal ſprings. Formerly, it is ſaid, the Spaniſh inhabitants had mines both of ſilver and copper; but the preſent occupiers employ their induſtry more profitably on the ſurface than in digging into the bowels of the earth. The moſt important of its preſent natural productions are ſugar, indigo, coffee, and cotton. The ſeveral ſpecies of grain cultivated in this iſland are, maize, or Indian corn, producing uſually two crops in the year, and ſometimes three; Guinea-corn, producing one crop in the year, planted in September, and gathered in January following, yielding from 30 to 60 buſhels an acre: and various kinds of calavances, a ſpecies of pea; and rice, but in no great quantity. The iſland abounds alſo with different kinds of graſs, of excellent quality: the artificial graſs, called "Scot's graſs," grows ſpontaneouſly in moſt of the ſwamps and moraſſes of the Weſt Indies; and it is ſo productive, that a ſingle acre of it will maintain five horſes for a whole year. The "Guinea-graſs" is next in importance to the ſugar-cane, as the grazing and breeding-farms are chiefly ſupported by it. Hence ariſes the plenty of horned cattle, both for the butcher and planter; which is ſuch, that few markets in Europe furniſh beef of better quality, and at a cheaper rate, than that of Jamaica. Mutton alſo is cheap and good. The ſeeds of the Guinea-graſs were brought from the coaſt of Guinea, as food for ſome birds which were preſented to Mr. Ellis, chief juſtice of the iſlands. The ſeveral kinds of kitchen-garden productions, that are known in Europe, thrive in the mountains of this iſland; and the markets of Kingſton and Spaniſh town are ſupplied with cabbages, lettuces, carrots, turnips, parſnips, artichokes, kidney-beans, green peas, aſparagus, and various ſorts of European herbs, in the greateſt abundance. Other indigenous productions that may be claſſed among the eſculent vegetables, are plantains, bananas, yams of ſeveral varieties, calalaa (a ſpecies of ſpinage), eddoes, caſſavi, and ſweet potatoes. Among the more elegant fruits of the iſland we may reckon the anana or pine-apple, tamarind, papaw, guava, ſweet-ſap, caſhew-apple, cuſtard-apple, cocoa-nut, ſtar-apple, grenadilla, avocado-pear, hog-plum, pindal-nut, neſbary, mammee, mammee-ſapota, Spaniſh gooſeberry, prickly pear, and ſome others, for which Jamaica is probably indebted to the bounty of nature. For the orange, the lemon, lime, ſhaddock, vine, melon, fig, and pomegranate, the Weſt India iſlands are perhaps obliged to their Spaniſh invaders. The cinnamon has been lately introduced, and the mango is become almoſt as common as the orange. In 1773 a botanic garden was eſtabliſhed in Jamaica, and in 1782 its valuable exotics were much increaſed.

This iſland is divided into three counties, *viz.* Middleſex, Surry, and Cornwall, which ſee reſpectively; and theſe three counties include twenty pariſhes, in which are eighteen churches and chapels; each pariſh being provided with a rector, and other church officers, and the preſentation to each living being lodged with the governor or commander-in-chief. The ſupreme court of judicature for the whole iſland is held in the town of St. Jago de la Vega, the capital of the county of Middleſex, in which court the chief juſtice of the iſland preſides, whoſe office is worth about 3000*l.* per annum. The aſſiſtant judges are gentlemen of the iſland, commonly planters, who receive for their attendance no recompence. From this court an appeal lies in civil actions for 300*l.* or upwards to the governor and council, as a court of error. Aſſiſe courts are alſo held every three months, in Kingſton for the county of Surry, and in Savanne-la-Mar for the county of Cornwall. The governor, or commander-in-chief is chancellor by his office, and preſides ſolely in that high department; he is alſo the ſole ordinary for the probate of wills and granting letters of adminiſtration. The office of enrollments, or of ſecretary of the iſland, which is an office of record, is important and lucrative; it is held by patent from the crown, and exerciſed by deputation. Its emoluments exceed 6000*l.* ſterling per annum. The provoſt-marſhal-general is alſo an officer of high rank and great authority, and held by patent from the crown. This acting officer is high-ſheriff of the whole iſland, and his legal receipts have been known to exceed 7000*l.* ſterling a-year. The office of clerk of the ſupreme court is alſo held by patent, and exerciſed by deputation: ſome years ago its value exceeded 9000*l.* currency. There are ſeveral other lucrative appointments, held by patent or commiſſion; and it is computed that not leſs than 30,000*l.* ſterling is remitted annually by the deputies in office within the iſland to their principals in the mother country. The legiſlature of Jamaica is compoſed of the captain-general or commander-in-chief, of a council nominated by the crown, conſiſting of twelve gentlemen, and a houſe of aſſembly, containing 43 members, who are elected by the freeholders. All bills paſſed in this aſſembly have the force of laws as ſoon as the governor's aſſent is obtained; but the power of rejection is ſtill reſerved in the crown.

The revenues of the iſland are partly *perpetual* by an act of the year 1728, and partly *annual*, depending on grants of the legiſlature. The revenue law may raiſe about 12,000*l.* per annum, of which 8000*l.* is particularly appropriated, and the ſurplus is applicable to the contingent expences, in aid of the annual funds. The governor receives 2500*l.* per annum out of the 8000*l.* fund: and a further ſalary of 2500*l.* is ſettled upon him, during his reſidence in the iſland, by a ſpecial act of the legiſlature. The annual funds may amount to 70,000*l.*, of which about 40,000*l.* is a proviſion for granting an additional pay to the officers and ſoldiers of his majeſty's forces ſtationed for the protection of the iſland. The current coins in Jamaica are Portugal pieces of gold, called the half-johannas, valued in England at 36*s.* each; which paſs, if of full weight, at 55*s.* Spaniſh gold coins current are doubloons at 5*l.* 5*s.* each, and piſtoles at 26*s.* 3*d.* Silver coins are Spaniſh milled dollars at 6*s.* 8*d.*, and ſo in proportion for the ſmaller parts of this coin: the loweſt coin is called a *bitt*, equal to about 5*d.* ſterling. A guinea paſſes for 32*s.* 6*d.* The number of white inhabitants was computed in 1780 at 25,000; but having ſince encreaſed, Mr. Edwards ſuppoſes that, including the troops and ſea-faring people, their number may be fixed at 30,000. The freed negroes and people of colour were computed in 1788 at 500 in each pariſh on an average; which makes 10,000 excluſive of the black people called Maroons. Theſe amount to about 1400. Of negroes in a ſtate of ſlavery, the preciſe number in 1787 was 210,894, and including thoſe who are fraudulently not returned, this number may be augmented to 250,000. The whole number of inhabitants of every deſcription is therefore eſtimated at 291,400. Mr. Edwards reports, from the books of the inſpector-general of Great Britain, that the trade of Jamaica, in 1787, employed 400 veſſels, containing 78,862 tons, navigated by 8845 men; that the total value of the exports from the iſland to various parts from January 5th, 1787, to January 5th, 1788, amounted to 2,136,442*l.* 17*s.* 3*d.*; and that the total value of the imports amounted to 1,496,232*l.* 5*s.* 4*d.* or by certain allowances neceſſary to be made, to 1,6480018*l.* 14*s.* 4*d.* ſterling. Jamaica, ſays Mr. Edwards, had now nearly attained the meridian of its proſperity. The total of ſugar plantations in all the pariſhes of the iſland are ſtated by this author to have been, in 1789, 710, and the number of negroes employed in them 128,798. The number of its coffee plantations has very conſiderably increaſed; for in 1774 the export of coffee was 654,700lbs., and in 1790, 1,783,740lbs. The exports conſiſt of ſugar, rum, molaſſes, pimento, coffee, cotton wool, indigo, ginger, cacao, tobacco, mahogany, logwood, hides, and ſeveral miſcellaneous articles. The imports conſiſt of Britiſh manufactures, foreign merchandize from Great Britain, ſalted proviſions from Ireland, formerly negroes from Africa, ſalted cod, &c. from the Britiſh colonies in America; from the United States, Indian corn, wheat flour, rice, lumber, ſtaves, &c. in Britiſh ſhips, from Madeira and Teneriffe wine: Mr. Edwards gives the following ſtatement of the value of this iſland, conſidered as Britiſh property:—250 negroes at 50*l.* ſterling each, amounting to 12½ millions; the landed and perſonal property to which theſe negroes are appurtenant, (including the buildings,) are moderately reckoned at double the value of the ſlaves themſelves; making 25 millions in addition to the 12 millions 500 thouſand before ſtated; and in further addition the houſes and property in the towns, and the veſſels employed in the trade, are valued at one million 500 thouſand pounds more: amounting in the whole to 39 millions of pounds ſterling. Edwards's Hiſt. Weſt Ind. vol. i.

Jamaica, a townſhip of America, in Windham county, Virginia, watered by ſeveral branches of Weſt river, and containing 263 inhabitants.—Alſo, a poſt-town and capital of Queen's county, New York, on the W. part of Long iſland, containing a Preſbyterian, Epiſcopalian, and Dutch church, an academy, and nearly 100 dwelling-houſes: 12 miles E. of New York city; the whole townſhip contains 1661 inhabitants.—Alſo, a town of Africa, in the iſland of York, built by a Mulatto, the ſon of an Engliſhman, where the Engliſh have a factory.

Jamaica *Pepper.* See Pimento.

Jamaica *Wood.* See Brazil.

JAMALGUNGE, a town of Bengal; 42 miles S.S.E. of Dinagepour.

JAMAMA, or Imam, a town of Arabia, the capital of a diſtrict in the province of Nedſjed, ſituated on a river, which runs into the Perſian gulf, and famous for being the birth-place of a prophet, named Moſeilama, who exiſted before the days of Mahomet. N. lat. 25 5'. E. long. 46° 8'.

JAMANASSIRO, a town of Japan, in the iſland of Niphon; 65 miles N.W. of Jedo.

JAMARD, in *Biography*, an ingenious and worthy eccleſiaſtic, who was, before the Revolution, a canon regular of St. Genevieve, prior of Roquefort, member of the Academy of Sciences, Belles Lettres, and Arts at Rouen; and who publiſhed in 1769, at Paris, in 8vo. "Recherches ſur la Theorie de la Muſique," or an Enquiry into the Theory of Muſic. The work is purely theoretical, and ſtrictly confined within the limits of harmonics, or diviſion of the muſical ſcale. The author has, unluckily, given offence to the patriotic muſicians of France, ſtill excluſive admirers of Lully and Rameau, by the following reflection. "It is aſtoniſhing that the Italians, who adhere ſtrictly to no regular ſyſtem or theory of ſound, ſhould compoſe better muſic than we do, who are in poſſeſſion of ſuch excellent principles of harmony;" but M. Laborde, ſtrongly attached to the old ſchool, by no means admits the fact. "In the firſt place, ſo far from granting that the Italians produce better muſic than we (the French) it is certain, on the contrary, that our's, with reſpect to harmony, is much ſuperior to that of the Italians, and that we allow their ſuperiority in nothing but the muſical drama, or opera, which is not tied down to ſuch rules as muſic properly ſo called, nor regarded in general as amenable to the laws of counterpoint.

"In the ſecond place, it is neceſſary to obſerve, that almoſt all the Italians compoſe by rote and by feeling, according to the method of their ſeveral ſchools. Very few of them have ever ſtudied the theory, or have the leaſt idea of the principles on which it is founded. We muſt allow, however, that this is the caſe with moſt practical muſicians, they ſeem to think theory a ſcience totally independent on practice. There is no practice, however, ſafe or exempt from error but by the knowledge of the principles of harmony, and the rules that flow from thoſe principles. We will allow, if you pleaſe, that the Italians are ſuperior to us in melody; but they muſt grant that we are their maſters in harmony, and that we write in a manner much ſuperior to them in accuracy, purity, and elegance." All this is very fine and honourable to France, but will the reſt of Europe ſubſcribe to M. Laborde's deciſions? and will it be believed that no good muſic ever *has* been compoſed or *can* be, by perſons unacquainted with Rameau's ſyſtem of the fundamental baſe? or that all the great maſters of Italy who have produced ſuch admirable works were ignorant of harmony? But we muſt not forget M. Jamard's theory in this diſcuſſion. This ingenious author has not only puſhed calculation by the diviſion of the monochord into all the diatonic, chromatic, and enharmonic intervals; but to the moſt minute ſhades of ſound poſſible; even to the warbling of birds, the ſliding the finger up and down the ſtring of a violin, or the incalculable tones of ſpeech. The worſt that can be ſaid, perhaps, of this labour is, that its uſe and application are not obvious. But a ſerious objection by nice ears will be urged againſt the author's making ſo imperfect an inſtrument as the French horn the guide and umpire of the diatonic ſcale, of which the 4th and 6th are ſo intolerably falſe and out of tune, that "the ploughman whiſtling o'er the furrow'd land" would not deform his wild melody by ſuch a ſcale. But though the *whole* ſyſtem of M. Jamard may be inadmiſſible and impracticable, as much ingenuity and ſcience are manifeſted in theſe calculations as could poſſibly be expected from a mere mathematician, totally unacquainted with practical muſic and its effects.

JAMAS, in *Geography*, a town of Japan, in the iſland of Ximo; 12 miles S.W. of Udo.

JAMATA, a town of Japan, in Niphon; ten miles W.S.W. of Jedo.

JAMBA, in *Ancient Geography*, a town of Aſia, in Babylonia, according to Ptolemy, ſituated near a marſh towards Arabia Deſerta.

JAMBA, in the *Mythological Romances of the Hindoos*. This is the name of a bear with whom Kriſhna and others of their deified heroes had adventures; ridiculous, if taken literally, but reaſonably imagined to be merely a veil for phyſical or ſcientific facts. See JAMBAVANTA.

JAMBAVAN, or JAMBHUVAN, the name of a bear expectorated by Viſhnu, as related in the legends of the Hindoos, for the purpoſe of aiding Rama in the wars of Lanka or Ceylon. On this occaſion moſt of the gods and demigods of the Hindoo pantheon were called upon by Viſhnu to aſſiſt Rama, himſelf indeed incarnate, againſt the giant king Ravana, as detailed at great length in that curious poem the Ramayana, by Valmiki, which has not yet been tranſlated. See RAMAYANA and RAVANA.

JAMBAVANTA. In the Sri Bhagavata, or Life of Kriſhna, eſtimated by the Hindoos as the eighteenth Purana (ſee PURANA), a number of adventures are related in which a bear acts a conſpicuous part under the name of Jambavanta. In Viſhnu's anatara, or incarnation in the perſon of Rama, a bear likewiſe under nearly the ſame name is introduced. Some aſtronomical alluſions are imagined to be hidden under theſe ſylvan allegories. Kriſhna is the ſun, he attacks and overcomes the bear, retiring with the daughter of his adverſary: this may refer to the ſun's approach to, and receding from, the northern tropic; Jambavanti being, it is ſuppoſed, a perſonification of Urſa major.

JAMBAVANTI, a female bear, daughter of Jambavanta, eſpouſed by Kriſhna, as related with many ſimilar apparently idle tales, in the Puranas and other romances, ſacred and profane, of the Hindoos.

JAMBEAUX, among our *Old Writers*, armour for the legs. The word is French, from *jambe*, the *leg*.

JAMBEC, in *Geography*, a town of Sumatra, which is the capital of a ſtate, and ſituated on a large river, both of the ſame name; the town is diſtant from the ſea on the eaſtern ſide of the iſland about 60 miles. This was formerly a place of conſiderable note, and both the Engliſh and Dutch companies had eſtabliſhments there. The trade conſiſts in gold duſt, pepper, and canes, but it is now eſteemed of little importance; the gold being moſtly drawn to the weſtern coaſt acroſs the country. S. lat. 1° 24'. E. long. 103° 39'.

JAMBER, a ſmall iſland in the Atlantic, near the coaſt of Africa. N. lat. 10° 21'.

JAMBIA, in *Ancient Geography*, a town of Arabia Felix, on the Arabic gulf, according to Ptolemy. It was ſituated near the Elanitic gulf.

IAMBIC FOOT, or IAMBUS, in *Metre*, conſiſts of two ſyllables; the firſt, ſhort; the ſecond, long ˘ ¯; as ἔχων *preces, around.*

> "Syllaba longa brevi ſubjecta vocatur iambus,
> Pes citus."　　　　Hor. de Art. Poet. 251.

Several derivations of this word are given by ancient authors, but none of them have much probability. (See Schol. on Hephæſtion, p. 157 and 169. edit. Gaisford. Etym. Magn. Sch. on Nicander. Euſtath. on Od. 11. p. 1684. Diomedes, p. 473.) The moſt probable one is from *ἰάπτειν, to aim at*, or *attack*. Ariſtotle (Poet. § 4. Winſtanl.) and Strabo (l. 9. § 10.) derive it from *ἰαμβίζειν, to ſatirize*; but I cannot find that this word was ever uſed before the invention of iambic verſe; or that in later authors it was ever uſed without ſome reference to it. When Gorgias ſaid that Plato *καλῶς οἶδε ἰαμβίζειν*, he meant that he could defame as well as a writer of iambics; and with the ſame alluſion he called him *another Archilochus*. (See Athen. 11. 505. d.) The paſſage in which ἰαμβοποιήσας occurs in Ariſtot. Poet. (§ 22. ſee Tyrwhitt's note,) has been miſunderſtood by all his commentators. It ſhould be read οἷον Ευκλειδης ὁ ἀρχαῖος (διεκωμῴδει τὸν ποιητὴν) ὡς ῥᾴδιον ποιεῖν, εἴ τις δώσει ἐκτείνειν ἐφ' ὁπόσον βούλεται· ἰαμβοποιήσας ἐν αὐτῇ τῇ λέξει; that is, *having made an iambic verſe in the very expreſſion.* It is more probable, therefore, that ἰαμβίζειν was derived from the verſe, than the verſe from it.

IAMBIC *Verſe*, is that which conſiſted principally of iambic feet. The Greeks uſed a great variety of forms of this verſe, either ſeparately, or intermixed with other verſes. (See Schol. on Hephæſt. p. 167.) It was meaſured by dipodiæ or double feet. When they uſed therefore a ſingle iambic foot as a verſe, it was called

Iambic Monometer Brachycatalectic, for which was uſed any foot of two ſyllables, except a trochee. Soph. Œd. Col. 117. 149. El. 856. 867. edit. Brunck.

An *Iambic Mon. Catal.* conſiſted of an amphibrach or a bacchius. (Soph. Aj. 873. 897. 1205. El. 1237. 1258. Œd. Col. 123.) This was ſometimes intermixed with iambic trimeters. Soph. Œd. t. 1468. Trach. 865. Œd. c. 1271.

Iambic Monom. called alſo an *iambic baſis*, conſiſted of two iambic feet; and admitted, inſtead of the firſt iambus, a tribrach, or a ſpondee, or a dactyl, or an anapæſt. Eur. Phœn. 312. Or. 979. Soph. El. 127. 1232. Æſch. Suppl. 278. Perſ. 1043. (See Burney's Pref. to Æſch. p. 16.) Ariſtoph. Nub. 1103. Ach. 276. It is prefixed by Ariſtophanes (Eq. 380. 455. 939.) to an iambic dimeter catal. at the end of a ſyſtem of iambic dimeters.

Iambic Monom. Hypercat. or *Iambic Penthemimer*, admitted the ſame varieties in the firſt foot. Eur. Hec. 919. Soph. Aj. 599. Æſch. Perſ. 641. (See Burney, p. 25. and 80.) The laſt ſyllable was either long or ſhort.

Iambic Dimeter Brach. admitted a tribrach alſo in the ſecond foot. Soph. El. 857. 1246. Œd. t. 667. 696. Ariſt. Eq. 386. Pind. Ol. 4. ult. Pyth. 8. Str. 8. Iſthm. 7. Str. 8. See Herm. Comm. de Pind. Metr. v. 3. p. 216. Heyn.

Iambic Dim. Cat. called by the Scholiaſt on Nicander *Hemiambic*. (Gaisford, p. 246.) Soph. El. 1241. 1262. Ariſtoph. Ach. 1223. He often cloſes a ſyſtem of dimeters with this verſe (Eq. 381. 456. 940.), and often intermixes them. (Ach. 1010. 1039.) In the ſecond place he generally preſerves an iambus (Herm. de Metr. p. 145.); but he has a tribrach in Ach. 1039; and an anapæſt, Nub. 1104. The *Anacreontic verſe* is referred by Hephæſtion to this metre. It conſiſted of two different ſyſtems; in one of which the firſt foot was always an anapæſt; in the other, either an iambus or a ſpondee; and in his genuine odes, no other variety was, I think, admitted. The laſt ſyllable was common. Both of theſe have been conſidered by others as *Ionici a majore*, with an anacruſis of one or two ſyllables. (See Herm. de Metr. p. 348.) This metre occurs with an anapæſt in the firſt place, in Eur. Cycl. 493—511. Soph. Ph. 1176, 7. El. 1067, 8. 1079, 80.

Iambic Dimeter.—The tragedians admitted an iambus or a ſpondee indifferently in the firſt and third places of this verſe, and a tribrach in the three firſt, and a pyrrhic in the laſt (Soph. Ant. 853—5. 872—4. 952, 3. 963, 4. Eur. Or. 978. 982. Æſch. Prom. 159—161. 178—180. Sept. 982, et ſeq. Pind. Ol. 4. Ep. 3. Nem. 1. 1.): but when many of theſe verſes were united together in a ſyſtem, as was often done by the writers of comedy, the meaſure was continued to the end of the ſyſtem; the laſt ſyllable, therefore, was not common, but the fourth foot admitted the ſame varieties as the ſecond; according to this ſcheme,

⏑ –	⏑ – /	⏑ –	⏑ –
⏑⏑⏑	⏑⏑⏑	⏑⏑⏑	⏑⏑⏑
⏑⏑–	⏑⏑–	⏑⏑–	⏑⏑–
– –		– –	
–⏑⏑		–⏑⏑	

Ariſtoph. Eq. 367—379. 443—454. 911—938. Ach. 1040. 1192. 1209. Lyſiſtr. 260—3. (Herm. p. 144. Gaisford. p. 243—5.)

Iambic Dim. Hypercat. Eur. Or. 975. Soph. Ant. 338. 349. Æſch. Prom. 431. Pind. Ol. 6. 1. 7. 5. Bacchylides, fr. 7. and Biaſ. fr. 4. Brunck. And with an anapæſt in the third place. Pind. Pyth. 8. Ep. 1. The third verſe of the *Alcaic ode* was in this metre. Alcæus ſeems always to have uſed an iambic in the third ſeat. See Bentley on Hor. Od. 2. 19. 15.

Iambic Trim. Brachycat. Eur. Or. 976. 1398. 1448. 1451. Soph. Ant. 587. Œd. t. 1339. Pind. Nem. 8. Ep. 6.

Iambic Trim. Cat.—This is aſcribed to Archilochus by Hephæſtion. Archil. fr. 24. Brunck. Eur. Phœn. 301. Or. 1365. Soph. Œd. t. 865. 889. Theocrit. Epigr. 18. Br. Anal. Phalæcus has an epigram in this verſe. Anal. 1. 421.

Iambic Trimeter, is the metre of this kind moſt commonly uſed; and it conſiſted of three iambic dipodiæ.

> "Iambus ipſe ſex enim locis manet
> Et inde nomen inditum eſt Senario;
> Sed ter feritur; hinc Trimetrus dicitur,
> Scandendo binos quod pedes conjungimus."
>
> Terentianus Maurus.

It is ſo nearly allied to proſe, that Ariſtotle (Rhetor. 3. 1. 9. 3. 8. 4. Poet. § 4.) and Demetrius Phalereus (§ 43. ſee alſo Cicer. Orat. § 189.) have obſerved, that many iambic verſes were uttered in common converſation; and they are frequently to be met with in the works of Greek proſe authors. From this circumſtance it was well ſuited to the ſermo pedeſtris of ſatire, to which purpoſe it was applied by its inventor Archilochus. (See Hor. Art. Poet. 79. and Od. 1. 16. 2. and 22. Epiſt. 1. 19. 24.) The ſame circumſtance made it alſo peculiarly applicable to dramatic compoſition.

> "Hunc Socci cepere pedem, graveſque Cothurni,
> Alterniſque aptum ſermonibus, et populares
> Vincentem ſtrepitus, et natum rebus agendis."
>
> Hor. Art. Poet. 80.

See alſo Cicer. Orat. § 191.

A pure iambic verſe would conſiſt of ſix iambic feet; as

> Ἐπεὶ σχολὴ πάρεστι, παῖ Μενοιτίου.
>
> Dion. Hal. de Compoſ. § 17.

but neceſſity obliged the firſt writers to admit other feet, which was chiefly done in the firſt, third, and fifth places.

> "Tardior ut paulo graviorque veniret ad aures,
> Spondeos ſtabiles in jura paterna recepit,
> Commodus & patiens; non ut de ſede ſecunda
> Cederet, aut quarta ſocialiter."—
>
> Hor. Art. Poet. 254.

The few fragments of Archilochus and Solon which remain, have a ſpondee in the firſt and third places much more frequently than an iambic; and they ſeem to have uſed them indifferently in the fifth. Archilochus alſo affords two inſtances of the reſolution of the iambus into the tribrach in the ſecond; and one, of the admiſſion of a dactyl into the firſt place. Theſe licences were afterwards generally uſed by the tragic poets, who admitted the following varieties into their verſe.

```
∪ –  ∪ – / ∪ –  ∪ – / ∪ –  ∪–
∪∪∪ ∪∪∪   ∪∪∪ ∪∪∪   ∪∪∪  ∪∪
– –       – –       – –
–∪∪       –∪∪
∪∪–
```

Many critics, among whom are Muſgrave (on Eur. El. 23) and Brunck (on Soph. Œd. c. 371 and 1169, and Phil. 491.), have thought that the anapæſt was admitted in the ſecond and fourth places; and it was long the univerſal opinion that it was allowed in the third and fifth; and there are ſeveral verſes in the printed editions which ſeem to confirm this opinion; but in proportion as more and better manuſcripts have been conſulted, the number of theſe places has been diminiſhed, and the anapæſt has been confined to the firſt place, where Æſchylus and Sophocles have been careful to include it in a ſingle word, and Euripides either in a ſingle word, or in a prepoſition and the word which it governs. (Morell. Proſod. p. 11. 19. Porſon. præf. ad Eur. Hec. Hermann. præf. ad Eur. Hec. p. 33. 38. and 53.) In proper names, ſuch as Ἑρμιόνη, Ἀντιγόνη, which could not otherwiſe be uſed in an iambic verſe, greater licence was allowed; and an anapæſt was admitted in any place but the laſt. And this liberty has been ſometimes uſed in names which did not neceſſarily require it, as, Μενέλαος, Ἀγαμέμνων, but care was taken that the whole anapæſt ſhould always be included in the name. Porſon. præf. p. 20. Herm. præf. p. 60.

It has been obſerved by Mr. Porſon, to whom we owe the firſt notice of ſome of theſe rules, and the eſtabliſhment and confirmation of others, that in the tragic writers, when an iambic trimeter ends in a triſyllable, the fifth foot is very rarely a ſpondee, unleſs the laſt word but one be a monoſyllable. It is the ſame, if the verſe ends with a trochee and a ſyllable, or with a long ſyllable and an iambus, if the long ſyllable is a prepoſition, or an article, or any ſyllable particularly belonging to the following word; but if the long ſyllable is an enclitic, or a particle referring to what goes before, it may then make part of a ſpondee. (Porſon. præf. p. 30. Herm. on Eur. Hec. 341.) This rule is ſtrictly obſerved alſo by Lycophron. Mr. Porſon (ſee note on Eur. Phœn. 1464.) has obſerved that καὶ never makes the latter part of a *ſpondee* in the fifth foot of a tragic iambic. Perhaps he overlooked Soph. Phil. 961; and he ſeems himſelf to have admitted a conjecture of Canter on Æſch. Suppl. 411, which introduces it.

The comic poets uſed much greater licence, and the form of their verſe was

```
∪ –́  ∪ – / ∪ –́  ∪ – / ∪ –́   ∪–
∪∪́∪ ∪∪∪   ∪∪́∪ ∪∪∪   ∪∪́∪  ∪∪
∪∪–́ ∪∪–   ∪∪–́ ∪∪–   ∪∪–́
– –́       – –́       – –
–∪́∪       –∪́∪       –∪́∪
```

The reaſon of theſe licences will be more clearly ſeen, if we conſider that in the iambic trimeter there are three ἄρσεις, or ictus, or emphaſes, which are here marked, the firſt of which took place on the long ſyllable of the firſt iambus, or its equivalent. As the rhythm was principally directed by theſe, it may be conſidered as beginning at the firſt arſis; and the verſe will then become a trochaic trimeter catalectic, in this form

```
 –
 ∪  ‖ –́ ∪ – ∪ / –́ ∪ – ∪ / –́ ∪ –
∪ ∪
```

(See Bentley on the Metres of Terence; Daves Miſc. Crit. p. 189; Herm. de Metr.) The ſyllable before the firſt arſis, when the rhythm had not yet commenced, was indifferently either ſhort or long, and ſometimes two ſhort ones were admitted. In the remaining part of the verſe, as two ſhort ſyllables were conſidered as equivalent to one long, the tribrach was uſed almoſt indiſcriminately inſtead of the trochee, except in the fifth foot, where the tragedians ſeldom reſolve the long ſyllable, and never, if it is preceded by a long one. The firſt foot of each trochaic dipodia (either –́∪ or ∪́∪∪) being moſt diſtinctly heard, was preſerved pure by the tragic poets, but in the familiar ſtyle of comedy, the dactyl was ſometimes ſubſtituted for the trochee, which would produce an anapæſt in the ſecond place of the iambic verſe. In the next foot, at the cloſe of each dipodia, a ſpondee or a trochee was indifferently uſed by the tragedians, and a dactyl by the writers of comedy.

Daves (p. 250.), and Morell (p. 12.), have obſerved that Ariſtophanes avoids putting an anapæſt immediately after a dactyl or a tribrach in an iambic trimeter. Hermann (de Metr. 150–162.) produces many inſtances (to which more might be added) of an anapæſt after a tribrach, which he conſiders as a proceleuſmatic, formed from the reſolution of the long ſyllable of an anapæſt and an iambus; but they are probably corruptions, and may be removed without difficulty. It may be obſerved alſo that when an anapæſt is admitted into the fifth place by Ariſtophanes, it is included within one word; or contains the whole of two, as of a prepoſition and an article; or is entirely comprehended within the laſt words of the verſe: but the beginning of the anapæſt is never joined in the ſame word with the fourth foot, or any part of it. In Brunck's edition there are only ſeven exceptions to this rule; two of which (Ach. 800. 962.), are occaſioned by the marks of diæreſis improperly placed, and the other five (Plut. 942; Nub. 238. 1192. 1458; Av. 90.) may be very eaſily corrected.

The cæſura of the iambic verſe takes place at the end of the firſt trochaic dipodia, that is, in the middle of the third foot; and a new trochaic order then begins. The conſtant obſervation of this cæſura would make the verſe too uniform and monotonous; it is therefore very frequently neglected: for I would not conſider as a cæſura, the termination of a word in the middle of the fourth foot; ſince the firſt foot of the trochaic order which ſucceeds would then frequently be a ſpondee. As Σὺ δ᾽ ἐλθὲ, καὶ σήμαινον—Ἀργείοις τάδε. Inſtead of either of theſe, a diviſion ſometimes takes place after an eliſion at the end of the third foot; but otherwiſe the tragedians very rarely make the third or fourth foot a ſingle word; and carefully avoid including them both in one word; as that would deſtroy all perception of the trochaic order of the verſe. Bentley, Herm. de Metr. p. 147; and on Eur. Hec. v. 721; Porſon. pr. to Hec. p. 24; Gaiſford on Hephæſt. p. 239.

The words which cannot begin a ſentence, cannot ſtand at the beginning of an iambic verſe (Bentley on Menand. p. 108. Monthly Rev. June, 1785, p. 424.), and the arſis is very ſeldom admitted on an enclitic (Porſon, p. 16.), or on the laſt ſyllable of a word of more than two ſyllables (Daves, p. 211. 320.) though to this a few exceptions may be found. Ariſt. Lyſ. 739. 744. Rar. 785.

In the *ſatiric fable* the ſame licence was probably allowed as in the comedies. In the ſingle drama which remains, a dactyl is not to be found in the fifth place, nor an anapæſt in the third; unleſs Pierſon's conjecture on v. 28. be admitted.

The earlieſt *iambographi*, or writers of iambic verſes, Archilochus, Solon, and Simonides, uſed a ſpondee or an iambus indifferently, as has been before obſerved, in the odd places; but were very ſparing in the uſe of feet of three ſyllables. The "Poem upon Women," which was written perhaps by ſome Simonides of more recent date, has a tribrach once, in the firſt, ſecond, and fifth places, and an anapæſt once in the third. Lycophron has admitted a tribrach in the third place (v. 1164. ed. Reichard., and fourth (700. 991.), and with part in a proper name in the ſecond and fourth (520. 874. 1046). He has ten or eleven dactyls in the third place, but an anapæſt only in a proper name (720. 930. 952.); for in v. 634. τε ſhould be expunged. See Herm. de Metr. 150, who aſſerts that the iambographi never admit a dactyl or anapæſt. Brunck. Soph. Œd. c. 371. Porſon. præf. to Hec. p. 19.

Another kind of iambic trimeter much allied to this, was the *Choliamlicus, Claudus*, or *Scazon*, called alſo *Hipponacteus*, from Hipponax, who is ſaid to have firſt uſed it. He applied it to the ſame purpoſe of ſevere ſatire, and bitter invective, as Archilochus. (Leonid. Epigr. 97. Alcæus, Ep. 18. Philipp. Ep. 83. Demetr. Phal. § 325. Euſtath. on Od. 11. p. 1684. Cic. de Nat. Deor. 3. 38. Hor. Epod. 6. 14. Ovid. Ibis, 523.) The diſtinguiſhing characteriſtic of it was a ſpondee in the ſixth place. The varieties which it admitted, as far as we can collect from the fragments of Hipponax, Babrius, and others which remain, were according to the following ſcheme.

⏑ – ⏑ – / ⏑ – ⏑ – / ⏑ – – –
⏑⏑⏑ ⏑⏑⏑ ⏑⏑⏑ ⏑⏑⏑ – ⏑
– – – – – –
– ⏑⏑ – ⏑⏑
⏑⏑ – ⏑⏑ – ⏑⏑ –

Of theſe the anapæſt was very rarely uſed, and the dactyl not frequently. (Bentley on Phalaris, p. 433—6. Gaisford on Heph. p. 251—8.) Theſe verſes were ſometimes called *Mimiambi*. (Terentianus Maurus. A. Gell. 15. 25. 20. 10.) Joh. Stobæus has preſerved ſeveral of them from *Herodes in Hemiambis*, which ought perhaps to be changed to *Mimiambis*. (See Caſaub. on Athen. 1. cap. 17.) This metre was ſometimes uſed by Callimachus. See his Fragments, collected by Bentley, 83—98.

When the fifth foot was alſo a ſpondee, the verſe was called ἰσχιοῤῥωγικός. (See Tyrwhitt's Babrius, p. 13.) This was principally uſed by Ananias (or, as he is called by Athenæus, Ananius), but was occaſionally intermixed with the other by Hipponax and Babrius. See alſo an epigram on Hipponax, by Theocritus.

Iambic Trimeter Hypercat. Ariſtoph. Lyſiſtr. 1297. Theſm. 988. It occurs in Æſch. Chœph. 321. 352, according to Burney's arrangement; and in Pind. Ol. 3. 6. and Nem. 9. 11. according to Hermann.

Of Iambic Tetrameter Brachycat. which is mentioned by the ſcholiaſt on Hephæſtion, I find no example.

Iambic Tetrameter Catal., called alſo Hipponacteus. (Sch. on Ariſtoph. Plut. 253. Hephæſtion. Marius Victorinus. See Gaisford, p. 246.) This was very frequently uſed by the comic writers, and had a pauſe at the end of the fourth foot, though the word frequently did not end with it. It admitted, in the firſt, third, and fifth feet, the ſame varieties as in the ſame feet of the comic trimeter; and, in the ſecond and ſixth, the ſame as in the ſecond and fourth of the other. The fourth foot could only be an iambus or a tribrach; and in the ſeventh an iambus only was allowed, except in the caſe of a proper name, when an anapæſt was admitted in either place. Ariſtoph. Ran. 905—970. Nub. 1034—1084. Therm. 531—573. Lyſiſtr. 539, 540. Porſon, præf. to Hec. p. 39. Monthly Rev. Sept. 1789, p. 253, *note*.

Iambic Tetrameter. A verſe of Alcæus in this metre is quoted by Hephæſtion, and his Scholiaſt. Boiſcus of Cyzicus is ſaid to have firſt uſed it. It was not uſed by the Greek dramatiſts. Hermann. p. 181. Gaisford, p. 245.

Iambic Tetrameter Hypercat. The Scholiaſt on Hephæſtion produces a verſe in this metre, and ſays that the meaſure of iambic verſes was extended ſtill further; but the examples which he cites are made up of ſhorter verſes of Archilochus joined together.

The Romans do not appear to have made uſe of ſo great a variety of iambic verſes as the Greeks. I will enumerate thoſe which were moſt commonly uſed by them.

Iambic Monometer Hypercat. occurs occaſionally in the tragedies which are aſcribed to Seneca. (Œd. 411. 415. 732.) An anapæſt and a ſpondee were uſed in the firſt place.

Iambic Dimeter Catal. Seneca, Med. 849—878. Œd. 485. Plaut. Mort. 1. 2. 19.

Iambic Dimeter. Seneca uſes a ſyſtem of theſe verſes in Agam. 759—784. In the firſt foot he has admitted a ſpondee and a dactyl; in the third, a ſpondee; and the laſt ſyllable is common. He has an anapæſt in the firſt and fourth, Œd. 414. Plautus (Mort. 1. 2. 25. 26. 49. 50.) and Terence (Andr. 1. 2. 5. 1. 5. 5. 8. 17. 3. 3. 5. 3. 4. 26.) uſe a ſpondee and anapæſt in every foot but the laſt, and a dactyl alſo in the two firſt. Hermann (de Metr. p. 146.), Virgil (Catal. 5.), Horace (Epod. 1—10), Martial (1. 50. 3. 14), and Seneca (Med. 771—786.), have uſed this verſe alternately with the iambic trimeter. Horace (Epod. 14, 15.) has intermixed it with hexameters, and Martial (1. 62.) with ſcazons. Beſides the iambic and ſpondee, an anapæſt and dactyl are admitted in the firſt place by Martial, and a tribrach by Horace, who once uſes a dactyl alſo in that ſituation. The ſecond was always an iambus or tribrach. The ſpondee was the moſt common foot in the third, but an iambus is occaſionally uſed, and Martial and Seneca have ſometimes an anapæſt.

Iambic Dimeter Hypercat. This is the third verſe of the Alcaic ode, which Horace always uſes in this form, preſerving a ſpondee in the third place ⏓ – ⏑ – / – – ⏑ – / ⏓

Iambic Trimeter Brachycat. Seneca Œd. 719, 720. 731. 733, 4. 736. Agam. 596. He admits a ſpondee and anapæſt in the firſt place, and a ſpondee in the third, fourth, and fifth.

Iambic Trimeter Cat. Horace uſes this metre (Od. 2. 18.) with a cæſura in the middle of the third foot. As it follows a trochaic dimeter catal., and the ſyllable preceding the cæſura is either long or ſhort, this verſe may be conſidered as an aſynartete conſiſting of an iambic penthemimer, and an ithyphallic. A ſpondee was allowed in the firſt place, and a tribrach in the ſecond. In Od. i. 4, the ſame meter occurs with the ſame cæſura, and a long ſyllable always before it. As it is joined with an aſynartete, compounded of a dactylic tetrameter, and an ithyphallic, it may properly be conſidered as an aſynartete here alſo.

Iambic Trimeter. In the tragedies of Seneca, an iambus, tribrach, ſpondee, dactyl, anapæſt, and proceleuſmatic were admittted in the firſt place, and the four firſt of theſe in the third, which received an anapæſt alſo, though rarely, and only in words of four ſyllables. In the ſecond and fourth, an iambus, or a tribrach only, was admitted. In the fifth place an iambus is found only in five verſes, and a dactyl only in four; the verſe ending, in both caſes, with a word of four ſyllables; and a tribrach only in three, and contained by one word. (See AVANTIUS.) An anapæſt and a ſpondee were admitted indifferently in this place; but it is obſervable that the anapæſt is always contained in one word, with or without an eliſion of the laſt ſyllable, except in eight places where a pyrrhic is found followed by *eſt*, or *ſit*. The only exceptions to this rule are in Herc. Oct. 406. 757, and Oct. 393, which may be all made regular by an eaſy tranſpoſition. The anapæſt in *neſcio quid*, which occurs five times, is not an exception, as that expreſſion was conſidered as one word.

Plautus and Terence in the firſt four feet uſe an iambus, ſpondee, dactyl, tribrach, anapæſt, and proceleuſmatic. In the fifth, a ſpondee, dactyl, and anapæſt. The third and fourth feet were very rarely allowed to be ſingle words, which would have thrown the arſis on the laſt ſyllable of the words; and whenever this happened, they were careful to have the preceding ſyllable ſhort. (See Bentley on Terence.) Phædrus uſes the ſame licence as the comic writers, excepting that he does not admit a proceleuſmatic.

Catullus in Carm. 4. 20. 29; Virgil in Catal. 3, 4; and Horace in Epod. 16. (where he uſes this metre alternately with hexameters), admit no foot but the iambic, except a pyrrhic at the end, from the laſt ſyllable being common. In other places where this verſe is uſed alone, as Catullus, 52, Horace, Epod. 17, or with alternate dimeters, a ſpondee, anapæſt, and dactyl were admitted in the firſt and third places; a ſpondee and anapæſt in the fifth; and a tribrach in the ſecond, third, and fourth.

The ſcazon is uſed not unfrequently by Catullus; by Virgil, Catal. 2. 7.; and by Martial very frequently. Virgil admits no foot of three ſyllables, and Catullus very rarely. Martial has the ſame variety as in the regular trimeter in the four firſt feet; and in the ſecond and fourth he admits alſo occaſionally an anapæſt. In this metre the fifth foot, among the Latins, was almoſt invariably an iambus, though a ſpondee may be found there in Martial. 1. 67. 13.

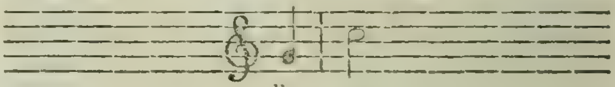
Iambic Trimeter Hypercat. Seneca Agam. 612. Plaut. Aul. 2. 1. 3. 2. Stich. 1. 1. See Herm. de Metr. 169—175.

Iambic Tetrameter Catal., called alſo *Septenarius*. Catullus, 25. Terence, Andr. 4. 2. Eun. 3, 4. 3. 5. Hec. 2. 2. 5. 2. Plaut. Ani. 3. 3. Mil. Gl. 2. 4. Mort. 1. 3. In all the feet of this verſe, but the fourth and ſeventh, the ſame variety was allowed as in the trimeter. In the fourth, Bentley (on Hec. 2. 2. 10.) admits in Terence only an iambus; but in Eun. 3. 5. 55. his own edition has an anapæſt, and in Hec. 5. 2. 24, a proceleuſmatic, in that ſituation. Plautus has ſometimes admitted in the fourth a tribrach and an anapæſt, and ſometimes ſeems to have conſidered the verſe as an aſynartete, and therefore admits a pyrrhic and an hiatus before the cæſura. (Ani. 3. 3. 61.) In the ſeventh, a ſpondee, dactyl, and anapæſt were uſed. See Herm. de Metr. p. 177—181.

Iambic Tetrameter. This metre was alſo uſed very frequently by the comic poets. The cæſura was either at the end of the fourth foot, or in the middle of the fifth. In this latter caſe, all the ſix feet firſt admitted the ſame variety as the comic trimeter. In the former the fourth foot was generally an iambus. The ſeventh foot might be a ſpondee or an anapæſt. The eighth was always an iambus. (Ter. Andr. 1, 2. 1. 3. Eun. 3. 5. 5. 8. Phorm. 2. 1. Plautus, Bacchid. 4. 9. Amphitr. 3. 4.) The verſes quoted by Cicero (Tuſc. 1. 44.) from an old tragic poet, and which he calls *Septenarii*, were referred to this metre by Scaliger, Gerh. Voſſius, and lately by Hermann. Bentley was of opinion that this verſe was never uſed by the Latin tragedians. See Herm. de Metr. p. 181—186.

N.B. The editor is indebted for the two preceding valuable articles to the Rev. Mr. Adams, vicar of Halſtead, Eſſex.

As a poetical foot conſiſts of a certain number of ſyllables which conſtitute a diſtinct part of a verſe, ſo a *bar* of an air in muſic contains a certain number of notes of different lengths which are reducible to long and ſhort ſyllables: an hexameter verſe conſiſts of ſix of theſe feet, a pentameter of five; an iambic foot has one ſhort and one long ſyllable: as Θεȣ, λεγε, *potens*, *amas*.



In ancient muſic, ſays Rouſſeau, there were two kinds of iambic verſe, one of which was only recited to the ſound of inſtruments, whereas the other was ſung. It is not eaſy to comprehend what effect the accompaniment of inſtruments could have on ſimple recitation; and all that we can reaſonably conclude is, that the moſt ſimple manner of pronouncing Greek poetry, or at leaſt iambics, was to muſical tones, and very much reſembled ſinging.

IAMBICE, in the *Muſical Inſtruments of the Ancients.* Among the ſtringed inſtruments of the ancients mentioned by J. Pollux, we find one called iambice; and Muſonius, "de luxu Græcorum," ſays that it was a kind of triangular cithara, invented by Ibycus.

JAMBLICHUS, in *Biography*, an ancient philoſopher, who was a native of Syria, and educated at Babylon. Upon Trajan's conqueſt of Aſſyria, he was reduced to a ſtate of ſlavery; but recovering his liberty, he afterwards flouriſhed under the reign of the emperor Antoninus. His treatiſe in the Greek language, entitled "Babylonica de Simonidis et Rhodanis Amoribus," and conſiſting of 16 books, is ſaid to have been lodged in MS. in the library of the Eſcurial, and deſtroyed by fire in the year 1671. A fragment of it was preſerved by Leo Allatius, accompanied with his own Latin verſion, in his Selections from the MSS. of Greek Rhetoricians and Sophiſts, Rome, 1641, 8vo.

JAMBLICHUS was alſo a native of Chalcis in Cœlo-Syria, and flouriſhed about the beginning of the fourth century. He received his firſt inſtructions from Anatolius, preſident of the Peripatetic ſchool at Alexandria; and afterwards became a diſciple of Porphyry. He was eminently verſed in the myſteries of the Plotinian ſyſtem, and taught it with ſuch reputation and ſucceſs, as to attach to his ſchool a great number of diſciples. Although he was much inferior to Porphyry in eloquence, he commanded the reverence of his followers by high pretenſions to theological powers. In the exerciſe of theſe powers, which he profeſſed to acquire by an intercourſe with inviſible beings, he aſtoniſhed the credulous, and obtained the name of "the moſt divine and wonderful teacher." His reading was extenſive, but his ſtyle was inaccurate and inelegant; and he took great liberty in borrowing from others, and particularly from Porphyry. This charge of plagiariſm is alleged againſt Jamblichus by Kuſter, Voſſius, Gale, Moſheim, and other learned men; but Dr. Lardner does not perceive any ground for it This impartial and candid writer is of opinion, that Porphyry and Jamblichus found the ſame ſtories in authors more ancient than themſelves, whom they both tranſcribed, and ſometimes almoſt word for word. He adds, that moſt of the things related by theſe two authors concerning the wonderful works aſcribed to Pythagoras are ſo trifling, and ſo manifeſtly fabulous, that he cannot believe they intended to oppoſe them to the miracles of Jeſus Chriſt. The miracles of our Saviour, ſays Lardner, are all great and awful, related by credible witneſſes, with all the circumſtances of credibility: the trifling and fabulous accounts of Pythagoras cannot be ſet in competition with them. It is ſufficient diſparagement to thoſe proud and learned philoſophers that they gave credit to the Pythagorean fables. We need not reproach them with an intention to oppoſe them to the miracles of Jeſus Chriſt. "The Life of Pythagoras;" "An Exhortation to the Study of Philoſophy;" "Three Books on Mathematical Learning;" "A Commentary upon Nichomachus;" "Inſtitutes of Arithmetic;" and "A Treatiſe on the Myſteries of the Egyptians, Chaldæcal Aſſyrians;" are all the writings of Jamblichus now extant. The moſt eſteemed editions of the above-mentioned works are thoſe "De Myſt. Ægypt. Chald. et Aſſyr. necnon et alii Tractatus Philoſophici," printed by Aldus, at Venice, 1497, fol.; "De Myſt. Ægypt. necnon Porphyrii, Epiſtola, &c. Gr. and Lat. ex Interpretatione et cum Notis Thonæ Gale," Oxon, 1678, fol.; and "De Vita Pythag. Liber. Gr. and Lat. ex emendatione et cum notis Ludolphi Kuſteri;" Amſter. 1707, 4to. From St. Jerome we learn that Jamblichus wrote copious comments on the precepts of Pythagoras, commonly called "the Golden Verſes;" and the emperor Julian, who holds him in equal eſtimation with Plato, cites a treatiſe on the ſun, from which he has made many extracts. Fabricius mentions another work of Jamblichus, not now extant, entitled "Of Images;" or "Of the Divinity of Images;" of which Photius has given ſome account. The deſign of Jamblichus, it is ſaid, in this work, is to ſhew the divinity of idols, which he calls images, and that they are filled with the divine preſence, and are fallen down from Jupiter, &c. In ſupport of this opinion he relates many incredible ſtories. This work of Jamblichus is confuted by Philoponus. The time and place of his death are uncertain; but there is reaſon for believing that he died before Conſtantine, and probably about the year 333.

The ſchool of Jamblichus produced many Eclectic philoſophers, who were diſperſed through various parts of the Roman empire. The immediate ſucceſſor of Jamblichus was Ædeſius of Cappadocia. Fabr. Bib. Græc. vol. iv. and vol. vi. Brucker's Hiſt. Philoſ. by Enfield, vol. ii. Lardner's Works, vol. viii.

Jamblichus, another Platonic philoſopher, who was a native of Apamea, in Syria, flouriſhed during the reign of the emperor Julian, who was much attached to him, and very freely correſponded with him. This philoſopher is ſaid to have been poiſoned under the reign of the emperor Valens. This Jamblichus has been confounded with the former by many writers, though they lived at very diſtant periods, and the works of the one have been aſcribed to the other. This Jamblichus was the friend of Alypius, wrote with him on the ſubject of muſic, and compoſed the hiſtory of that great muſician's life.

JAMBLICI Sal, in *Medicine*, a kind of ſalt prepared with ſal ammoniac, and ſeveral aromatic ingredients, ſuch as pepper, ginger, thyme, origanum, and the like; it has its name from its reputed author Jamblichus, and is ſuppoſed by many old writers to be an excellent medicine for concocting the crude humours, and gently producing ſtools. It was taken faſting in the quantity of half a ſpoonful, either alone or in a poached egg, or mixed with any liquor.

JAMBO, or **Janbo**, in *Geography*, a ſea-port town of Arabia Felix, in the province of Hedsjas, on the coaſt of the Red ſea; 72 miles S.W. of Medina. N. lat. 24° 5'.

JAMBOLIFERA, in *Botany*. See Calyptranthes.

JAMBON, in *Geography*, a river of the iſland of St. Vincent, which runs into the ſea; five miles S. of Young Point.

Jambon, in *Natural Hiſtory*, a name given by authors to a kind of ſea-ſhell, reſembling a ham of bacon. It is a ſpecies of *pinna marina*.

JAMBOS, in *Botany*. See Eugenia.

JAMBS, among *Carpenters* and *Bricklayers*. See Jaums.

JAMBU, in *Ornithology*. See Columba *Jambu*.

Jambu, the name of a Braſilian ſpecies of partridge, of which there are two ſpecies. They are of a duſky yellow colour, and are equal to the European partridges in the delicacy of their taſte. Margrave.

IAMBUS, Ιαμϐος, in the *Greek* and *Latin Proſody*, a poetical foot, conſiſting of a ſhort ſyllable followed by a long one: as in

˘ˉ ˘ˉ ˘ˉ ˘ˉ
Θεȣ, λεγω, *Dei*, *meas*.

"Syllaba longa brevi ſubjecta vocatur iambus," as Horace expreſſes it; who alſo calls the iambus a ſwift, rapid foot, *pes citus*.

The word, according to ſome, took its riſe from Iambus, the ſon of Pan and Echo, who invented this foot: or, perhaps, who only uſed ſharp biting expreſſions to Ceres, when afflicted for the death of Proſerpine. Some rather derive it from the Greek ιος, *venenum*, *poiſon*; or from ιαμϐιζω, *maledico*, *I rail*, or *revile*; becauſe the verſes compoſed of iambuſes were at firſt only uſed in ſatire.

The invention of this kind of verſe is aſcribed by Horace to Archilocus:

> "Archilochum propria rabies armavit iambo."
> Art. Poet.

See Iambic *Foot*.

JAMDRO, or **Palté**, in *Geography*, a lake of Thibet, of ſuch extent that it is ſaid to be about 300 miles in circumference, or to require to encompaſs it 18 days journey of 20 miles each. By the Lama's map the circumference is only 150 Britiſh miles. According to the deſcription of Giorgi, it has in the middle a range of hillocks and iſles; or, according to the Lama's map, one large iſland, encircled by a lake from three to eight miles wide. The iſland is ſaid to be about twelve leagues in diameter, and the trench that every where ſurrounds it is about two leagues broad. On the ſouth of the iſland is the convent of the great female lama, Turcapamo, who was adored as a deity, and received with ſupreme pomp when ſhe viſited Laſſa, which is about three days journey, or about 24 miles N. of the lake. On the north of the lake ſtands Cambala, a mountain of great height, and at a diſtance of ſeven miles runs the river Sampo, or Burrampoot, which is here 500 feet wide. N. lat. 28° 50'. E. long. 90° 45'.

JAMENGIAN, a town of Perſia, in the province of Farſiſtan; 42 miles W.S.W. of Schiras.

JAMES, St., in *Scripture Biography*, denominated "The Elder," by way of contradiſtinction to the ſubject of the next article, was the ſon of Zebedee, a fiſherman upon the lake of Galilee, and of Salome, who is ſuppoſed by Theophylact and others to have been related to our Lord. As he is always mentioned firſt, except in Luke, ix. 28. he was probably older than his brother John. Of the call of James and John to be ſtated attendants on our Lord's miniſtry, we have an account in Matt. iv. 21, 22. Mark, i. 19, 20. Luke, v. 1—10. Theſe two brothers were diſtinguiſhed by the appellation of "Boanerges," or ſons of thunder, not by way of reproach, as Cave has erroneouſly intimated, but as an honourable anticipation of the reſolution and courage with which they would openly declare the truths of the Goſpel, as ſoon as they were made acquainted with them. It appears that after they were enliſted in the number of our Lord's diſciples, they were admitted into a peculiar intimacy with their Maſter, and attended him on ſome of the moſt intereſting occaſions in the courſe of his miniſtry. At the reſurrection of Jairus's daughter, at our Lord's transfiguration on the mount, and in the ſcene of his laſt agony, James was preſent; and he was one of the four apoſtles to whom Chriſt delivered his prediction concerning the previous calamities and ultimate deſtruction of Jeruſalem. James appears to have been eminently diligent and zealous in fulfilling the commiſſion which in common with the other apoſtles he had received, or of announcing the character and pretenſions of their Maſter through various parts of Judea, which were afterwards the ſcenes of his perſonal miniſtry. On ſome occaſions, however, both he and his brother John, indulging a reſentment, and alſo an ambition which were inconſiſtent with the nature of Chriſt's kingdom and the mild ſpirit of his religion, ſubjected themſelves to the juſt reprehenſion of their Maſter. When they wiſhed to command fire from heaven to deſtroy the Samaritans for refuſing them the accommodation which they ſolicited, he reproaches them with not knowing what manner of ſpirit actuated them; and when, apprehending his kingdom to be temporal, they beſpoke ſtations of dignity and influence when it was eſtabliſhed, he corrected their miſtaken views, checked their inordinate ambition, and forewarned them of the trials and ſufferings that awaited them. After the reſurrection of Chriſt, James retired into Galilee, but ſoon returning to Jeruſalem, he was witneſs of his aſcenſion, and participated of the extraordinary gifts communicated to the apoſtles on the day of Pentecoſt. His ſubſequent activity in preaching the Goſpel to the Jews drew upon him the particular notice of the enemies of the Chriſtian cauſe; and in the year 44, Herod Agrippa, himſelf a Jew, and deſirous of engaging the attachment of the Jewiſh people, cauſed James to be apprehended and to be beheaded with a ſword; thus rendering him the firſt among the apoſtles who became a martyr for Chriſt and his religion. It has been ſaid by Gaſpar Sanctius, and alſo by others, that this James planted the Goſpel in Spain; but this account is inconſiſtent with the hiſtory in the Acts, none of the apoſtles having left Judea ſo ſoon; nor is the opinion founded on the teſtimony of any ancient writer of good credit; and it is now given up, though once defended by Baronius, both by him and other popiſh writers. See the Four Goſpels and the Acts. Lardner's Works, vol. vi.; or Supplement to the Credibility, ch. ix.

James, St. denominated "The Leſs," partly by way of diſtinction from the former, and probably alſo on account of his ſtature, an apoſtle of Chriſt, was the ſon of Alpheus, or Cleophas, and frequently called the Lord's brother. Some ſuppoſe the reaſon of this appellation to have been, that he was the ſon of Joſeph by a former wife; but according to others he was thus called, becauſe his father married Mary, ſiſter to our Lord's mother, ſo that they were in reality couſins; and, therefore, in conformity to the latitude with which the Jews applied the terms brother or ſiſter, they were denominated brethren. That he was an apoſtle is evident from a great variety of paſſages in the New Teſtament, though it does not appear when his deſignation to this office took place. He was honoured by our Lord with a ſeparate interview ſoon after his reſurrection (1 Cor. xv. 7.); he was diſtinguiſhed as one of the apoſtles of the circumciſion (Acts, i. 13.); and ſoon after the death of Stephen, about the year 36, he ſeems to have been appointed preſident or ſuperintendant of the Chriſtian church at Jeruſalem, to have reſided in that city, to have preſided in the council held there in the year 49 or 50, and to have maintained a character which commanded the reſpect of all who knew him, and entitled him to the appellation of "The Juſt." But notwithſtanding the high opinion that was generally entertained of his character, his life was terminated by a premature and violent death. Hegeſippus, cited by Euſebius, has detailed the circumſtances attending it. Having made a public declaration of his faith in Chriſt, the Scribes and Phariſees excited a tumult among the Jews, which began at the temple; or at leaſt they availed themſelves of a general diſturbance, however it might have originated, and demanded of James an explicit and public declaration of his ſentiments concerning the character of Chriſt. The apoſtle, ſtanding on an eminence in the temple, whence he could be heard by the aſſembled multitude, avowed his faith and maintained his opinion, that Jeſus was the Chriſt or expected Meſſiah, and that his doctrine furniſhed ſufficient inſtruction how men might be ſaved. The Jews were exaſperated, and the Scribes and Phariſees, repenting of their conduct in extorting from the apoſtle ſuch a teſtimony to Jeſus, cauſed him to be precipitated from the battlement of the temple upon which he ſtood, and then to be ſtoned, becauſe he was not killed with the fall. St. James, kneeling down, prayed earneſtly to God on behalf of thoſe who were thus maltreating him; but they perſiſted in their violent and ſavage treatment of him, till at length one of them ſtruck him with a long pole, which put an end to his life. According to Hegeſippus, this event happened about the time of the Paſſover, which was probably that of the year 62. At this time Feſtus is ſuppoſed to have been dead, and Albinus his ſucceſſor was not arrived: ſo that the province was without a governor. Such a ſeaſon left the Jews at liberty to gratify their licentious and turbulent diſpoſitions; and they were very likely to embrace it; and we may therefore very reaſonably place this event at that juncture. Of Joſephus's account we have not availed ourſelves, becauſe ſeveral learned men have ſuſpected it to be an interpolation. Biſhop Pearſon, however, who ſeems to admit the genuineneſs of the whole paſſage of Joſephus, placed the death of James in the year 62; and it is now the general opinion among learned men that James died about that time. For an account of the epiſtle addreſſed to the twelve tribes ſcattered abroad, comprehending all Jews both in Judea and out of it, and juſtly aſcribed to the apoſtle James, we refer to the article Epistle. As for other works that have been attributed to him, ſuch as the Πρωτο-ευαγγελιον (Proto-euangelion), inſerted in Greek and Latin in Fabricius's Cod. Apocryph. New. Teſt., and a "Liturgy," bearing his name, they are evidently not of his writing. The former is manifeſtly ſuppoſititious, and the latter bears internal marks that it belongs to a later period than the apoſtolical age. Lardner's Works, vol. vi. or Supplement to Credib. ch. xvi. Cave's Hiſt. Lit. vol. i.

James, a deacon. Bede informs us that, when Paulinus was biſhop of the Northumbrians, his deacon, named James, acquired great fame for his ſkill in the church ſong.

This muſt have been about the year 620, ſoon after the converſion of the Saxons by Auſtin: when Paulinus was tranſlated to Rocheſter, deacon James was left at York, to inſtruct the eccleſiaſtics in the Roman method of chanting.

James I. king of Scotland, of the houſe of Stuart, ſon of Robert III. by Anabella Drummond, was born in the year 1394. In 1405 his father determined to ſend the young prince to France, in order that he might eſcape the dangers to which he was expoſed from his uncle the duke of Albany, but in endeavouring to avoid one peril he fell into another; being taken by an Engliſh cruiſer, he and his whole ſuite were carried priſoners to the Tower of London. Here the young prince received an excellent education, to which Henry IV. of England was remarkably attentive, thereby making ſome atonement for his injuſtice in detaining him. Robert died in the following year, and James was proclaimed king, but during the remainder of the reign of Henry IV. and the whole of that of Henry V., he was kept in confinement, with a view no doubt of preventing the ſtrength of Scotland from being united to that of France againſt the Engliſh arms. At length, under the regency of the duke of Bedford, James was reſtored to his kingdom, having been full eighteen years a priſoner in this country. James was now thirty years of age, well furniſhed with learning, and a proficient in the elegant accompliſhments of life, and dextrous in the manly exerciſes, which at that period were in high eſtimation. He married Joanna Beaufort, a lady of diſtinguiſhed beauty, deſcended from the royal family of England, and on his return to Scotland he had much trouble to reduce the public affairs to order. During the regency of the duke of Albany and his ſon, many of the moſt valuable poſſeſſions of the crown had been alienated, and the licentiouſneſs of the great, ſanctioned by the authority and example of the chiefs, ſeemed to ſet at defiance all reſtraints of law and juſtice. James inſtantly cauſed the whole of the family of Albany and their adherents to be arreſted. The latter were chiefly diſcharged; but the late regent, his two ſons, and his father-in-law, he cauſed to be convicted, executed, and their eſtates to be confiſcated to the crown. Whether theſe proceedings were founded in juſtice cannot now be aſcertained, but it is certain the king himſelf preſided as judge, and as the verdicts in Scotland are decided by a majority of votes, it would ſcarcely be difficult for a judge and a king to obtain his wiſhes whether founded in equity or not. James is alſo charged with entrapping a number of Highland chiefs by hoſpitality, entertaining them in his caſtle, and in the midſt of their hilarity cauſing the gates to be ſhut upon them; a fact which proves that he was not over ſcrupulous in the means of maintaining his authority. His political ability was diſplayed in a leſs exceptionable manner by the enactment of many good laws in his parliaments, which much improved the ſtate of ſociety in the kingdom where they could be executed. His deſire of improving the revenues of the crown led him to many acts of tyranny, which rendered him odious to his nobility. In 1436 he gave his daughter Margaret in marriage to the dauphin of France, and ſent with her a ſplendid train and a vaſt body of troops. The Engliſh, who had in vain attempted to prevent this union by negociation, now endeavoured to intercept the Scotch fleet in its paſſage, but they miſſed their object, and the princeſs arrived in ſafety at Rochelle. James, exaſperated at this act of hoſtility, declared war againſt England, and ſummoned the whole array of his kingdom to aſſiſt in the ſiege of Roxburgh; which, however, he abandoned upon an intimation of a conſpiracy being formed againſt himſelf by his own people. He now retired to the Carthuſian monaſtery of Perth, which he had himſelf founded, where he lived in privacy, which, inſtead of preventing, facilitated the ſucceſs of the plot formed againſt his life. The chief actors in this tragedy were Robert Graham, and Walter, earl of Athol, the king's uncle. The former was actuated by revenge for the ſufferings of ſome of his family, the latter by the hope of obtaining the crown for himſelf. The aſſaſſins obtained by bribery admiſſion into the king's apartments; the alarm was raiſed, and the ladies attempted to ſecure the chamber-door; one of them, Catharine Douglas, thruſt her arm through a ſtaple, making therewith a ſort of bar, in which ſtate ſhe remained till it was dreadfully broken by the force of the aſſailants. The inſtant they got admiſſion they dragged the king from his concealment, and put him to death with a thouſand wounds. He left one ſon and five daughters. James was a poet as well as a ſovereign, and his works, deſcriptive of the manners and paſtimes of the age, became extremely popular, and are ſtill read with delight by thoſe who can reliſh the northern dialect. His private character was amiable, and he poſſeſſed qualities that would have obtained for him high reſpect in any condition; his improvements in the laws and police of his country, and his attempts to aboliſh anarchy, entitle him to reſpect, though in ſome inſtances his eagerneſs for reform led him to tyranny.

James, an accompliſhed but unfortunate prince, is ſaid by all the Britiſh hiſtorians to have been a ſkilful muſician; and it is aſſerted, that he not only performed admirably on the lute and harp, but was the inventor of many of the moſt ancient and favourite Scottiſh melodies. Where this prince acquired his knowledge in muſic is not aſcertained; but it is probable that it was in France, in his paſſage home from which country he was taken priſoner by the Engliſh. Before the Reformation we hear of no muſic being cultivated in Scotland but plain-ſong, or chanting in the church; nor afterwards, for a long time, except pſalmody.

The genuine and ancient Scots melodies are ſo truly national, that they reſemble no muſic of any other part of Europe. They ſeem to have been wholly preſerved by tradition till the beginning of the laſt century, when a collection of Scots ſongs was publiſhed by a Mr. Thomſon of Edinburgh, for which there was a very large ſubſcription; and in February, 1722, a benefit concert was advertiſed for the editor, to be terminated at the deſire of ſeveral perſons of quality, with a Scottiſh ſong. To this publication and concert may be aſcribed the ſubſequent favour of their national, ſingular, and often touching melodies, ſouth of the Tweed.

Taſſoni, indeed, (lib. x. cap. 23.) tells us, that "James I. king of Scotland, had not only compoſed ſacred muſic, but invented a new ſpecies of plaintive melody different from all others; in which he has been imitated by the prince of Venoſa; who," he adds, "in our times has embelliſhed muſic with many admirable inventions." This aſſertion greatly increaſed our deſire to examine works in which ſo many excellencies were concentred; particularly as we had long been extremely deſirous of tracing the peculiarities of the national melodies of Scotland, from a higher ſource than David Rizzio. But in a very attentive peruſal of all the ſeveral parts of the whole ſix books of the prince of Venoſa's madrigals, we were utterly unable to diſcover the leaſt ſimilitude or imitation of Caledonian airs in any one of them; which, ſo far from Scots melodies, ſeem to contain no melodies at all; nor, when ſcored, can we diſcover the leaſt regularity of deſign, phraſeology, rhythm, or, indeed, anything remarkable in theſe madrigals, except unprincipled modulation, and the perpetual embarraſſments and inexperience of an amateur, in the arrangement and filling up of the parts.

Buchanan, among other hiſtorians, has drawn the character of James I. of Scotland at full length ; and among many other particulars, mentions his being excellently ſkilled in muſic ; more indeed, he adds, than was neceſſary or fitting for a king : for there was no muſical inſtrument on which he could not play ſo well, as to be able to contend with the greateſt maſters of the art in thoſe days. Buch. Rer. Scotic. Hiſt. lib. x. ſect. 57.

And in the continuation of Fordun's Chronicle (Scotichronicon, vol. iv. p. 1323.), is a character of James I. which ranks him equally high as a muſician. And in Hector Boethius is an eulogium upon him, which we ſhall give in the dialect of the country, from the tranſlation of that hiſtorian by Bellenden. "He was well lernet to ficht with the ſword, to juſt, to turnay, to worſyl, to ſing and dance, was an expert muſicinar, richt crafty in playing baith of lute and harp, and ſindry other inſtruments of muſik." This poliſhed and ingenious prince may have added ſome melodies to the tunes of his country, imitating the national ſtyle ; but, in general, the old and genuine Scots tunes ſeem ſtill more ancient than even the time of James I., who being a good muſician, had he been the original inventor of melodies, would have made them accord more to the rules of compoſition built on the ſcale of Guido, which was well known all over Europe at the time when this monarch was in exiſtence. And, indeed, however ſingular and pleaſing theſe airs may be, they are drawn from ſo imperfect a ſcale, and ſo frequently begin in one key and end in another, that we cannot help thinking they were produced before the ſcale of Guido was formed. (See OSSIAN.) It ſeems as if national tunes might be called *traditional*, and the general muſic of Europe *cultivated*.

JAMES II. ſon of the preceding, was in his ſeventh year when his father was murdered : this was in the year 1437. The cuſtody of the youthful monarch, and the adminiſtration of government, devolved upon ſir Alexander Livingſton, and the chancellor Crichton, while Archibald, earl of Douglas, and duke of Touraine, was declared lieutenant-general of the kingdom. Diſcord, the natural attendant upon ſuch a government, aroſe among theſe great men, and the affairs of the nation fell into diſorder. Crichton and Livingſton were perpetually at variance, till the deſire of freeing themſelves from earl Douglas produced a reconciliation between them. They invited him, his brother, and his chief confidant to Edinburgh, and while ſitting at a ſumptuous dinner, they were all three ſeized at the royal table, and were immediately murdered. Lord Douglas's ſon, within three years of this cataſtrophe, procured the proſcription of Livingſton and Crichton, his own family he reſtored to all their former dignities, and the principal offices of the ſtate were given to his friends and relations. In 1449 James was married to Mary, daughter of the duke of Guelderland, and almoſt as ſoon as he could be ſaid to act for himſelf, he began to be jealous of the vaſt power and influence of the Douglas family. The earl, aware of his own danger, negociated an aſylum at the court of England, and at the ſame time entered into a bond with the earls Crawford and Roſs, and other noblemen, mutually to ſupport each other againſt their common adverſaries. The knowledge of theſe facts was ſoon communicated to the king, who ſummoned the earl to his court. The haughty lord refuſed to comply till he ſhould be aſſured of protection under the great ſeal. The form was readily complied with, but it was no ſafeguard againſt the meditated treachery. James received him with apparent cordiality, and invited him to ſupper. After the repaſt, he demanded of his gueſt the bond entered into with the earls of Crawford and Roſs ; this he nobly refuſed, and the king with his own hand ſtabbed him. From this period James was perpetually harraſſed by attempts made againſt his peace by the earl's family, and in 1456 a rebellion was excited by Donald, lord of the iſles, in connection with an invaſion from the Engliſh. He defeated his enemies, and in his turn, in 1460, reſumed hoſtilities, and laid ſiege to Roxburgh caſtle. Here he was killed by the accidental burſting of a piece of artillery. He was then in the prime of life, being not quite thirty years of age. He had already ſurmounted the difficulties which ariſe from youth and from violence of temper, to which he was ſubject, but which he had ſubdued, and there was every proſpect of a wiſe and proſperous reign. He left left three ſons and two daughters.

JAMES III. king of Scotland, ſucceeded to the crown when he was only eight years old, on the death of his father in 1460. The care of his perſon was given to his mother, while the chief management of the government devolved on lord Evandale, the chancellor, and James Kenedy, biſhop of St. Andrews. The death of the good prelate, in 1466, proved a public misfortune, by delivering the young king into the power of flattering and mercenary courtiers. In 1468 a marriage was contracted between James and Margaret, daughter to Chriſtiern I. king of Sweden, Denmark, and Norway. For the marriage portion, the Orkney and Shetland iſles were pledged, and they ever after remained under the dominion of Scotland. This marriage took place in July, 1469, and James took upon himſelf the reins of government. His character, as it opened, diſplayed weakneſs, indolence, and caprice : he had an attachment to literature and the fine arts, as they were then underſtood ; his mind was, however, unfortunately biaſſed towards deſpotiſm, but accompanied with lenity. He was eſteemed pious and devout, but did not ſcruple indulging his avarice by alienating eccleſiaſtical benefices to laymen. In 1477 an unhappy quarrel took place between the king and his two brothers, the duke of Albany and the earl of Mar : the former made his eſcape from the Edinburgh caſtle in which he was confined, but the earl of Mar was accuſed of employing magical practices againſt the king's life : of this crime he was convicted and made a cloſe priſoner, in which ſituation he ſhortly died, but whether by a fever or by more violent means is not known. The king gave great offence to his nobility, by ſelecting as his favourite and chief confidant, Cochrane, a maſon and architect, whom from that ſtate he elevated to the vacant earldom of Mar. During an invaſion of the Engliſh, which James endeavoured to repel, Cochrane was ſeized and hanged, and the king himſelf made priſoner by his own nobles. The Engliſh proceeded as far as Edinburgh, when an accommodation took place ; the king was liberated and reſumed the reins of government. Some ſucceeding years were marked with little elſe than miſgovernment on the part of the king, and progreſſive diſcontents among the nobles ; till in 1488, a confederation of the great broke out into open rebellion, the objects of which were to dethrone and impriſon James, and place his ſon on the throne. After various attempts at pacification, in which the king ſhewed an evident unwillingneſs to ſhed the blood of his people, he reſolved to commit his fortune to the deciſion of a battle, from which he was obliged to ſeek ſafety by flight ; in croſſing a rivulet his horſe ſtarted and threw him ; though ſtunned he was not dangerouſly hurt, and was carried by his attendants to a neighbouring mill, where ſome of his enemies, recognizing his countenance, cruelly murdered him. He left three ſons.

JAMES IV. was in his ſixteenth year when he was forced into a conteſt with his father, and whoſe murder elevated him to the crown in 1488. Though urged by the ambition of his nobles to the unnatural ſtep of open rebellion, he did not eaſily forgive himſelf the ſteps which he had taken. One of his firſt feelings after he had aſcended the throne, was remorſe for his unfilial and diſloyal conduct, and it is ſaid, that as there was no ſuperior earthly tribunal to which he was amenable, he condemned himſelf to wear an iron chain round his body as a puniſhment which he had juſtly incurred, and that he added a new link to its weight for every ſucceeding year of his life. The victorious barons, leſs ſcrupulous with regard to the bloody deed in which they had been engaged, were anxious only for ſecurity for the future; and obtained a declaration in parliament of their innocence with reſpect to the late king's death, and other ſlaughters, which were imputed to his own perverſeneſs and deceit; and a ſubſequent parliament in 1490 was inſtrumental in healing the feuds and animoſities of parties, and reſtoring internal tranquillity. The king contributed much to this deſirable end by the impartial adminiſtration of juſtice. The qualities of his mind and heart were well calculated to obtain for him the reſpect and attachment of his people in every ſituation and rank of life. For many years he maintained a ſtrict peace with Henry VII. of England, till at length he offended that monarch by adopting the cauſe of Perkin Warbec, who came ſtrongly recommended to him by the court of France. War was excited on this account for a ſhort time, but the love of peace, which was ever uppermoſt in the mind of Henry VII. ſoon put an end to all national differences. Though James, on this reconciliation, abandoned the cauſe of Perkin, he had too high a ſenſe of honour to give him up. In 1503 he married Margaret, the daughter of Henry, an event which, in the iſſue, produced the union of the two kingdoms under one crown, though at the diſtance of two centuries from this marriage. In ſubſequent parliaments James cauſed ſeveral very uſeful laws to be enacted which led to the improvement of the country, nor was he leſs anxious to render Scotland reſpectable with regard to foreign potentates. In the reign of Henry VIII. he was engaged in warfare with England: after ſeveral predatory incurſions from both parties, James entered England at the head of a hundred thouſand ſoldiers, and made himſelf maſter of many caſtles and other ſtrong holds. At one of theſe he formed an attachment to a lady of exquiſite charms, the power of which he could not reſiſt. He forgot the importance of time to the career of his army, and remained ſeveral days in a ſtate of inactivity, during which, from a concurrence of unfortunate circumſtances, his vaſt army was reduced by deſertion to leſs than thirty thouſand. Theſe, diſpirited by the conduct of their king, were brought to contend with an almoſt equal number at Flodden Field, in Northumberland, under the earl of Surrey. The battle was fought on the 9th of September, 1513: prodigies of valour were diſplayed on both ſides; the king rallied his troops again and again, as if aſhamed of the amours which had brought him into ſuch a ſtate of peril; he was determined to ſhew himſelf the man and the hero; wherever there was moſt danger, there was James, till he fell mortally wounded; this circumſtance, and the darkneſs of the night, put an end to the conflict. With the monarch were ſlain his natural ſon, the archbiſhop of St. Andrew's, twelve earls, and a multitude of the higheſt rank among the nobility and gentry of the kingdom. Scotland, ſays the hiſtorian, can reckon few more fatal days than that of Flodden Field. The body of the dead king fell into the hands of the conquerors, who carried it to the monaſtery of Sheene, near Richmond, where it was interred. James IV. was ſlain in the forty-firſt year of his age, and the twenty-ſixth of his reign. He was ſucceeded by

James V. his ſon, an infant not two years old. His minority paſſed in that contention of parties which commonly attended ſuch a period in Scotland. When, however, he arrived at an age to be allowed to manage the affairs of government, his character diſplayed itſelf in decided features. In his youth he had witneſſed the diſorders which a powerful and lawleſs ariſtocracy had inflicted upon his people, and he was now the conſtant and determined foe of the nobility. While he depreſſed the powerful, he raiſed and favoured the low, ſo as to obtain and merit from his people the appellation of "King of the Poor." No object was nearer to James's heart than the ſuppreſſion of thoſe bands of freebooters whom the licence of the times had ſuffered to range uncontrolled in the remote parts of the country. He even expoſed his perſon in expeditions againſt theſe marauders, whom he treated with unrelenting rigour. After reducing the borders and highlands to order, James paid a viſit to the iſles of his dominions, and held courts of juſtice in the Orkneys and Hebrides, to the terror of the tyrannical chieftains of thoſe regions. In 1537 he married the ſiſter of the king of France, who lived but a few months. In the ſame year he incurred the ſtain of cruelty in cauſing the ſon of lord Forbes to be beheaded for treaſon upon very ſlight and unſatisfactory evidence, and ſtill farther by the burning of the beautiful and heroical lady Glamis, ſiſter of the earl of Angus, for the imaginary crime of witchcraft practiſed on his own perſon. James had contracted a partiality for the French court, and married for a ſecond wife Mary, daughter of the duke of Guiſe, an union which probably enforced his propenſity to ſevere meaſures againſt the Proteſtants, who began to appear in great numbers in Scotland, and of whom ſeveral nobly ſuffered death in defence of their opinions. Henry VIII. was deſirous of joining James with himſelf in oppoſing the pretenſions of the Roman ſee, and ſent an embaſſy into Scotland to perſuade him to enrich himſelf with the ſpoils of the monaſteries. In ſome reſpects James was willing to liſten to the propoſals of the Engliſh monarch, but French influence was too powerful, and he afterwards ſent an excuſe to Henry for the breach of his engagement, which provoked that prince ſo much, that it was imagined a war between the two kingdoms would enſue. Hoſtilities were actually commenced, and James was urged, as well by the king of France as by his own clergy, to purſue ſome advantages, which he at firſt gained, into the enemy's country; but his army were evidently ill affected to their monarch, remonſtrated againſt the deſign, and in the event of an attack ſome time after, ſuffered themſelves to be taken priſoners, or deſerted from their colours without a ſtruggle. James, already depreſſed by the loſs of his two infant princes, was now overwhelmed with anguiſh, ſhame, and deſpair. He retired to Falkland, and ſhewed every ſymptom of declining health. So loſt was he to any thing that might intereſt his feelings, as a man or ſovereign, that when news was brought him of the birth of a daughter, he took no other notice of the event than to ſay, "The crown came with a girl, and will go with a girl." He expired December 14, 1542. The reader is referred for farther information relating to the foregoing kings of Scotland, to Pinkerton's hiſtory of that country, and to Henry's Hiſtory of Great Britain.

James I. of England, and the VIth of that name of Scotland, was ſon of Mary, queen of Scotland, by her couſin Henry, lord Darnley. He was born at Edinburgh caſtle in June, 1566, at the exact time when his mother was at open variance with her huſband, and had fixed her affections on the earl of Bothwell. The young prince was committed to the charge of the earl of Mar, who with much fidelity did his duty, and kept him out of the hands of Bothwell. In the following year Mary was forced to reſign the crown, which was placed on the head of her infant ſon. He was ſolemnly crowned at Stirling, and thenceforth all public acts ran in his name. He was educated by the celebrated

Buchanan while he was at Stirling caſtle; his progreſs in ſchool-learning was rapid, and he manifeſted talents which preſaged the future great man: but he became the prey of flatterers, who inſtilled into his youthful mind the moſt pernicious maxims of the plenitude of regal authority, and urged him to unpopular meaſures, which in 1582 produced a conſpiracy of the nobles againſt him, who took poſſeſſion of his perſon at Ruthven caſtle. From thence he was conveyed to the palace of Holyrood-houſe, and treated with much external reſpect, while in reality he was held in the utmoſt reſtraint. A new confederacy of other nobles produced his liberation, and he put himſelf under the ſway of his favourite the earl of Arran, who was violent and unprincipled, and who carried on meaſures of ſeverity againſt the nobles of the former conſpiracy, and againſt the clergy who favoured them. He contrived to engage the mind of the young king with a conſtant round of amuſement, and he himſelf exerciſed with unlimited ſway all the regal authority, and by his inſolence and rapacity rendered himſelf univerſally odious. Queen Elizabeth of England had long employed her arts to maintain a party in the country, which policy was become more neceſſary on account of her conduct to its queen. Though James had hitherto been induced to treat his mother very irreverently, yet when her life appeared to be in imminent danger, from the ſentence pronounced againſt her by an Engliſh court of judicature, he felt himſelf bound to interfere, and wrote a menacing letter to Elizabeth on the occaſion. He alſo applied to other courts for their aſſiſtance, and aſſembled his own nobles, who promiſed to ſtand by him in preventing or avenging ſuch an injuſtice. When he learned the fatal cataſtrophe, he rejected with a proper ſpirit of indignation the hypocritical excuſes of Elizabeth, and ſet about preparations for hoſtilities, but cooler reflection on his own reſources, which were inadequate to the purpoſes of carrying on a ſerious war, and reflecting alſo on the neceſſity he was under of keeping on terms with England to ſecure his ſucceſſion to the crown, of which he was the preſumptive heir, he reſolved to reſume a friendly correſpondence with the Engliſh court. It is to the honour of James that one of the firſt acts of his full majority, in 1587, was an attempt to put an end to all family feuds among the nobility, and perſonally to reconcile them with each other at a ſolemn feſtival in Holyrood-houſe. When the invaſion of England was reſolved upon by Philip, king of Spain, he put his kingdom into a ſtate of defence, reſolving to ſupport the queen againſt her enemies. His people alſo were zealous for the preſervation of Proteſtantiſm, and entered into a national bond for the maintenance of true religion, which was the origin and pattern of all future engagements of the kind, under the name of ſolemn leagues and covenants. After the glorious defeat of the Armada, Philip, in revenge of the conduct of James, ſtirred up a conſpiracy of ſome Popiſh lords in his kingdom, which was diſcovered by Elizabeth, and when it broke out into open rebellion, was inſtantly cruſhed by the king at the head of a body of troops. The conſpirators were treated with lenity, which James ever ſhewed towards the Catholics, and which brought the ſincerity of his own profeſſed faith into queſtion, though it probably proceeded partly from mildneſs of temper, and partly from timidity. Though he was probably ſatisfied of the errors of popery, he was fond of the ſplendour of eccleſiaſtical hierarchy, and bore a rooted antipathy to the republican model of Preſbyterianiſm.
